According to Zelezny and Schultz (2000), EC is an individual's psychological propensity to engage in pro-environmental behavior. It is conceptualized as a multidimensional mental state that comprises value, emotional response, personality traits, and attitudinal orientations (Kautish et al., 2019; Kautish et al., 2021). EC is often reflected in attitudes and behaviors to minimize ecological harm. It is demonstrated that consumers with higher EC value green product attributes favorably and lead to eco-friendly decisions (Kilbourne et al., 2008). The value system is changing for all consumers toward more sustainable consumption, and incorporating sustainability attributes in products is a principal strategy of the company for raising consumption among eco-conscious individuals (Kautish et al., 2021). Pro-environmental values play a critical role in shaping consumer acceptance and always lead to the choice of a more sustainable product and green consumption (Pickett-Baker et al., 2008). Hypotheses of moderating effects of EC are shown in Table 5.

SD was originally conceptualized as a stable trait by Crowne and Marlowe, (1960), whose 33-item Marlowe-Crowne Social Desirability Scale (MC-SDS) remains the benchmark for assessing individual differences in this motive. Later work distinguished two underlying processes: self-deceptive enhancement and impression management, captured by the Balanced Inventory of Desirable Responding (Paulhus, 1991). From a theoretical standpoint, SD is rooted in social-norms theory, which posits that behavior is guided by injunctive and descriptive expectations (Cialdini and Goldstein, 2004), and in impression-management theory, which treats self-presentation as a strategic effort to claim socially valued identities.

Because the SD motive heightens concern with how one's choices will be judged, it can amplify the influence of factors that signal social approval (e.g., perceived environmental benefit) while muting factors rooted in private affect (e.g., food neophobia). A study by Fisher and Katz, (2000) confirmed that respondents high in SD inflate other-oriented values. Extending this evidence, De Jong et al., (2010) demonstrated that moving from conventional self-reports to indirect questioning eliminates SD-driven inflation of sensitive consumption desires, revealing stronger underlying relationships between genuine motives and intentions. Similar patterns appear in sustainable consumption: structural models of South-Australian organic purchasers indicate that impression-management SD suppresses the effect of personal ecological attitude on stated purchase frequency (Wheeler et al., 2019). Collectively, these studies justify modelling SD not merely as a statistical control but as a theoretically meaningful moderator of intention frameworks.

Within our conceptual framework, SD functions as a moderator overlaying both facilitators and barriers. When SD is high, the positive paths from PB, EC and PI to 3DPF intention should strengthen, because endorsing a cutting-edge, sustainable technology conveys a favorable social image. Conversely, the negative path from FN is expected to weaken: publicly admitting fear of novel foods is socially unattractive, so high-SD consumers may under-report neophobic tendencies, diluting their deterrent effect. By integrating SD, the model recognizes that stated intentions toward 3DFP reflect not only cognitive evaluations but also the social signaling value of embracing a futuristic diet. Hypotheses of moderating effects of SD are shown in Table 5.The entire hypothesized model is visible in Figure 1.

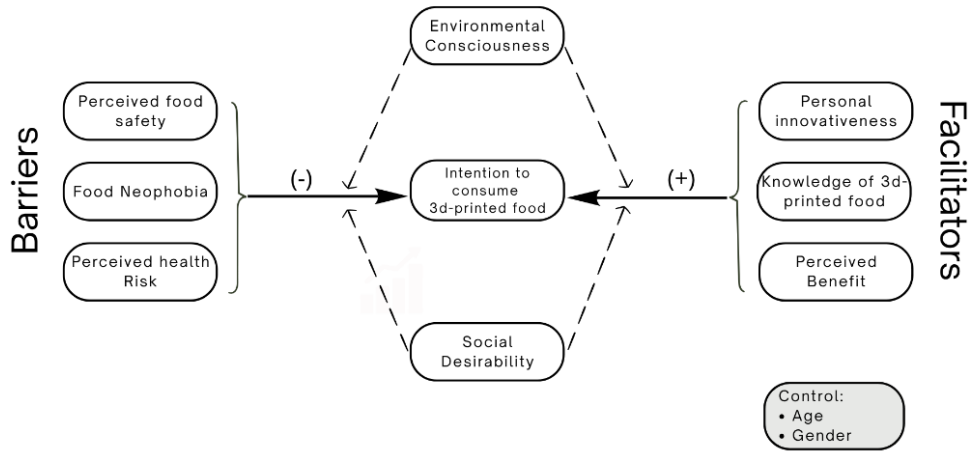

**Figure 3:** Hypothesized conceptual model

## 3. Materials and Method

This study adopts a quantitative research approach. Primary data were collected through a structured questionnaire administered to a convenience sample. The questionnaire consisted of two main sections. The first section began with a screening question assessing whether respondents were already familiar with 3DPF. It then included the measurement items corresponding to the constructs tested in the theoretical model. The second section gathered socio-demographic information (e.g., gender, age, educational attainment, and income level). Table 1 reports the key demographic characteristics of the sample.

| Variable | Category | No. | Percentage (%) |
|---|---|---|---|
| **Gender** | Male | 66 | 46.8% |
| | Female | 75 | 53.2% |
| | Other/Choose not to say | 0 | 0% |
| **Educational level** | Elementary school/Lower secondary school | 4 | 2.8% |
| | Higher Secondary School | 21 | 14.9% |
| | Bachelor's degree (3 years) | 36 | 25.5% |
| | Degree (5 years or more) | 68 | 48.2% |
| | Doctorate | 12 | 8.5% |
| **Monthly income range** | <1,000 € | 42 | 29.8% |
| | 1,000 – 3,000 € | 90 | 63.8% |
| | >3,000€ | 9 | 6.4% |

**Table 1:** Socio-demographic characteristics of the sample
(Note: Sample size = 141 respondents; Source: Authors' elaboration)

The sample's mean age was 29.8 years (SD=8.24; range 19–63) with a balanced gender distribution. The sample was characterized by a high level of educational attainment: cumulatively, nearly three-quarters of participants held a university degree (bachelor's or higher), with 48.2% holding a master's degree. Most participants (over 50%) reported a monthly income in the €1,000 to €3,000 range.

Out of a total of 270 responses, approximately 60% of participants (n = 162) answered "yes" to the initial screening question, indicating they had heard of 3DPF, even if only vaguely. To enhance data quality and reduce potential bias, 21 respondents were excluded due to invalid answers to the attention check question (Abbey and Meloy, 2017), for a total of 141 valid questionnaires.

### 3.1 Measures

The study employed nine latent constructs, which are detailed in Table 2. All constructs were rigorously validated in prior literature and carefully adapted to align with the specific objectives of this research.

The construct measuring *Knowledge of the Product* was adapted from Mitchell et al. (1996) and Kelting et al. (2017). The *Food Neophobia* scale draws from Pliner et al. (1992), Siegrist et al. (2013), Jaeger et al. (2017), and Lee et al. (2021). *Personal Innovativeness* was measured using the scale developed by Agarwal and Prasad (1998), while *Perceived Health Risk* was adapted from Hwang et al. (2020) and Tesikova et al. (2022). The construct *Perceived Benefit* follows Kim et al. (2019), *Social Desirability* is based on Ding et al. (2005), and *Perceived Safety* was derived from Lando and Carlton (2011) and Berry et al. (2015).

*Environmental Consciousness* was adapted from Kilbourne and Pickett (2008), and *Intention to Consume* was measured using items from Gao et al. (2017) and Alam et al. (2020).

The *Perceived Safety* construct was measured using a 7-point semantic differential scale, while all other constructs were assessed using 7-point Likert-type scales ranging from 1 ("strongly disagree") to 7 ("strongly agree").

| Dimension | Items | Factor Loadings | Cronbach's α | CR (ρc) | AVE |
|---|---|---|---|---|---|
| ***Knowledge of the Product*** | How familiar are you with 3D printed food? | 0.878 | 0.900 | 0.929 | 0.766 |
| | How clear is your idea with respect to the characteristics of 3D printed food? | 0.800 | | | |
| | How much do you know about 3D printed food? | 0.935 | | | |
| | How would you rate your knowledge of 3D printed food compared to the rest of the population? I think I am: one of the least informed/one of the most informed people | 0.883 | | | |
| ***Food Neophobia*** | In general. I don't trust innovative foods | 0.829 | 0.895 | 0.922 | 0.703 |
| | In general. I don't try innovative foods | 0.835 | | | |
| | The unusual appearance of 3D printed food prevents me from eating it | 0.843 | | | |
| | I have doubts about the hygiene and safety of 3D printed food | 0.814 | | | |
| | The ingredients of 3D printed food make me suspicious | 0.871 | | | |
| ***Personal Innovativeness*** | I like to explore new things | 0.890 | 0.917 | 0.938 | 0.755 |
| | I am usually the first among my friends to try new foods | 0.887 | | | |
| | I openly accept new ways of thinking | 0.658 | | | |
| | I like to try new things | 0.938 | | | |
| | I am interested in trying new foods | 0.942 | | | |
| ***Perceived Health Risk*** | I fear that 3D printed food is harmful to health | 0.939 | 0.947 | 0.962 | 0.863 |
| | I fear that 3D printed food is unhealthy | 0.952 | | | |
| | I believe there is a risk of chemical contamination (e.g. heavy metals and pesticides) in 3D printed food | 0.929 | | | |

| | | | | | |
|---|---|---|---|---|---|
| | I believe there is a risk of microbiological contamination (e.g. Escherichia coli and botulinum) in 3D printed food | 0.893 | | | |
| ***Perceived Benefit*** | Consuming 3D printed food is beneficial | 0.883 | 0.917 | 0.941 | 0.800 |
| | Consuming 3D printed food has value to me | 0.874 | | | |
| | I believe it is worthwhile to consume 3D printed food | 0.939 | | | |
| | Consuming 3D printed food is worthwhile to me | 0.881 | | | |
| ***Perceived Safety*** | I think consuming 3D printed food is: not at all safe/very safe | 0.947 | 0.879 | 0.943 | 0.892 |
| | I think the food safety level of 3D printed food is: very poor/very good | 0.942 | | | |
| ***Intention to Consume*** | I plan to consume 3D printed food | 0.950 | 0.952 | 0.963 | 0.840 |
| | I will try to consume 3D printed food more often | 0.926 | | | |
| | I plan to consume 3D printed food | 0.891 | | | |
| | I would be willing to consume 3D printed food | 0.909 | | | |
| | I plan to consume 3D printed food in the near future | 0.905 | | | |
| ***Social Desirability*** | I think it is socially desirable to eat 3D printed food | 0.895 | 0.703 | 0.824 | 0.613 |
| | My friends and family would agree that it is socially desirable to consume 3D printed food | 0.784 | | | |
| | There is a widespread perception that consuming 3D printed food is socially desirable | 0.652 | | | |
| ***Environmental Consciousness*** | I am very concerned about environmental issues | 0.780 | 0.737 | 0.830 | 0.621 |
| | Human beings are severely abusing the environment | 0.694 | | | |
| | I would be willing to reduce my consumption to help protect the environment | 0.879 | | | |

**Table 2:** Overview of the measurements for reliability test
(Note: CR=Composite Reliability; AVE=Average Variance Extracted; Source: Authors' elaboration)

### 3.2 Data Analysis

Data analysis was performed using SmartPLS version 4.1.0.6 to examine the relationships among the study constructs. The software implements structural equation modeling (SEM) techniques to explore linear relationships between variables and test the overall theoretical model, employing the Partial Least Squares (PLS) estimation method.

Partial least squares structural equation modeling (PLS-SEM) has gained increasing popularity across various fields, including strategic and international management as well as marketing, for testing theoretical frameworks and assessing hypothesized relationships within structural models (Channa et al., 2020). Furthermore, PLS-SEM focuses on estimating causal predictions in statistical models (Rigdon, 2014). The use of this technique is particularly appropriate given its strong capability to handle complex structural models that include a large number of constructs, indicators, and paths (Hair et al., 2018).

The analysis was conducted in two main stages. First, the measurement model was assessed by examining the convergent validity and unidimensionality of the constructs. Second, the structural model was evaluated using a bootstrapping procedure based on 5,000 resamples, in order to test the statistical significance of the relationships between latent constructs and the individual path coefficients.

## 4. Results

### 4.1 Measurement Model

The measurement model comprises 35 items developed to capture the proposed theoretical framework, along with two control variables (age and gender). A Confirmatory Factor Analysis (CFA) was first conducted to assess the validity and reliability of the latent constructs, in accordance with the guidelines provided by Hair et al. (2022).

Convergent and discriminant validity were evaluated using a range of established metrics: Cronbach's alpha, factor loadings, composite reliability (CR), average variance extracted (AVE), and the Heterotrait-Monotrait Ratio of correlations (HTMT), following the recommendations of Hair et al. (2022) (see Table 2). All factor loadings meet or exceed the commonly accepted threshold of 0.70, indicating satisfactory item-construct relationships. Both Cronbach's alpha and CR values are above the recommended 0.70 cutoff, confirming strong internal consistency. Additionally, AVE values for all constructs exceed the 0.50 benchmark (Fornell and Larcker, 1981), thereby supporting convergent validity.

To assess discriminant validity, the HTMT criterion was applied, as it is considered the most rigorous approach in PLS-SEM analysis (Henseler et al., 2015). As reported in Table 3, all HTMT values fall below the conservative threshold of 0.85, providing robust evidence of discriminant validity among the latent constructs.

Collectively, these findings confirm the soundness of the measurement model in terms of both reliability and validity.

| | AGE | EC | FN | GEN | ICONS | KN | PB | PHR | PI | SAF | SD |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **AGE** | | | | | | | | | | | |
| **EC** | 0.123 | | | | | | | | | | |
| **FN** | 0.056 | 0.264 | | | | | | | | | |

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| **GEN** | 0.219 | 0.198 | 0.115 | | | | | | | |
| **ICONS** | 0.035 | 0.296 | 0.655 | 0.037 | | | | | | |
| **KN** | 0.054 | 0.182 | 0.155 | 0.210 | 0.384 | | | | | |
| **PB** | 0.034 | 0.243 | 0.432 | 0.043 | 0.755 | 0.277 | | | | |
| **PHR** | 0.043 | 0.151 | 0.748 | 0.039 | 0.506 | 0.187 | 0.458 | | | |
| **PI** | 0.171 | 0.458 | 0.555 | 0.118 | 0.425 | 0.144 | 0.205 | 0.211 | | |
| **SAF** | 0.058 | 0.236 | 0.557 | 0.077 | 0.586 | 0.184 | 0.563 | 0.711 | 0.215 | |
| **SD** | 0.053 | 0.225 | 0.267 | 0.065 | 0.585 | 0.308 | 0.761 | 0.318 | 0.135 | 0.506 |

**Table 3:** Discriminant validity using HTMT
(Note: AGE = respondents' age; EC=Environmental Consciousness; FN=Food Neophobia; GEN=respondents' gender, ICONS=Intention to consume 3DPF; KN=Knowledge of the Product; PB=Perceived Benefit; PHR=Perceived Health Risk; PI=Personal Innovativeness; SAF=Perceived Safety; SD=Social Desirability)

In order to guarantee the accuracy of the model, two indices were calculated: the coefficient of determination ($R^2$) and the standardized root mean square residuals (SRMR). The $R^2$ is a value ranging from 0 to 1, and it is employed to demonstrate the nomological validity and explanatory power of the model. The results of the analysis demonstrate a high explanatory power of the PLS-SEM model (adjusted = 0.707; SRMR = 0.075). The findings suggest that the variables considered as exogenous (the three facilitators and the three barriers) account for more than 70% of the variance of the construct. The SRMR indicates a satisfactory model fit, falling below the threshold recommended by Hu and Bentler (1999).

### 4.2 Structural Model

A two-tailed PLS bootstrapping test with 5,000 subsamples was conducted to estimate standard errors and t-values, which are essential for evaluating regression coefficients and significance of effects (Dijkstra and Henseler, 2015; Hair et al., 2022). The direct effects among the latent variables are presented below in Table 4 and in Figure 2.

| Hypothesis | Path | Standardized effect (β) | T statistics | p-value |
|---|---|---|---|---|
| H1 | SAF→ICONS | 0.112 | 1.550 | 0.121 |
| H2 | FN→ICONS | -0.286** | 3.365 | 0.001 |
| H3 | PHR→ICONS | 0.049 | 0.500 | 0.617 |
| H4 | PB→ICONS | 0.385*** | 4.971 | 0.000 |
| H5 | PI→ICONS | 0.197** | 3.143 | 0.002 |
| H6 | KN→ICONS | 0.208*** | 3.585 | 0.000 |

**Table 4:** Direct effect hypotheses testing

Note: EC=Environmental Consciousness; FN=Food Neophobia; ICONS=Intention to consume 3DPF; KN=Knowledge of the Product; PB=Perceived Benefit; PHR=Perceived Health Risk; PI=Personal Innovativeness; SAF=Perceived Safety; SD=Social Desirability; ** p<0.05; *** p<0.001.

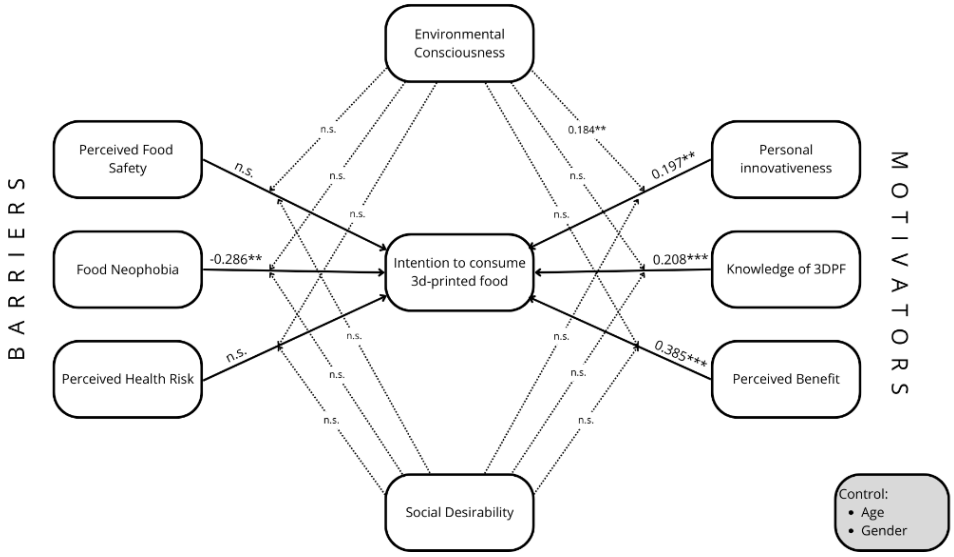

**Figure 4:** Structural model (Note: ** p<0.05; *** p<0.001)

The findings indicate that among the identified barriers, FN exerts a negative and significant influence (β = -0.286, t=3.365, p=0.001) on the intention to consume 3DPF, thereby substantiating hypothesis H2. Conversely, the findings demonstrate a positive and significant impact of all facilitators under investigation on intention to consume 3DPF, thereby supporting the hypothesized relationships (H4, H5, and H6). The findings indicate that PB exert a more substantial influence (β = 0.385, t=4.971, p<0.001) compared to KN (β = 0.208, t=3.585, p<0.001) and PI (β = 0.197, t=3.143, p=0.002). Therefore, the impact of facilitators on Intention to consume 3DPF is greater than that of barriers.

| Hypothesis | Path | Standardized effect (β) | T statistics | $F^2$ | p-value |
|---|---|---|---|---|---|
| H7a | EC*SAF→ICONS | 0.036 | 0.475 | 0.002 | 0.634 |
| H7b | EC* FN →ICONS | 0.078 | 0.698 | 0.006 | 0.485 |
| H7c | EC* PHR → ICONS | -0.062 | 0.635 | 0.004 | 0.526 |
| H7d | EC* PB→ICONS | -0.042 | 0.575 | 0.004 | 0.566 |
| H7e | EC* PI → ICONS | 0.184** | 2.024 | 0.068 | 0.043 |
| H7f | EC* KN → ICONS | -0.009 | 0.152 | 0.000 | 0.880 |
| H8a | SD*SAF → ICONS | 0.028 | 0.241 | 0.038 | 0.810 |

| | | | | | |
|---|---|---|---|---|---|
| H8b | SD* FN → ICONS | 0.022 | 0.229 | 0.001 | 0.819 |
| H8c | SD* PHR → ICONS | -0.168 | 1.667 | 0.001 | 0.095 |
| H8d | SD* PB → ICONS | 0.008 | 0.095 | 0.014 | 0.925 |
| H8e | SD* PI → ICONS | 0.082 | 1.196 | 0.000 | 0.232 |
| H8f | SD* KN → ICONS | -0.006 | 0.103 | 0.000 | 0.918 |

**Table 5:** Moderating effect hypotheses testing

(Note: EC=Environmental Consciousness; FN=Food Neophobia; ICONS=Intention to consume 3DPF; KN=Knowledge of the Product; PB=Perceived Benefit; PHR=Perceived Health Risk; PI=Personal Innovativeness; SAF=Perceived Safety; SD=Social Desirability; ** $p<0.05$; *** $p<0.001$.)

Among the hypotheses involving the moderating role of EC, only H7e showed a statistically significant effect ($\beta = 0.184$, $f^2 = 0.068$, $p = 0.043$), indicating that EC amplifies the positive relationship between PI and the Intention to consume 3DPF. This suggests that environmentally conscious individuals who are also open to innovation are more likely to adopt this type of food. For SD moderator, none of the interactions reached statistical significance at the $p < 0.05$ level. However, H8c showed marginal significance ($\beta = -0.168$, $p = 0.095$), suggesting a possible weakening effect of SD on the relationship between health risk perception and consumption intention. This might imply that when people are influenced by the desire to appear socially acceptable, the negative effect of PHR on intention to consume is weakened. However, these findings suggest that SD has limited influence on shaping consumers' intention to adopt 3DPF. A plausible explanation is that such food is not yet widely recognized or accepted as socially desirable, diminishing the impact of social pressure.

## 5. Discussion

The results of the analysis demonstrate a high explanatory power of the PLS-SEM model. According to extant literature, three variables were identified in the hypothesized model that inhibit the intention to consume 3DPF. In particular, the effect of FN on the Intention to Consume 3DPF was found to be robustly negative. In the hypothesized model, the emotional response of disgust towards unusual foods continues to represent, as evidenced by other contributions in the literature, a barrier that limits their consumption (Velasco Vizcaíno and Pohlmann, 2025). The remaining two hypothesized barriers, SAF ($\beta = 0.112$) and PHR ($\beta = 0.049$), were not found to be significant. The absence of a direct effect indicates that, based on the characteristics of the sample under consideration, the benefits may potentially outweigh the risks, or that the latter variable may exert its influence through hitherto undetected indirect pathways. Consequently, based on the findings of this study, hypothesis H2 is endorsed, while hypotheses H1 and H3 are rejected.

However, three factors were theorized to motivate the Intention to Consume 3DPF. The most significant predictor is PB ($\beta = 0.385$, $p < 0.001$), confirming the assumption that perceived advantages prevail over fears when individuals evaluate emerging food technologies. This is followed by KN ($\beta = 0.208$, $p < 0.001$) and PI ($\beta = 0.197$, $p = 0.002$). Cognitive familiarity has been demonstrated to reduce information deficiency, while openness to innovation has been shown to act as a dispositional lever that brings consumers closer to food-tech solutions, thus confirming the literature to date (Agarwal and Prasad,

1998; Wang et al., 2024). Therefore, all three facilitators included in the model act as enablers of the Intention to Consume 3DPF. In view of the above, hypotheses H4, H5 and H6 are verified and accepted simultaneously.

The model also hypothesized a dual moderating effect of the variables EC and SD on Intention to Consume 3DPF. A positive and significant interaction was identified between EC, PI and Intention to Consume 3DPF ($\beta = 0.184$; $p < 0.043$; $f^2 = 0.068$). This finding underscores the notion that open-mindedness, an inherent characteristic of consumers' psychological traits, is reinforced when individuals possess a pronounced environmental awareness. Consequently, consumers who prioritize environmental sustainability and are receptive to novel food products are more likely to experiment with 3DPF. These consumers appear to ascribe environmental and sustainable values (e.g. waste reduction or nutritional customization) to the consumption of those innovative foods. All other possible interactions of motivators and barriers with the EC variable did not show any significant effect on Intention to Consume. The findings of this study indicate that sensitivity to environmental issues does not exert a significant influence on the impact of SAF, FN, PHR, PB or KN on Intention to Consume 3DPF.

Furthermore, efforts to incorporate the SD variable as a moderator yielded β values ranging from –0.168 to 0.082, with significance levels falling below the critical threshold (p values ranging from 0.095 to 0.93). The only significant value relates to the test of hypothesis H8c. Although it is not strictly supported, the observed coefficient is consistent with the hypothesized direction, and the marginal significance ($p = 0.095$) indicates a potential effect that could emerge with greater statistical power. In summary, it can be expected that SD could moderate by reducing the impact of PHR on the Intention to Consume 3DPF. However, the current sample size ($N = 141$) is inadequate for the reliable detection of an effect of probable small magnitude ($f^2 < 0.02$).

In conclusion, the assumption regarding the potential moderating effects of SD and EC was confirmed only for hypothesis H7e. The remaining statistical interactions did not demonstrate statistical significance and were thus rejected.

## 6. Theoretical contribution

The results reveal a markedly unbalanced picture in favor of facilitators: all the enabling drivers (PB, KN, and PI) exert a positive and significant impact on the Intention to Consume 3DPF. Among the barriers, only FN proves to be a real obstacle to the behavior under analysis. This suggests that, in the domain of 3DPF, when consumers perceive clear and tangible benefits, risk perception takes a back seat, and the only remaining resistance is emotional-dispositional in nature.

The lack of a significant moderating effect of SD adds an interesting insight: consuming 3DPF does not yet appear to be a "socially expected" or reputation-enhancing behavior. As long as the technology does not reach greater public visibility (e.g., through events, mainstream media, or endorsement by influential figures), peer approval will not serve as a relevant incentive, and choices will remain primarily driven by personal curiosity and utility evaluations.

In contrast, EC acts as a "multiplier" for PI. Among consumers already open to experimentation, the appeal of environmental sustainability serves as a value-based lever that further strengthens their Intention to Consume 3DPF. This finding highlights the importance of alignment between personal values (green orientation) and dispositional traits (innovativeness) in shaping the adoption of emerging food-tech innovations.

Overall, the study advances theoretical understanding in three directions: (1) it confirms the predominance of facilitators over barriers in highly innovative contexts; (2) it emphasizes the still-incipient role of social norms in the adoption of 3DPF; and (3) it introduces the "eco-innovation" combination as a key segment, suggesting that traditional innovation diffusion models should be integrated with sustainability-related value variables.

## 7. Managerial Implication

At the managerial level, there is a clear need to transform knowledge into positive experience. In comparison to FN, information on motivating factors (i.e. nutritional personalization, creative design, waste reduction) has been shown to increase the intention to consume 3DPF (Jones et al., 2023). Therefore, it is recommended that companies invest in educational campaigns that combine informative content (e.g. videos, infographics, scientific Q&As) with hands-on tasting opportunities at points of sale and show cooking at culinary fairs, where participants can see and taste the product.

A secondary approach involves the effective communication of the environmental dimension. The use of transparent data to illuminate the diminished utilization of raw materials, the feasibility of employing by-products or alternative ingredients, and the curtailment of waste throughout the supply chain serves to reinforce the perception of value among environmentally conscious consumers. This, in turn, serves to amplify the positive impact on those who already demonstrate a high propensity for innovation.

Finally, given that FN represents the only significant barrier to be addressed, it is recommended that companies adopt gradual exposure strategies, commencing with familiar foodstuffs, shapes, flavors and ingredients (e.g. snacks, biscuits or pasta) and subsequently introducing more daring foods. The reduction of the "psychological distance" between traditional and 3DPF could assist in the normalization of the technology and lead to an increase in actual consumption. To address FN, policymakers and institutions are advised to prioritize the promotion of traceability and food safety through the implementation of regulatory frameworks. Standard labeling for these products could represent an opportunity, a practice that is currently lacking.

## 8. Limitations and future research directions

In conclusion, consumer PB, as well as PI and KN about 3DPF are important facilitators of consumer intention. FN remains a barrier that inhibits individuals in their intention to try 3DPF. The study enriches the literature in the area of alternative foods and provides an inclusive picture of the factors that serve as both drivers and barriers toward the use of these new products. However, the research is not without limitations. First, the sample of respondents has not yet reached the ideal size in relation to the number of dimensions and effects investigated, as data collection is still ongoing. In addition, the study analyzes self-rated measures that are subject to encore and do not detect actual behavior, but only a behavioral intention. Therefore, the next steps of analysis could be to expand the sample to strengthen the findings that emerged and to study the actual behavior through an experimental method.

# Algorithmic Dynamic Pricing in E-Commerce: A Systematic Review

Alessandro Bonetto[1],*, and Jacopo Ballerini[12]

[1] Department of Management, Università di Torino, Corso Unione Sovietica 218 bis, 10134 Torino, Italy

## Abstract

Dynamic pricing (DP) is now central to e-commerce, yet research remains fragmented across operations, marketing, IS and economics. This systematic review screens 1,087 Scopus records and synthesises 90 core studies (1999-2024) using bibliographic coupling and thematic analysis. We uncover four research clusters—(yellow) dual-channel optimisation, (green) inventory-driven DP and retail services, (red) consumer perception of fairness and personalisation, and (blue) service-sector applications.

*Keywords: SLR; Bibliometric analysis; Dynamic pricing; AI; E-commerce*

### 1. Introduction and research aim

The rapid diffusion of e-commerce over the past two decades has re-shaped competitive dynamics in retailing. Global online sales grew from US $1.8 trillion in 2016 to US $5.2 trillion in 2021 and are forecast to exceed US $7.5 trillion by 2025. In parallel, advances in cloud computing, big-data analytics and machine learning have equipped firms with the ability to update prices for millions of stock-keeping units (SKUs) in near real time. Dynamic pricing (DP)—the automated adaptation of prices to market conditions, demand signals or customer characteristics—has therefore become a defining capability for digital-first retailers such as Amazon, Booking.com and Alibaba. Despite its managerial salience, academic knowledge on DP in e-commerce appears dispersed across multiple disciplines. Operations management scholars typically focus on optimisation models that maximise revenue under inventory constraints (e.g., Elmaghraby & Keskinocak 2003; Talluri & Van Ryzin 2004). Marketing and informationsystems researchers, on the other hand, examine consumer reactions to personalised or time-based price changes (e.g., Kannan & Kopalle 2001; Grewal et al. 2016). Economics literature further adds game-theoretic perspectives on price competition and market efficiency. Consequently, concepts, terminology and methodological approaches vary widely, making cumulative theorising difficult and leaving practitioners without an overarching view of evidence-based design principles.

In this review, dynamic pricing refers to "the systematic adjustment of prices for identical goods or services over time or across customers, in response to demand fluctuations, competitor behaviour or customer-level data, enabled by algorithmic or rulebased decision systems" (adapted from Chen & Schwartz 2013). The scope is limited to pure or hybrid e-commerce contexts where transactions are concluded online. Offline-only settings (e.g., airline seat pricing) are excluded unless integrated with an online channel.

Guided by the above motivation, the review addresses two overarching research question (RQ): RQ1: How has the academic literature conceptualised, modelled and empirically examined dynamic pricing in e-commerce?

## 2. Methodology

In order to comprehensively explore broad literature themes, especially considering the increasing volume of academic work in business and management, particularly in the e-commerce sector, we utilize a methodological approach that integrates bibliometric analysis with a systematic literature review, drawing upon recent innovative frameworks applied in this area (Behera et al. 2019, Bresciani et al. 2021, Ciampi et al. 2022, Kraus et al. 2020). Bibliometric techniques support the efficient synthesis and interpretation of large volumes of bibliographic information, and enable the identification of research streams within specific domains (van Eck and Waltman 2010), while also reducing the potential bias that may arise from relying solely on systematic literature reviews and their inherently subjective interpretations (Zupic and Čater 2015). The integration of bibliometric techniques alongside the literature review allows for a more insightful and comprehensive systematic result. In particular, we applied the bibliographic coupling approach using the VosViewer 1.6.20 algorithm, which defines two documents as coupled when they share at least three or more common studies in their bibliography (Van Eck et al. 2006, van Eck and Waltman 2014, 2010). This algorithm has demonstrated both effectiveness and reliability in supporting the mapping of research areas and the identification of research streams or emerging trends (Boyack and Klavans 2010, Ciampi et al. 2022). As such, it represents a bibliometric technique particularly appropriate for this research topic, which, despite growing scholarly interest, remains highly fragmented as the data will show in the bibliometric insight section, thereby offering the possibility to conduct a well-informed and comprehensive systematic review.

## 3. Data collection

A rigorous and replicable procedure was adopted to select the set of papers forming the basis of my analysis (Akter et al. 2019, Kraus et al. 2022, Marzi et al. 2020, Pellegrini et al. 2020).

Consistent with prior literature (Ciampi et al. 2022, Tranfield et al. 2003), we conducted the bibliometric analysis and literature review through five distinct phases. Initially, drawing from key definitions related to dynamic pricing strategies (such as flexible pricing, differentiated pricing, etc.) and online selling (such as online commerce, ecommerce, etc.), we formulated the following search query:

*TITLE-ABS-KEY (("dynamic pric*" OR "flexible pric*" OR "variable pric*" OR "adaptive pric*" OR "differentiated pric*" OR "dynamic tariff*" OR "real-time pric*" OR "modulated pric*" OR "personalized pric*" OR "contextual pric*" OR "demandbased pric*"OR "fluctuating rates" OR "algorithmic pric*" ) AND ( "electronic commerce" OR "online commerce" OR "digital commerce" OR "internet commerce" OR "electronic trad*" OR "online retail*" OR "online" OR "digital marketplac*" OR "virtual commerce" OR "electronic business" OR "internet-based commerce" OR "webbased commerce" OR "cyber commerce" OR "online trad*" OR "e-commerce" OR "ecommerce")).*

I conducted the search using the Scopus database, which is widely recognized as a suitable source for systematic literature reviews (Falagas et al. 2008, Kraus et al. 2020). In addition to its strong academic reputation, Scopus offers broader journal coverage compared to its main competitor, Web of Science, encompassing nearly all (99.11%) of the journals indexed by the latter (Singh et al. 2021). Since the research field on this topic is addressed using various

terminologies, we decided to include a broad set of synonyms and related terms in order to make the search as comprehensive as possible and avoid missing relevant literature streams that may not use generic expressions such as "dynamic pricing" or "e-commerce" alone we also employed the "*" as a jolly operator to capture a wide range of lexical variations and maximize the inclusiveness of the search terms (Ciampi et al. 2022).

By executing the search query, which represented the second phase of my analysis, we identified an initial dataset of 1,087 papers. Following established literature (Delgado García et al. 2015, Gupta et al. 2019, Kraus et al. 2020, Voester et al. 2017) and considering the managerial focus of this review, we included only articles published in peer-reviewed journals, written in English, and either already published or accepted for publication by 31 December 2024. Furthermore, we restricted the selection to contributions within the fields of business, management, and accounting, ultimately narrowing the sample down to 220 papers. Moreover, to guarantee the inclusion of only articles with adequate scientific quality (Kraus et al. 2022), we chose to exclude all publications appearing in journals not listed in the Academic Journal Guide 2021 by the Chartered Association of Business Schools (ABS) or with a minimum ranking of 2 and in that case the journal needs to have an evaluation in the Australian Business

Deans Council (ABDC) of at least A. This journal selection process led to a further refinement of the dataset to 165 papers. In the subsequent phase of my analysis, we conducted an independent review of each of the 165 documents to assess their relevance (Akter et al. 2019, Akter and Fosso Wamba 2016, Tranfield et al. 2003). Before starting this step, we established inclusion criteria to guide the selection process: (1) The article must have a managerial focus and include conclusions that are managerial in nature or otherwise applicable at the company level. (2) The article must address dynamic pricing applied exclusively to an e-commerce environment, without extensions to offline commerce contexts. (3) The concept of dynamic pricing must be central to the article, not merely mentioned or treated as a secondary topic. (4) Algorithmic comparison studies on dynamic pricing may be included if they contain significant managerial implications or if they compare substantially different approaches to dynamic pricing with relevant operational consequences. (5) E-commerce is considered according to the previously stated definition, encompassing any online channel that sells physical goods or services. Many papers were excluded because their implications and conclusions were purely algorithmic or theoretical in nature. Others were omitted due to examining dynamic pricing in contexts where e-commerce was merely mentioned, or conversely, where dynamic pricing was only briefly cited while the paper's main focus lay elsewhere. This selection process reduced the dataset to 100 papers, which provide a targeted and indepth analysis of dynamic pricing in e-commerce and its practical managerial implications.

In the fourth phase, several key bibliometric indicators were calculated and interpreted to examine the structure and development of the literature under review (Todeschini and Baccini 2016). Then, using its bibliographic coupling algorithm, VosViewer enabled the creation of a graphical map where each sphere represents a paper, and papers are grouped into clusters based on the similarity of their reference lists (van Eck and Waltman 2014, 2010). This resulting cluster arrangement serves as a valuable tool for understanding the literature within a scientific dataset and identifying the main research streams it comprises (van Eck and Waltman 2014, 2010). Through this similarity analysis, 90 papers were found to be linked by at least one common reference, producing a graphical structure made up of four clusters with clearly distinguishable configurations (see Sect. 4). In the final phase, a systematic review of these 90 papers was conducted (Gaur and Kumar 2018, Tranfield et al. 2003) to examine and link the explored themes, identify the most significant relationships

among the studies and thematic clusters, highlight key areas that remain underexplored, and outline directions for future research.

## 4. Bibliometric insights

Beginning in 2016, the annual number of publications has increased exponentially, reflecting the growing scientific interest in this topic. This rise parallels the sharp global expansion of e-commerce sales, which climbed from 1.8 trillion dollars in 2016 to 5.2 trillion dollars in 2021 (Chevalier 2021) and are projected to reach 7.5 trillion dollars in 2025 (Sikder 2023). The rise of the value of the e-commerce market is logically connected to the fact that e-commerce and dynamic pricing have been closely intertwined since the very emergence of e-commerce, a relationship that has only grown stronger over the years (Hillen 2021).

No single author or group of authors stands out in terms of the number of publications on the topic, which may indicate that there is not yet a consolidated core of scholars specialized in this field. In contrast, there are journals that place considerable focus on the subject, as demonstrated by the fact that the top 10 journals by publication volume account for 55% of the total material examined, despite representing only 22% of all journals included in the final list. Finally, the only constant among both journals and authors is their diversity, in the former case, reflected by the variety of topics covered, and in the latter, by the large number of different scholars engaged with this subject.

As previously noted, the specific scientific areas covered by the journals are diverse, reflecting the various fields of specialization of the journals themselves. Among the most prolific journals are those addressing topics such as business decisions and the theory and practice of management (Journal of Business Research, Management Science). Further down the list of leading journals, the theme of support for enhanced decision making emerges (Decision Support Systems). There is also a clear focus on retailing and services studies, particularly concerning consumer behaviour and policy as well as managerial decisions, alongside the field of operations management (Journal of Retailing and Consumer Services, Manufacturing and Service Operations Management). Additionally, two journals concentrate on topics related to hospitality and tourism economics (International Journal of Hospitality Management, Tourism Economics). Finally, three very niche and specialized areas are represented, namely transportation, e-commerce, and pricing management (Transportation Research Part E:

Logistics and Transportation Review, Electronic Commerce Research and Applications, Journal of Revenue and Pricing Management). The distribution of studies per author shows that only one researcher (Viglia, G.) stands out for having authored three articles on the topic, while the next nine most prolific authors each contributed two studies. This pattern, as previously noted, highlights the fragmentation of the field also at the level of individual scholars, with no clear group of academics consistently focused on this specific area. A distribution that does not align with their respective shares of the global e-commerce market, accounting for 19% and 52% (von Abrams 2021) when considering only the e-commerce dimension. However, if one also takes into account the aspect of research on dynamic pricing, this geographic distribution of articles can be explained by the technological supremacy of the United States in information technology and the use of big data (Kelton 2022). The clustering structure resulting from the similarity analysis performed by using VosViewer 1.6.20 software (Figure 1) reveals the presence of four thematic clusters whose configurations appear to be outlined. The papers belonging to the yellow cluster address dynamic pricing in dual channel contexts, related game theory, and review manipulation. The red cluster, on the other hand, focuses on dynamic pricing strategies in e-commerce retail, on services connected to e-commerce, and more generally on strategies related to inventory and subscriptions. Notably, this cluster also includes part of the literature that explores highly

innovative concepts such as the metaverse and blockchain. The green cluster deals with consumer perceptions of dynamic pricing, particularly regarding price discrimination, and also covers aspects more directly linked to marketing. Finally, the blue cluster represents the body of literature that examines dynamic pricing in the hotel industry, especially in relation to price-quality considerations and consumer behaviour.

## Abstract

Questo studio presenta i risultati di un'indagine quasi-sperimentale pre-test/posttest volta a valutare il potenziale impatto delle tecnologie immersive (realtà virtuale e realtà estesa) e del metaverso, come percepito da operatori turistici attivi nella Regione Umbria. In particolare, sono state coinvolte 26 persone suddivise in quattro gruppi aventi differenti punti di vista: operatori della ricettività, intermediari turistici, amministratori locali e turisti. Durante lo studio, i partecipanti sono stati invitati a riflettere sull'applicazione delle tecnologie immersive e del metaverso nel settore turistico attraverso due focus group, uno prima e uno dopo l'esperienza immersiva. Le opinioni raccolte prima dell'esperienza sono risultate prevalentemente positive. Tuttavia, dopo l'esperienza, gli intervistati hanno evidenziato alcuni punti di debolezza delle tecnologie, pur confermando e specificando diversi punti di forza, che sono risultati predominanti rispetto ai limiti emersi.

*Keyword: Metaverso, Tecnologie immersive, PMI turistiche, Esperimento.*

## 1. Introduzione – Presentazione della tesi oggetto di verifica

Negli ultimi anni l'attenzione verso il tema del Metaverso sembra essersi ridotta a causa delle difficoltà economiche segnalate dalle principali imprese che hanno investito nello sviluppo di queste tecnologie, tra tutte Meta. I visori per realtà virtuale non hanno ancora raggiunto una diffusione capillare e il loro utilizzo rimane limitato per vari motivi: il prezzo ancora elevato dei modelli più avanzati, le difficoltà ergonomiche, la mancanza di una *killer application* in grado di giustificare il sacrificio economico per ottenere una esperienza in Realtà Virtuale (VR) o realtà estesa (XR) (Bruni *et al.*, 2025).

Tuttavia, il numero di imprese e startup che investono nella realizzazione di visori più performanti e di occhiali XR sempre più avanzati è in costante aumento. Le grandi aziende tecnologiche continuano a investire in questi sistemi, che inevitabilmente influenzeranno il processo di interazione uomo-computer-internet. Sulla base degli ultimi studi proposti dalla letteratura di riferimento, che integra ricerche di marketing e di management con esperienze in VR e XR, i potenziali utilizzatori, sia utenti (Bruni *et al.*, 2025) che imprese, devono continuare a immaginare e sperimentare possibili applicazioni di queste tecnologie. Da un lato, per esplorare nuove opportunità di business e, dall'altro, per prepararsi a un futuro in cui l'uso di tali tecnologie potrebbe diventare mainstream.

Dal punto di vista definitorio, secondo Flavian *et al.* (2022, p.2), il metaverso o realtà virtuale immersiva può essere definito come "a *persisting and continuous multiuser realm that combines physical reality with digital virtuality, using advanced technologies, such as Virtual Reality (VR) and Augmented Reality (AR), to create multisensory interactions between individuals, digital objects and virtual environments*".

Le pratiche turistiche nel metaverso si riferiscono conseguentemente nel "*exploration and participation in extensive, virtually shared environments that simulate immersive travel experiences through avatars*" (Shin e Kang, 2024, p.175).

La letteratura turistica evidenzia come l'uso delle tecnologie immersive abbia il potenziale per avere un grande impatto sul settore turistico (Gursoy *et al.*, 2022; Buhalis *et al.*, 2023). I viaggiatori possono visitare destinazioni remote o inaccessibili, fare esperienze sportive estreme, partecipare ad eventi dal vivo, ecc. senza lasciare la comodità della propria casa (Go & Kang, 2023; Koo *et al.*, 2023). Attraverso le esperienze immersive virtuali, le aziende e le destinazioni turistiche possono promuovere i loro prodotti "reali" fornendo anteprime virtuali, arricchirli con contenuti XR e, al contempo, creare nuovi prodotti digitali sostitutivi (Ioannidis & Kontis, 2023).

Nonostante questa nuova tecnologia possa potenzialmente rivoluzionare i rapporti tra i vari soggetti dell'industria turistica (Buhalis *et al.*, 2023), gli studi empirici presenti in letteratura risultano ancora relativamente limitati (Bec *et al.*, 2021; Kim *et al*, 2021). In particolare, emergono importanti lacune riguardo alla possibilità di sostituire il viaggio reale con quello virtuale; inoltre, mancano contributi e punti di vista da parte degli operatori turistici (Fan *et al.*, 2022; Chan *et al.*, 2023).

In questo lavoro, si cercherà quindi di effettuare una prima valutazione dell'impatto di questa tecnologia dal punto di vista degli operatori turistici di PMI attive in Regione Umbria attraverso due distinti focus group effettuati prima e dopo aver fatto esperienza dell'uso tecnologie immersive.

## 2. Letteratura e contesto di riferimento

La telepresenza, ovvero la sensazione di essere fisicamente presenti in un ambiente virtuale (da soli e/o in compagnia), è stata ampiamente studiata nel turismo, per la sua presunta capacità di incentivare le visite reali ai luoghi esplorati virtualmente (Fan *et al.*, 2022; Li *et al.*, 2024; Shin e Kang, 2024; Yoon e Nam, 2024). Diversi studi mostrano che la realtà virtuale può stimolare l'interesse per le destinazioni turistiche. In particolare, arricchisce la conoscenza dei luoghi e genera emozioni positive, come l'anticipazione della felicità legata a una futura visita, che possono incentivare il viaggio reale (An *et al.*, 2021; Skard *et al.*, 2022; Zhu *et al.*, 2023). L'anticipazione virtuale riduce al contempo la percezione dei rischi associati ai viaggi (Kang, 2020; Yung *et al.*, 2022; Fan *et al.*, 2022; Yoon e Nam, 2024).

Dall'analisi della letteratura emerge come un alto livello di immersività, che coinvolge sia gli aspetti emotivi che cognitivi, è fondamentale per aumentare l'intenzione di visitare i luoghi fisici (Robaina-Calderın *et al.*, 2023). Inoltre, sono cruciali la facilità d'uso, l'utilità percepita, il valore intrinseco dell'intrattenimento e la qualità dei contenuti per convertire l'intenzione di visita in azione concreta (Fan *et al.*,

2022; Sousa *et al.*, 2024; Lim *et al.*, 2024). Alcuni studi hanno esplorato il potenziale dei viaggi virtuali come alternativa ai viaggi reali, specialmente durante periodi di crisi come la pandemia di COVID-19 quando la mobilità era limitata (Kim *et al.*, 2021;

Schiopu *et al.*, 2021; Chang *et al.*, 2020). La ricerca teorica suggerisce così che le esperienze virtuali possono non solo sostituire, ma anche anticipare ed estendere le esperienze reali,

offrendo un'alternativa (economica e accessibile) al viaggio reale (Forlani *et al.*, 2024; Perri *et al.*, 2024). Dal punto di vista delle imprese e delle destinazioni turistiche, le esperienze virtuali nel metaverso potrebbero offrire una soluzione per gestire meglio le risorse turistiche, riducendo l'impatto dell'*overtourism* e promuovendo la sostenibilità ambientale e sociale (Bec *et al.*, 2021; Go e Kang, 2023). Inoltre, queste esperienze potrebbero rendere il turismo più accessibile economicamente, offrendo nuove opportunità di business per le organizzazioni turistiche. Nonostante il potenziale, la ricerca sperimentale in questo campo è ancora agli inizi (Perri *et al.*, 2024; Tussyadiah *et al.*, 2018). È necessario condurre ulteriori studi empirici per comprendere appieno gli effetti di queste tecnologie sul settore turistico e ridurre l'incertezza attuale, incoraggiando così gli investimenti necessari per sfruttare appieno le potenzialità nei tre aspetti: anticipazione del viaggio reale, estensione del viaggio reale, viaggio virtuale come sostituzione del viaggio reale.

## 3. Design e metodologia della ricerca

In questo studio è stata adottata una metodologia quasi-sperimentale pre-test/posttest, come descritto da Bryman (2016), per esplorare l'impatto delle tecnologie immersive nel settore turistico. La ricerca ha coinvolto 26 partecipanti attivi nella Regione Umbria, selezionati per rappresentare due prospettive distinte: quella degli operatori e quella degli utilizzatori. Gli operatori sono stati selezionati per offrire il punto di vista di tre diversi comparti: ricettività, intermediazione e gestione della destinazione. La metodologia ha previsto l'utilizzo di focus group, condotti sia prima che dopo l'esperienza virtuale, per riflettere sull'applicazione delle tecnologie di metaverso VR e XR nel turismo. Questo approccio ha permesso di raccogliere dati qualitativi sui cambiamenti nelle percezioni e nelle opinioni dei partecipanti.

La ricerca si è articolata in quattro fasi distinte. Nella prima fase, è stata introdotta ai partecipanti una panoramica sulle tecnologie immersive e sul metaverso attraverso presentazioni frontali e video esplicativi della durata di circa 15 minuti. La seconda fase ha previsto un brainstorming di gruppo utilizzando la tecnica 3-12-3 *Brainstorm*, durante il quale i partecipanti sono stati invitati a esprimere le loro idee e impressioni sui concetti di metaverso e turismo. Nella terza fase, i partecipanti hanno sperimentato un'esperienza immersiva in VR, utilizzando visori e applicazioni come "Walk the Plank" e Horizon Worlds. Infine, nella quarta fase, i partecipanti sono tornati in aula per lavorare in gruppi (distinti per tipologia di operatore) e definire i loro punti di vista sui limiti e sulle opportunità dell'applicazione di queste tecnologie al turismo. Gli autori hanno quindi confrontato gli output dei focus group (testi scritti su lavagne, post-it e video) prima e dopo l'esperienza virtuale, al fine di far emergere le differenze più significative nell'approccio dei partecipanti al tema.

La ricerca è stata effettuata all'interno del "MetaMarketingLab" [17]del Corso di Laurea in Economia e Management del Turismo dell'Università di Perugia.

## 4. Risultati pre e post test

Come descritto, in fase di pre-test è stato chiesto ai partecipanti di esprime le loro opinioni sul ruolo del metaverso nel turismo. I risultati emersi, riassunti attraverso un'analisi tematica delle risposte, mostrano una serie di opportunità che l'applicazione del metaverso e delle tecnologie digitali immersive potrebbero offrire nel turismo:

[17] Il Laboratorio Informatico Immersivo è stato costituito dal Dipartimento di Economia dell'Università di Perugia con il contributo del "Comitato Davide Piampiano" di Assisi che ha finanziato l'acquisto del hardware necessario a costruire ambienti virtuali e fruire dell'esperienza della realtà virtuale immersiva.

1. anticipare le esperienze di visita di un luogo o, in alcuni casi, sostituirle, contribuendo a ridurre il fenomeno dell'*overtourism*;

2. aumentare la visibilità e migliorare la capacità di narrazione per luoghi meno conosciuti, ma meritevoli di attenzione, costruendo materiali specifici e dettagliati;

3. presentare le destinazioni turistiche in modo innovativo, spiegando in maniera esperienziale le differenze e le connessioni tra i vari territori;

4. permettere un'esperienza, seppur virtuale, a persone con ridotta mobilità o disabilità e a coloro con limitate risorse economiche.

Nel pre-test, la valutazione dei punti di forza e di debolezza ha evidenziato una percezione del ruolo narrativo-esperienziale della tecnologia digitale, che è risultata essere prevalentemente immaginaria. Molti operatori e fruitori conoscono queste tecnologie principalmente per sentito dire, piuttosto che per un'effettiva sperimentazione diretta. Di conseguenza, aspetti particolari come il potenziale emozionale, la possibilità di sperimentare l'immersività e l'integrazione tra oggetti digitali e mondo reale non sono stati pienamente valutati, a causa della mancanza di esperienza pratica. Nel post-test, dopo la sperimentazione con i visori delle esperienze immersive "Walk the Plank" e "Horizon Worlds", è stato chiesto ai partecipanti di soffermarsi in particolare sui limiti e sulle opportunità della tecnologia. I risultati dettagliati di questa fase sono riportati nella Tabella 1.

| **Punti di forza** | **Debolezze** |
|---|---|
| Possibilità di cross-selling e up-selling | Possibile appiattimento dell'offerta e mancanza di autenticità emozionale |
| Supporto nel processo decisionale del turista e possibilità di creare meta-destinazioni. | Difficoltà nella realizzazione di contenuti di qualità (limite di costo) |
| Modalità complementari di promozione delle destinazioni turistiche con arricchimento della narrazione | Rischio di dipendenza dagli utenti, con possibili conseguenze di isolamento sociale e problemi di privacy |
| Personalizzazione dell'offerta turistica | Sfide per piccoli operatori e agenzie nel creare contenuti di qualità e raggiungere il target di riferimento |
| Promozione della sostenibilità in vari aspetti: ambientale (riduzione dell'*overtourism* e dell'inquinamento), economica (riduzione dei costi per turisti e operatori), sociale (miglioramento dell'accessibilità fisica) | Bassa adozione corrente delle tecnologie immersive tra gli utenti |
| Creazione di nuove opportunità commerciali per operatori del turismo | Forte dipendenza dalle big tech per la gestione dei contenuti e delle informazioni |

**Tabella 1:** Punti di forza e di debolezza delle tecnologie VRI. Risultanti post-test

## 5. Conclusioni e implicazioni di management

La ricerca evidenzia che l'adozione di tecnologie immersive nel settore turistico è ancora in una fase iniziale. Sebbene la letteratura di marketing e management prospetti scenari avanzati e promettenti per l'industria turistica (Fan *et al.,* 2022; Go & Kang,

2023), soprattutto per imprese di medie e grandi dimensioni, la realtà delle piccole imprese familiari italiane, in particolare nell'area oggetto di studio, mostra una percezione limitata delle opportunità offerte. Prima di un test pratico, supportato da tecnici esperti, gli operatori turistici avevano un'idea vaga del valore delle tecnologie immersive per le loro imprese e per la destinazione turistica. Molti imprenditori non avevano mai sperimentato direttamente tali tecnologie e faticavano a immaginare i potenziali impatti sul settore. Alcuni non riuscivano a percepire gli effetti sulla domanda, altri non vedevano la possibilità di fidelizzazione dei clienti o i benefici commerciali derivanti dalla creazione di contenuti immersivi. Anche i turisti, senza la conoscenza diretta della realtà virtuale, tendevano ad essere scettici sul reale utilizzo di queste tecnologie.

Dopo aver proposto un'esperienza immersiva diretta ai partecipanti, le opinioni su queste tecnologie sono cambiate, producendo risposte più articolate, nelle quali le opportunità sono diventate più nitide, ma al contempo gli aspetti di criticità sono emersi con maggiore forza.

Ciò indica che studi empirici sono fondamentali per comprendere a fondo i benefici delle tecnologie immersive, che potranno essere realmente percepiti dagli utenti solo in presenza di contenuti e strumenti utili. Tali benefici potrebbero essere particolarmente rilevanti per aree territoriali minori o meno conosciute, dove il supporto tecnologico e una narrazione spettacolarizzata delle esperienze potrebbero rappresentare un vantaggio competitivo determinante. Con riferimento agli operatori di PMI turistiche le impressioni iniziali degli operatori erano prevalentemente positive e possibiliste, ma dopo il test sono emersi anche limiti e difficoltà. Gli operatori hanno manifestato preoccupazione per il gap tecnologico che potrebbe crearsi con le grandi imprese e hanno riconosciuto la necessità di formazione per gestire la relazione con i fornitori di tecnologie e servizi immersivi. Le debolezze e alcuni punti di forza derivano dalla difficoltà di generare contenuti appropriati o di controllare la loro creazione, spesso affidata a imprese specializzate in software o comunicazione.

In sintesi, l'integrazione delle tecnologie immersive nelle PMI del turismo è un tema che richiede ulteriori studi, utilizzando metodologie in grado di rilevare le percezioni degli operatori e le reali possibilità di integrazione in percorsi specifici. Non tutte le destinazioni o offerte turistiche necessitano di queste tecnologie, ma alcune imprese e territori potrebbero trarne molti benefici. Il contesto umbro, ma anche italiano, caratterizzato da piccole e micro-imprese turistiche dovrà valutare le opportunità e le sfide prodotte da tali tecnologie anche adattando l'attuale offerta, integrandola con servizi avanzati destinati a potenziali utenti che potrebbero fruirne prima, durante e dopo la visita mediante device e piattaforme diverse utilizzate in momenti e luoghi diversi attraverso esperienze sincrone e asincrone. Per rispondere a queste domande aperte, sarà necessario proseguire con la raccolta e l'analisi di esperienze e casi studio di successo, al fine di identificare non solo i benefici, ma anche i fattori abilitanti e le barriere che ne limitano l'adozione.

## Abstract

This paper explores how XR and Metaverse create digital metacontexts that could support place-making processes. We argue that XR technologies possess transformative potential comparable to social networks impact on society over the past two decades. Through their capacity to generate immersive 3D digital interactions, these technologies enable new forms of place meaning-making that extend beyond traditional physical boundaries. This study examines how XR and the Metaverse support place-making by creating layered digital experiences that enhance place attachment, community engagement, and spatial meaning. Our findings suggest that these technologies offer more than promotional tools, they serve as instruments for collaborative place-making, place creation and community development.

*Keywords: Metaverse; Extended Reality (XR); Place-making; Metacontext; Immersive Technologies*

### 1. Introduction

Social context encompasses environmental and situational factors influencing individual behaviors, thoughts, and feelings through the dynamic interplay between society, culture, and physical environments. While places derive their initial character from material elements, their essence emerges through immaterial contextual factors including interpersonal relationships, institutions, and social norms.

The digital revolution has fundamentally altered how we experience place. Social networks and mobile connectivity have expanded contextual boundaries, making it impossible to distinguish between online and offline realities. Most people in developed regions remain continuously connected, integrating digital interactions into daily spatial experiences and transforming how we create and perceive place meaning.

*Extended Reality (XR)* and *Metaverse* represent the next evolutionary step, expanding contextual possibilities through immersive storytelling about society, culture, and physical environments. Place experience operates across fluid boundaries involving multiple stakeholders, manifesting across various urban touchpoints from streets to public spaces (Taecharungroj & Rauhut Kompaniets, 2024). Drawing from brand experience theory (Brakus et al., 2009), it encompasses holistic sensations, feelings, and responses that shape how people perceive, interact with, and remember places.

We propose that XR-augmented contexts and Metaverse environments create

*"metacontexts"* - enhanced digital layers where people explore alternative ways to express their values, culture, and perspectives about places. These systems enable rapid place storytelling, highlight contextually relevant elements for community quality of life, and illuminate temporal changes while facilitating cultural integration. Recent literature has highlighted these technologies' role in smart cities pursuing sustainable objectives (Sharifi et al., 2025).

This study *aims* to conceptualize and analyze how XR and Metaverse create digital metacontexts that support and transform traditional place-making processes, ultimately contributing to more inclusive, engaging, and meaningful place experiences. A *research question* is formulated:

*RQ1*: How do XR and Metaverse technologies create digital metacontexts that support traditional place-making processes?

## 2. Literature background

*XR and Metaverse characteristics*

Extended Reality (XR) serves as an umbrella term encompassing immersive technologies including Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR), each characterized by specific features and functionalities (Palmas et al., 2020). XR represents technologies enabling immersion in combined real-virtual environments and facilitating transitions across the reality-virtuality continuum (Milgram et al., 1994). Current XR technologies utilize various headsets enabling users to immerse themselves in completely virtual Metaverse worlds while simultaneously experiencing digital objects superimposed on real-world vision. Despite ongoing definitional debates, the Metaverse concept remains technically complex, with persistent, multi-user virtual worlds using portable avatars still presenting implementation challenges (Ball, 2022). For this study, we define the Metaverse as a 3D virtual social context characterized by technologies enabling user interaction through avatars in immersive digital spaces with synchronous interaction capabilities. Headsets provide immersive experiences while reproducing representations of physical society in virtual worlds (Bruni and Galvagno, 2025). We consider XR and Metaverse integration as creating unified immersive experiences serving as sense and context makers. Indeed, actually the headsets on the market permit seamlessly transition between 3D videos, digital object manipulation overlaid on real scenarios, and avatar-guided experiences in completely digital worlds within Metaverse applications.

*Place-making characteristics*

Place making represents a collaborative process extending beyond consumption-focused objectives (Richards and Duif, 2019). It emphasizes co-creation (Sepe and Pitt, 2014) and community quality of life enhancement (Richards and Duif, 2019). This continuous process involves people in improving their places and managing public spaces to make them attractive and interesting (Baker, 2019). Place making never truly ends, it requires ongoing collaboration to create places for people, with people (Bruni and Rauhut Kompaniets, 2024). The process prioritizes building and revealing sense of place (Sweeney et al., 2018; Dupre, 2019) while ensuring continuous community participation in place design and maintenance. Effective place-making generates contexts and requires continuous support from sense-making tools.

Digital technologies have transformed place-making practices, creating new opportunities for community engagement and spatial interaction. Recent years have seen an emerging focus on creative digital place-making applications that combine tangible and intangible resources, emotions, and creativity to capture public attention through narratives. This digital evolution

represents the intersection of people, place, and technology, enabling active citizen participation in neighborhood shaping (Basaraba, 2023). Technology implementations in urban environments reshape how communities experience places, providing enhanced opportunities for participation, place attachment, and experience through digital interfaces. Contemporary place-making must address both material and immaterial dimensions while leveraging technological capabilities to enhance collaborative processes. Community engagement drives knowledge acquisition and innovation needed for equitable, socially sustainable communities, positioning creative and digital innovations as essential tools for inclusive place development.

## 3. Methodology

This paper presents propositions describing potential XR and Metaverse support for placemaking processes. These propositions emerge from integrating place-making characteristics with XR and Metaverse capabilities. We employed a qualitative approach using MacInnis's (2011) relational framework, specifically the "Integrating" subtype. This approach implies the ability to *"see previously distinct pieces as similar often in terms of a unified whole whose meaning is different from its constituent parts"* (MacInnis, 2011). Our methodology involved three steps: (1) identifying place-making defining characteristics, (2) highlighting XR and Metaverse characteristics, and (3) integrating these characteristics to generate propositions for future research development.

## 4. Findings

Our analysis reveals an alignment between place-making process requirements, selected by collecting the most significant works of the authors who have published research on the topic of place making and XR/Metaverse technological capabilities, suggesting significant potential for digital enhancement of collaborative place development. XR and Metaverse technologies directly address the foundational need for co-creation by enabling collaborative virtual environments where multiple stakeholders can simultaneously contribute to place design and development, transcending traditional barriers of time and physical location (Sepe and Pitt, 2014).

| **Place making process requirements** | **XR and Metaverse capabilities** |
|---|---|
| Co-creation foundation (Sepe and Pitt, 2014) | Virtual environments where multiple stakeholders can simultaneously contribute to place-making *(for e.g.: co-design in complete 3D place/ambient simulation; beta 3D application to share with place internal-external stakeholders)* |
| Community quality of life enhancement (Richards and Duif, 2019) | Platforms for visualizing and testing place improvements before physical implementation, ensuring community needs alignment *(for e.g.: adding digital objects on the real physical scenarios in XR like digital bridges, buildings and alternative environment to test the people reaction)* |
| Continuous community engagement (Baker, 2019) | Accessible, always-available spaces for ongoing place management and community interaction regardless of physical limitations *(for e.g.: georeferenced XR digital noticeboards in the places involved in the place making project, open, where everyone can insert their own comments)* |
| Sense of place development (Sweeney et al., 2018; Dupre, 2019) | Immersive experiences that strengthen emotional connections to places through storytelling, historical recreation, and cultural representation *(for e.g.: immersive contents for place community; 3D videos; digital museums; 24h available AI avatars-touristic guide; physical guide digital experts )* |

| | |
|---|---|
| Context generation and sense-making | Dynamic, updateable digital layers capturing and communicating place meanings, values, and community narratives *(for e.g.: physical tourist guides experts in digital worlds, able to support the digital tourist-citizen in the place experience both in completely virtual environments and in mixed ones)* |

## 5. Conclusions and Implications

This study demonstrates that XR and Metaverse technologies represent more than promotional tools for places, they constitute fundamental instruments for transforming place-making processes. By creating digital metacontexts where people can really interact to build new experiences, these technologies enable new forms of community engagement with internal and external stakeholders, collaborative design, and meaning-making that extend beyond physical limitations empowering the sense-making. Our findings contribute to place-making theory by introducing the concept of *metacontexts* as digital spaces (independent or integrated with XR in the real place scenarios) where traditional placemaking processes can be developed, expanded, and made more inclusive. This represents a significant evolution in understanding how digital technologies can support and 'digital extend' community-driven place development. For practitioners, these technologies offer opportunities to engage broader community segments in place-making, test interventions before implementation, and create lasting digital archives of place-based knowledge and community values.

Future research should empirically test the propositions presented here, examine long-term impacts of XR-supported place-making initiatives, and investigate how different communities adapt these technologies for their specific place-making needs.

# Le piattaforme digitali transattive nel settore del gambling: lo sviluppo del betting exchange in Italia

Paolo Calvosa

Università degli Studi di Napoli Federico II,
Dipartimento di Economia, Management, Istituzioni

calvosa@unina.it

## Abstract

Negli ultimi anni le piattaforme digitali hanno assunto un ruolo centrale nell'economia moderna, avendo determinato la riconfigurazione delle dinamiche di mercato in numerosi settori industriali e dei servizi. In campo economico-manageriale gli studiosi hanno distinto tali piattaforme in due macro-tipologie: 1) le "piattaforme di innovazione", che consentono ad aziende terze (complementors) di creare prodotti e servizi che migliorano le funzionalità di un prodotto o servizio di base, come ad esempio nel caso degli sviluppatori di software che realizzano app per i sistema operativi, quali Microsoft Windows o Google Android; 2) le "piattaforme transattive", come Uber, Airbnb o Amazon, che mettono in contatto via internet acquirenti e venditori, riducendo i costi di ricerca e transazione per milioni di consumatori e fornitori. Di recente, le piattaforme transattive hanno fatto il loro ingresso anche nel settore del gambling. Negli ultimi anni infatti, seppur gradualmente, si sta sviluppando una innovativa tipologia di gioco, il Betting exchange, che fa leva su una piattaforma digitale gestita dai bookmaker. Questa piattaforma consente ai giocatori di scommettere l'uno contro l'altro, incrociando così la domanda e l'offerta di gioco via internet. Tale modello di puntata è, quindi, alternativo a quello "tradizionale" che prevede l'acquisto delle scommesse dai bookmaker sulla base delle quote da loro offerte in qualità di "banco". Obiettivo del lavoro è sviluppare un percorso di ricerca finalizzato ad analizzare le caratteristiche del Betting exchange e a comprendere quanto tale piattaforma digitale transattiva stia modificando – o potrà potenzialmente farlo in futuro – le dinamiche competitive e le modalità di consumo nel settore del gambling. Nel lavoro, ancora in corso di svolgimento, l'analisi si è focalizzata, in primo luogo, sullo studio delle caratteristiche e dello stato di sviluppo di tale piattaforma nel mercato regolamentato italiano delle scommesse.

*Keywords: piattaforme digitali transattive, piattaforme on line "peer to peer", internet gambling, betting exchange, Italia.*

## 1. Introduzione

È possibile definire una piattaforma digitale, in senso ampio, come un sistema sociotecnico che media almeno un lato dell'offerta e un lato della domanda, attraverso la tecnologia digitale (Parker et al., 2016). Gli attori 'tipo' di una piattaforma digitale sono: il "proprietario (o leader) della piattaforma", che la sviluppa, gestisce e controlla; i "*complementors*", che co-creano valore dal lato dell'offerta; gli utenti finali, che agiscono dal lato della domanda (Kretschmer et al., 2020; Schreieck, Wiesche, Krcmar, 2023).

Negli ultimi anni il tema delle piattaforme digitali ha ricevuto una crescente attenzione nel campo dei sistemi informativi e delle ricerche di natura economico-manageriale, visto il ruolo centrale che tali piattaforme hanno assunto nell'economia moderna.

Alcune piattaforme digitali di social media, come Facebook, Instagram o TikTok, hanno cambiato il modo in cui le persone interagiscono e condividono esperienze. Altre piattaforme digitali nel campo dei sistemi operativi, come Android e iOS, sono diventate centrali nello sviluppo delle innovazioni nel settore dei *device* mobili. Nel settore finanziario, piattaforme digitali come PayPal ed Apple Pay stanno rivoluzionando le modalità con le quali i clienti usano i mezzi di pagamento. Piattaforme on line "*peer-to-peer*", come Uber e Airbnb, che fungono da intermediari digitali mettendo in connessione domanda ed offerta tramite la Rete, stanno rivoluzionando il modo in cui si accede ai mezzi di trasporto e ai servizi di pernottamento (de Reuver, Sørensen, Basole, 2018).

Occorre però rilevare che gli studiosi in campo economico-manageriale, pur avendo aperto la strada alla ricerca sulle piattaforme digitali, tramite lo studio delle piattaforme interne e industriali (tra gli al: Rochet, Tirole, 2003; Gawer, Cusumano, 2002; Gawer, 2014; Thomas, Autio, Gann, 2014), per molto tempo non hanno considerato le tecnologie digitali come fattore chiave, dal punto di vista teorico, per spiegare i fenomeni studiati (de Reuver, Sørensen, Basole, 2018). Solo più di recente, il ruolo delle tecnologie digitali per l'analisi delle piattaforme settoriali è divenuto centrale anche in ambito manageriale. In proposito, alcuni studiosi 'pionieri' del tema delle piattaforme industriali "non digitali" (Cusumano, Gawer, Yoffie, 2019; Gawer, Cusumano, Yoffie, 2023) hanno analizzato più approfonditamente le caratteristiche distintive delle piattaforme on line, descrivendole come forme organizzative specifiche, che si estendono oltre i confini aziendali tradizionali e le catene di fornitura regolate da contratti, verso "ecosistemi" più ampi, meno formali e solitamente globali, che coinvolgono innovatori e fornitori di vari prodotti e servizi nell'economia digitale. Essi, hanno distinto tali piattaforme in due macro-tipologie: 1) le "piattaforme di innovazione" (*innovation platforms*), che consentono ad aziende terze (*complementors*) di creare prodotti e servizi che migliorano le funzionalità di un prodotto o servizio di base, come ad esempio nel caso degli sviluppatori di software che realizzano applicazioni per i sistemi operativi, quali Microsoft Windows, Google Android o iOS; 2) le "piattaforme transattive" (*transaction platforms*) – come Uber, Airbnb, Facebook, Alibaba o Amazon – che mettono in contatto via internet acquirenti e venditori, riducendo in questo modo i costi di ricerca e transazione per milioni di consumatori e fornitori.

Focalizzando l'attenzione sulle piattaforme transattive, è interessante evidenziare che, accanto alle piattaforme più note appena elencate, ormai consolidate nei settori in cui operano, ne stanno emergendo altre in diversi settori. Tra questi, uno molto significativo in termini economici e sociali è quello del gambling, nel quale negli ultimi anni, seppur gradualmente, si sta sviluppando un nuovo tipo di relazione tra *bookmaker* (operatore/impresa di gioco) e scommettitore, che prevede la connessione diretta tra giocatori via internet, mediata dal *bookmaker*. Come si avrà modo di approfondire in seguito, ciò ha dato luogo ad una innovativa tipologia di scommessa, il *Betting exchange*, che fa leva su una piattaforma digitale che consente al giocatore di effettuare le puntate "l'uno contro l'altro" (incrociando la domanda e l'offerta di gioco), invece che scommettere – come avviene per il gioco "tradizionale" – in base alle quote offerte dal bookmaker, in qualità di "banco".

Obiettivo del lavoro è sviluppare un percorso di ricerca finalizzato ad analizzare le caratteristiche del *Betting exchange* e a comprendere quanto tale piattaforma digitale transattiva stia modificando – o potrà potenzialmente farlo in futuro – le dinamiche competitive e le modalità di consumo nel settore del gambling. Nel lavoro, ancora in corso di svolgimento,

l'analisi si è focalizzata, in primo luogo, sullo studio delle caratteristiche e dello stato di sviluppo di tale piattaforma nel mercato regolamentato italiano delle scommesse.

## 2. Il *Betting exchange*: una piattaforma on line "*peer to peer*" nel settore del gambling

La forma di gioco del *Betting exchange* è stata creata da Andrew Black e Edward Wray, che nel 2000 hanno lanciato sul mercato *Betfair*, la prima piattaforma on line "*peer to peer*" nell'ambito delle scommesse. L'idea alla base di tale piattaforma era quella di creare un mercato dove i giocatori potessero piazzare le puntate l'uno contro l'altro, piuttosto che contro un *bookmaker*, facendo leva sulle potenzialità connettive a distanza proprie della Rete (Davies et al., 2005).

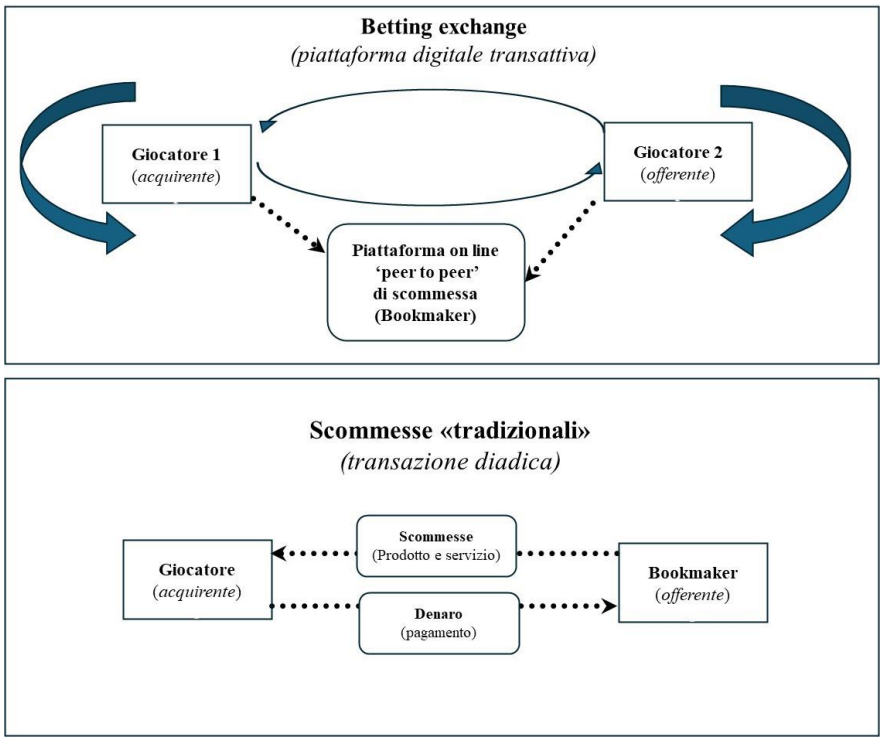

**Figura 1:** *Betting exchange* vs. Scommesse "tradizionali": da una relazione diadica a una transazione *platform based*. *Fonte*: ns. adattamento da Gawer, Cusumano, Yoffie, 2023.

In effetti, come schematizzato nella parte alta della Figura 1, il *Betting exchange* si basa su una piattaforma transattiva che abilita ad una nuova modalità di scommessa a distanza, per la quale i giocatori possono rivestire il ruolo di scommettitore o di banco e il *bookmaker* agisce come puro intermediario, limitandosi a mettere in contatto, attraverso la piattaforma on line e in maniera anonima, i singoli scommettitori (per questo sono dette anche "scommesse a interazione diretta tra singoli giocatori"). Le quote associate agli eventi su cui si scommette sono, quindi, stabilite dai giocatori stessi e l'operatore di gioco funge solo da "facilitatore", facendo incontrare domanda e offerta, trattenendosi come commissione un margine dall'importo delle vincite. Il *Betting exchange* rappresenta un'importante innovazione nel campo delle scommesse, in quanto è una forma di gioco "*peer to peer*" che sostituisce l'interazione diretta tra giocatori alla raccolta "tradizionale". Il modello "tradizionale" di gioco – come graficamente illustrato nella parte inferiore della Figura 1 – è infatti basato su una relazione diadica tra giocatore e *bookmaker*, il quale, tramite negozi di scommessa fisici

e/o siti web di gioco, accetta scommesse su eventi, principalmente sportivi, a un prezzo da lui definito, espresso indirettamente dalle quote di vincita offerte.

Nel *Betting exchange*, quindi, il *bookmaker* modifica il proprio profilo di rischio dal momento che si libera del cosiddetto "rischio di banco". Tale rischio, infatti, è assunto da uno dei due giocatori che si mettono in connessione tramite la piattaforma digitale, e il *bookmaker* crea solo le condizioni atte a favorire l'incontro tra giocatori con posizioni speculari (Pandimiglio, Spallone, 2013).

È da evidenziare che i due modelli si differenziano anche per l'effetto delle esternalità di rete (Schilling, 2011). Solo per i giocatori che acquistano tramite la piattaforma "*peer to peer*", infatti, oltre al tipo e al prezzo della scommessa, la presenza di più venditori (giocatori che "bancano la scommessa") attrae più acquirenti, e la presenza di più acquirenti (giocatori che "acquistano la scommessa") attrae più venditori. Questo crea un circolo virtuoso in conseguenza degli "effetti di rete mediati dalla piattaforma"[18] (Gawer, Cusumano, Yoffie, 2023).

Il meccanismo del *Betting exchange*, basato sulla compravendita delle quote, crea una dinamica di mercato simile a quella delle piattaforme on line "*peer to peer*" finanziarie, che mettono in contatto direttamente acquirenti e venditori di asset, come criptovalute o altri strumenti finanziari, senza la necessità di intermediari tradizionali come banche o broker. Letteralmente, infatti, il significato del termine *Betting exchange* in italiano è "borsa delle scommesse". Sono, infatti, molti i punti di contatto tra la pura disciplina finanziaria del trading con quella delle scommesse sportive mediate dalla piattaforma digitale. Nel *Betting exchange*, i termini "*punter*" e "*layer*", che descrivono i due ruoli che un utente può assumere nel gioco, sono presi a prestito dal mondo del trading. Il "*punter*" è colui che scommette a favore di un determinato esito (come nella scommessa sportiva classica), mentre il "*layer*" è l'utente che offre la quota, ovvero scommette contro l'accadimento di quell'esito (es. la sconfitta di una squadra in un evento sportivo), ruolo che nella scommessa "tradizionale" è svolto dal *bookmaker* (www.betfair.it). Le specifiche di funzionamento del gioco consentono inoltre di adottare strategie di "*arbitrage betting*", "*lay betting*" e "*cash out*", utilizzate nelle piattaforme digitali transattive di tipo finanziario (Liu, Donovan, Popov, 2024). Per questi aspetti specifici del gioco, talvolta ci riferisce al *Betting exchange* come "trading sportivo".

Nel tempo, tale tipologia di piattaforma digitale di scommessa, inizialmente introdotta nel Regno Unito dove ha sede *Betfair*, si è sviluppata anche in altri mercati nazionali. Accanto a *Betfair* si sono affermati nuovi player che hanno proposto piattaforme di *Betting exchange*, quali ad esempio *Smarkets, Orbit Exchange, Matchbook* e *Betdaq*. Anche in Italia circa dieci anni fa le piattaforme di gioco del *Betting exchange* hanno fatto il loro ingresso nel mercato regolamentato. Gli effetti di tale ingresso sono esaminati nel paragrafo successivo.

## 3. Lo sviluppo del *Betting exchange* in Italia

In Italia le scommesse del *Betting exchange* sono state autorizzate dal decreto Bersani del 2006, che ha aperto ad una ampia legalizzazione dei giochi on line nel mercato. La raccolta di tale modalità di scommessa è però stata effettivamente avviata nell'aprile del 2014, dopo l'emanazione di una serie di decreti attuativi e il superamento di alcune problematiche di coordinamento con la regolamentazione comunitaria. È bene segnalare che nel mercato regolamentato italiano, come per qualunque altra modalità di gioco, vige un regime concessorio per la vendita di scommesse tramite la piattaforma del *Betting exchange* e, quindi,

18 Le frecce curve presenti nello schema grafico del *Betting exchange*, riportato nella parte alta della Figura 1, indicano proprio gli effetti di rete omolaterali e trasversali.

solo gli operatori che hanno ottenuto tale concessione statale possono offrirle legalmente ai giocatori.

Per esaminare l'evoluzione di mercato del *Betting exchange*, si è proceduto ad elaborare l'andamento delle vendite, in termini di raccolta e spesa di gioco, dal 2014 (anno di avvio della raccolta di gioco), al 2023 (Figura 2).

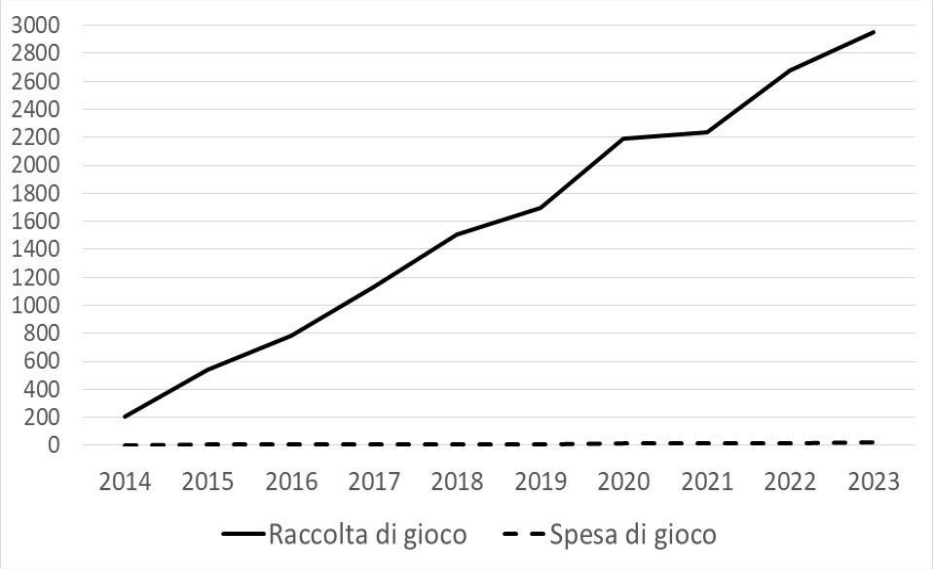

**Figura 2:** La raccolta e la spesa di gioco del *Betting exchange*. Mercato regolamentato italiano. Anni 2014-2023 (milioni di euro). *Fonte*: ns. elaborazione su dati dell'Agenzia delle Dogane e dei Monopoli (Adm)

Dalla figura 2 emerge che in termini di raccolta di gioco – pari al totale di tutte le somme scommesse e, quindi, incassate complessivamente dagli operatori con concessione dell'Adm – si è assistito ad una crescita costante che ha portato tale tipologia di scommessa a raggiungere nel 2023 un valore di circa 3 miliardi di euro. La spesa di gioco – pari alla raccolta di gioco meno le somme che ritornano ai giocatori sotto forma di vincita (denominate anche *pay-out*) – ha registrato, invece, valori molto contenuti. Ciò è la conseguenza del ruolo di puro intermediario assunto dal concessionario, che fa sì che il *pay-out* per tale scommessa sia il più alto tra tutte le forme di gioco erogate in Italia. Nel 2023, tale segmento di gioco ha restituito, infatti, in termini di vincita, il 99,35 per cento della raccolta di gioco, dando luogo ad una spesa di gioco molto contenuta, pari a 19,4 milioni di euro (ns. elaborazione su dati Adm, 2024).

## 4. Prime considerazioni e sviluppo della ricerca

L'analisi svolta, seppur inserita in un primo stadio della ricerca, consente di evidenziare alcuni interessanti aspetti relativi alle caratteristiche del *Betting exchange* e al suo stato di sviluppo in Italia.

Se si confronta la spesa di gioco per il *Betting exchange* con quella complessiva del mercato regolamentato, emerge che essa è al momento assolutamente residuale, rappresentando meno dello 0,1 per cento dei circa 20,7 miliardi di euro spesi nel gambling in Italia nel 2023. La residualità del modello di gioco risulta anche confrontando i livelli di spesa del *Betting exchange* con quelli delle scommesse sportive "tradizionali". Tale spesa, nel 2023, rappresenta

poco più dell'1 per cento di quella ottenuta tramite la vendita diretta da parte dei bookmaker dei giochi a base sportiva e ippica (ns. elaborazione su dati Adm, 2024).

Per un pieno sviluppo in Italia di tale categoria di scommessa dal punto di vista della spesa di gioco dovrebbero aumentare in maniera significativa i livelli di puntata/raccolta. Ma ciò sembra essere frenato da alcuni fattori.

In primo luogo, gli operatori di gioco sembrano temere che il gioco basato sulla piattaforma digitale transattiva possa penalizzare i risultati aziendali, visti i maggiori livelli di vincite medie per gli scommettitori e, quindi, i minori margini di guadagno ottenuti con la formula del *Betting exchange,* rispetto al modello tradizionale di scommessa (Agimeg, 2024). Il *pay-out* del *Betting exchange* nel 2023 – come già evidenziato – è stato infatti pari al 99,35 per cento della raccolta, mentre per le scommesse sportive "tradizionali" si aggira attorno all'86 per cento (ns. elaborazione su dati Adm, 2024). Tale segmento di scommessa risulta, pertanto, poco attrattivo per gli operatori di gioco.

In secondo luogo, essendo il *Betting exchange* una scommessa di tipo "*peer to peer*", la qualità dell'esperienza di gioco è condizionata dal raggiungimento di un certo livello di "liquidità di gioco". Occorre, cioè, che il sito di gioco metta in connessione via internet un numero elevato di giocatori in modo tale che ci sia, per i vari eventi su cui si punta, un volume di scommessa offerta (denaro che è in attesa di abbinamento) in linea con il volume di scommessa richiesta (denaro sulle scommesse abbinate). In sintesi, per il *Betting exchange* solo se si raggiungono sufficienti livelli di liquidità è possibile abbinare le puntate su un determinato evento (Flepp, Nüesch, Franck, 2017). Entrano quindi "in gioco" i rendimenti crescenti da adozione delle tecnologie dal lato della domanda, collegati agli effetti delle esternalità di rete, di cui si è già parlato in precedenza, che, potenzialmente, possono portare alla formazione di un mercato "*Winner takes all*". In Italia, però, l'aumento della liquidità è al momento frenato dal divieto normativo di mettere in connessione i giocatori italiani con quelli esteri, nell'ambito di una "liquidità internazionale" che moltiplicherebbe l'effetto delle esternalità di rete.

Un altro fattore di freno allo sviluppo del *Betting exchange* sembra collegato alla sua minore semplicità di gioco rispetto alle scommesse "tradizionali". In tale forma di scommessa, come già evidenziato, le puntate (punta e banca) sono molti simili, nella logica, a quelle effettuate sui titoli nei mercati di borsa. È utile quindi disporre di alcune conoscenze tecniche che aumentano le probabilità di vincita, e ciò riduce la platea potenziale di giocatori, rispetto a quella tipica delle scommesse sportive "tradizionali". Le osservazioni svolte suggeriscono un altro interessante aspetto. Per questa categoria di gioco, la natura e le caratteristiche distintive ne fanno al momento una modalità di accesso preferita da alcuni tipi di clienti. Il profilo-tipo per tale scommessa è, infatti, quello di un giocatore con elevate conoscenze tecniche di gioco e che nella scelta della modalità di puntata attribuisce particolare rilevanza ai benefici economici derivanti dalle maggiori quote di vincita, rispetto a quelle offerte dalle scommesse tradizionali. Guardando agli operatori di gioco, infine, emerge un assetto di mercato dominato da un singolo operatore. Ciò sembra confermare: da un lato, la minore attrattività di questo gioco per i bookmaker, visti i minori margini di guadagno; dall'altro, la tendenza allo sviluppo di un mercato del tipo *WTA,* in forza degli effetti positivi delle esternalità di rete. A dominare il mercato, infatti, è *Betfair*, che ha creato tale tipologia di gioco, introducendone poi la raccolta in Italia nel 2014. Tale impresa ha una posizione quasi monopolistica, come emerge dai dati del mercato italiano al primo semestre del 2022, che mostrano che *Betfair* incassava il 92 per cento della spesa di gioco. Gli altri due operatori attivi nel segmento erano *Betflag*, con una quota di mercato del 7,7 per cento, e *Betpoint* che, con una quota dello 0,2 per cento, si configurava come operatore marginale del business (e, infatti, nel 2023 ha deciso di non offrire più questo gioco) (Agimeg, 2022; 2024).

L'analisi svolta apre ad un approfondimento di ricerca finalizzato ad esaminare le differenze di sviluppo di tale tipologia di piattaforma in Italia rispetto ad altre nazioni, nonché a comprendere il bilanciamento, per i giocatori, tra i benefici connessi allo sviluppo del *Betting exchange*, in termini di maggiori vincite medie (che si traducono in un minor prezzo delle scommesse); e i costi sociali, in termini di aumento potenziale dei comportamenti di gioco eccessivo, data l'elevata elasticità della domanda che caratterizza i prodotti di gioco (Pandimiglio, Spallone, 2011). Inoltre, più in generale, lo studio in profondità, in Italia e all'estero, delle caratteristiche e dell'evoluzione del *Betting exchange*, nonché dei fattori di ostacolo e di rischio del suo sviluppo, potrebbe aiutare a comprendere quali siano le possibilità che in futuro tale piattaforma possa riconfigurare le dinamiche competitive e le modalità di consumo nel settore del gambling, come già avvenuto con altre piattaforme digitali transattive in diversi settori.

## Abstract

This study explores how integrating physical and digital touchpoints, known as phygital experiences, shapes wellness-experience management and perception in technologically advanced fitness centers. Guided by Batat's Phygital Customer Experience and Funk's Sport Experience Design frameworks, the analysis draws on 14 semi-structured interviews with managers, trainers, and members of three techintegrated centers in Spain, Italy, and the UK. Analysis revealed four key themes: synergistic design, engagement, inclusiveness, and customer-centricity, that illustrate how value is co-created across physical, digital, human, and media connectors and redefine relationships between users, organizations, and context in hybrid environments. The findings empirically support the Phygital Customer Experience framework and extend Sport Experience Design to the wellness domain. While focused on urban fitness centers and active users, limiting broader generalization, the study offers actionable insights for wellness providers seeking to deliver phygital services and enrich member experiences, and highlights directions for future research into technology-resistant populations and other wellness contexts.

*Keywords: Phygital customer experience, wellness, SX framework, PH-CX framework, service design, customer-centricity*

### 1. Introduction

The wellness and fitness industry is rapidly becoming "phygital", as wearables, mobile apps, and immersive AR combine with physical facilities to reshape the user experience (Andreasson & Johansson, 2014; Ozdamli & Milrich, 2023; Pizzo et al., 2021). Yet much of the existing literature continues to treat physical and digital touchpoints as distinct domains, restricting our understanding of the holistic ecosystems in which value is co-created through their interplay (Batat, 2022). Phygital research also remains concentrated in retail, tourism, and luxury (Del Vecchio et al., 2023) and frequently portrays customer journeys as linear (Mele et al., 2024). Despite rapid digitalisation, the wellness sector remains underexplored. Fitness centers offer a setting where members interact with facilities, trainers, and digital platforms (Pizzo et al., 2021), making them ideal to study how touchpoints shape the customer experience. Technology-mediated interactions are increasingly central to these experiences (Funk, 2017).

Addressing these gaps, the present study investigates how physical, digital, human, and media connectors interact within wellness centres to produce non-linear, adaptive, and emotionally rich customer journeys. Grounded in the Phygital Customer Experience (PH-CX) model (Batat, 2022) and the Sport Experience Design (SX) framework (Funk, 2017), we explore two questions: (1) How does the seamless integration of digital and physical touchpoints influence the management of the wellness experience? and (2) How does this integration shape customers' perceptions of the wellness experience? To address these questions, the study employs semi-structured interviews (Adams, 2015) with a purposive sample of gym members, instructors, and managers from different technologically advanced wellness centers located in Madrid, Rome, and London.

Findings indicate that combining wearables, mobile apps, immersive displays, and expert support enables real-time personalisation, optimises training workflows, and integrates customer-centric logic into service design. For participants, such integration heightens engagement through deeper personal involvement and digitally mediated peer interaction, while also fostering inclusiveness by accommodating diverse fitness levels, goals, and technological skills. Empirically supporting the PH-CX model and extending the SX framework to phygital wellness, the study redefines relationships among users, organisations, and context, showing how physical, digital, human, and media connectors co-create value through mutually reinforcing mechanisms of engagement, inclusiveness, and customer-centricity. From a managerial perspective, the results recommend providers to align digital tools with user goals, empower trainers as human bridges across touchpoints, and cultivate accessible, community-driven services that welcome a variety of abilities and digital expertise.

## 2. Methodology

This study used a qualitative approach to explore the emerging phenomenon of phygital customer experiences in wellness centers, where such methods are well-suited given the limited existing research (Lim, 2024).

### 2.1 Research context

The study examines how three leading fitness chains are redefining wellness through phygital integration: O2 Wellness in Madrid; Forum Sport Center in Rome; Virgin Active (Rome, Milan, London).

### 2.2 Data collection

Semi-structured interviews were chosen for their balance of consistency and flexibility in exploring emerging phenomena (Adams, 2015). Fourteen participants (2 managers, 3 instructors, 9 members) from technologically advanced wellness centers in Spain, Italy, and the UK were recruited via purposive sampling (Bouncken et al., 2025), selecting individuals with meaningful engagement in phygital environments (Batat, 2022). Sample size was justified using Malterud et al., (2016) information power concept, citing the study's narrow focus, highly specific sample, and application of Funk's, (2017) SX framework, reducing the need for a large sample. Data collection occurred January-March 2025 using three stakeholder-specific interview guides. Interviews (30-40 minutes) were conducted remotely via video/phone (Hanna, 2012), audio-recorded, transcribed, and translated (from Italian) prioritizing conceptual equivalence (van Nes et al., 2010).

### 2.3 Data analysis

We applied Braun & Clarke's, (2006) six-step qualitative content analysis, using Funk's SX framework as a coding guide. Interview transcripts were lineby-line coded, grouped into themes, like "synergistic design", that showed how wellness centers blend physical and digital

touchpoints. The study was informed by two complementary frameworks: the PH-CX framework (Batat, 2022), defining phygital interaction components, and the SX framework (Funk, 2017), guiding research questions and analysis structure to explore sport user-context-organization interplay.

## 3. Findings

Our findings indicate that phygital fitness centers enhance the exercise experience through four mutually reinforcing pillars: synergistic design, engagement, inclusiveness, and customer-centricity, each of which is both conceptually distinct and mutually reinforcing. **Synergistic design** emerges when digital and physical touchpoints merge. Wearable devices stream live biometrics to trainers, who can recalibrate programs instantaneously, while virtual coaching systems complement onsite staff, producing a dynamic equilibrium between autonomous self-regulation and expert supervision. **Engagement** operates on two axes. On the customer-to-brand dimension, synchronised devices enable members to customise routines and visualise longitudinal progress, yet many report residual friction when integrating third-party tracking applications. On the customer-to-customer dimension, digitally mediated communities, WhatsApp groups, leaderboards, and gamified challenges, foster social connections, although respondents still desire more, supported group events that maintain motivational momentum. **Inclusiveness** is advanced through hybrid service modalities: live-streamed classes, remote coaching sessions, and interactive, multilingual displays, that accommodate heterogeneous customers. Nevertheless, the complexity of certain interfaces can alienate non-expert technology users, underscoring the indispensable role of trainers as data translators who convert information into actionable insight. Finally, **customer-centricity** foregrounds the principle that technological innovation should amplify, not neglect, human needs. While immersive tools demonstrably heighten enjoyment and adherence, interviewees consistently emphasise that the motivational, interpretive, and empathic functions performed by trainers remain irreplaceable.

## 4. Discussion and Implications

Addressing RQ1, the study shows that blending digital and physical touchpoints strengthens wellness management by enabling more personalised services, providing trainers with real-time data that sharpens their support, and creating a seamless, customer-centric journey across channels. Turning to RQ2, the same integration shapes user perceptions by elevating engagement, widening inclusiveness through remote access and adaptive interfaces, and cultivating immersive, motivating environments that keep participants involved.

From a theoretical standpoint, this study empirically supports and extends two complementary models: Funk's, (2017) SX and Batat's, (2022) PH-CX, within the under-explored domain of indoor wellness. Responding to recent calls for deeper insight into phygital integration (Del Vecchio et al., 2023; Mele et al., 2024), the findings confirm that the seamless integration of physical and digital touchpoints is reshaping service design and management, while advancing Batat's holistic ecosystem view of value creation, which highlights immersive, emotional and customer-centred experiences. Funk's, (2017) SX framework, which maps interactions among user, context, and organization across four relational domains, can be reinterpreted to describe a phygital wellness ecosystem. Area A (user + context) becomes the engagement layer, where phygital technologies drive practical, emotional, sensory, and social engagement. Area B (user + organisation) is reframed as the inclusiveness layer, as trainers and digital touchpoints jointly deliver personalised and accessible services. Area C (organisation + context) becomes the customer-centricity layer, where datadriven design aligns offerings with evolving member needs, echoing Batat's technicality. Finally, Area D (user + context + organisation) represents the phygital wellness

experience, a seamless journey that realises Batat's continuum of value. Figure 1 shows how the user, context, and organisation interact to co-create value in phygital environments.

From a managerial perspective, indoor wellness environments are most effective when managers coordinate physical, digital, media and human resources around customercentred design. Wearables and apps generate real-time data yet remain disconnected from context (Pizzo et al., 2021), so trainers must become interpreters who translate metrics into personalised instruction and co-create service protocols to enhance engagement and outcomes. Gamified features such as leaderboards, badges and virtual competitions can intensify engagement, but without careful mediation they risk diverting attention from members' goals; framing digital rewards within each user's broader fitness plan ensures that playful elements reinforce, rather than diminish, meaningful progress. Equally, rigid targets, exemplified by the popular 10 000-step rule, may reduce autonomy and intrinsic motivation. Treating technology as a supportive tool that enables self-determined goal setting sustains long-term commitment and physical activity. Thus, human expertise, purposeful gamification and autonomy-supportive design mutually reinforce effective hybrid wellness services.

**Figure 1:** Venn diagram illustrating the revised SX framework applied to the phygital experience in wellness contexts.

## 5. Limitations and Future Research

By concentrating on advanced, gym-based wellness centres, this study overlooks other phygital formats, such as digitally enhanced Pilates studios, suggesting that future research should broaden the contextual lens. The sample excluded non-users and dropouts, leaving resistance, disengagement and potential re-engagement unexamined; incorporating these groups would illuminate barriers and motivation cycles across the user journey. Findings rest on qualitative data that capture emotional, functional and social dimensions yet still require quantitative and mixed-methods empirical testing across larger, more diverse populations. Moreover, the data-privacy and security implications of wearables and fitness apps remain underexplored. Future research should further investigate the potential intrusiveness of such technologies and their impact on users' sense of autonomy and privacy within phygital

environments. Finally, because the analysis offers only a time-limited observation, it cannot track the rapid emergence of innovations such as immersive VR workouts or AI-driven coaching; longitudinal studies are therefore essential to follow how continual technological change reshapes phygital experiences and how organisations evolve to sustain value over time.

## Abstract

This paper explores the growing importance of artificial intelligence (AI) and its integration into open innovation, drawing upon the theoretical framework proposed by Broekhuizen et al. (2023). We adopted an exploratory qualitative approach—focus groups—and applied the model within a specific regional setting with the aim of understanding how experts perceive and implement AI applications to support open innovation practices. The findings confirm the growing role of AI as an enabler of open innovation, while also highlighting significant heterogeneity in how organisations adopt and interpret it. The nine functions that emerged from the focus groups show that AI is not only perceived as an operational tool but also as an object of governance, mediation, and ethics. The research serves both theoretical and managerial implications: theoretically, it enriches our understanding of the AI–open innovation intersection by revealing that AI's roles go beyond technical functions, encompassing symbolic, regulatory, and ethical dimensions; managerially, it highlights how SMEs should adopt incremental AI strategies that emphasise small-scale experimentation, inhouse training, and the co-development of shared platforms with other ecosystem stakeholders.

*Keywords: open innovation; artificial intelligence; AI; innovation ecosystem; digital transformation; focus group*

## 1. Introduction

The rising prominence of the open innovation paradigm reflects a growing interest in collaborative ecosystems, where co-creation among heterogeneous actors offers an effective response to the increasing complexity and dynamism of today's economic and technological environment. The open innovation approach is based on the joint exploitation of resources inside and outside the organisation, and favours the integration of ideas, knowledge, processes and technologies from multiple and complementary sources. Open innovation, as according to Deloitte (2023), derives advantages and its effects are evident in transforming innovation processes and strengthening the competitive capacity of companies. In this regard, innovation ecosystems are conceived as fertile contexts where economic, financial and social benefits can be achieved for all stakeholders (McKinsey & Company, 2023).

According to the Open Innovation Report 2023, the uptake of open innovation practices is significantly increasing: 72% of European companies have initiated collaborations with start-ups and 50% have entered into partnerships with other entrepreneurial actors (Sopra Steria, 2023). Compared to the closed and internal model, open innovation is distinguished by the inclusion of a variety of external actors - such as universities, research centres, start-ups, customers, suppliers and even competitors - in the innovation generation and development process. This allows for more agile and strategic access to skills and technologies not immediately available within the organisation.

In parallel, digital transformation is acquiring an increasingly central role in the redefinition of business strategies, pushing companies to integrate new technologies into their processes with the aim of increasing their efficiency, productivity and sustainability (Statista, 2024). As such, the integration of AI technologies into organisational processes is broadly recognised as a key stage of development for progression digital transformation initiatives. In this scenario, artificial intelligence (AI) is one of the most relevant technologies that can strengthen and enhance the dynamics of open innovation. From predictive analytics through natural language processing and machine learning to automation systems, the multiple applications of AI make it a strategic lever for innovation and at the same time pose fresh challenges, mostly through the evolution of job functions and the need for an increasingly specialisation of skill sets (Statista, 2024).

Although the relevance of open innovation and AI has been acknowledged in previous studies, there is still a limited qualitative understanding of these phenomena, as highlighted by Anchayhua et al. (2025). For this reason, it appears interesting to explore experts' viewpoints with the aim of understanding in greater detail how such phenomena are impacting the socio-economic and technological context of the Lazio Region. By engaging stakeholders with a greater knowledge base, broader contextual understanding of the opportunities and challenges associated with open innovation and AI will be identified in this regional context.

## 2. Theoretical background

Over the past two decades, open innovation has significantly reshaped the way organisations develop and bring novel ideas to the market. This concept, which was originally coined by Chesbrough in 2003, highlights the limitations related to the traditional "closed" innovation model, where R&D are kept strictly internal and intellectual property is tightly controlled. On the contrary, open innovation promotes the purposeful use of external knowledge sources alongside internal efforts to accelerate innovation and adapt to rapidly changing environments (Chesbrough & Appleyard, 2007). Such a shift has led firms to embrace collaboration with a broad set of actors, involving startups, universities, institutions, research centres, suppliers, and customers, thereby transforming the innovation process into a more dynamic and networked process (Bogers et al., 2018; Deloitte, 2023). Adopting an ecosystem-centric perspective highlights how innovation has evolved into a more collective endeavour by involving a broad spectrum of participants from across organizational and sectoral boundaries (Dodgson et al., 2006). The concept of open innovation, once largely associated with industrial contexts, now extends far beyond its original domain and influences a broad range of sectors like the public sector (Mergel, 2021), financial services (Fasnacht & Fasnacht, 2018), museums and exhibition spaces aimed at enhancing visitors' experiences (García-Muiña et al., 2019), tourism (Hermawati et al., 2020), as well as the power and energy sector (Greco et al., 2017).

This shift from closed to open innovation models is evident in both large corporations and small and medium-sized enterprises (SMEs), although their motivations and obstacles diverge rather sharply. Large firms, typically equipped with in-house R&D resources, have historically leaned toward closed innovation. Yet, as market demands grow more complex and speed becomes crucial, these organisations increasingly adopt hybrid models. For example, Mitsubishi Electric's strategy blends internal innovation and collaborative standard-setting, balancing the protection of intellectual property with the need to supplement internal resources (Kajiura, 2012). In addition, large firms frequently harness advanced information technology to coordinate both closed and open innovation processes, adapting their strategies to fit organisational priorities (Andrade-Rojas et al., 2024). In contrast, SMEs often lack the capacity to innovate solely through internal means. Instead, they depend heavily on

open innovation networks and partnerships to access external knowledge, which is essential for their survival and growth. Empirical studies, such as those focusing on industrial SMEs and technology firms in South Korea, underscore the significance of these collaborations (Roberts and Spedale, 2025; Heusler et al., 2024; Grama-Vigouroux et al., 2020). While SMEs can derive significant advantages from AI-enabled open innovation, they also contend with ongoing resource constraints, making robust organisational capabilities and supportive innovation ecosystems vital (Jin et al., 2022; Hitchen et al., 2017).

Across both organisational types, cultural and structural barriers, like the "Not Invented Here" syndrome and differing attitudes toward risk, can impede openness (BurgerHelmchen, 2024).

Artificial intelligence (AI) has significantly altered the landscape of open innovation across organisations, regardless of the enterprise's size. AI enhances firms' abilities to absorb and process external knowledge, accelerating innovation cycles and enabling more agile decision-making (Bahoo et al., 2023). This becomes particularly important in rapidly changing environments, where the ability to quickly identify and seize emerging opportunities can be critical (Sahoo et al., 2023). AI-powered platforms and ecosystems are facilitating more seamless collaboration - firms can now engage with external partners more effectively, as exemplified by Chinese open innovation platforms and Haier's micro-community approach (Cricchio et al., 2025; Li et al., 2024; Steiber and Alvarez, 2024). However, realizing these strategic benefits depends on the presence of robust organisational support structures. Essential factors include digital knowledge management, a culture that supports openness to new ideas, and empowering employees to contribute meaningfully. This is especially pertinent for SMEs, which often lack formal innovation infrastructures and therefore require tailored support to fully leverage AI's capabilities (Naruetharadhol et al., 2022; Jin et al., 2019; Radziwon and Bogers, 2019). Furthermore, AI augments established innovation methodologies such as crowdsourcing, enabling more sophisticated filtering and learning processes that expand firm's capacity to utilise external ideas (Füller et al., 2021). Nevertheless, collaborative innovation in AI remains complex. For instance, while university-industry partnerships generate a high volume of AI-related patents, these patents typically have less impact than those developed independently by firms or academic institutions. This highlights some of the challenges and nuances associated with AI as a general-purpose technology (Messeni Petruzzelli et al., 2023).

Following the definition of the key theoretical foundations of open innovation - considering both large enterprise and small and medium-sized enterprise - and having acknowledged the growing significance of artificial intelligence in these processes, this study draws upon the theoretical framework proposed by Broekhuizen et al. (2023). Their framework presents a 3x3 matrix that aligns the three stages of open innovation (i.e. initiation, development, realization) with three management functions of AI (i.e. mapping, coordinating, controlling) (Table 1). This approach seeks to clarify how various AI applications can augment or automate human tasks, thereby addressing persistent challenges in open innovation. In our study, we focus on understanding how enterprises are integrating AI into open innovation practices. Specifically, we examine AI's role in facilitating collaboration, managing risks, safeguarding knowledge and data, and identifying new opportunities.

| | | AI functions | | |
|---|---|---|---|---|
| | | **Mapping** | **Coordinating** | **Controlling** |
| **Open innovation stages** | **Initiation** | *I – AI as scout* | *II – AI as matchmaker* | *III – AI as forecaster* |
| | **Development** | *IV – AI as cartographer* | *V – AI as conductor* | *VI – AI as whistleblower* |
| | **Realization** | *VII – AI as vanguard* | *VIII – AI as broker* | *IX – AI as custodian* |

**Table 1:** 3x3 Matrix (Broekhuizen et al., 2023)

It is therefore of particular interest to investigate this phenomenon through an exploratory qualitative approach (Anchayhua et al., 2025) - namely, focus groups - by applying this model within a specific regional and contextual setting. With this in mind, we pose the following research question (RQ):

RQ: How do experts consider and implement AI applications to support open innovation practices?

## 3. Methodology

### 3.1 Materials and methods

For this study we employed focus groups as the primary research method with the aim of interviewing innovation experts from the Lazio Region. In this view, our goal was to gain a deeper understanding of how open innovation practices and emerging technologies, especially artificial intelligence, are being adopted and developed within the regional entrepreneurial ecosystem.

Focus groups operate as a qualitative research tool where participants engage in collective dialogue, allowing for the emergence of rich insights through shared experiences and perspectives (Morgan and Krueger, 1998). Each session commenced with a concise presentation that clarified the study's objectives and anticipated outcomes. This introductory segment explained the underlying rationale of the research, emphasizing its relevance for participating organizations. Key themes included the integration of artificial intelligence and open innovation within regional business environments, the significance of collaboration and trust within innovation networks, and the strategic impact of digital transformation at the local level. The primary goals of the focus groups were to identify both challenges and opportunities unique to the Lazio Region, and to gather expert perspectives regarding the application and limitations of AI as a driver of innovation. Insights generated during these discussions also informed the development of interview protocols for subsequent engagements with managers from small and medium-sized enterprises in the Region.

The focus group sessions, conducted online on June 5th, followed a structured set of questions grounded in the theoretical framework outlined by Broekhuizen et al. (2023).

These questions were specifically crafted to prompt participants to reflect on key themes such as innovation, technology adoption, and inter-organizational collaboration. Each session, conducted in English, lasted roughly three hours. A trained moderator led the discussions, maintaining alignment with central topics and encouraging engagement, while an assistant managed note-taking and logistical matters. The first session included five participants, while the second comprised two.

### 3.2 Sample

The sample consisted of seven enterprises which exhibited a heterogeneous mix of size, sector, and revenue. To guarantee a diversity of perspectives and a multidisciplinary approach, the selection was based on strict criteria: interviewees needed demonstrable expertise in innovation and digital transformation. The sample's varied backgrounds, sectors and organisational sizes were intended to provide a comprehensive and multidimensional understanding of the subject matter. Most participants (71.4%) belonged to small enterprises with fewer than 50 employees, medium enterprises accounting for 14.3%, and large enterprises making up the remaining 14.3%. This distribution indicates that there is an overwhelming representation of smaller firms in the regional innovation space. With respect to sectoral association, the sample included firms in manufacturing (28.6%), services (28.6%), technology (14.3%), marketing and communication (14.3%), and food and beverage (14.3%), suggesting a diversified yet relatively balanced representation of industry sectors. With respect to annual revenue, almost half of the enterprises (42.9%) had revenue below 1 million euros; 28.6% had revenues of between 5-20 million euros; and 28.6% had revenues greater than 20 million euros. No firms had revenues of between 1 and 5 million euros. This profile indicates that the sample included mainly small firms, engaged in multiple sectors, and were young in terms of finances (Table 2).

| Gender | n (%) |
|---|---|
| Male | 3 (42,9%) |
| Female | 4 (57,1%) |
| Enterprise | |
| Small enterprise (< 50 employees) | 5 (71,4%) |
| Medium enterprise (50-250 employees) | 1 (14,3%) |
| Large enterprise (> 250 employees) | 1 (14,3%) |
| Sector | |
| Manufacturing | 2 (28,6%) |
| Services | 2 (28,6%) |
| Technology | 1 (14,3%) |
| Marketing & communication | 1 (14,3%) |
| Food & beverage | 1 (14,3%) |
| Revenue | |

| | |
|---|---|
| < 1 million 3 (42,9%) 1 – 5 million | 0 |
| 5 – 20 million | 2 (28,6%) |
| > 20 million | 2 (28,6%) |

**Table 2:** A socio-demographic profile of focus group participants (n =7)

## 4. Results

In this section we present the findings emerging from a series of questions posed to the sample, structured around the theoretical model developed by Broekhuizen et al. (2023) (Table 3 and Figure 1).

| **Phases** | **Clusters** | **Respondents** |
|---|---|---|
| *I – AI as scout* | 1. Opportunity identification through AI | R1, R4 |
| | 2. Partner discovery and network expansion | R1, R5 |
| | 3. Data analysis and scenario simulation | |
| | 4. AI integration in business tools | R2, R3 |
| | | R4, R5 |
| *II – AI as matchmaker* | 1. AI for streamlining internal coordination | R3 |
| | 2. AI-enhanced traditional coordination tools | |
| | 3. AI for communication efficiency | R2, R5 |
| | 4. AI in balancing remote access and cybersecurity | |
| | 5. Limited collaborative AI experience | R2 |
| | 6. AI-generated outputs supporting coordination | R3 |
| | | R5 |
| | | R6 |

| | | |
|---|---|---|
| *III – AI as forecaster* | 1.<br>2. Human supervision and strategic judgment<br>3. Automation and early warning systems<br>4. Financial and credit risk management Predictive monitoring and pattern recognition<br>5. Regulatory and product safety compliance | R1, R3<br>R2<br>R4<br>R5<br>R6 |
| *IV – AI as cartographer* | 1. Data security and confidentiality<br>2. Culture of data and openness<br>3. Role of AI as enabler<br>4. Human oversight and legal frameworks | R3, R4, R5, R6, R7<br>R1, R2, R5, R6<br>R1, R2, R5, R7<br>R2, R4, R6 |
| *V – AI as conductor* | 1. Legal and authorial uncertainty<br>2. Private AI and internal frameworks<br>3. Trust, fear and openness dilemma<br>4. Technical solutions (blockchain/NDA)<br>5. Strategic value of data | R1, R2, R3<br>R2, R4, R5<br>R1, R2, R3<br>R1, R4, R5<br>R2, R5 |
| *VI – AI as whistleblower* | 1. Ethics, bias, and social impact<br>2. Need for regulation and common frameworks<br>3. Transparency, human oversight, accountability<br>4. Pluralism in technology and avoiding monopolies<br>5. Education, certification, and internal ethics<br>6. Limitations of control and guarantees | R1, R3, R5<br>R2, R3, R6, R7<br>R1, R2, R6<br>R1, R2<br>R6, R7<br>R4, R5, R7 |

| *VIII – AI as broker* | 1. Operational optimisation | R2, R7 |
| | 2. Collaboration and networks | R1, R2, R4 |
| | 3. Human role and ethics | R2, R3, R4 |
| | 4. Strategic matching | R1, R3, R5 |
| *IX – AI as custodian* | 1. Scepticism and regulation need | R1, R2, R3, R5, R7 |
| | 2. AI as a monitoring tool | R6 |
| | 3. No relevant IP to protect | R7 |

**Table 3:** Authors' own elaboration based on Broekhuizen et al. (2023)

The first area of investigation - *AI as scout* - aimed at discovering how AI can be a valuable instrument for finding new opportunities and partners. The interviewees described how AI is seen as a transformational and operational improvement. The first theme to emerge was opportunity identification through AI, as participants such as R1 stated, "*opportunities emerge across all organisational areas—from manufacturing to HR—by addressing inefficiencies and waste.*" R4 agreed and explained that by relying on an AI-system monitoring mobile network signals she was able to, "*identify clients we didn't even know existed and sign contracts with them.*" The second theme was related to the identification of new partners and building networks, and how AI can be an integrating end-product for ecosystem-building and strategic matchmaking. For example, R1 commented on the impact for both large corporations and SMEs, as he laid out the necessity for "*assessing before doing*" to make sure everyone was supported and aligned. There was an example provided from R5, a startup founder, as well: "*We built a project that would link our unique characteristics of our patented product to unique market opportunities.*" The third theme identified was in analysing data and modelling scenarios, whereby R2 mentions AI's ability to execute "*powerful matching of data across multiple databases to identify the ideal possible interlocutor.*" Lastly, a fourth theme addresses the connection of AI with business tools and processes. In this context, R4 describes how human relations skills can be combined with AI to create pathways into untapped geographic markets. In a similar position, R5 describes a multilayered, geo-data analysis approach using AI to filter and narrow down on viable applications of a digital product.

The second area of investigation - *AI as matchmaker* - aimed at understanding how AI can facilitate coordination and collaboration. Participants showed diverse perspectives of AI's role in enhancing coordination and collaboration. A range of themes demonstrated everything from simplified tools to AI-generated outputs all for coordinating teams. R3 explicitly pointed out the need to simplify the complexity of internal tools, saying, "*We went the reverse route; we chose to use simpler tools all supported by AI, which will assist them in their workflows."* Integration with coordination platforms was recognized across the board. R5 noted, "*For larger teams, AI significantly accelerates coordination, especially when you manage to use something like*

*ClickUp,*" while R2 pointed out that AI-enhanced planning tools and accelerated email prioritization are becoming indispensable. On the communications side, R2 shared some ambivalence about AI automation: "*I still like to do summaries myself… It helps me keep in my own alignment, even if it is more tiring.*" Security concerns were also noted, as R3 recalled a security breach that forced the company to restrict external remote collaboration and spend money on building a new infrastructure. In contrast to these opinions, R6 stated that she had limited experience of AI tools for group collaboration: *"The tools I have used have been more for individual use rather than collaborative team work."* In contrast, R7 provided a specific instance of the use of AI in improving coordination and stated, "*We developed an AI app to help optimize employees and management structure, it allowed for more objective and efficient coordination. It was the AI output which allowed us to improve in these areas*". These contributions indicate that while generative AI's capability to streamline workflows and enhance existing tools is valued, and that it is being explored in a real-time group collaborative nature, the emphasis has been on new processes for generating output and preserving process objectivity.

In the third area of investigation - *AI as forecaster* - the interviewees emphasized five key areas in the domain of utilisation of AI in risk management and successful business management. The first was a strong indication that human supervision is essential, and that each entrepreneur or decision making individual plays invaluable functions. For instance, R1 stated: "*We still have to supervise.... assessing success and risks remains the entrepreneur's responsibility*" while R3: "*There is no way I would completely trust what AI would say, reasoning is still human*". The second cluster was the use for implementation of early warning systems, which provides a similar arrangement over and above normal utilisation. In this case, R2 explained how their system has the ability to flag potentially critical situations for client companies, where AI would be able to detect and utilise for significant labour savings, and reduced reliance on individuals; "*AI can monitor, and work on lesser observed cases and even be automated for success*". The next cluster has relevance from an administrative, and also credit risk domain. But specifically with the mention of R4 utilising AI to assess client solvency - as he pointed out "*I utilise AI to assess clients and their creditworthiness supplier, and to rest easier regarding future insolvency, especially to corner surplus on our potential and have sustainable alternatives towards business decisions*". In the fourth cluster, AI was seen as the process of discovery of underlying and hidden patterns. R5 illustrated how monitoring could be extended to patterns in subtle signals - including SEO trends - to assist someone in pre-empting upcoming risks: "*AI has its place in recognizing patterns that could be expanded to web positioning, to assist in the efforts of those who monitor online environments.*" Finally, the fifth cluster revealed AI in respect of safety and regulatory compliance. R6 articulated AI's relevance in risk modelling in respective products, especially in areas such as toys involving chemical materials. "*AI had the potential to model risk parameters from input by supplier, to the final product itself, and posed a pathway to contextualize safety monitoring.*"

The fourth area of investigation - *AI as cartographer* - aimed at discovering how AI can overcome barriers to data sharing and promote data use. The first main challenge highlighted by participants is data security and confidentiality, as multiple respondents, such as R3 and R6, showed strong hesitance to share internal or sensitive data. For example, R3 indicates that "*the more a system opens up, the more it is vulnerable*," and companies will likely have "*a space of security*" because they are careful and trusting in change. In parallel to that discussion, participants discussed a data-sharing culture, specifically in terms of sharing data in open data, and structured collaboration. R1 emphasized the "*promotion of a data culture*" from the "*networking of companies, public institutions and universities*" to support data openness, while R5 emphasized AI can help "*favour a culture of data use*" mainly through the intelligent use of open data. In addition, AI is also framed as a facilitator to provide richer collaboration and access to actionable insights from less-sensitive data. As R2 stated, "*AI tools can enhance communication, even around risk*", but human interpretation is still needed to extract actionable value. Similarly, R7 noted that AI has made "*raw data more available*", even if companies "*keep the targeted data*

*close to home*". Finally, participants expressed some concern about a lack of legal clarity and need for human oversight, such as R4 noted, "*AI use is still legally unstable*", particularly in personal data-related scenarios.

R6 reiterated: knowledge can only be shared "*as long as it's involved in researchprojects that are protected by an NDA*", showing the necessity for formal agreements and regulatory protections.

The fifth area of investigation - *AI as conducter* - aimed at understanding how to harmonise ideas while protecting information. Here, participants generally recognised the difficulty of integrating creativity and collaboration with the imperative of safeguarding information. A first principal theme relates to legal and authorial ambiguity, such as R3 declares: "*The notion of authorship is becoming outdated... as soon as you share, you lose part of your intellectual ownership*." R1 states: "*There are no clear laws, and it's difficult to provide a complete answer at this moment*." This uncertainty contributes to what we present as the trust-fear-openness paradox, whereby R3 emphasises the multiplicity of attitudes: "T*here's fear, availability, openness... it is a process that is still evolving*" while R2 also echoes such ambivalences: "*We are already writing for the machines- we're feeding them, and while doing so, we are losing the protection*." Some participants do offer to implement technical and organisational means of safeguard such as R1 states: "*An intelligent system could cover who has access to what, supported by maybe a blockchain for tracing*" while R5 recalls: "*In my company we used NDAs internally to limit access to sensitive data from the e-commerce client*." Private AI and internal workflows are identified as a useful middle ground. R2 notes: "*For those companies who are primarily worried about exposing data, they should work with private AI which is custom-trained on their datasets instead of large public models*." R5 echoes this: "*At least we give ourselves a healthy operational model*." Finally, interviewees highlight the strategic value of proprietary data whereby R2 cautions: "*Company data is frequently sensitive and strategic - we have to protect it with intentionality, knowledge, and compliant tools*." Overall, while the interviews don't reveal any concrete answer, they suggest an environment where manifesting protection and innovation must evolve together as the landscape evolves - bound to evolve with both legal change and technological potential.

The sixth area of investigation - *AI as whistleblower* - focused on how AI can guarantee ethical behaviour and security. The discussion contained several different perspectives about how AI might be a vehicle for ethical practices as well as address the barriers of data-sharing. The first theme spoke to the ethical fragility and social impact of AI, with an uneasiness that AI will also perpetuate and amplify societal biases. As R3 suggests, "*AI learns from our input. If the input is untrue, then the output is more untrue, and possibly amplified*." Concerns manifested over polarisation, R3 warned that "*open environments could just reflect the echo chambers of social media*." The second theme was the desire for structural frameworks and shared protocols. R2 pointed out, "*We became a member of RETIC which helps us define frameworks in this space. However, everything is still a work in progress*." While there was some scepticism as to the probability of effective regulation as with R5 speaking to this point, "*There are no guarantees of ethical behaviour with AI, just as there are no guarantees with the internet*." Another theme was consensus that transparency, and human oversight is of utmost importance. R1 stressed the need to, "*keep everyone in the loop to have a measured human control*." Relatedly, technological pluralism was framed as an opportunity to encourage a diversity of perspectives, and opportunities to help mitigate monopolies, and promote critical thinking. R2 remarked "*Having technologies helps us compare outputs - assuming we're trained and critical enough to do it.*" Education and certification emerged as real ways to incorporate ethics into organisations. R6 spoke about training staff and following communication guidelines, while R7 envisioned "*certifications for AI use like we have for sustainability or gender.*" Finally, some participants had doubts about control. R4 presents this perspective: "*AI is a weapon. It can be used for good or evil; but we can't control anything.*" R7 added, "*There's so many things we can't even monitor anymore.*"

In the seventh area of investigation - *AI as vanguard* - the aim was to understand how AI can be used to identify business opportunities. Participants frequently noted that AI offers excellent opportunities for increasing and reducing business processes, particularly for SMEs involved in open innovation. R2 noted that AI has the ability to "*reduce the burden of repetitive work within companies and help them to concentrate on what is really their core business, in a tailored way,*" indicating that AI offers the ability for companies to redistribute their resources toward more productive endeavours by automating specific repetitive elements of operations. R3 added that AI represents a "*characterising component of collaborative environments between institutions and companies*" and can help "*reduce the difficulty of dealing with large datasets and dealing with organisational processes*," all of which support decision-making is and effort-related outputs within multiple workflows associated with organizational activities and efficiencies. This ultimately reaffirms AI's potential to cultivate collaborative and interdependent virtual innovation ecosystems, where entities leverage shared knowledge to develop improvements in process. R5 focused on customer management noting that AI "*can support the effort that, not too long ago, needed several operators*," pointing to areas associated with customer care and lead management which are paramount areas of business. The adoption of AI-based automated support in such places will not only drive efficiencies, but enhance the customer experience by enabling faster responses and more customized touch points in service delivery. R4 discussed the importance of industry-specific customisation, and he noted that AI can be useful in "*processing lots of information, orienting clients, moment, and merchandising concerns*," to create customised solutions that reflect the individual operational requirements of the various sectors. This particular flexibility and fit of AI makes it a contributing solution in the open innovation context. At the strategic level, R1 commented on the pivotal opportunity that open innovation represents, in "*opening companies up to outside knowledge and experiences*," to support the development of clear innovation road maps for process improvement. This indicates the need to integrate internal competencies with the external technological evolution for optimal benefit.

In the eighth area of investigation - *AI as broker* - participants shared a complex view of AI's role in managing activities and resources with multiple partners. One primary insight was the performance features of AI-driven platforms, including centralised booking or CRM platforms that take in inputs from many sources while reducing a logistical risk of overbooking. As R7 stated, " *It allows you to optimise the data flows and avoid risks that happen all the time, like overbooking.*" Another area emphasised how AI can enable collaboration between multiple partners, also internally and externally, by removing real time data sharing and trust barriers. R1 explained that a developed platform would aid the development of a business network, by inducing "*collaboration and lowering the distrust inherent in entrepreneurial ecosystems.*" Subsequently, it was identified that human- AI interface, and human-led initiative, are important to education and labour. R3 stated that platforms only "*help*," but, "*with a large management effort*," and if there is excessive reliance on AI, "*there's a risk that people stop acting and delegate to the machine.*" In this respect R4 added that AI can "*help processing the data with a lot of partners*," but human capacity to lead is indispensable. Finally, the last cluster highlighted an interest in AI-enabled strategic intelligence and matching primarily in education and labour markets. R5 suggested that "*university databases matched the need required from the company*", and R3 noted that this proactive matching was already being investigated, but both R3 and R5 warned about organisation governance and personal active contribution.

The ninth area of investigation - *AI as custodian* - aims at understanding how AI ensures fair distribution and protects intellectual property. Participants' responses revealed that there is a dominant scepticism about AI's capabilities currently to assure fairness in distribution and to secure IP. Several respondents including R1 and R3 firmly state that it "*won't be able to guarantee it*" and that the regulation "*needs to be regulated somehow sooner or later.*" (R3). R2 acknowledges that we need a legal frame but admits "*There must be a reference regulation... but I don't have enough*

*competence on that subject.*" That said, there is some cautious encouragement from R5 who expresses hope of AI: "*We hope it's intelligent enough to find a way... but it's tough.*" R6 does point to an existing AI case where the technology is actively being used to report oversights into brand misuse online. "*There has to be someone comparing these reports constantly... I can't do it by myself.*" Finally, R7 introduces a different flavour to the conversation by explaining that because their business does not hinge on IP, instead based on experience, they serve as a counterexample of the issue.

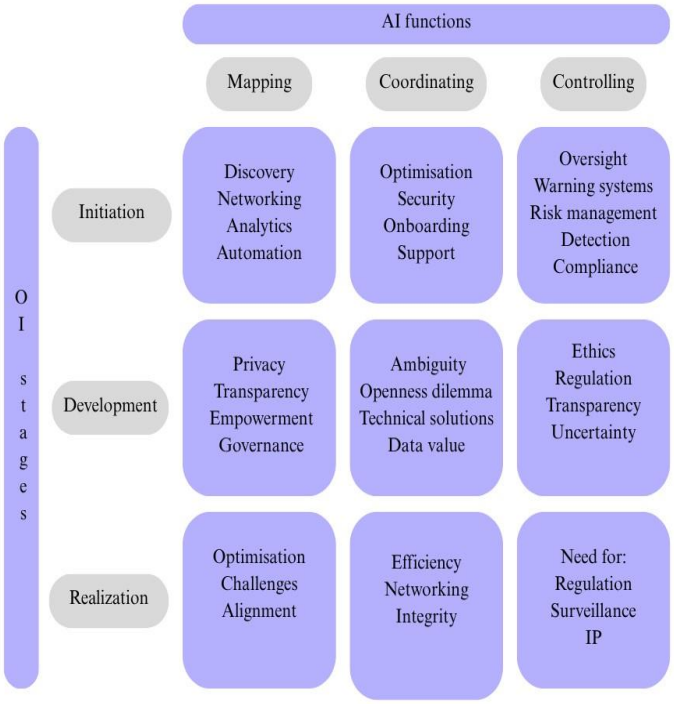

**Figure 1:** Authors' own elaboration based on Broekhuizen et al. (2023)

## 5. Discussion

This paper examines a burgeoning theme in innovation studies: the convergence of open innovation and artificial intelligence (AI), with an empirical focus on SMEs in the Region Lazio. Although AI's strategic importance for collaborative innovation is well recognised, qualitative research on how regional actors perceive, adopt, and integrate AI into their open innovation processes remains scarce. Our study fills this gap by exploring the functional roles that practitioners assign to AI across the stages of open innovation, while also mapping key barriers and enabling conditions.

The findings reaffirm AI's growing importance as an enabler within open innovation, strengthening both empirical and theoretical insights from recent literature. Yet, we also reveal considerable heterogeneity in how organizations adopt and interpret AI, resulting in a context-dependent and dynamic landscape. Aligned with Broekhuizen et al. (2023), our focus groups surfaced nine distinct AI functions, demonstrating that AI is regarded not only as an operational tool but also as an object of governance, mediation, oversight, and ethical reflection. In the Lazio context, SMEs experiment with AI at various points in the innovation cycle—particularly in mapping, coordination, and forecasting (AI as "*scout*," "*matchmaker*,"

and "*forecaster*"). Some firms, such as R2 and R7, leverage AI to streamline resource management and monitor patterns and risks, reflecting a tactical, performance-oriented approach, aligning with Kajiura (2012). Others, like R6 and R4, highlight regulatory uncertainties, ambiguities around IP, and the need for human oversight — concerns that align with the rationale behind proactive strategies aiming to balance IP protection with the need to collaborate and innovate (Kajiura, 2012) —casting AI in roles akin to "*whistleblower*." A prominent tension emerged between openness and protection, evidenced by selective use of tools such as NDAs, private AI systems, and blockchain. This underscores that the propensity for open innovation depends not only on technological capabilities but also on cultural and regulatory constraints, echoing the structural and cognitive barriers identified by Burger-Helmchen (2024). Simultaneously, our research shows that AI can bridge otherwise distant organisational spheres—companies, institutions, and academia— through initiatives like RETIC projects and university–industry matching platforms. This aligns with the findings exemplified by Cricchio et al. (2025), showing how open innovation platforms enable firms to balance collaboration and specialisation.

Overall, our results suggest that AI-driven digital transformation is never neutral but is shaped by strategic choices and organisational interpretations that redefine open innovation logics. As such, AI functions as a generative technology - capable of amplifying both the promise and the ambivalence of open innovation - and demands a flexible, reflexive, and multi-level management approach.

## 6. Conclusion

This study offers an initial qualitative contribution to understanding AI-enhanced open innovation processes in SMEs. It demonstrates that AI adoption is gradual and influenced not only by technical resources but also by cultural, institutional, and relational factors. Interviewed firms fluctuate between openness and caution, enthusiasm and scepticism. To achieve systemic impact, coordination between public and private actors will be essential to develop shared skills, regulations, and infrastructure. In this scenario, AI functions not as a substitute but as an amplifier of collective intelligence within regional ecosystems.

Theoretically, this work enriches our understanding of the AI–open innovation intersection by revealing that AI's roles extend beyond technical functions to include symbolic, regulatory, and ethical dimensions. New tensions emerge - between openness and control, and between automation and human agency - that warrant further theoretical exploration. From a managerial perspective, the implications are clear: SMEs should pursue incremental AI strategies, emphasizing small-scale experimentation, in-house training, and the development of shared platforms with other ecosystem stakeholders. Simultaneously, regional institutions can build trust and promote interoperability among systems and actors.

The main limitation lies in the sample's size and scope: although it ensured sectoral and organisational diversity, the empirical base remains small (n = 7) and confined to a single geographic area. Moreover, the qualitative focus group methodology enables rich phenomenological insights but does not support broad generalisation.

Future research could expand to other regions and integrate quantitative (surveys, network analysis) and longitudinal methods to track AI adoption over time in open innovation processes. Additionally, examining the role of intermediaries - such as universities, incubators, and public bodies - in facilitating SMEs' transition to AI-based collaborative models would be valuable. Finally, given widespread concerns about regulatory uncertainty and reputational risk, the ethical and legal dimensions of AI adoption deserve dedicated study.

# Marketing Innovation and Digital Technologies Integration in Luxury Brands: Evidence from Italy

Ezgi Hazal Gurcan

Sapienza University of Rome, Rome, Italy

ezgihazal.gurcan@uniroma1.it

## Abstract

This study investigates how Italian luxury brands integrate digital technologies and marketing innovation in ways that align with their established brand identity. While the luxury sector is increasingly adopting tools like AI, AR/VR, and social media, existing research often overlooks how these changes are implemented in culturally embedded industries. Focusing on Italian firms, the research examines how digital initiatives are developed, how partnerships with external actors are managed, and how consistency is maintained across different channels. Using a qualitative multiple case study approach, the study draws on interviews with managers and consumers to better understand how innovation is shaped by internal capabilities and brand values. The findings aim to contribute to discussions on digital transformation in sectors where tradition and strategic differentiation remain key.

*Keywords: Luxury branding, digital technologies, marketing innovation, value creation, Italy*

### 1. Introduction & Background

Luxury brands are traditionally associated with symbolic value creation rooted in heritage, craftsmanship, and cultural capital. In an increasingly digital and data-driven environment, these brands are rethinking how they engage with consumers, communicate exclusivity, and deliver value through new technologies. Rather than replacing tradition, marketing innovation and digital tools offer new ways for luxury firms to strengthen their identity while staying relevant in a fast-evolving global market. This ongoing shift reflects a broader process of co-evolution between marketing and innovation, wherein firms must simultaneously adapt their internal capabilities and redefine how value is created, delivered, and perceived. For luxury brands, this involves integrating advanced digital technologies and marketing innovation with long-standing symbolic assets such as exclusivity, authenticity, and aesthetic heritage. While the literature on digital transformation and marketing innovation is expanding, most research focuses on general retail or tech-forward industries. Less is known about how firms in tradition-rich sectors like luxury fashion integrate digital innovation with brand heritage and symbolic value creation. This gap is particularly evident in culturally embedded contexts like Italy, where creativity, craftsmanship, and brand identity are tightly interwoven. Addressing this gap, this paper aims to how Italian luxury firms leverage digital tools and marketing innovation to co-evolve their value propositions while preserving exclusivity and authenticity.

## 2. Literature Review

This literature review synthesizes key academic contributions at the intersection of luxury branding, digital transformation, and marketing innovation. It is structured thematically to highlight conceptual advancements and identify underexplored areas that inform the research questions.

Digital Technologies in Luxury Marketing: Digital technologies are increasingly seen as strategic imperatives rather than optional tools, especially in luxury marketing. Plangger et al. (2022) argue that firms that frequently adopt emerging technologies such as artificial intelligence (AI), machine learning, and AR/VR lead in customer experience innovation and overall market performance. Historically, luxury brands approached digital with caution, concerned about maintaining exclusivity and symbolic capital in an open, accessible digital world (Rovai, 2018). Early literature characterized luxury's digital adaptation as reluctant and fragmented. However, in the last decade, a significant shift has occurred. AI-driven personalization, immersive AR/VR showrooms, and advanced data analytics are now commonly employed to simulate boutique experiences online while retaining luxury cues such as scarcity, intimacy, and storytelling (Athaide et al., 2024; Hoyer et al., 2020). The digital transformation of luxury is not merely about channel expansion, but about rethinking how symbolic value is digitally conveyed. Brands such as Gucci, Dior, and Bottega Veneta have launched integrated campaigns where technological interaction complements traditional brand codes, showing digital process in the sector.

Gap: Despite this shift, limited research investigates how digital technologies are strategically integrated in ways that uphold a brand's cultural heritage, aesthetic traditions, and symbolic distinctiveness.

Marketing Innovation and Luxury Consumer Engagement: In parallel to technological adoption, luxury brands are embracing marketing innovation as a means to connect with new generations while reinforcing prestige. Traditional luxury marketing was largely top-down and image-focused. In contrast, modern strategies incorporate twoway engagement through social media, influencer marketing, and user-generated content. Chanel's "We Love Coco" campaign, which engaged consumers through curated Instagram content, exemplifies this shift (Alonso, 2018). Other maisons like Louis Vuitton and Balmain use behind-the-scenes storytelling and livestreamed fashion shows to build transparency and emotional connection. Academic studies suggest that these strategies are not just communication tools; they influence consumer perception, loyalty, and willingness to pay (Godey et al., 2016). Experiential pop-ups, augmented reality filters, and mobile-exclusive launches reflect a reorientation toward experiential, participatory luxury that maintains emotional exclusivity. Marketing innovation, therefore, becomes a driver of symbolic value creation, not a departure from it.

Gap: Although consumer responses to these innovations are increasingly studied, there is still a lack of insight into how luxury brands internally manage and coordinate such campaigns, especially when involving external agencies, platforms, or influencers, to maintain coherence with brand identity.

Omnichannel Integration in Luxury Retail: Luxury brands have increasingly implemented omnichannel strategies to provide seamless, integrated experiences across physical and digital touchpoints (Guzzetti et al., 2024). Consumers no longer distinguish between online and offline: 68% of luxury shopping journeys begin online, even if the final purchase occurs in-store (Athaide et al., 2018). The pandemic accelerated digital adaptation, pushing brands to rethink flagship stores, invest in mobile-first platforms, and adopt virtual clienteling tools. Valentino's omnichannel expansion, which led to a 62% increase in online sales, is an

example of successful alignment between back-end integration and front-end experience (Belvedere et al., 2021). Yet omnichannel transformation involves more than digital tools, it requires cultural and structural change inside the organization. Sutanto et al. (2024) emphasize the importance of consistency across brand touchpoints to reinforce luxury positioning, and warn that disjointed experiences erode trust and symbolic equity.

Gap: While the technical and commercial aspects of omnichannel retail are well-documented, few studies explore the strategic and organizational enablers that luxury brands require to implement these initiatives while preserving brand coherence.

Value Creation and Co-Creation Through Innovation: Digital and marketing innovations in luxury are not only about efficiency or reach, they are central to value creation. This value is multifaceted: it strengthens the consumer experience (through personalization and interactivity), improves brand equity (through symbolic resonance and community), and firm performance (through new markets and revenue streams). Hoyer et al. (2020) describe this as a reconfiguration of the customer journey into one that is more immersive, participatory, and relational. Luxury consumers today are not passive recipients but active participants in brand storytelling. As Alonso (2018) shows, usergenerated content, influencer partnerships, and branded communities empower consumers to shape brand narratives, building loyalty and emotional investment. At the same time, luxury brands are leveraging digital platforms to scale these co-creation processes without compromising exclusivity. Yet this requires careful orchestration.

Gap: There is limited research on how luxury brands manage co-creation partnerships, especially with tech providers, platforms, and creatives, in ways that support symbolic brand integrity and long-term differentiation.

Toward a Research Agenda: Drawing on the gaps identified, this study aims to develop a research agenda at the intersection of brand strategy, marketing innovation, and digital transformation in the luxury context. It responds to the following unresolved questions:

- How do luxury firms integrate digital technologies in ways that align with cultural heritage and brand values?

- What role do external partnerships (e.g., tech agencies, influencers) play in shaping innovation strategies, and how are these collaborations governed?

- How do luxury firms manage internal structures and cultures to support consistent, omnichannel brand expression?

- What are the strategic trade-offs luxury brands face when balancing tradition with innovation?

By focusing on Italian luxury firms, an underexplored yet culturally significant context, this study contributes to understanding how innovation can be aligned with identity. It positions digital transformation not as a rupture from luxury's roots, but as a reconfiguration of symbolic value creation for the 21st century.

## 3. Methodology

This study adopts a qualitative multiple case study approach to explore how Italian luxury brands engage in digital transformation and marketing innovation while preserving brand identity and tradition. Case study methodology is well-suited for examining complex strategic phenomena embedded in specific cultural contexts (Yin, 2018). The research will include 5 to 7 Italian luxury firms from sectors such as fashion, accessories, and beauty, selected for

their visible engagement in digital innovation. Data collection will rely on two primary sources: (1) semi-structured interviews with key professionals (e.g., marketing, branding, or digital transformation managers), and (2) in-depth interviews with luxury consumers who have engaged with digital brand experiences (e.g., AR try-ons, digital campaigns, personalized e-commerce). These two perspectives will offer insights into how innovation is both developed and experienced. Secondary sources, such as corporate reports, websites, campaign materials, and media coverage, will be used to triangulate findings. A cross-case thematic analysis will be employed, first identifying themes within each case, then comparing across firms and consumer narratives to surface patterns in how digital innovation creates value while preserving symbolic capital.

Analysis Approach: Once data collection begins, qualitative data will be coded thematically using a grounded approach. Early categories will be derived from the literature on brand innovation, digital capabilities, and organizational identity. The goal is to uncover patterns in how luxury firms manage the tension between innovation and brand coherence. This methodological foundation will also serve to pilot and refine a broader research design for subsequent stages of the doctoral project, including potential comparative studies with other national contexts or value chain actors.

Questionnaries:
Target Respondents:
- Brand innovation managers
- Marketing directors or CMOs
- Digital transformation leads
- Sustainability or communication managers (if relevant)

Interview Duration: ~45–60 minutes
Format: Online or in-person, semi-structured interviews
Interview Themes & Example Questions:

1. Strategic Objectives and Innovation
- What are your strategic goals related to digital transformation?
- How do digital tools support your brand positioning or growth strategy?

2. Role of Brand Identity and Heritage
- How do brand values or heritage influence your innovation decisions?
- How do you ensure consistency across digital and physical channels?

3. External Collaborations and Partner Ecosystems
- Do you work with external partners (e.g., tech providers, agencies)?
- How are these partnerships managed to ensure brand coherence?
- What challenges or benefits arise from outsourcing parts of innovation?

4. Omnichannel and Customer Experience
- How is your brand integrating physical and digital customer journeys?
- What tools or platforms are key to your omnichannel strategy?

5. Future Outlook
- What do you see as the next big innovation priority for your brand?
- Where do you see the biggest internal capability gaps?
- How do you think the luxury sector will evolve digitally in the next 5 years?

## 4. Expected Contributions

This study contributes to the understanding of how luxury brands integrate digital technologies and marketing innovation in ways that align with their heritage and brand identity. By focusing on Italian firms, it highlights practices and challenges in a context where tradition and creativity are closely connected. The research also offers insights into how luxury companies manage internal structures and external collaborations to support

innovation while maintaining consistency across channels. These findings may support both academic discussions on brand transformation and practical considerations for managers navigating similar tensions between tradition and change.

# Strategic Integration of Conversational AI in Retail SMEs: Addressing Organizational Readiness and Budget Constraints

Siamak Hajiani[1],*, and Fabiola Sfodera[1]

[1] Sapienza University of Rome, Rome, Italy

* Corresponding author: siamak.hajiani@uniroma1.it, Sapienza University of Rome, Rome, Italy

## Abstract

This study examines the adoption of conversational artificial intelligence (AI) systems—chatbots, virtual assistants, and generative agents—by small and medium-sized enterprises (SMEs) in retail e-commerce. While existing research highlights potential benefits, little is known about SME adoption in practice. Using the Technology–Organization–Environment (TOE) framework, this study analyzes strategies, barriers, and drivers through semi-structured interviews with Italian e-commerce managers. Findings show that leadership vision often outweighs technical readiness, with customer service automation as the dominant use case. Yet challenges remain around balancing automation with human interaction, ensuring data quality and usability, and leveraging ecosystem partnerships. Hybrid human–AI models emerge as a practical pathway, reflecting the sector's need for scalable but customer-centric solutions. The study develops the theoretical discussion on SME-specific adoption dynamics and provides actionable insights for resource-constrained firms pursuing AI integration.

*Keywords: Customer Service Automation, Conversational AI, SMEs, Retail E-Commerce, Generative AI, Chatbots*

## 1. Introduction and Problem Statement

Small and medium-sized Italian companies operating mainly in the e-commerce retail sector represent a dynamic segment of the digital economy. Although they account for a minority of SMEs overall, their impact is growing: in the ATECO 47.91.1 category ("retail sale of any type of product via the internet"), over 41,700 businesses are expected in 2025 (ISTAT). Many of these firms are digital natives, structured from the outset to sell online via direct-to-consumer (D2C) channels, marketplaces, and social commerce, with business models based on digitized processes, lean management, and customer-centricity. Growth has been further accelerated by the pandemic and public initiatives such as Transition Plan 4.0 and regional digitization incentives.

Despite this momentum, retail SMEs face significant challenges, including intense competition, platform dependence, rising logistics costs, and scalability issues. In this context, conversational artificial intelligence (AI) systems—such as AI-powered chatbots, virtual assistants, and generative AI agents—are reshaping customer service, marketing, and operations. These tools promise benefits such as 24/7 availability, faster responses, lower

costs, and personalized engagement (Kumar et al., 2024; Kedi et al., 2024), yet their adoption is constrained by limited budgets, lack of internal technical skills, and immature digital infrastructures (Schönberger, 2023; Kumar et al., 2024). Organizational readiness also matters: firms require both robust infrastructure and adaptable cultures to support AI-driven change, while data availability—including structured product information and customer interaction histories—remains essential (Hau, 2023).

Current research often emphasizes barriers, user acceptance, or system design in SMEs (Rese et al., 2020; Tran et al., 2021), with less attention to integration strategies. While rule-based chatbots in service and sales have been studied, the strategic use of conversational generative AI—capable of adaptive, context-aware dialogue—remains underexplored (Kumar et al., 2024). This study addresses this gap by investigating how retail e-commerce SMEs can strategically integrate conversational AI, considering organizational readiness and budget constraints, and by offering scalable strategies aligned with SME capabilities.

## 2. Literature Review

**Conceptualizing Conversational AI Systems:** Conversational AI refers to software agents capable of interacting via natural language. These range from rule-based chatbots to advanced generative systems powered by large language models. In retail e-commerce SMEs, they support customer inquiries, product recommendations, lead generation, and 24/7 customer service (Kumar et al., 2024; Zeng et al., 2023). Generative agents, such as those built on GPT models, enable context-aware and adaptive dialogue (Kedi et al., 2024). However, much of the literature still emphasizes traditional chatbots, with conceptual boundaries between types often unclear (Pantano & Pizzi, 2020).

**AI Adoption in SMEs:** SMEs recognize the value of AI but face hurdles such as limited funding, skills gaps, and difficulties in embedding new technologies into existing workflows (Schönberger, 2023; Rizomyliotis et al., 2022). Organizational inertia, vendor dependence, and uncertain ROI further constrain adoption (Albats et al., 2023). Regional variations also exist, with digitally mature markets displaying faster uptake than emerging ones (Yusuf et al., 2024). Few studies examine how SMEs can mitigate these barriers through phased, low-risk approaches.

Two recurring adoption challenges are emphasized in the literature.

- Technical expertise: Many SMEs lack in-house AI capabilities, relying instead on external vendors or user-friendly solutions (Ridho, 2023; Hau, 2023).

- Data readiness: Effective conversational systems require not only structured product and customer data but also consistency, context, and accessibility (Li et al., 2020). Fragmented or low-quality datasets reduce system performance, while recent advances such as retrieval-augmented generation (RAG) highlight how integrating organizational data into generative models can enhance personalization and trust.

Budget constraints often limit experimentation with advanced or custom-built systems. SMEs tend to adopt scalable, cost-effective solutions such as off-the-shelf chatbots, cloud-based services, or open-source platforms (Thatavarthi, 2023; Alkudah & Almomani, 2024).

## 3. Theoretical Positioning

Building on SME adoption research, this study applies the Technology–Organization–Environment (TOE) framework (Tornatzky & Fleischer, 1990) to examine conversational AI adoption. In retail e-commerce, technological demands such as system interoperability, scalability, and integration with existing platforms intersect with organizational realities like

limited data readiness, managerial commitment, and workforce skills. These internal conditions are further shaped by external dependencies: eCommerce SMEs rely heavily on vendor ecosystems such as Shopify or Amazon, face compliance requirements under GDPR, and operate under competitive pressure to deliver real-time personalization (Schönberger, 2023; Schwaeke et al., 2025).

The interplay of these factors produces uneven adoption pathways. For some firms, strong alignment between data resources, leadership support, and ecosystem partnerships allows conversational AI to become a strategic enabler. For others, weak readiness or external pressures accelerate adoption faster than capabilities can keep pace, resulting in underutilization or failure. It is this dynamic configuration of resources, context, and strategy—rather than isolated enablers or barriers—that provides the theoretical foundation for this study.

## 4. Research Question and Objectives

This study is guided by the following research question:

How can retail e-commerce SMEs strategically integrate conversational AI systems, considering their organizational readiness, data readiness, and budget constraints?

To answer this, the study aims to:

- Identify enablers and barriers influencing AI adoption in retail SMEs.
- Examine organizational readiness, with specific attention to data readiness for personalization and customer acquisition, alongside technical capacity.
- Explore scalable implementation strategies tailored to SMEs.
- Analyze use cases of conversational generative AI in marketing and customer engagement, including hybrid human–AI service models.
- Develop a framework to support strategic, resource-aware adoption within the TOE framework.

## 5. Methodology

This study adopts a qualitative, exploratory design, grounded in an interpretivist perspective, to examine how retail e-commerce SMEs approach conversational AI integration. Semi-structured interviews were conducted with decision-makers from five Italian SMEs in the fashion, cosmetics, and jewelry subsectors, which are highly reliant on digital customer interaction (ISTAT). Firms were selected according to the EU SME definition (<50 employees, ≤€10M turnover/balance sheet).

Interviews explored motivations, barriers, and strategies for AI adoption, with particular attention to resource constraints and organizational reasoning. Data were thematically analyzed using both inductive coding and the TOE framework as a guiding lens. Codes captured technological readiness, organizational capacity, leadership vision, and environmental pressures. Cross-case comparison enabled identification of recurring themes and divergent approaches across subsectors.

## 6. Findings and Contributions

The interviews reveal several dynamics shaping the adoption of conversational AI. Leadership support and a clear strategic vision often outweighed technical readiness, with firms advancing despite limited infrastructure. Customer service automation was the dominant use case, yet managers stressed the need to maintain a human element, pointing

toward hybrid models where AI manages routine queries and staff handle higher-value interactions. Data readiness emerged as critical: while structured customer histories enable personalization, fragmented or incomplete data hinder outreach to new customers and limit AI potential. Generative AI can partly bridge these gaps by accelerating enrichment and classification, making readiness less daunting for SMEs. Ultimately, progress depends on treating data as a business asset rather than a purely technical concern. Several SMEs also emphasized reliance on external vendors and platforms, underlining the role of ecosystem partnerships in compensating for resource gaps.

The results suggest that SMEs benefit most from phased, resource-conscious adoption strategies that balance efficiency with differentiation in customer experience. Rather than prematurely pursuing advanced capabilities, firms are advised to focus on data preparedness, select use cases aligned with strategy, and combine AI-driven efficiency with human empathy. These insights provide a more nuanced understanding of how SMEs can realistically and strategically integrate conversational AI under resource constraints.

## Abstract

This paper develops a conceptual framework explaining how gamification mechanisms influence consumer behavior across the Consumer Decision Journey (CDJ). While gamification has gained prominence in marketing, its theoretical integration with decision-making remains fragmented. We propose that game elements - such as challenges, points, narratives, and social comparisons - activate psychological levers (e.g., curiosity, mastery, urgency, social validation) at each CDJ stage. Drawing from consumer behavior and gamification literature, we develop five propositions illustrating how gamified design enhances problem recognition, search, evaluation, purchase, and post-purchase engagement. A synthesis model guides future empirical inquiry and managerial application, bridging design logic with consumer psychology and advancing theory on digitally mediated journeys.

*Keywords: Gamification, Consumer Journey, Digital Marketing, Consumer Behaviour, Conceptual Paper.*

## 1. Introduction

Gamification (i.e. the use of game-design elements in non-game contexts) has become a prominent strategy to enhance consumer experiences, stimulate engagement, and influence behavior (Deterding et al., 2011; Huotari & Hamari, 2017). When aligned with broader objectives, such as sustainability, gamified features can effectively shape pro-environmental behavior through engaging interactions (Mulcahy et al., 2020). As digital environments increasingly mediate brand–consumer relationships, scholars have explored the motivational and behavioral effects of gamification (Hamari et al., 2014). Yet, research has primarily focused on isolated applications like loyalty programs (Hofacker et al., 2016) or branded apps (Eppmann et al., 2018), limiting a holistic view of its strategic potential across the entire decision process. For example, gamified features in e-commerce have been shown to boost emotional engagement and shape consumer attitudes (Huang & Benyoucef, 2013).

We argue that gamification is underleveraged across the full Consumer Decision Journey (CDJ) - from problem recognition to post-purchase. The CDJ, as conceptualized by Engel et al. (1995), Puccinelli et al. (2009), and Lemon and Verhoef (2016), structures consumer behavior into sequential yet interactive stages. However, gamification research has mostly emphasized downstream outcomes like loyalty and advocacy, neglecting earlier phases such as need recognition and evaluation.

To fill this gap, this paper proposes a stage-based conceptual framework that integrates gamification mechanisms across each CDJ stage. We draw on gamification literature,

decision-making theory, and digital marketing to explain how game elements can enhance consumer motivation, cognition, and behavior throughout the journey.

The paper aims to develop a theory-driven model that aligns gamification tools (e.g., challenges, narratives, or social comparisons) with consumer psychological drivers at each decision stage. Our contributions are threefold. First, we map game elements to motivational goals across the CDJ. Second, we identify key psychological mechanisms (e.g., curiosity, mastery, urgency, belonging) that link gamified design to consumer behavior. Third, we propose five testable propositions and directions for future research, responding to calls for more integrative, actionable models in marketing (Kindermann et al., 2023; Golder et al., 2012; Högberg et al., 2019a).

## 2. Theoretical Background

Gamification refers to the use of game-design elements in non-game contexts to motivate and influence behavior (Deterding et al., 2011). Its effectiveness in marketing depends on how well game mechanisms align with consumers' psychological needs, a connection still underdeveloped in many contexts (Li et al., 2024). Increasingly used to foster engagement and loyalty through points, badges, and narrative quests, gamification can also create experiential value aligned with broader goals like sustainability (Huotari & Hamari, 2017; Hofacker et al., 2016; Zhou et al., 2023). While studies highlight its positive effects on enjoyment, perceived usefulness, and behavioral intentions (Eppmann et al., 2018), most focus on isolated touchpoints, such as loyalty programs or branded apps, neglecting its role across the broader decision cycle (Hamari et al., 2014).

Gamification literature tends to follow either a design-centric or psychology-centric lens, but few works connect game mechanics to consumer decision-making stages. Understanding this alignment, especially in value co-creation contexts, could provide a stronger foundation for marketing strategies (Xu et al., 2017).

The Consumer Decision Journey (CDJ), described by Engel et al. (1995), Puccinelli et al. (2009), and Lemon and Verhoef (2016), outlines five sequential stages: problem recognition, information search, evaluation, purchase, and post-purchase. Despite its wide adoption, the model has been criticized for its linearity, as digital interactions introduce complexity through micro-moments and emotional nudges (Whittaker et al., 2021; Court et al., 2009; Edelman, 2010). Particularly in gamified or app-mediated contexts, journeys are increasingly non-linear, requiring models that capture iterative and interactive experiences (Lemon & Verhoef, 2016; Abou-Shouk & Soliman, 2021). Yet, there are no studies that integrate gamification with CDJ stages in a systematic and theory-driven manner.

We argue that gamification, when aligned with consumers' motivational goals, can enrich experiences across the CDJ. However, current practices often remain superficial, lacking systematic motivational alignment (Högberg et al., 2019b). Building on Eppmann et al.'s (2018) conceptualization of gameful experiences—enjoyment, absorption, creative thinking, activation, and affect—we propose a framework linking specific gamification elements to psychological levers at each CDJ stage. This responds to recent calls for integrating diverse theoretical insights into richer conceptual models (Kindermann et al., 2023; Golder et al., 2012) and offers guidance for designing gamified experiences that empower and engage consumers throughout their journey (Mishra & Malhotra, 2021).

## 3. Conceptual Framework: Gamification Across the Consumer Journey

This section introduces a conceptual framework mapping gamification mechanics to consumer motivations across the CDJ stages: problem recognition, information search, evaluation, purchase, and post-purchase (Figure 1).

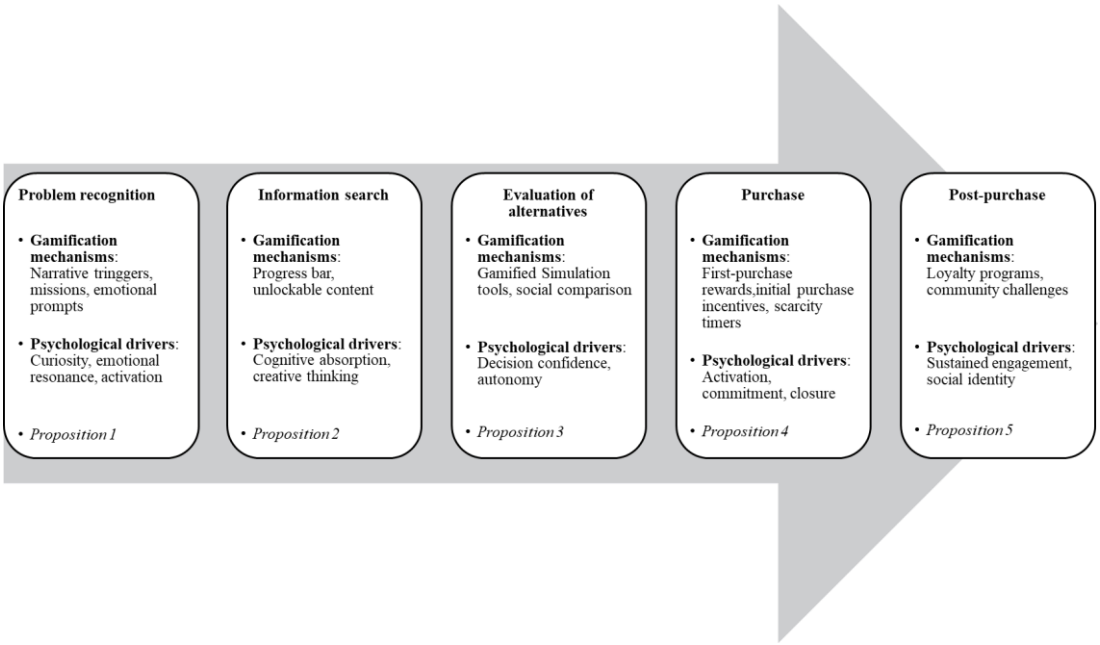

**Figure 1:** Conceptual Framework Gamification and the Consumer Decision Journey
(Source: Authors' elaboration, 2025)

Drawing from consumer behaviour literature (i.e. curiosity, autonomy, mastery, and belonging), we demonstrate how game design elements can strategically guide cognitive, emotional, and behavioral responses.

In the problem recognition stage, gamified elements like identity quizzes and discovery prompts activate curiosity and emotional reflection, prompting consumers to recognize latent needs (Yang et al., 2023). During information search, mechanisms such as unlockable content and interactive tutorials deliver feedback and progress markers, enhancing cognitive absorption and making exploration intrinsically rewarding (Högberg et al., 2019a).

At evaluation, gamified comparison tools and rating challenges simplify complex trade-offs, strengthening decision confidence and perceived mastery. In the purchase phase, features like countdown timers and symbolic milestones introduce urgency and emotional gratification, transforming transactions into meaningful achievements (Li et al., 2023). Finally, the post-purchase stage leverages community missions, loyalty tiers, and review incentives to reinforce habits, social belonging, and ongoing engagement.

Gamification here is not a superficial tactic but a strategic architecture aligned with consumer psychology. It enables firms to design experiences that move consumers across decision phases while cultivating long-term involvement (Xi & Hamari, 2020; Behl et al., 2022).

To support this model, Table 1 summarizes CDJ stages, core goals, psychological levers, and corresponding gamification mechanisms. Figure 1 visually illustrates the integrated dynamics between design features and motivational states across the journey.

| CDJ Stage | Core Consumer Goal | Psychological Lever | Gamification Mechanism *(Examples)* |
|---|---|---|---|
| ***Problem Recognition*** | Realize need or latent desire, generate needs | Curiosity, Identity Alignment | Narrative prompts, Discovery missions, Persona quizzes, thematic missions |
| ***Information Search*** | Explore and understand brand/product options/knowledge | Autonomy, Perceived Competence, Goal Progress | Unlockable content, Interactive tutorials, Achievement badges |
| ***Evaluation*** | Compare and decide among alternatives | Mastery, Decision Confidence, Trust, social proof | Gamified filters, Rating challenges, Comparison games |
| ***Purchase*** | Finalize the transaction | Urgency, Emotional Reward, Gratification | Countdown timers, Milestone celebrations, Surprise offers, social referrals |
| ***Post-Purchase*** | Continue engagement and co-create value, build loyalty | Belonging, Habit Formation, Self-expression | Community missions, Loyalty tiers, Review incentives |

**Table 1:** Mapping Gamification to the Consumer Decision Journey (Source: Authors' elaboration, 2025).

This structured conceptual framework sets the foundation for formal theoretical propositions detailed in the subsequent section.

## 4. Proposition Development

Building on the conceptual framework outlined above, we propose a series of theoretical propositions that articulate precisely how gamification influences consumer behavior across different stages of the CDJ. These propositions operationalize the psychological levers identified previously (i.e. curiosity, autonomy, mastery, urgency, and belonging), illustrating clear, testable relationships between gamified mechanisms and consumer responses. At the earliest CDJ stage, problem recognition, consumers may lack explicit awareness of their latent needs. Here, gamified mechanisms like exploratory quizzes and symbolic tasks stimulate curiosity and foster identity alignment, promoting self-reflection. Such reflective gamification can especially enhance awareness of sustainability-related behaviors and lifestyle gaps, suggesting the first proposition:

*Proposition 1. Gamification mechanics that stimulate curiosity (e.g., quizzes, exploratory tasks) enhance consumer problem recognition by prompting self-reflection on latent needs or lifestyle gaps.*

Transitioning to information search, consumers aim to resolve uncertainty by acquiring product-related knowledge. At this stage, autonomy and competence become pivotal motivational drivers (Ryan & Deci, 2000). Gamification techniques such as unlockable content, interactive tutorials, and exploration rewards facilitate active learning and cognitive engagement. Thus, the second proposition is derived:

*Proposition 2. Gamified tools that support mastery-oriented discovery (e.g., interactive guides, unlockable content) increase the depth and persistence of consumer information search.*

In the subsequent evaluation phase, consumers engage in comparing alternatives, a cognitively demanding process often associated with decision fatigue. Gamified decision aids, including visual comparisons, rating challenges, and simulated environments, can simplify complex decisions, enhancing perceived mastery and reducing cognitive load. Consequently, we propose the third proposition:

*Proposition 3. Gamification elements that create cognitive challenge and comparison (e.g., product simulations, rating games) improve the quality of alternative evaluation.*

At the purchase stage, the consumer decision culminates, significantly influenced by emotional triggers and urgency. Mechanisms such as countdown timers and symbolic milestones embed emotional significance, reinforcing immediate conversion through heightened urgency and gratification (García-Jurado et al., 2021). Hence, our fourth proposition emerges:

*Proposition 4. Gamification mechanics invoking urgency and symbolic reward (e.g., countdowns, milestone celebrations) increase purchase likelihood by leveraging time-sensitive motivational levers.*

Finally, post-purchase experiences remain essential for sustained consumer relationships and ongoing brand engagement. Gamification strategies like community missions and loyalty tiers facilitate identity expression, habitual engagement, and co-creation of value, fostering emotional bonds and long-term loyalty. The fifth proposition thus states:

*Proposition 5. Gamified experiences that promote community engagement and reward continuity (e.g., loyalty tiers, review missions) strengthen post-purchase behavior through habit formation and identity expression.*

Collectively, these propositions provide clearly defined theoretical pathways, explicitly guiding future empirical research and offering practical insights for strategically integrating gamification across the CDJ.

## 5. Discussion and Future Research

### 5.1 Theoretical and Managerial Implications

This paper advances marketing theory by conceptually integrating gamification across the full CDJ, responding to calls for comprehensive engagement models (Huotari & Hamari, 2017; Lemon & Verhoef, 2016). It aligns game elements (e.g. challenge, progression, and social incentives), with psychological drivers like curiosity, autonomy, and commitment (Deterding et al., 2011; Eppmann et al., 2018), contributing to a dynamic, consumer-centric theory of gamification (Kindermann et al., 2023). The proposed propositions offer testable pathways and invite integration with self-determination and flow theory.

Managerially, the framework offers actionable guidance for designing gamified experiences aligned with each CDJ phase. Beyond loyalty programs, marketers should engage consumers early using tools like narrative prompts and exploratory challenges. Tailoring gamified features to stage-specific emotions, such as mastery during evaluation or belonging post-purchase, can enhance engagement and co-creation (Dzandu et al., 2022). The model also fosters cross-functional integration of UX, behavioral design, and strategy. In the face of digital fatigue, gamification provides an intrinsically motivating alternative to traditional promotions.

## 5.2 Future Research Agenda

The framework suggests several avenues for further inquiry. First, future studies should empirically validate how specific gamification mechanics affect psychological processes across CDJ stages. Experimental and field research can clarify how combinations of mechanics and motivations shape journey progression.

Second, scholars should explore boundary conditions that influence gamification's impact. Game features like leaderboards may drive engagement in some contexts but reduce it in others. Cross-cultural and segmentation studies can reveal how gamification interacts with traits, norms, market maturity, and product categories.

Third, research should address temporal dynamics: Do gamified touchpoints build loyalty over time or lose effectiveness due to novelty wear-off? Longitudinal studies can assess how early-stage gamification influences long-term behaviors like advocacy.

Fourth, future work should explore the interplay between gamification and emerging technologies (e.g., AI, avatars, AR). Personalized, real-time game elements may reshape decision quality and value creation across the CDJ. Domain-specific applications (e.g., sustainability, health, education) also raise new opportunities and ethical questions.

Finally, more work is needed on how gamification alters consumption meanings. As brands embed game mechanics into value propositions, researchers should examine consumer interpretations. Do gamified purchases feel playful, manipulative, or identity-affirming? Such inquiry can enrich theory on experiential consumption and brand relationships.

## 6. Conclusion

This paper proposes a conceptual framework integrating gamification into the Classical CDJ, offering new insight into how gameful design can guide motivations and behaviors across the consumer journey. Moving beyond isolated applications, it positions gamification as a strategic logic for experience orchestration.

By linking gamification to stage-specific psychological mechanisms, this work advances both gamification and decision-making theory. It answers calls for actionable, theory-driven models that bridge scholarship and practice, while emphasizing the need for contextual alignment between mechanics and consumer needs.

The propositions and future research directions provide a foundation for empirical testing and cross-contextual extension. Practically, the model encourages marketers to view gamification not merely as a tool, but as a strategic driver for shaping meaningful consumer–brand interactions. Ultimately, this work supports a more integrated, purposeful application of gamification in marketing that goes beyond driving engagement to architecting motivationally aligned, context-sensitive consumer experiences.

# New Frontiers for Value Co-Creation in the Entertainment Industry

Andrea Gargiulo[1], Daniele Leone[1],*, and Marco Ferretti[1]

[1] Università degli Studi di Napoli "Parthenope", Via Generale Parisi 13, 80133 Naples, Italy

* Corresponding author: daniele.leone@uniparthenope.it

## Abstract

This paper investigates the evolving role of Artificial Intelligence (AI) in reshaping value co-creation within the entertainment industry. Drawing on the theoretical foundations of Service-Dominant (S-D) logic, customer engagement, and socio-technical frameworks, the study explores how AI integration enhances or hinders customer participation in cocreation processes. Through a qualitative analysis it examines real-world applications of AI, such as personalization engines, generative tools, and predictive analytics. The findings reveal a dual-track model of value co-creation: (1) Human-Machine Co-creation, where AI augments user experience through personalization and immersion; and (2) Customer-Company Co-creation, rooted in emotional bonding and symbolic participation. While AI can deepen engagement and streamline creative processes, intrusive implementations risk alienating users and eroding brand authenticity. Case studies highlight that customer participation thrives when AI is adopted transparently and respectfully to support human creativity. Conversely, overreliance on AI in emotionally or culturally significant domains can damage trust and weaken the brand-fan relationship. The study concludes that effective AI deployment requires ethical design, narrative sensitivity, and strategic alignment with human values. These insights offer practical guidance for marketers, policymakers, and researchers navigating AI-enabled co-creation in the digital economy.

*Keywords: Artificial Intelligence, Innovative Marketing, Value co-creation, Customer Engagement*

## 1. Introduction

In an era of accelerating digital transformation, the entertainment industry has become a fertile ground for technological experimentation and consumer engagement. Fuelled by advancements in Artificial Intelligence (AI), companies are rapidly reshaping how content is created, distributed, and consumed (Hallur et al., 2021). From recommendation systems on platforms like Netflix and Spotify to generative AI tools in music, film, and gaming, intelligent technologies are no longer confined to backend efficiencies—they now actively shape the emotional and symbolic experiences at the heart of entertainment. This shift represents more than a technical upgrade; it marks a cultural and strategic inflection point where machines participate in co-creating value alongside humans.

The implications of this evolution are profound. Marketing scholarship has increasingly adopted the lens of value co-creation, particularly through the Service-Dominant (S-D) logic proposed by Vargo and Lusch (2004, 2008), which reframes value as something that emerges through collaborative interaction rather than being embedded in products. As AI technologies become more autonomous and generative, their role within this co-creative framework grows more complex. AI is no longer just an enabler of personalization or

automation—it can act as a semi-autonomous contributor to creative processes, content generation, and even customer experience design. This raises essential questions about the nature of human participation: Is AI deepening the customer's role as a co-creator of value, or is it displacing it?

Existing research has provided important insights into the use of AI in personalization, predictive analytics, and customer engagement (Gama & Magistretti, 2025; Banh & Strobel, 2023). Scholars have also highlighted the potential of AI to enhance customer experience by making content more relevant, timely, and interactive (Chandra & Rahman, 2024). However, much of this work has focused on AI's operational or technical capabilities, with limited attention paid to its broader impact on the relational and symbolic dimensions of marketing—especially in emotionally charged, creative industries like entertainment. The few studies that touch on co-creation with AI tend to treat technology as a background tool rather than a visible, influential actor in the value formation process. As AI becomes more embedded in storytelling, fandom, and identitybased engagement, these limitations become more pressing.

This paper seeks to fill that gap by investigating the evolving interplay between AI and customer participation in the value co-creation process. Specifically, it explores under what conditions AI integration enhances or hinders customer participation in value cocreation processes within the entertainment industry. This question is especially urgent in sectors where value is co-produced not only through functionality and convenience but through emotional resonance, symbolic meaning, and creative agency. The goal is to understand how AI can serve as a supportive partner in co-creation—augmenting rather than replacing human input—and to identify the risks associated with misaligned or overly intrusive implementations. By combining theoretical insights from S-D logic, customer experience theory, and socio-technical systems with empirical case analysis, this study offers a framework for navigating the promises and perils of AI-enabled co-creation in one of the most dynamic and culturally significant domains of the digital economy.

## 2. Literature Review

The growing influence of digital technologies has brought forth a fundamental shift in how organizations operate, compete, and engage with customers. This process, known as digital transformation, is more than a technological upgrade—it signifies a deep, structural change that reshapes the identity and functionality of organizations (Hovorka & Mueller, 2025). At the heart of this transformation is Artificial Intelligence (AI), a general-purpose technology capable of adapting across industries, reshaping both operational processes and strategic orientations (Gama & Magistretti, 2025). AI in marketing refers to the use of advanced algorithms and computational models—ranging from machine learning to generative AI—to analyse consumer data, predict behaviours, automate decisions, and personalize experiences at scale. As digitalization accelerates, AI has become an essential enabler of data-driven marketing strategies, offering tools to enhance segmentation, customer relationship management, dynamic pricing, and targeted content delivery.

The origins of this evolution trace back to foundational work on information theory, such as Claude Shannon's conceptualization of the "bit" in 1948, which paved the way for digitized information processing (Hilbert, 2020). Since then, the widespread availability of broadband internet, the exponential growth of data, and advances in storage and computing power have set the stage for AI's rise as a central component of contemporary marketing. These developments have enabled firms to integrate AI into existing workflows and customer journeys, often reshaping the interface between brand and consumer in the process. AI's versatility lies in its ability to learn from data without explicit programming, through subfields like machine learning (ML), which identifies patterns and improves performance over time,

and deep learning (DL), which leverages neural networks to handle unstructured and high-dimensional data. The latest wave— generative artificial intelligence (GAI)—introduces a powerful shift: instead of simply analysing or classifying data, AI systems now possess the ability to generate new content, ideas, and narratives. This opens new avenues for co-creation with customers, personalized storytelling, and dynamic campaign optimization (Banh & Strobel, 2023).

From a strategic perspective, AI is not merely an automation tool; it is increasingly viewed as a core capability that drives innovation and competitive advantage. Organizations are embedding AI into their innovation management processes, enabling faster experimentation, adaptive product development, and more effective market sensing (Gama & Magistretti, 2025). However, alongside these opportunities, challenges persist— including data privacy concerns, algorithmic transparency, ethical considerations, and the potential depersonalization of customer interactions. Despite these tensions, the momentum of AI adoption in marketing is undeniable. As digital transformation continues to reshape organizational landscapes, AI is expected to become even more embedded in marketing decision-making, pushing boundaries around personalization, engagement, and customer empowerment.

The integration of Artificial Intelligence (AI) into marketing has introduced new dynamics to the value co-creation process. Value co-creation has emerged as a cornerstone of contemporary marketing thought, reflecting a shift from firm-centred production models toward collaborative processes of value generation between multiple actors. This perspective is rooted in the service-dominant (S-D) logic proposed by Vargo and Lusch (2004, 2008), which reconceptualizes value not as something embedded in goods or services, but as something co-created through interactions, experiences, and the integration of resources. The S-D logic asserts that service—the application of skills and knowledge for the benefit of another party—is the fundamental basis of exchange, and that all actors (individuals, firms, institutions) are resource integrators operating within dynamic networks. As the framework has evolved, it has emphasized the inherently experiential, interactive, and phenomenologically determined nature of value, while also highlighting the importance of systemic connections and the need for new, non-goodsdominant language to describe marketing processes. In their extensive revisitation of foundational premises, Vargo and Lusch (2008) reinforced the notion that value is always co-created, contextually interpreted, and shaped through interactions among social and economic actors.

This foundational shift in understanding value has been amplified in the digital era by the emergence of Artificial Intelligence (AI) as a key participant in co-creation. AI-enabled technologies now act as active collaborators in value processes, giving rise to a new mode of interaction: human-machine value co-creation. These intelligent systems—ranging from chatbots and recommendation engines to generative AI models—enable real-time, responsive, and personalized engagement with customers, shaping both experience and outcome (Bosisio, 2024; Chandra & Rahman, 2024). Unlike traditional tools of automation, AI is capable of learning, adapting, and even generating new content, transforming it into an operant resource that contributes meaningfully to the co-creation process. Whether through deliberate engagement mechanisms like customization interfaces or through ambient systems that respond to user behavior and feedback, AI systems extend the co-creative role beyond human actors. As such, they mirror the S-D logic's emphasis on interactive networks and resource integration, while also introducing new forms of agency into the co-creation landscape.

Nonetheless, the involvement of AI does not diminish the centrality of human-centred value co-creation. Traditional customer-company co-creation remains vital, particularly in contexts that rely on empathy, shared meaning, and goal alignment (Tuunanen et al.,

2024). In what S-D logic refers to as the "joint sphere" of interaction, customers and firms collaborate through dialogue, mutual understanding, and context-sensitive service experiences. Rather than replacing these mechanisms, AI augments them—enhancing personalization, responsiveness, and co-decision making, especially when designed to simulate human-like traits such as empathy and adaptivity (Chandra & Rahman, 2024). The co-creation ecosystem is thus increasingly hybrid, comprising a blend of humanhuman, human-AI, and platform-mediated interactions (Wang et al., 2024). These networked exchanges exemplify the S-D logic view of value creation as a systemic, multiactor process. In this way, AI's integration into marketing not only reflects a technological advancement but also deepens the theoretical and practical dimensions of value cocreation, reaffirming the customer's role as a proactive, empowered, and contextually situated co-creator of value.

To complement the theoretical lens of Service-Dominant logic and enrich our understanding of AI-enabled value co-creation, additional marketing and socio-technical frameworks are instructive. First, Customer Experience Theory provides a vital foundation for analysing how AI affects consumers' holistic interactions across emotional, cognitive, and sensory dimensions. As Verhoef et al. (2009) emphasize, customer experience is dynamic and multifaceted, shaped by both firm-controlled elements and external social contexts—making it an essential dimension of AI-mediated engagement. Second, technology acceptance frameworks, including the Technology Acceptance Model (TAM) and the Unified Theory of Acceptance and Use of Technology (UTAUT), offer insights into how users' perceptions of usefulness and ease of use influence their willingness to co-create with AI systems (Venkatesh et al., 2003; Silva, 2015). If customers perceive AI as opaque, overly complex, or non-intuitive, their engagement may decline, inhibiting co-creation processes. Third, Customer Engagement Theory highlights the emotional, cognitive, and behavioural investments customers make in brand interactions (Brodie et al., 2011). AI systems that enable real-time feedback, interactivity, and relevance can foster deeper engagement, which serves as a precursor to value cocreation. Finally, Actor-Network Theory (ANT) challenges anthropocentric models by recognizing non-human actants—such as AI—as integral components of socio-technical networks (Dwiartama & Rosin, 2014). ANT's emphasis on the relational agency of machines supports the conceptualization of AI not merely as a tool, but as an active participant in value creation ecosystems. These theoretical perspectives collectively underscore the multifactorial and dynamic nature of AI-enabled co-creation, where acceptance, engagement, and distributed agency mediate the quality and outcomes of marketing interactions. This extended framework enables a richer understanding of how intelligent technologies shape, support, or even constrain participatory value exchange across hybrid (human-machine) networks.

## 3. Methodology

This study adopts a qualitative approach, using case studies from multiple sectors. Data were collected through interviews and document analysis. To investigate how the integration of Artificial Intelligence (AI) influenced customer participation in the value co-creation process within contemporary marketing strategies, we employed a qualitative single-sector case study design (Yin, 2009; Yin, 2018). This methodological approach was particularly well-suited to capture the complex, socio-technological, and contextspecific dynamics surrounding AI integration in a digitally mature industry. The aim was not merely to examine technological adoption, but to explore how AI reshaped consumer experiences, participation, and engagement within marketing practices. The entertainment sector was selected as the

empirical setting for this research due to its high degree of digital transformation, deep reliance on customer engagement, and dynamic use of crossmedia marketing strategies—all of which positioned it as a fertile ground for examining

AI-driven co-creation processes (Greenaway et al., 1995; Clarke & Gibson-Sweet, 1999; Jain et al., 2017).

A qualitative case study approach enabled us to investigate how entertainment companies were deploying AI to foster participatory value creation—such as through recommendation algorithms, generative tools, real-time audience analytics, or interactive content. This approach allowed for an in-depth analysis of technological, organizational, and cultural mechanisms driving customer involvement in co-creating value. By adopting an exploratory lens, we were able to delve into how human and machine collaboration unfolded in specific business models, marketing strategies, and content delivery formats.

The entertainment industry was selected based on several criteria relevant to the research objective:

- High Level of AI Integration: The entertainment sector has been a leading adopter of AI tools, ranging from generative AI in content creation to machine learning in customer profiling, chatbots, and personalization engines.

- Market Dynamism and Cultural Centrality: Entertainment is a rapidly evolving industry with significant cultural influence and economic value, offering unique insights into digital business transformation and value co-creation.

- Customer Experience Orientation: User-centricity is embedded in entertainment business models, making this sector ideal for examining participatory mechanisms and personalized experiences driven by AI.

- Cross-Media Capabilities: Entertainment companies operate across multiple digital platforms (e.g., streaming, gaming, music, social media), enabling the investigation of coordinated AI-driven strategies that amplify consumer interaction.

- Availability of Rich Secondary Data: The sector benefits from an abundance of public and secondary sources including corporate communications, industry reports, technical white papers, and digital archives.

Rather than adopting a multi-sector comparative framework, this study concentrated exclusively on sub-segments within the entertainment industry to maintain analytical depth while still capturing a diverse range of AI applications. A sectoral analysis was first conducted to identify key areas where AI had a marked influence on customer participation and co-creation. Following this analysis, four focal sub-sectors were selected: film and television, music, gaming, and sports entertainment. These areas were chosen due to their advanced AI implementation and distinct approaches to customer interaction.

Data collection was conducted using qualitative content analysis of secondary sources. Materials included industry white papers, investor reports, executive interviews, trade journals, digital marketing audits, and official press releases from major entertainment firms. This triangulated data approach enhanced the robustness and reliability of the research, enabling cross-validation of insights across independent and reputable sources. Thematic coding was employed to analyse how AI tools supported value co-creation. Key themes included personalization, automation of creative processes, data-driven audience segmentation, and interactive consumer experiences. These themes were mapped against the

theoretical framework of co-creation to identify mechanisms through which AI shaped the customer journey and enabled participatory value exchange.

By focusing on a single yet diverse sector, the study was able to produce grounded and context-sensitive insights. The entertainment industry, as a microcosm of digital transformation, served as a powerful lens through which to explore emerging dynamics in customer-centric business models. Moreover, concentrating on this sector provided clarity and coherence to the analysis, allowing for a more focused examination of how AI is reconfiguring not just marketing tools, but the very nature of consumer involvement in the creation of cultural and commercial value. This methodology ultimately allowed for a nuanced understanding of the research question by situating AI integration within realworld marketing ecosystems. It provided valuable perspectives on the changing relationship between companies and consumers, as mediated by intelligent technologies in one of the most innovation-driven and customer-focused industries in the digital economy.

## 5. Results and Discussion

The entertainment industry—encompassing film, television, music, gaming, and sports— is uniquely positioned at the crossroads of human creativity and technological innovation. As Artificial Intelligence (AI) becomes deeply integrated into content production, distribution, and consumption, it is reshaping the dynamics of value co-creation in two distinct and, at times, conflicting directions: human-machine value co-creation and customer-company value co-creation. This section explores the conditions under which AI integration either enhances or hinders customer participation in these intertwined processes.

Across the entertainment sector, AI has proven highly effective in enhancing humanmachine value co-creation by supporting efficiency, personalization, and interactivity.

Netflix's sophisticated recommendation engine exemplifies this application. By analysing granular user data—such as watch history, time of day, and even pause behavior—Netflix continuously tailors its content recommendations to align with individual user preferences. This personalization strategy has not only increased user satisfaction but also improved retention and engagement metrics, affirming AI's role as a co-creator of value through responsive content curation.

Similarly, Spotify's introduction of its AI-powered "DJ" showcases the power of generative AI in deepening engagement through context-aware, dynamic audio experiences. The DJ synthesizes real-time data and user preferences to simulate a humanhosted radio experience, increasing usage time and emotional resonance without replacing musical content creation itself. In both cases, AI does not displace human creativity but augments the consumer journey by enhancing discoverability and contextual relevance.

In gaming, the upcoming Nintendo Switch 2's use of NVIDIA's AI-based Deep Learning Super Sampling (DLSS) illustrates another form of machine-enhanced value creation. Here, AI contributes not to the game's narrative content, but to performance optimization—smoother graphics, realistic lighting, and faster processing. These advancements enhance the player's sensory immersion and allow developers to stretch the platform's technical limits, thus generating additional value without intruding on creative direction. Such AI integration underscores the potential of machines to become collaborative agents that work alongside human inputs. These systems create new experiential layers that would be otherwise impossible or inefficient to achieve manually, supporting the logic of human-machine co-creation as a complementary and scalable framework.

Despite these technological benefits, the same AI capabilities can undermine customercompany value co-creation, particularly when used intrusively in the creative core of entertainment production. Entertainment products are not utilitarian commodities; their value derives from emotional resonance, cultural significance, and artistic expression—all deeply human attributes. When AI is perceived as supplanting rather than supporting human input, customer engagement often falters, and the communal process of cocreating value with a brand gets disrupted.

The controversy surrounding Timbaland's AI-driven record label, *Stage Zero*, illustrates this clearly. The label's launch of *TaTa*, a virtual artist powered by generative AI, drew criticism from fans and musicians alike, particularly after it was revealed that public music submissions were used to train the AI model. Many perceived this as a shift away from nurturing real human talent toward manufacturing artificial personas. The backlash centred not only on the ethics of data use, but on the perceived erosion of authenticity and emotional depth Regardless of the factual basis of these claims, the perception of AI's intrusive presence eroded fans' sense of connection to the artist. This backlash demonstrates a broader risk: when customers feel that authenticity and emotional depth are sacrificed for efficiency or trend alignment, they may disengage not only from the product but from the brand itself.

A similar pattern emerged with Disney's AI-related missteps. The animated film *Wish* faced speculation that AI had been used in music composition, specifically regarding a song performed by Chris Pine that critics described as lacking emotional richness. Additionally, fan scepticism intensified when promotional materials—such as a visually flawed poster for *The Fantastic Four: First Steps*—were suspected to be AI-generated, leading to public backlash and decreased trust in the brand's creative integrity. Even at Disneyland, suspected AI-generated artwork was discreetly removed due to negative fan reactions.

These examples illustrate how intrusive AI integration—where machines encroach on tasks traditionally reserved for human artistic judgment—can compromise the symbolic and emotional capital of entertainment products. When audiences perceive content as "algorithmically hollow," their willingness to celebrate, share, and emotionally invest in a brand diminishes. This erodes the customer-company value co-creation loop, particularly the peer-to-peer diffusion of cultural value that sustains media franchises.

In the entertainment sector, customer-company value co-creation often manifests through symbolic participation, where audiences become brand advocates by celebrating content, creating fan communities, and extending narratives through user-generated media. The success of media franchising models—like those employed by Disney—depends heavily on this symbolic participation. Disney's model thrives by emotionally engaging customers in a cross-generational value loop, where stories and characters become part of a family or cultural identity. Fans don't just consume—they advocate, recreate, and spread the brand's meaning. This enables content to maintain relevance and profitability for decades, often resonating with new generations long after its initial release, thanks to the emotional connection first established with original consumers and passed on to their close circles. However, as observed in the decline of the Marvel Cinematic Universe and *Star Wars* fandom, oversaturation and perceived declines in quality due to rushed production and inconsistent narratives (partially enabled by AI-supported scalability) have diluted this participatory energy. Instead of elevating customer-company co-creation, the relentless drive for content expansion—often made feasible by AI-supported analytics and automation—has had a paradoxical effect: it crowds out the space for meaningful emotional engagement, turning once highly celebrated properties into background noise. These results highlight a crucial tension: AI may scale production and facilitate efficiency, but this very acceleration

risks displacing the slow-burn cultural resonance needed to sustain symbolic value co-creation.

The entertainment industry thus finds itself at a strategic inflection point. AI offers immense potential to support value co-creation—but only when its integration respects the boundaries of human judgment, creativity, and emotional labour. Case studies across subsectors point to specific conditions under which AI enhances rather than hinders cocreation:

- Non-Intrusiveness: AI should act as a facilitator rather than a replacement. Spotify's DJ or Netflix's personalization engines exemplify systems that increase engagement without infringing on creative domains.

- Transparency and Curation: Consumers are more receptive to AI when its role is clear, curated, and aligned with human oversight. Nintendo's cautious approach to AI in game development and Disney's renewed emphasis on quality over quantity reflect this awareness.

- Creative Amplification: AI should help human creators do more of what they do best—streamlining logistics, enhancing interactivity, and expanding expressive potential—rather than generating core narrative or artistic content.

- Preservation of Brand Meaning: Especially in franchising, symbolic capital is fragile. When AI disrupts the emotional contract between brand and fan, the network effects that drive value co-creation collapse.

In short, human-machine co-creation can reinforce customer-company co-creation only when AI is positioned as a support mechanism, not as a substitute for the human experience at the heart of entertainment.

To conceptualize the insights drawn from the case studies and theoretical frameworks,

*Table 1* presents a dual-track model of value co-creation in AI-integrated entertainment. This model distinguishes between two interrelated but distinct forms of co-creation: "Human-Machine Co-creation" and "Customer-Company Co-creation". Each operates according to specific value drivers, assigns a different role to AI, and carries unique risks when AI integration is misaligned with stakeholder expectations.

| **Type of Co-creation** | **Value Driver** | **Role of AI** | **Risk when misaligned** |
|---|---|---|---|
| *Human-Machine* | Efficiency, Personalization and immersion, Data processing and insights | Augmenter of capabilities, Scenario simulator, Optimizer of operations | Customer passivity or alienation, Over-automation, Bias or error amplification |

| | | | |
|---|---|---|---|
| *Customer-Company* | Brand advocacy and word of mouth, Loyalty and repeated purchases,<br><br>Isolation of competitors | Quality enhancer,<br><br>Trend detector,<br><br>Co-designer,<br><br>Brainstorming | Loss of authenticity and customer engagement,<br><br>Damage to brand reputation |

**Table 1:** AI and the Dual Modes of Value Co-creation

"*Human-Machine*" refers to value that is co-created directly through interaction between the user and intelligent technologies. Here, AI functions as a supportive agent, enhancing the efficiency, personalization, and immersion of user experiences. Examples include Netflix's algorithmic recommendation engine or Spotify's AI-powered DJ—tools that respond to behavioural data to deliver tailored, seamless content journeys. In these cases, AI adds value by making the entertainment experience more relevant, convenient, and context sensitive. However, when the role of AI in human-machine co-creation is misaligned—especially when it becomes too dominant or overly directive—the result can be customer passivity or alienation. Users may feel that their agency is diminished or that their experience is overly mediated by algorithms, leading to a reduction in emotional involvement. For instance, overly aggressive personalization may trap users in content bubbles, suppressing discovery and novelty, thereby dampening their active role in cocreation.

"*Customer-Company*" centres on the relational, symbolic, and experiential interactions between consumers and entertainment brands. Here, value is generated through symbolic participation and emotional bonding—activities such as fandom, advocacy, and community-building that contribute to a brand's cultural capital. AI's role in this sphere should be one of curated enhancement: amplifying human creativity, facilitating participatory storytelling, or supporting shared experiences without overshadowing the human core. When AI is misused in this context—particularly when it intrudes into creative domains that are culturally and emotionally significant—the results can be far more damaging. The risk is the loss of trust, authenticity, and brand equity, as demonstrated in controversies like the backlash to suspected AI use in Timbaland's Stage Zero or Disney's marketing materials. If fans perceive that AI has supplanted human creativity or diluted the emotional depth of the content, the co-creation relationship deteriorates, often irreversibly.

Crucially, these two tracks of value co-creation are not mutually exclusive; they are interdependent and must be strategically aligned. Successful AI integration in entertainment requires a nuanced approach that maximizes the benefits of machine augmentation without compromising the human authenticity that underpins long-term brand loyalty and cultural resonance. The table underscores the need for boundary management—ensuring that AI operates as a tool that extends rather than replaces human creativity and relational engagement. It calls for transparency, ethical design, and intentional curation of AI roles within content ecosystems to avoid eroding the symbolic and emotional anchors that support customer-company value co-creation. This model not only encapsulates the findings of this research but also offers a conceptual roadmap for navigating the evolving landscape of AI-enabled marketing. It reinforces the central thesis: that AI can enhance value co-creation when deployed as an empathetic, contextsensitive partner in both technological and symbolic domains, but can equally undermine it when its use disrupts the affective and participatory dimensions that define the entertainment experience.

## 6. Conclusion

This paper explored how AI integration reshapes customer participation in value cocreation within the entertainment industry. The findings converge along three interrelated trajectories. First, AI's role as a co-creative agent is highly contingent on how it is embedded within the user experience—enhancing immersion, personalization, and responsiveness in ways that support rather than substitute human creativity. Second, while AI enables a new mode of human-machine value co-creation, its influence on customercompany value co-creation is more fragile, hinging on trust, authenticity, and emotional resonance. Third, the co-creative ecosystem in entertainment is increasingly hybrid, requiring deliberate alignment between technological affordances and symbolic expectations. When AI is perceived as augmentative, it can strengthen both user engagement and brand affinity; when perceived as intrusive or synthetic, it can trigger disengagement and erode cultural capital.

For managers, this study underscores the need to position AI as a curator and amplifier of human expression, not as a creative replacement. Strategic integration should prioritize transparency, emotional resonance, and user empowerment. AI should be deployed with sensitivity to narrative authenticity and brand identity, particularly in fan-centric industries like entertainment. For policymakers, the findings highlight the need for regulation that balances innovation with ethical standards around data use, content authenticity, and consumer transparency. Guardrails must protect against over-automation that could displace human creative labour or mislead consumers regarding AI-generated content. For academics, this research contributes to evolving theories of value co-creation by mapping the interplay between AI agency and customer participation. However, it is limited by its single-sector focus. While the entertainment industry offers rich, diverse contexts for studying co-creation, its cultural specificity may not fully represent dynamics in other industries. Furthermore, this qualitative approach yields deep, contextual insights but may overlook generalizable patterns across larger datasets. Future research should integrate quantitative methods to validate these findings at scale and explore sectoral comparisons to refine theory and practice around AI-enabled co-creation across the broader digital economy.

# From E-Commerce Habits to Chatbot Acceptance: Extending the Technology Acceptance Model to Ai Conversational Agents

Vincenzo Gissi[1], *, and Elisabetta Savelli[1]

[1] University of Urbino Carlo Bo

*Corresponding author: v.gissi@campus.uniurb.it

## Abstract

This study explores how consumers' familiarity with e-commerce, as well as their perceived benefits and barriers related to it, influence the acceptance of AI-powered chatbots in online shopping contexts. Drawing on the Technology Acceptance Model (TAM), the research integrates external variables such as frequency of e-commerce use and perceived convenience, risk, and lack of physical interaction with chatbot adoption. A survey was conducted on 220 participants, and data were analyzed using ANOVA and Structural Equation Modeling (SEM). Results show that e-commerce usage frequency significantly shapes how users perceive the benefits and barriers of online shopping. However, it does not directly influence their perception of chatbot usefulness or ease of use. Among the factors considered, only perceived convenience was found to positively affect both TAM constructs. The model confirms that perceived usefulness and, to a lesser extent, ease of use predict attitude toward chatbots, which strongly influences behavioral intention. These findings extend the TAM framework to the domain of conversational AI, offering theoretical insights and practical guidelines for improving chatbot adoption strategies in e-commerce environments.

*Keywords: AI, chatbot, e-commerce, consumer perception, TAM*

## 1. Introduction

E-commerce has emerged as a fundamental pillar of the global economy, redefining interactions between businesses and customers and driving profound socio-economic transformation (Hendricks & Mwapwele, 2024). The continuous evolution of e-commerce is evidenced by the increasing growth in online sales. In 2024, global retail e-commerce sales reached an estimated 6 trillion U.S. dollars and forecasts suggest a 31% increase over the next few years, approaching nearly 8 trillion dollars by 2028 (Statista, 2025).

In recent years, the adoption of AI-powered chatbots in e-commerce has grown exponentially, progressively transforming the way in which communication takes place between retailers and consumers (Tran et al., 2021). Thanks to the advancement of large language models (LLMs), chatbots have become more intelligent, enhancing the quality of customer interactions. Additionally, the widespread use of tools like ChatGPT, Gemini, and Claude have familiarized users with conversational AI, thereby accelerating the growth of the chatbot market in e-commerce.

Since more and more companies are investing in this technology (e.g. Amazon, Zalando…) due to its benefits, such as reduced operating costs and service efficiency, it is essential to understand how consumers experience the interaction with chatbots (Li & Wang, 2023). Gaining such insights can help to prevent user resistance and ensure that the implementation of chatbots yields a positive return on investment.

Despite its importance existing research on this topic remains scarce (Jiang et al., 2022; Li & Wang, 2023), highlighting the need for further studies to better understand this phenomenon.

Therefore, this study aims to explore the consumers' perception of, and willingness to use, chatbots during online shopping experiences specifically considering how familiarity with e-commerce, along with its perceived benefits and barriers, influence such perceptions and usage intentions. In detail, the study seeks to answer two research questions: (1) What are the main benefits and barriers associated with e-commerce, and how do they vary based on consumers' level of e-commerce usage? (2) How are chatbots perceived in online shopping experiences, and to what extent can e-commerce usage, perceived benefits and barriers shape such perception of and intention towards chatbots?

To address these questions, a quantitative study based on 220 participants was carried out. Findings revealed that consumers with higher levels of e-commerce usage perceive different benefits and barriers compared to those who use it less frequently. In particular, those who perceive e-commerce as convenient are more likely to find chatbots both useful and easy to use, which in turn positively influences their attitude towards and intention to use chatbots.

## 2. Theoretical Background

E-commerce: benefits and barriers. E-commerce adoption is influenced by a combination of perceived benefits and barriers, which vary depending on the individual and organizational context. Among the main benefits, there is the ability to shop online 24/7 year-round, the convenience of ordering products from anywhere, including via mobile devices, the ease of comparing prices and reading reviews, and the significant time savings by avoiding in-store visits (Taher, 2021). By contrast, common barriers such as data security, financial loss, and risk of receiving counterfeit or low-quality products, have been often identified as important challenges affecting e-commerce adoption (Handoyo, 2024).

Previous studies on technology acceptance have shown that experience with a given technology alters users' perceptions of it (Burton-Jones & Hubona, 2006; Venkatesh et al., 2003). In the context of e-commerce, this implies that the more individuals become familiar with online shopping, the more they recognize its benefits and tend to perceive fewer barriers (Lian & Yen, 2014; Nirmala & Devi, 2011). Extending this perspective, the first hypothesis of the study aims to validate these findings by confirming their robustness in the current context and sample:

H1: Consumers' frequency of e-commerce usage shapes the benefits and barriers they perceive.

AI Chatbots in E-commerce. Artificial intelligence has revolutionized e-commerce, improving customer experience, optimizing operational efficiency, and enhancing data-driven decision making (Bawack et al., 2022). Its applications range from intelligent inventory management and demand forecasting to creating highly targeted and personalized marketing campaigns. AI is key in automating interactions with consumers through virtual assistants and chatbots, capable of handling a wide range of customer requests without the need for human intervention (Wang et al., 2023). Chung et al. (2019) noted that chatbots help buyers

save time and provide useful insights on product availability and performance. Moreover, Lee and Li (2023) found that chatbot features like 24/7 access, information integration, and interactivity positively influence customer perceptions and increase adoption. However, Luo et al. (2019) stated that when customers are aware of the chatbot's presence from the start, their purchase intention decreases, indicating a prejudice against these tools. Despite numerous studies on chatbot adoption in e-commerce, there is still little clarity about the factors that influence their perception and use (Zhang et al., 2024), likely because these systems are becoming increasingly intelligent and their perception evolves over time (Zehnle et al., 2025).

Hypotheses development. To investigate the determinants of chatbot acceptance in e-commerce, this study adopts the Technology Acceptance Model (TAM) (Davis, 1989), a widely used framework explaining how users come to accept and use new technologies. Perceived Usefulness (PU) and Perceived Ease of Use (PEOU) are key predictors of Attitude (ATT) towards technology, which in turn affects Behavioural Intention (BI) to use it.

In this study, TAM is extended by incorporating consumers' level of e-commerce usage and their perceived benefits and barriers as external antecedents of PU and PEOU. Based on this framework, the following hypotheses are proposed:

H2: The level of usage of e-commerce positively influences both PU and PEOU

H3: Perceived benefits associated to e-commerce positively influence both PU and PEOU, while perceived barriers associated to e-commerce negatively influence them

H4: PU and PEOU of chatbots positively influence the attitude towards them

H5: The attitude towards chatbots positively influences the behavioural intention to use it

## 3. Methodology

Data for this study were collected through an online self-administered questionnaire distributed over a six-month period (January–June 2025). The survey investigated four main areas: (i) the frequency of e-commerce usage, (ii) perceived benefits and barriers related to online shopping, (iii) the core constructs of the Technology Acceptance Model (TAM) related to chatbots adoption in e-commerce, and (iv) respondents' socio-demographic characteristics.

All items were measured on a 7-point Likert scale (1= strong disagreement/very unlikely; 7= strong agreement/very likely). A total of 220 valid responses were obtained.

Data analysis was conducted using R software version 3.0, including both descriptive statistics and inferential analyses. In particular, ANOVA was performed to assess differences in perceived benefits and barriers (H1), as well as in chatbots' perceived PU and PEOU (H2), across groups with different levels of e-commerce usage, while Structural Equation Modeling (SEM) was employed to test the relationships among variables as hypothesized in this study (H3–H5).

## 4. Results

Respondents reported a moderate use of e-commerce, with a mean score of 4.33 (SD = 1.67). Based on their responses, participants were grouped into three usage categories: Low Users (n = 37, scores 1-2), Medium Users (n = 128, scores 3-5), and High Users (n = 55, scores 6-7). A one-way ANOVA was conducted to examine whether these groups perceive e-commerce benefits and barriers differently. Results revealed statistically significant differences in several dimensions. Practical benefits such as convenience, time saving, and

24/7 accessibility showed significant variation across groups ($p = 0.0107$), with High Users reporting greater appreciation for these aspects compared to Low Users. Information richness was also perceived differently ($p < 0.001$), with both Medium and High Users rating e-commerce as more informative than Low Users. Significant differences emerged for perceived risks, especially regarding data privacy and payment security ($p = 0.0049$) and delivery reliability ($p < 0.001$). Low Users tended to perceive these risks as higher. Finally, users diverged strongly on the disadvantage of lacking physical contact with products and sellers ($p < 0.001$), which was perceived as more problematic by Low Users. In contrast, no significant differences were found among the groups in their evaluation of enjoyment, advantageous prices, or the ability to find personalized products, suggesting that these aspects are perceived similarly regardless of usage intensity.

These findings support H1, confirming that e-commerce usage significantly shapes users' perception of its benefits and barriers. Specifically, as usage intensity increases, the overall perception of benefits tends to rise, while the perception of barriers tends to decrease.

However, when examining whether e-commerce usage also influences the perception of chatbots, specifically their PEOU ($p = 0.961$) and PU ($p = 0.821$), no statistically significant differences were found among user groups. Therefore, H2 is not supported.

Among the examined predictors, only perceived convenience significantly influenced PEOU ($p < 0.001$) and PU ($p = 0.020$), supporting H3 only partially.

Regarding H4, both perceptions constructs had a positive effect on users' attitude toward chatbots, with PU showing a strong and significant influence ($p < 0.001$), while the effect of PEOU was marginally significant ($p = 0.052$).

Finally, H5 was fully supported: ATT toward chatbots had a strong positive effect on BI ($p < 0.001$).

## 5. Discussions

This study explores how consumers' familiarity with e-commerce, and their perceptions of its benefits and barriers, affect their evaluation and acceptance of AI chatbots in online shopping. The findings offer several insights. First, the support for H1 confirms that e-commerce usage frequency significantly shapes consumers' perceptions. High-frequency users tend to recognize more of the practical benefits of e-commerce - such as convenience, information richness, and delivery efficiency - and perceive fewer barriers related to privacy, trust, or the lack of physical interaction. This is consistent with previous literature (Burton-Jones and Hubona, 2006; Venkatesh et al., 2003), which shows that repeated digital experiences increase familiarity and reduce perceived risks. Surprisingly, H2 was not supported. The expected relationship between e-commerce usage and chatbot-specific perceptions, (i.e. PU and PEOU) did not emerge. This suggests that frequent exposure to online shopping alone is not sufficient to shape consumers' perceptions of chatbot quality. This finding diverges from what TAM extensions typically predict and it may indicate that chatbot evaluations rely more on direct interaction with the tool rather than general digital experience.

H3 was partially supported, as only one benefit (i.e. perceived convenience) significantly predicted PU and PEOU. Other expected predictors such as perceived risks, absence of physical contact, and product information did not show significant effects. This indicates that practical and time-saving advantages remain the most influential factors in shaping perceptions of chatbot usefulness and ease of use, confirming findings from Chung et al.

(2019) and Lee & Li (2023), but not fully aligning with studies that emphasize trust and risk as dominant factors (Luo et al., 2019).

The results strongly support H4 and H5, in line with the original TAM framework (Davis, 1989). Both PU and, to a lesser extent, PEOU were positively associated with consumers' attitude toward chatbots, which in turn strongly influenced their intention to use. The dominant role of PU in shaping attitude aligns with prior research highlighting that PUis often the most critical driver of technology acceptance (Davis, 1989).

## 6. Implications and Conclusions

This study contributes to the literature by extending the TAM to AI-based chatbots in e-commerce, addressing the need to understand how users evaluate increasingly intelligent and adaptive technologies. By integrating perceived benefits/barriers and e-commerce usage as external variables, the study refines TAM's explanatory power, showing that only specific factors like perceived convenience influence chatbot perceptions. The findings confirm the central role of PU in shaping attitude and intention, while highlighting a weaker role for PEOU, suggesting that in AI contexts, outcome value may matter more than usability. Moreover, the lack of a direct link between usage frequency and chatbot perception suggests that general digital familiarity is not sufficient to drive chatbot acceptance, calling for new theoretical insights into human–AI interaction dynamics. From a managerial perspective, the findings highlight the importance of emphasizing convenience in chatbot design and communication strategies. Since perceived convenience significantly drives perceived usefulness and ease of use, companies should ensure that chatbot interactions clearly save users time, simplify tasks, and replicate the key advantages of e-commerce. Moreover, the fact that attitude strongly predicts usage intention suggests that businesses should focus on shaping positive first impressions through intuitive design, proactive support, and transparency about chatbot capabilities.

Despite these contributions, some limitations of the study must be acknowledged. First, the data are based on self-reported measures, which may be subject to social desirability bias. Second, while the study identifies perceived benefits and barriers, it does not directly assess actual chatbot interaction, a factor that could significantly influence perceptions, especially in AI contexts. Third, the cross-sectional design limits the ability to track how perceptions evolve over time as users gain more experience with chatbots. Future research could address these limitations by employing longitudinal designs or experimental settings that involve real-time chatbot usage. Additionally, further studies could explore the impact of factors such as transparency, personalization, or anthropomorphism on trust and acceptance. Finally, given the growing role of generative AI, future work should also examine how AI identity disclosure and the perceived autonomy of chatbots influence user behavior across different cultural or generational segments.

# The Impact of Mastery Orientation on Reactions Toward Generative AI

Luigi Monsurrò[1], Francesca Bergianti[1], *, and Silvia Grappi[1]

[1] University of Modena and Reggio Emilia, Italy

* Corresponding author: fbergianti@unimore.it

## Abstract

Generative AI (GenAI) tools are becoming increasingly present in people's everyday lives. It is therefore not surprising that research is examining the impact of this technology in several domains. However, how personality traits influence users' adoption and reactions towards GenAI is still an understudied topic. Through a survey-based study, we focus on the trait of mastery orientation and test its impact on attitudinal and behavioural reactions towards GenAI. Results show an indirect and positive effect of mastery orientation towards the width of usage of GenAI and an indirect and negative effect on the AI anxiety about job replacement. Both effects are mediated by attitude.

*Keywords*: *Generative AI, Mastery orientation, Personality traits, Human-computer interaction*

## 1. Introduction and theoretical background

If Artificial Intelligence (AI) has been traditionally a topic that was part of the popular culture mainly in the form of fictional stories (e.g., "2001: A Space Odyssey"), now it is becoming part of the popular culture in its actual form. Indeed, AI, and Generative AI (GenAI) in particular, is becoming part of the everyday life of a lot of people (Ritcher, 2025), and part of new business ideas and models (O'Neill, 2024).

From a behavioural perspective, research has investigated GenAI and its impact in multiple contexts such as ethics (Stahl & Eke, 2024), productivity (Dell'Acqua et al., 2023), or creativity (Lee & Chung, 2024). Some studies have taken a more user-centric perspective, investigating how users' personality traits can influence their GenAI behaviour (Faruk et al., 2023; Kovbasiuk et al., 2024). However, a personality trait that is still understudied in the GenAI adoption setting is mastery orientation.

The concept of mastery orientation comes from the goal theory (Ames, 1992), which studies the meaning that people attach to achievements. Traditionally, there are two different orientations that explain the meaning of an achievement: mastery orientation and performance orientation. While performance orientation is more connected to the idea of doing something to demonstrate superiority and outperform peers (Martin et al., 2008, Senko & Miles, 2008), mastery orientation is more connected with the idea of affirming competence (Martin et al., 2008) and to develop abilities and knowledge (Senko & Miles, 2008): therefore, the evaluation of a performance is self-referenced and the demonstration of abilities is based on the expression of maximum effort (Treasere & Roberts, 1994). Research on mastery orientation in employee settings sheds light on the fact that people with mastery orientation

put faith in their effort rather than their existing ability, seek challenging tasks, and have faith in their effort even in the face of adversity or failure (Kumar et al., 2022).

Based on these findings, we argue that people with high levels of mastery orientation can have a positive approach towards GenAI tools. Indeed, AI has been shown to elicit resistance and negative reactions: people can feel threatened by the risks of being replaced by AI in a task they enjoy (Leung et al., 2018), and high-skilled employees can feel that the implementation of GenAI tools can threaten their skill-based status (SimanTov-Nachlieli, 2024). We propose that this may not be the case for people with high levels of mastery orientation. That is because the threat of GenAI is based on the output and its efficiency in producing content, but not necessarily in the process of producing an output. In other words, people who have high levels of mastery orientation are not threatened by GenAI production of content because they are more focused on the acquisition of competence and in its process, rather than the result itself. This lack of threat can result in a positive attitudinal and behavioural reaction towards GenAI. Therefore, based on literature about mastery orientation (e.g., Kumar et al., 2022) and AI usage (e.g., Puntoni et al., 2019), we propose the following hypotheses:

H1. People with high (vs. low) levels of mastery orientation (a) use GenAI in more contexts (i.e., width of use) and (b) perceive the risk of being replaced less (i.e., AI anxiety about job replacement).

H2. The effects of mastery orientation on the width of usage and AI anxiety about job replacement are mediated by attitude. In particular, people with high (vs. low) levels of mastery orientation have a more positive attitude towards GenAI that, in turn, (a) positively impact the width of use, and (b) negatively impact AI anxiety about job replacement.

The frameworks that will be tested are represented in Figure 1 and Figure 2.

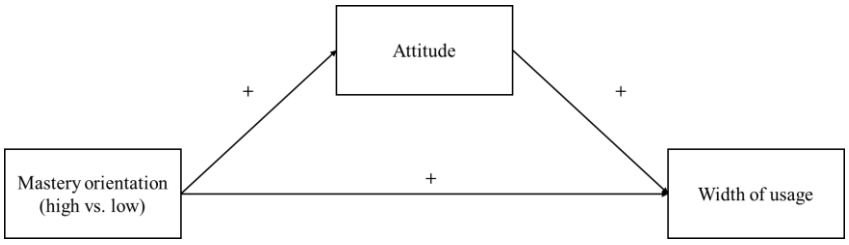

**Figure 1:** H1a and H2a

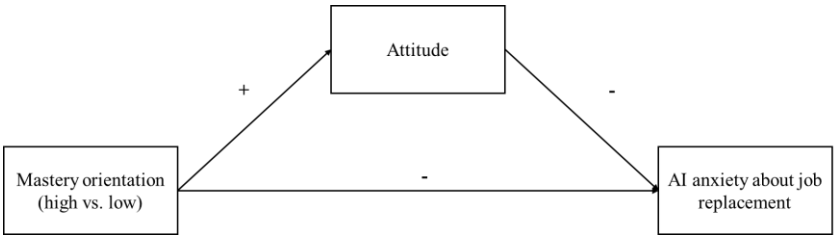

**Figure 2:** H1b and H2b

## 2. Methodology

As an initial exploration of the topic, we conducted a survey-based study with a sample of 96 Italian respondents (29.2% men; average age 23.3 years, SD = 3.70). We measured respondents' mastery orientation (three items adapted from Kumar et al., 2022), attitude towards GenAI tools (five items adapted from Becker-Olson, 2003; Coyle & Thorson, 2001; Song & Zinkhan, 2008), GenAI width of usage (calculated as the sum of contexts of use, i.e., work, study, hobbies, personal purposes), AI anxiety about job replacement (three items adapted from Wang and Wang, 2022).

## 4. Results

The 96 respondents were assigned to two mutually exclusive groups based on a median split (median = 4.83) of the composite scores on the mastery orientation scale. These groups represented individuals with high and low mastery orientation. Then, we performed two separate mediation analyses to test H1 and H2 (Process Model 4; Hayes, 2022).

Findings (Table 1) showed that there was no significant direct effect of mastery orientation on GenAI width of use or on perceived risk of job replacement. Therefore, H1a and H1b were not supported. However, results showed that individuals' mastery orientation significantly affected their attitude towards GenAI tools (b = .43; p = .025; confidence interval [CI] = .05, .81). Specifically, attitude toward GenAI tools was more positive in the high mastery orientation group compared to the low mastery orientation group. The first mediation analysis showed that attitude towards GenAI tools positively influenced GenAI width of usage (b = .37; p < .001; CI = .19, .55). Furthermore, results show an indirect and positive effect of mastery orientation on GenAI width of usage through Attitude (IE = .16; 95% bootstrap CI = .02, .34), thus supporting H2a. The second mediation analysis showed that attitude towards GenAI tools negatively influenced the AI anxiety about job replacement (b = −.51; p = .001; CI = −.81, −.21). Furthermore, results show an indirect and negative effect of mastery orientation on AI anxiety about job replacement through Attitude (IE = -.22; 95% bootstrap CI = -.49, -.02), thus supporting H2b. Thus, respondents with higher mastery orientation exhibited more favorable attitudes toward GenAI tools, which in turn led to greater width of usage and AI anxiety about job replacement.

## 5. Conclusions

In conclusion, this work contributes to the growing literature on GenAI adoption by highlighting the role of mastery orientation as an antecedent in shaping individuals' responses to GenAI tools. Specifically, the findings show that individuals with a high mastery orientation, who are motivated by learning and personal growth, and actively seek out challenging tasks to develop new skills and improve their competence, tend to have a more positive attitude towards GenAI tools. This, in turn, leads to broader use of GenAI tools and lower negative feelings of anxiety about them. This can be explained by the fact that individuals with high mastery orientation are more likely to see new technologies as learning opportunities and develop positive attitudes toward them. This inclines them to use these tools more extensively and feel less anxious about negative consequences, such as replacement. Conversely, those with low mastery orientation may avoid challenges and be less open to change, thus feel threatened by new technologies and experience more anxiety about them.

These results underscore the importance of individual differences in motivational orientation when adopting new technologies. From a practical standpoint, the findings suggest that organizations, institutions, and policymakers aiming to implement GenAI solutions may

[19] M = mediator; Y = dependent variable; X = independent variable (categorized as follows: 0 = low mastery orientation; 1 = high mastery orientation). LLCI = lower limit confidence interval; ULCI = upper limit confidence interval. Confidence interval = 95%. Significant effects are in bold.

benefit from supporting and developing mastery-oriented mindsets among employees, students, etc.—for instance, through training programs that emphasize learning, growth, and skill development. However, this is a preliminary study with limitations, including a relatively small and non-representative sample and a reliance on self-reported measures. Future research could further examine the robustness of these findings by testing alternative mediators or moderators (e.g., perceived usefulness or technological expertise – Faruk et al., 2023) and by employing longitudinal or experimental designs to better establish causality.

## Abstract

This study explores the characteristics of potential users of "deadbots"—AI-based digital replicas of deceased individuals—among Italian Millennials and Generation Z. A structured questionnaire was administered online to a purposive sample of 415 individuals. Using constructs adapted from UTAUT2 and related literature, the survey measured performance expectancy, subjective norm, positive and negative anticipated emotions, moral norms, trust, and uncanniness toward using a deadbot. To identify distinct user profiles, a k-means cluster analysis was conducted, resulting in a two-cluster solution: Uncanny-averse (58%) and Thoughtfully curious (42%). These findings highlight two distinct user profiles with different levels of openness toward this type of technology. The study offers initial insights into the segmentation of emerging markets for grief tech and highlights the need for further modeling to predict behavioral intentions toward deadbot adoption.

*Keywords: Deadbots, UTAUT2, Cluster analysis, Italy.*

### 1. Summary of relevant literature

Deadbots are a type of chatbot built on large language models, which allow them to generate personalized responses to textual inputs in a flexible manner and to be trained to emulate the distinctive speech patterns, lexical choices, and conversational style of someone who is no longer living [1]. These digital entities replicate the beliefs, desires, and preferences of deceased individuals using comprehensive collections of digitally recorded information about a person and processed by an intelligent system capable of reproducing a person's personality [2]. Much of the literature focuses on the relationships individuals may form with a deadbot and the challenges that can arise when, instead of serving as a supportive tool to cope with the loss of a loved one, the deadbot becomes a barrier to acceptance, ultimately hindering a successful grieving process [1]. In managing emotions after a loss, a deadbot may take on a dysregulating role [3], fostering overreliance or even dependency in users and leaving them increasingly vulnerable to manipulative practices or deceptive communication by digital recreation service providers [4]. Thus, unlike passive acts of remembrance, deathbots simulate an ongoing presence, which can lead to emotional confusion or prolonged attachment, ultimately encouraging the formation of continuing pseudo-bonds [2], where "the virtual relationship with the dead becomes a chronic coping strategy of denial" [4, p. 475].

Given the psychological, emotional, and ethical complexities associated with deadbot use, it becomes crucial to investigate the profiles of potential adopters. Understanding the motivations that drive individuals to embrace such technology is essential for anticipating future consumer behavior and informing responsible innovation in this emerging field. Despite growing academic interest in deadbots, empirical studies focusing on user acceptance remain scarce, with existing research primarily concentrated in non-European contexts [6–7]. This study aims to fill that gap by exploring the characteristics, perceptions, and behavioral intentions of Italian consumers in relation to deadbots, offering initial insights into how this controversial technology might be received across different segments of the population.

## 2. Research design

This study employed a structured questionnaire administered via the Prolific platform to a purposive sample of Italian individuals in May 2025. Participants were required to be Italian and born between 1980 and 2007, corresponding to Millennials and adult members of Generation Z. A total of 417 completed questionnaires were collected. After data cleaning, 415 valid responses were retained for analysis.

Participants were first presented with a product concept description (deadbot) in line with concept testing methodology [8]. The following questionnaire comprised eight sections and 27 items, with measures developed based on a modified version of the UTAUT2 model [9]. Performance expectancy and subjective norm were adapted to the context of deadbot usage. Instead of hedonic motivation—which focuses on product use with a temporal frame oriented to the present or immediate future—the emotional dimension was assessed through anticipated affective reactions, both negative and positive. These represent the prefiguration of emotions expected to occur in the future by using the deadbot [10]. Following prior studies [e.g., 11], trust was included as a known significant predictor of behavioral intention, particularly in chatbot usage contexts. Given the ethically sensitive nature of "digitally resurrecting" a deceased loved one, personal moral norms were examined as well [12]. These norms reflect the ethical standards and principles that guide consumer behavior, expressing individuals' deeply held beliefs about what is right or wrong in consumption. Finally, the construct of uncanniness was assessed, referring to the psychological discomfort experienced when a human-like technology—such as AI agents—appears almost, but not quite, human [13]. All construct items were measured using a five-point Likert scale, ranging from 1 = totally disagree to 5 = totally agree, capturing participants' level of agreement with each statement. Lastly, participants were asked about their prior knowledge of deadbots and frequency of AI conversational agent use.

## 3. Results and discussion

From a sociodemographic perspective, the sample is composed of 50.1% males, 50.8% Millennials, and 42.7% students. Additionally, 53.5% are employed either fulltime or part-time, 16.1% are unemployed and job seeking, and 30.4% fall into another category (not in paid work, due to start a new job within the next month, etc.).

To identify distinct respondent profiles, we conducted a cluster analysis following a multi-step preprocess aimed at ensuring data quality and dimensional adequacy [14]. First, we assessed the presence of multicollinearity among items by examining inter-item correlations. Items exhibiting multicollinearity were removed. Next, for each construct, we computed mean scores by averaging the retained items, thereby reducing dimensionality while preserving the theoretical structure of the data. These composite variables were then z-standardized to prevent variables with larger variances from disproportionately influencing the clustering solution. We applied the k-means clustering algorithm, which partitions observations into mutually exclusive clusters based on proximity in multidimensional space.

To determine the optimal number of clusters, we evaluated solutions ranging from 2 to 4 clusters using the Silhouette index [15], an internal validity criterion that measures cohesion and separation. The two-cluster solution yielded the highest Silhouette coefficient, equal to 0.52, indicating a welldefined partition with satisfactory internal consistency and between-cluster separation. The larger cluster was labeled Uncanny-averse (UA) (N=242; 58%), and the other one Thoughtfully curious (TC) (N=173; 42%) (Table 1). From a sociodemographic perspective, the TC cluster includes a higher percentage of males and, behaviorally, is characterized by individuals who use AI-based conversational agents more frequently. These findings are not discussed in the present paper due to space limitations.

| **Variables** | **Means** | |
|---|---|---|
| | ***Thoughtfully curious*** | ***Uncanny-averse*** |
| Performance expectancy | 2.9 | 1.6 |
| Loneliness alleviation | 2.8 | 1.6 |
| Subjective norm | 2.7 | 1.7 |
| Positive emotions | 2.6 | 1.4 |
| Negative emotions | 3.0 | 3.9 |
| Trust | 2.9 | 1.9 |
| ***Personal moral norms*** | ***2.7*** | ***3.9*** |
| ***Uncanniness*** | ***3.5*** | ***4.6*** |
| Intention to use | 3.1 | 1.3 |
| Intention to create for own self | 2.9 | 1.3 |
| ***Curiosity to try*** | ***3.8*** | ***1.7*** |

**Table 1:** Cluster means

The results show that the scores of both intention to use the deadbot of a deceased loved one and intention to create one's own deadbot are modest. In the cluster labeled UA, both intentions are basically null, with a mean score of 1.3. Differently, the TC express a substantially neutral stance, with a mean of 3.1 for usage and 2.9 for selfcreation. However, the TC respondents expressed a strong curiosity in trying the deadbot if the opportunity arose, with a mean score of 3.8, compared to 1.7 among the UA. This finding is interesting, as the literature suggests that curiosity enhances consumers' openness to exploring and engaging with new technologies or unfamiliar products, which can often lead to stronger purchase intentions [16]. This dynamic appears to be well understood by companies commercializing deadbots, as their pricing strategies often follow a freemium model or start with a very low entry cost—around €10—for triggering trials and increase progressively as the deadbot's interaction quality improves, reaching prices of over €100,000 for avatars.

Similar perceptions—extremely negative among the UA and largely neutral among the TC—emerge regarding the expected performance of the deadbot, which encompasses both functional aspects (e.g., support in daily activities) and symbolic dimensions (e.g., assistance in grief processing and memory preservation) with means equal to 1.6 and 2.9 respectively, and the capacity of the deadbot to alleviate loneliness (1.6 vs. 2.8) anticipated positive emotions such as joy and happiness (1.4 vs. 2.6), negative emotions such as sadness and anxiety (3.9 vs. 3.0), and trust in the deadbot's sincerity, respect for privacy, and preservation of the deceased's dignity (1.9 vs. 2.9). The differences between the two clusters thus converge in outlining two distinct emotional–cognitive profiles: on one side, the UA express a markedly negative evaluation, dominated by distrust, negative emotional expectations, and a failure to recognize any potential benefit in using the deadbot; on the other, the TC show a largely neutral stance, characterized by moderate levels of expected performance, trust, and emotional involvement.

From a social perspective, the UA perceive strong disapproval from significant others regarding the potential use of a deadbot (M=1.7), whereas the TC once again exhibit a neutral perception, with a mean score of 2.7 on subjective norm. It is therefore plausible to hypothesize that one of the factors underlying low intention to use may be linked to the perceived social context—friends, relatives, partners, and so forth—which could discourage adoption.

Salient referents' disapproval toward the use of a deadbot may be linked to the significant ethical implications of digital immortalization, as it can be seen as an act that violates the dignity of the deceased and the traditional ways in which individuals are honored after death. Confirming the findings of previous studies that reveal widespread skepticism toward this technology—where most participants considered interacting with a digital replica of the dead to be disrespectful or even blasphemous [6]—the UAs show strong opposition based on their moral norms (M=3.9). Such opposition may be rooted in the Italian cultural context, where Catholic traditions strongly influence memorial practices and the veneration of the dead, preserving a spiritual divide between life and afterlife. Differently, a mean score of 2.7 among TCs regarding personal moral norms suggests that, for at least some individuals, deadbots are not in conflict with their value systems and ethical standards. This aligns with previous research which indicates that a post-secularization process is underway in Italy, leading to a shift in attitudes and practices surrounding death, particularly among younger generations [17].

Finally, deadbots are perceived as highly disturbing by the UA, showing a mean score of 4.6 with relation to uncanniness, while again a relatively neutral perception characterizes the TC (M=3.5). This finding is interesting when considering previous research that longitudinally examined the perception of uncanniness in interactions with the Facebook profiles of deceased individuals by their living "friends" [18]. Over a threeyear period, from 2015 to 2018, the perception of "creepiness" associated with reanimated Facebook profiles disappeared, giving way to a growing sense of familiarity with this type of posthumous interaction. To date, digital memorialization practices and interactions with the profiles of deceased individuals on social media platforms are widespread and largely regarded as normal [19]. It is therefore plausible to assume that, given the scalability and qualitative improvement of the technology, as well as changes in the socio-cultural characteristics of consumers, deadbots may also become widespread within few years, representing just another way to remember those who are no longer with us while maintaining healthy continuing bonds. In this regard, it is enough to consider that on Chinese e-commerce platforms, deadbots are available for as little as 10 yuan (around €1.30) [20].

## 4. Conclusion and future research

This study presents the results of an initial analysis aimed at exploring the characteristics of potential deadbot users within a sample of Italian consumers. The next steps of the research involve adopting more advanced statistical methods to test a conceptual model predicting the intention to use a deadbot, assessing if and to what extent the investigated variables influence behavioral intention.

## Abstract

This study examines Non-Fungible Tokens' (NFTs) business potential in the luxury market as well as how they can impact luxury firms' advertising strategies. According to the results of an experiment with 168 participants, consumers' purchase intention is influenced by the possession level (high vs. low) conveyed by a communication message about a luxury product based on NFT, and this effect is mediated by the perception of brand luxury. Additionally, the results highlight the moderating influence of people's status orientation, demonstrating that the perception of luxury brands and status consumption orientation mediate the relationship between the NFT technology possession level and the willingness to purchase luxury goods.

*Keywords: Virtual ownership; Purchase intention; Non-Fungible Token; Digital luxury; Emerging technologies; New consumer behavior.*

### 1. Introduction and Literature Review

New technological innovations drives economic and social change (Perez, 2010), fostering growth through increased productivity (Vijselaar & Albers, 2004), improved design (Patrício et al., 2018), and enhanced business functions (Holland & Skarke, 2008). It also benefits society by promoting wellness and human potential (Roco & Bainbridge, 2013). The rise of Big Tech companies, i.e. Apple, Amazon, Microsoft, Google/Alphabet, and Facebook/Meta, illustrates this impact, with these firms reaching a combined market capitalization of US$6.4 trillion in 2022 (Birch & Bronson, 2022; Statista, 2023a). Conversely, the rise of virtual worlds, driven by rapid technological advancement, has opened new spaces for interaction and commerce, fostering the success of Non-Fungible Tokens (NFTs). NFTs are unique digital assets that represent tangible or intangible goods, differing from interchangeable (fungible) items (Sestino et al., 2022a; Popescu, 2021). These include digital art, music, and fashion, and are accessible only in virtual environments. NFT market growth has been explosive, with sales jumping from US$82 million in 2020 to US$17.6 billion in 2021 (Despotovic et al, 2022). They lower entry barriers in markets like art, democratizing access via public digital auctions and enhancing visibility for lesser-known artists (Wilson et al., 2022). Blockchain technology, that is the main enabling technologies activatingNFTs, typically is able to ensure veridicity, authenticity and security of the produced contents (Rehman et al., 2021; Sestino et al., 2022b). Luxury brands have embraced NFTs to both propose new unique value propositions, and to drive new consumptions patterns (see Sung

et al., 2023), e.g., by leveraging on its unicity strictly linked to the status symbols and exclusivity researched by luxury consumers (O'Cass & McEwen, 2004), providing both prestige and competitive advantage (Wilson et al., 2022). Many businesses now operate NFT initiatives via Decentralized Autonomous Organizations (DAOs), using smart contracts in place of traditional legal agreements (Chandra, 2022). The art and sports industries have benefited most, with Beeple's digital artwork selling for US$69.3 million (Riegelhaupt, 2021) and the NBA's Top Shot platform generating over US$944 million since 2020 (Kräussl & Tugnetti, 2022). The NFT market is expected to grow 22.82% annually, with U.S. revenues hitting over US$1 billion in 2023 (Statista, 2023b). OpenSea leads with 1.3 million users and 73% market share, though platforms like Blur are gaining ground (Forbes, 2022). This is where our effort comes into play: this work explores how NFTs create new business opportunities in the luxury industry, particularly in marketing and in particular it aims to highlight the strategic value of NFT communication and its implications for luxury brand marketing.

The art sector is of the most promising in advancing the use of NFT. In 2021, digital artist Mike Winkelmann, known as Beeple, sold his digital artwork titled "Everyday: The First 5000 Days" for a record sum of US$69.3 million (Riegelhaupt, 2021). The growth of NFTS, especially in the art sector, is driven by the potential of the blockchain technology.

Personal characteristics like materialism and ostentation (Audrin et al., 2017) as well as interpersonal aspects like an individuals'standing and consumption orientation (Zhang & Zhao, 2019) all have an impact on the behavior of luxury customers (Belk et al., 2022; Sestino et al., 2022a). According to O'Cass and McEwen (2004), the status consumption orientation refers to people's propensity to use luxury goods or services as a means of demonstrating their social standing. It is true that luxury buyers aim to improve their social standing by acquiring status-oriented items (Amatulli & Guido, 2012; Guido et al., 2020).

Purchase intention is positively influenced by the advancement of technology in the luxury market (Sestino et al.,2022a). In particular, the adoption of new technologies may foster the perception of the brand's luxury because consumers view these tactics as practical steps to raise the value of the intended customer experience (Iqbal & Campbell, 2021; Jain & De Schultz, 2019, Xu & Metha, 2022). Furthermore, luxury and technology have historically been opposed ideas, and their combination represents a significant literary novelty (Sestino et al., 2022a).

According to the literature, even though NFT can be a new means for forward-thinking customers to demonstrate and elevate their social standing, it is impossible to display this digital asset outside of a virtual setting (Sestino et al., 2022a). According to Wu et al. (2017), the NFT ecosystem is founded on a less ostentatious kind of consumerism that involves renouncing owning a luxury item and the widespread display of wealth through status symbols.

## 2. Research objectives

The objective of this work is to better understand how consumers may be influenced by the marketing communication when evaluating the purchase of NFTs in the art context. The primary goal of this paper is therefore to unveil if a communication focus in the marketing communication based on the possession ensured by the blockchain technology may incentivize the purchase behavior because of an increased evaluation of the luxuriousness of the NFT. The second goal is instead to evaluate how such perception of luxury determined by the possession level emphasized in the marketing communication may be better stimulated for those people exhibiting high levels of status consumption orientation.

## 3. Methodology

To test the impact of the NFTs communication focus on possession level (low vs. high) on customers' propensity to purchase, we ran a two-cell experiment.

A sample of 168 people, selected at random from online communities and specialized Facebook, Instagram, and LinkedIn fan pages that support luxury consumption and lifestyle, participated in the two-cell experiment based on two scenarios. Half of the participants were shown a scenario that suggested consuming an NFT with little emphasis on the level of possession that came with owning it (low communication focus on possession condition); the other half were shown a scenario that barely mentioned the possibility of being the sole owners of a particular NFT after it was purchased (high communication focus on possession condition).

The questionnaire will be administered to a random sample of Italian consumers. It will assess status consumption orientation through the five-items scale by O'Cass & McEwen (2004). In the second part, participants will be randomly assigned to two different conditions based on two manipulated levels of the communication focus. Then, in the third section, we will assess the willingness to buy, by using the scale proposed by Dodds et al. (1991), and finally the individuals' luxury perception by using a semantic differential measure composed of 13 items (e.g., "Very influential - Fairly influential"; "Very sophisticated - Fairly sophisticated"), developed by Kim & Johnson (2015).

## 4. Expected Contributions

With this study, we add a psychological perspective on the meaning attributed to the sense of uniqueness and ownership, opening the door to an interdisciplinary understanding of how individuals tend to psychologically assign meaning to products. Relatedly, about personality traits, future contributions could further explore the interpretation of these results by employing scientifically recognized personality models, such as the Big Five personality traits.

# Managing Knowledge in the Phygital Era: AI and Immersive Technologies for Innovation in Marketing

Simonetta Pattuglia[1],*, Patrizia de Luca[2], Nicola Leone[1], and Nona Kokoladze[1]

[1] Università degli Studi di Roma "Tor Vergata", Rome, Italy
[2] Università degli Studi di Trieste, Trieste, Italy

* Corresponding author: pattuglia@economia.uniroma2.it

## Abstract

This study explores how advanced digital technologies—such as AI, AR/VR, and the metaverse—are transforming knowledge creation and sharing practices in marketing-oriented organizations. By applying and extending the SECI model (Nonaka, Takeuchi, 1995) within technologically augmented and immersive contexts in marketing, it offers two main contributions: first, it introduces the concept of a "phygital SECI framework" that integrates physical and digital knowledge flows; second, it identifies the emergence of the "technological agent" as an autonomous enabler of knowledge management. Drawing on qualitative insights from 21 Italian companies, this work provides a nuanced perspective on how organizations can strategically leverage immersive technologies to foster marketing innovation. Within this scenario, knowledge management plays a strategic role in bridging marketing and innovation, impacting on new forms of customer engagement, market intelligence, and collaborative innovation and acting as a catalyst for renewing the company's value proposition (Nonaka et al., 1998; Di Vaio et al., 2021; Hock-Doepgen et al., 2021)

*Keywords: Knowledge Management, SECI Model, Digital Transformation, Phygital, Artificial Intelligence, Marketing*

## 1. Introduction: The Silent Revolution of Corporate Knowledge

Imagine walking into the offices of a modern Italian company: a marketing team is collaborating with colleagues from Tokyo through virtual avatars in a metaverse environment; upstairs, an artificial intelligence is coding in real-time the experience of a technical expert describing a complex procedure; while in the R&D laboratory, researchers use augmented reality visors to visualize three-dimensional data emerging from the intersection of heterogeneous databases. This is not science fiction, but the emerging reality of phygital knowledge management – a paradigm that merges physical and digital dimensions in organizational knowledge management. The current economic scenario is characterized by rapid technological development and profound socio-economic transformation that has generated a paradigmatic change in which innovation and marketing are involved in a process of joint evolution (Kaplan et al., 2024; Rauschnabel et al., 2022). This co-evolutionary phenomenon requires reflections on companies' ability to innovate the ways in which marketing is conceived and practiced to create value with increasingly personalized, engaging, immersive, and co-created products and experiences (Barrera & Shah, 2023). Latest-generation digital technologies are redefining business operational paradigms, enabling new learning models and driving the development of entirely new products and services (Al Mezawy et al., 2023; Harreis et al., 2023; Pawlowski & Bick, 2022). These technologies disrupt

the status quo, altering how people live and work (Kaplan et al., 2024). However, according to Deloitte's Global Human Capital Trends, 75% of interviewed organizations consider the creation and preservation of knowledge through evolving workforces as important or very important for their success, yet only 9% feel very prepared to address this trend (Deloitte, 2020). This study explores how advanced digital technologies—such as AI, AR/VR, and the metaverse—are transforming knowledge creation and sharing practices in marketing-oriented organizations. By applying and extending the SECI model within technologically augmented and immersive contexts, it offers two main contributions: first, it introduces the concept of a phygital SECI framework that integrates physical and digital knowledge flows; second, it identifies the emergence of the "technological agent" as an autonomous enabler of knowledge management. Drawing on qualitative insights from 21 Italian companies, this work provides a nuanced perspective on how organizations can strategically leverage immersive technologies to foster marketing innovation. Within this scenario, knowledge management plays a strategic role in bridging marketing and innovation, acting as a catalyst for renewing the company's value proposition (Nonaka et al., 1998; Di Vaio et al., 2021; Hock-Doepgen et al., 2021). The physical-digital convergence (phygital) marks a new frontier (Mele et al., 2023), where knowledge flows become increasingly distributed, context-aware, and technologically enhanced.

## 2. Theoretical Framework: The SECI Model in the Digital Era

The SECI model (Socialization, Externalization, Combination, Internalization) by Nonaka and Takeuchi (1995) represents one of the most influential frameworks for understanding organizational knowledge creation processes. This model identifies four modes of knowledge conversion that operate in a dynamic cycle: socialization (tacit-totacit), externalization (tacit-to-explicit), combination (explicit-to-explicit), and internalization (explicit-to-tacit). The advent of advanced digital technologies has opened new possibilities for the application and evolution of the SECI model. As illustrated in our research, Generative Artificial Intelligence supports externalization by codifying experts' tacit expertise through automatic transcription and structuring of processes (Matsumoto et al., 2024). Virtual and Augmented Reality technologies facilitate socialization and internalization by creating immersive environments for experiential learning and simulation-based decision-making (Ribiere, 2023). The Metaverse also plays a significant role in facilitating socialization and internalization. Blockchain enables new forms of combination through verifiable knowledge sharing, aggregating different sources into transparent systems, while predictive analytics supports the intersection of data from multiple sources (Jarrahi et al., 2023). These technological developments can adapt, enrich, and enhance the traditional SECI model, creating what we can define as an augmented or "phygital SECI".

## 3. Research Objective and Contribution

This study aims to investigate how advanced digital technologies (AI, VR, AR, metaverse, blockchain) enable new forms of knowledge creation and sharing in marketing-oriented organizations, extending the traditional SECI model to accommodate technologically augmented contexts. This research contributes to knowledge management literature by introducing the concept of a "phygital SECI framework" that integrates physical and digital knowledge flows, and by identifying the emergence of the "technological agent" as a fifth element in knowledge management systems. For practitioners, this work provides strategic insights on how organizations can leverage immersive technologies to foster marketing innovation, offering concrete examples of successful implementations and identifying key challenges and opportunities in the Italian business context.

In particular we address the following research questions: 1. How do advanced digital technologies (AI, AR/VR, metaverse) influence knowledge creation and sharing practices

within marketing-oriented organizations? 2. If knowledge management is seen as important, why are many organizations still not ready to adopt new technologies

— and how does this lack of readiness affect their ability to use phygital (physical + digital) marketing strategies? Table 1 presents our hypotetical technology-enhanced SECI framework mapping how different digital technologies may support each knowledge conversion mode.

| SECI Phase | Traditional Mode | Digital Technologies | Observed Applications |
|---|---|---|---|
| **Socialization** (Tacit → Tacit) | Face-to-face interaction, observation, shared experiences | VR/Metaverse platforms, AI conversational agents | Virtual shared environments, immersive team building, collaborative learning spaces |
| **Externalization** (Tacit → Explicit) | Dialogue, metaphors, analogies | Generative AI, AR capture tools | AI-assisted documentation, expert knowledge codification, process structuring |
| **Combination** (Explicit → Explicit) | Meetings, documents, databases | Blockchain, predictive analytics, BI platforms | Data aggregation, crossfunctional insights, verified knowledge sharing |
| **SECI Phase** | **Traditional Mode** | **Digital Technologies** | **Observed Applications** |
| **Internalization** (Explicit → Tacit) | Learning by doing, training | VR/AR simulations, adaptive AI | Experiential learning, safe practice environments, personalized training |

**Table 1:** Technology-Enhanced SECI Framework

## 4. Methodology

This study adopted a qualitative, exploratory, and phenomenon-driven approach, aimed at investigating an emerging context little studied in literature (Miller et al., 2014; Farnese et al., 2019). The research was based on semi-structured online interviews collected between April 2024 and May 2025 with executive managers in marketing and knowledge management (9 Executives and strategic decision makers e.g., CEOs, founders; 9 Managers in marketing and commercial operations; 3 Leaders in innovation and technology functions) following a thematic analysis methodology according to the Gioia's approach (Gioia et al., 2013).

Our ongoing research journey through the Italian business ecosystem has, to date, led us to collect 21 interviews from organizations that represent a microcosm of the ongoing digital transformation. The final sample includes 8 B2C and 13 B2B companies operating in diversified sectors: automotive, fast-moving consumer goods (FMCG), financial companies, innovation, technology/AR/VR, consulting and software companies, manufacturing companies; media, marketing/communication and digital marketing agencies, media companies, pharmaceuticals, wine and beverages, as represented in Table 2.

| **Sector** | **Firms** | **Key Functions** | **Interview Date** |
|---|---|---|---|
| FMCG | 1 | Chief e-Commerce & Customer Office | 29/04/2024 |
| Marketing/Communicat ion | 3 | Marketing Assistant,<br>Innovation<br>Director, Marketing Manager | 6/05/2024<br>24/05/2024 |
| Technology/AR/VR | 3 | Unity Developer, Project Manager, Head of Marketing | 31/10/2024<br>04/11/2024 |
| Consulting | 1 | Founder & CEO | 30/10/2024 |
| **Sector** | **Firms** | **Key Functions** | **Interview Date** |
| Media | 1 | CEO | 04/11/2024 |
| Automotive | 1 | Marketing and Communication Manager | 22/04/2025 |
| Wine/Beverages | 1 | President and Sales & Marketing<br>Director | 17/05/2025 |
| Finance | 1 | Marketing and Products Manager | 22/04/2025 |
| Digital Marketing | 1 | COO | 05/11/2024<br>23/04/2025 |
| Enterprise Software | 1 | CX Solution Advisor | 06/05/2025 |

| | | | |
|---|---|---|---|
| Others | 7 | Various executive roles | 24/05/2024<br>06/06/2024<br>27/05/2025 |

**Table 2:** Sample Distribution by Sector and Functions

Out of the 21 organizations, 10 authorized the disclosure of the company name while 11 requested anonimity, testifying to the strategic sensitivity of the topic. The protagonists of our interviews include senior and middlemanagement figures: Chief e-Commerce & Customer Office, CEOs and founders, Innovation Directors, Unity developers, Marketing and communication managers, and many other executive roles. Data collection was conducted through Google Forms allowing standardization of questions and facilitating comparative analysis of responses. The interviews specifically explored the use of advanced digital technologies (AI, VR, XR, MR, Metaverse, Blockchain) in knowledge management processes, with particular attention to the four SECI model modalities.

## 5. Main preliminary results

Our analysis reveals a more mature and multifaceted technology adoption landscape than initial expectations. Of the interviewed companies, 15 out of 21 declare active use of advanced digital technologies, while 3 companies are in a phase of partial or experimental use. Only 3 companies do not yet use these technologies, but even these ones recognize their future potential.

| **Adoption Status** | **Firms** | **Phases** |
|---|---|---|
| Active Use | 15 | Full integration in business processes |
| Partial/Experimental | 3 | Pilot projects and testing phases |
| No Current Use | 3 | Recognizing future potential |

**Table 3:** Technology Adoption Status

### 5.1 Socialization: Virtual Spaces for Tacit Knowledge Sharing in Marketing

In the socialization phase, immersive technologies, VR and Metaverse platforms, emerge as facilitators of socialization through the creation of shared virtual spaces. VR platforms enable global teams to collaborate in shared virtual spaces, creating new forms of tacit knowledge sharing that transcend geographical boundaries. Extended reality (XR) can create shared learning spaces where employees learn by observing expert colleague avatars in action simulating apprenticeship analogous to on-the-job training. AI plays a key role in externalization by capturing expert input during problem-solving and automatically transforming it into structured, shareable formats — one of the most advanced applications observed.

Our findings reveal innovative approaches to virtual collaboration:

*"The metaverse is useful for meetings or presentations, but also for moments of leisure and experimentation. [...] In companies, the metaverse is mostly used to "force" colleagues to try it out. Therefore, platforms like Workrooms or Spatial are used to hold meetings and share presentations."*

(Technology AR/VR B2B, Co-founder and Innovation strategist, 04/11/2024)

The potential for cross-functional knowledge transfer through virtual environments is particularly promising: *"Sharing experiences and knowledge in the metaverse would be an excellent idea to develop crossfunctional expertise. Having a 360° view of each role could make it possible to transfer this information more quickly to other functions or to employees who will take over in the future."*

(Food B2B, Marketing Assistant, 24/05/2024)

AI tools like Microsoft Copilot "*streamline internal processes and content creation are used*" (Nissan, Marketing and Communication Manager, 29/04/2024).

However, challenges remain in terms of user adoption and technological barriers:

*" Initial in-person meetings, but then we were able to manage meetings and updates remotely".*

(Technology AR/VR B2B, Project Manager, 31/10/2024)

### 5.2 Externalization: AI as Knowledge Codification Catalyst in Marketing and Communication

In externalization, AI-powered documentation systems capture expert knowledge during real-time problemsolving sessions, automatically structuring insights into accessible formats. This represents one of the most mature applications observed in our study. The automotive sector demonstrates remarkable AI integration success: *" We are already experimenting with streamlining internal processes supported by AI (for example, content creation and the use of company Microsoft tools, i.e., Copilot solutions)."*

(Nissan, Chief e-Commerce & Customer Office, 29/04/2024)

In the media sector, AI has revolutionized content creation processes:

*"In my small operational structure, everyone uses AI—from writing sales emails to creating graphics for social media. This approach allows us to optimize creative and communication processes, making our work faster and more efficient."*

(Technology AR/VR B2B, CEO, 04/11/2024)

The consulting industry shows particular enthusiasm for AI's knowledge externalization capabilities: *" AI is useful for brainstorming, finding inspiration, correcting emails, creating social media posts or drafting editorial plans, organizing work, analyzing data, and tracking KPIs."*

(Technology AR/VR B2B, Co-founder and innovation strategist, 04/11/2024)

Further, the metaverse is used not only for meetings and presentations, but also to encourage experimentation and informal interaction. Virtual environments can promote cross-functional learning by offering a 360° view of different roles and responsibilities. Despite the potential, user adoption and tech readiness remain challenges in fully replacing in-person interactions.

### 5.3 Combination: Data Aggregation and Cross-Functional Insights in Marketing and Communication

In combination, blockchain-verified knowledge repositories allow organizations to aggregate insights from multiple sources while maintaining data integrity and traceability. Predictive analytics supports the intersection of data from multiple sources, creating new knowledge combinations. The power of AI in data aggregation and analysis is evident: AI is instrumental in aggregating and analyzing data across platforms, monitoring market trends, social media and KPIs:

*"AI is very powerful for collecting and analyzing data. In particular, we use it to monitor social media data and KPIs, gather useful information and conduct research, and perform competitor and market analysis."*

(KIIAI Innovation Lab, Co-founder and innovation strategist, 04/11/2024)

Media companies are leveraging AI for content summarization and knowledge synthesis:

*"Our news service is based on AI-generated summarization, and our users seem to appreciate the result."*

(Minnovo, CEO, 04/11/2024)

Internal knowledge aggregation through AI chatbots is emerging as a key application:

*"AI certainly helps with this, as all the information can be aggregated and made accessible to everyone through an internal chatbot. Of course, there must be written procedures for the AI to learn from"*

(Minnovo, CEO, 04/11/2024)

### 5.4 Internalization: Experiential Learning Through Immersive Technologies in Marketing

In internalization, AR simulations provide safe environments for employees to practice real-world tasks and procedures in virtual environments, accelerating and supporting the shift from explicit instructions to tacit understanding. While adoption is still emerging, this area shows strong future potential.

The potential for simulation-based learning is recognized across sectors:

*" It could be useful to carry out simulations."*

(Eurospital/Piaceri Mediterranei, Marketing Assistant, 24/05/2024) Current applications remain limited but show promise:

*" Internally, it has been used very little for simulations or learning, except to understand how to navigate, explore, present, and simulate a real meeting or an art exhibition."*

(KIIAI Innovation Lab, Co-founder and innovation strategist, 04/11/2024)

The potential for tacit knowledge transfer through observation in virtual environments is particularly intriguing: *" For tacit knowledge, the metaverse could perhaps help, as being able to observe someone doing something would break down the learning barrier"*

(Technology AR/VR B2B, CEO, 04/11/2024)

### 5.5 Present Applications and Challenges

If knowledge management implement by new technologies in marketing and communication is seen as important, why are many organizations still not ready to adopt new technologies

— and how does this lack of readiness affect their ability to use phygital (physical + digital) marketing strategies? The main limits to expansion and implementation are: lack of basic digitalization an of sufficient education about AI, VR Metaverse tools; resistance to newness in organizations; lack of economic investment. Therefore, the analysis of future perspectives and market readiness (3-5 years) reveals a predominantly cautious but optimistic attitude. This suggests a phase of observation and evaluation rather than uncritical enthusiasm.

*"In my opinion, 3–5 years is still too soon to see mass adoption of the metaverse. The real game changer will be the accessibility of the devices—both in terms of cost and usability. They will need to be small and easy to handle in order to truly become part of daily life and revolutionize the way we interact with the virtual world."*

(Technology AR/VR B2B, CEO, 04/11/2024)

The long-term vision emphasizes hardware accessibility as a key factor:

*"The metaverse will become much more well-known and popular in the future as the hardware needed to access it becomes more affordable. This technological evolution will break down economic and technical barriers, allowing a wider audience to immerse themselves in engaging virtual experiences and transforming the metaverse into an integral part of everyday life."*

(Technology AR/VR B2B, CEO, 04/11/2024)

The main challenges identified include the complexity of integration with existing systems, the need for staff training, and managing innovation risk, particularly for startups that must overcome the "liability of newness" and high implementation costs. A critical challenge is market readiness:

*"To have an audience that is already prepared for this type of user experience. Unfortunately, the Italian market still has a very low level of basic digitalization, and this prevents the introduction of such innovative tools"*

(Pop Corn srl, CEO, 05/11/2024)

In Table 4, sectors, technologies and their implementations, and challenges are summarized.

.

| **Sector** | **Primary Technologies** | **Applications** | **Key Challenges** |
|---|---|---|---|
| FMCG | AI (limited) | Consumer experience enhancement | Not current priority |
| Media, Marketing and Communication agencies | AI, limited Metaverse | Content creation, future planning | Hardware accessibility |
| Automotive | AI (GenAI) | Production, ERP, administration | Integration complexity |

| | | | |
|---|---|---|---|
| Wine and Beverages | AI, experimental VR | Social listening, content creation | Cost-benefit evaluation |
| **Sector** | **Primary Technologies** | **Applications** | **Key Challenges** |
| Financial Companies | AI | Behavioral prediction, risk analysis | Data privacy concerns |
| AR/VR/ Companies | AR, VR, Metaverse | Customer engagement, marketing | Market maturity |

**Table 4:** Technology Applications by Sector and Key Challenges

## 6. Theoretical Implications

Our research reveals the emergence of what we term the "technological agent" (Rahwan, I., Cebrian, M. et al. 2019; Luck, M., McBurney, Priest C., 2013; Chapman M, Gareth T., et al., 2013) as a fifth element in knowledge management systems even applied in marketing. This technological agent exhibits four key characteristics: Autonomy, AI systems can independently process and generate knowledge without direct human intervention, creating new knowledge combinations and insights; learning, machine learning algorithms continuously improve their knowledge processing capabilities, adapting to organizational contexts and user preferences; collaboration, AI agents work alongside human experts, creating hybrid human-machine knowledge creation processes that exceed the capabilities of either alone; adaptation: these systems dynamically adjust their knowledge management approaches based on contextual factors, user feedback, and environmental changes.

The technological agent doesn't replace human knowledge workers but rather augments their capabilities, creating new forms of human-machine collaboration that redefine the traditional SECI model boundaries.

## 7. Managerial Implications

This research reveals the emergence of a new paradigm in organizational knowledge management applied to marketing areas, where the traditional boundaries between physical and digital knowledge creation are dissolving. The SECI model, while maintaining its foundational relevance, is evolving to accommodate technological agents that act as autonomous knowledge partners rather than mere tools. Our findings demonstrate that successful phygital knowledge management requires more than technological implementation—it demands a fundamental rethinking of how organizations approach knowledge creation, sharing, and application, both to the internal and to external marketing and communication functions. Companies must develop new competencies in managing hybrid human-machine knowledge ecosystems while maintaining the human-centric elements that drive innovation and creativity. The strategic implications for marketing functions are particularly significant, as these technologies enable new forms of customer engagement, market intelligence, and collaborative innovation that can transform competitive advantage in the digital economy and acting as a catalyst also for renewing

companies' value proposition (Nonaka et al., 1998; Di Vaio et al., 2021; Hock-Doepgen et al., 2021).

## 8. Limits of the Research and Future Directions

The main limitations of this work are related to the number of companies that have been interviewed and the geographical areas covered, that limit the generalizability of the findings. Although the country's situation can be considered interesting in comparison to other country specific conditions, further and larger research must be conducted to realize such new investigation. Building on the above, future directions of studies could extend the investigation to a wider range of industries and geographies, adopting longitudinal approaches to monitor the rapid evolution of digital practices, combining qualitative insights with quantitative evidence to consolidate findings. Exploring the intersection between technological adoption and change management in marketing and communication, also includes the role of organizational culture, leadership in innovation and employee engagement in shaping the effective use of advanced tools.

## Abstract

Blockchain Technology (BT) is increasingly used not only as a traceability tool that could enhance safety and transparency in food supply chains, but also as a strategic marketing lever. However, adoption of this technology among small and medium-sized enterprises (SMEs) remains low. To identify the factors underlying this phenomenon, this research focuses on knowledge of BT, uncertainty about its benefits, and privacy concerns, and assesses the influence of these variables on intention to adopt blockchain-based traceability systems through two empirical studies. Study 1 involved 86 SMEs located in Italy and demonstrates that BT knowledge increases the intention to adopt this technology through a reduction of SMEs' uncertainty about BT. Study 2 involved 109 managers of small agri-food companies located in the UK and demonstrates that BT knowledge has a positive impact on adoption intention, but only when privacy concerns are low. While limited by regional scope and sample size, these findings expand the literature on BT adoption barriers and provide practical guidance for enhancing BT adoption among agri-food SMEs. Policymakers aiming at boosting BT adoption among SMEs could focus on targeted education and reassurance about the security of this technology in order to reduce uncertainty and concerns over possible privacy infringements.

*Keywords: Blockchain Technology, small agri-food companies, knowledge, uncertainty, privacy concerns.*

## 1. Introduction

Recent investigations have underscored that consumers increasingly seek food products aligned with sustainability, health, and ethical sourcing, prioritizing transparency about ingredients, origin, and production methods (Hazley & Kearney, 2024). To meet these growing needs, Blockchain Technology (BT) has emerged as a promising innovation in the food sector. It can enhance traceability, improve safety, reduce fraud and food waste (Friedman & Ormiston, 2022), and strengthen consumer trust (Ma et al., 2022). Beyond operational efficiency, blockchain creates new value by signaling verified origin and transparency, thus functioning as a marketing lever that can improve brand positioning and possibly increase product sales (Mazzù et al., 2022).

However, many agri-food companies, especially the smaller ones, hesitate to adopt it for a variety of reasons, including their limited knowledge of BT (Bianchini and Kwon, 2020), regulatory uncertainty (Zkik et al., 2022), the fear of being controlled by blockchain operators (Mathivathanan et al., 2021), and privacy risks (Hackius et al., 2019). Recent studies have

noticed a dearth of research on the possible interplays of these adoption barriers and have, therefore, called for a more insightful understanding of the mechanisms behind BT adoption (Kouhizadeh et al., 2021). Moreover, the available studies have often devoted great attention to large enterprises (Lerman et al., 2022), while empirical studies on SMEs' adoption of BT are still very limited. To address these research gaps, this research investigates how BT knowledge affects SMEs' intention to adopt this technology. In particular, the research focuses on a possible mechanism activated by BT knowledge – i.e., the reduction of SMEs' uncertainty about BT benefits – and also tests whether the effect of BT knowledge on adoption intention is moderated by SMEs' privacy concerns.

## 2. Theoretical Background

### 2.1 Knowledge of BT, uncertainty, and adoption intention

Knowledge of a technology, distinct from mere awareness, has been shown to foster favorable perceptions about the technology's benefits (Rogers, 2010). Knowledge supports decision-making and encourages adoption of new products and innovations (Adu-Gyamfi et al., 2022). In the specific case of BT, knowledge can reduce potential adopters' uncertainty about some key aspects of this technology. The literature highlighted indeed that BT is not yet clearly regulated, and its benefits are still poorly understood (Mathivathanan et al., 2021). Moreover, many individuals tend to associate it with suspected Bitcoin operations and money laundering activities, which further increases the uncertainty about BT characteristics (Guo and Liang 2016). However, greater knowledge of BT may reduce such uncertainty about its benefits and usefulness, and this effect, in turn, might have positive reflections on the intention to adopt this technology. Hence, we formulated the following hypothesis:

H1. Knowledge of BT increases SMEs' intention to adopt this technology, through a reduction of uncertainty about BT features.

### 2.3 Moderating effect of privacy concerns over BT use

According to Protection Motivation Theory (PMT), organizations respond to perceived threats by adjusting their behaviors based on risk severity and coping ability (Maddux & Rogers, 1983). While BT promises transparency, concerns about data misuse and surveillance may reduce adoption intention (Oh et al., 2023). Such concerns might counterbalance the positive effect of knowledge on adoption intention. Therefore, it appears plausible to hypothesize the following moderating effect:

H2. Knowledge of BT increases small agri-food companies' intention to adopt this technology only when privacy concerns are low.

## 3. Empirical studies

This research employs a two-study design to empirically test the hypotheses illustrated above. Study 1, conducted with Italian SMEs, assessed whether knowledge of BT increases the intention to adopt this technology through a reduction of uncertainty about its characteristics. Study 2, conducted with UK small agri-food company managers, explores how knowledge of blockchain technology and privacy concerns interact to shape SMEs' intention to adopt blockchain-based traceability services.

### 3.1. Study 1

#### 3.1.1 Method

We contacted 86 SMEs located in Italy, which were randomly selected from the Bureau van Dijk's AIDA (Analisi Informatizzata delle Aziende Italiane) database. They completed an

online questionnaire that provided them with a brief description of BT and then asked them to rate their knowledge of BT (through a two-item scale drawn from Rocklage et al., 2021), uncertainty about BT benefits (through a four-item scale drawn from Mathivathanan et al., 2021), and their intention to adopt it (through a three-item scale adapted from Grewal et al., 1998).

### 3.1.2. Results

About 46% of the companies who participated in the study are based in Southern Italy and the vast majority of them (92%) employ a maximum of 60 workers. These companies rated their knowledge of BT as low (M = 3.45, SD = 1.98) and reported moderate levels of uncertainty (M = 4.33, SD = 1.28) and intention to adopt BT (M = 4.13, SD = 1.73). To test H1, we used Hayes' (2022) PROCESS macro and run a mediation analysis that assessed whether the influence of BT knowledge on adoption intention can be attributed to a reduction in the uncertainty about BT characteristics. The analysis returned a significant negative effect of knowledge on uncertainty (b = -.19, p = .006), indicating that knowledge of BT reduces SMEs' uncertainty about this technology. We also detected a significant negative effect of uncertainty on adoption intention (b = -.40, p = .001), and a significant indirect effect of knowledge on adoption intention (b = .08, 95% .02, .16), which confirmed H1.

## 3.2 Study 2

### 3.2.1 Method

We recruited 109 UK agri-food SME managers via Prolific Academic, using filters for industry, firm size (less than 250 employees), and decision-making roles. Only respondents from firms not using BT were included. Participants received a short description of BT and rated their adoption intention and BT knowledge using the same scales as in Study 1. They also rated their privacy concerns using a four-item scale drawn from Jaspers and Pearson (2022).

### 3.2.2 Results

47% of firms had less than 50 employees and 451% reported an annual income lower than £100,000. Reported BT knowledge was low (M = 2.87, SD = 1.57), adoption intention was low (M = 3.19), and privacy concerns were moderate (M = 4.24, SD = 1.64). To test H2, we used Hayes' (2022) PROCESS macro and ran a moderation analysis that assessed whether the influence of BT knowledge on adoption intention depends on privacy concerns. By regressing the intention to adopt BT on knowledge of BT, privacy concerns, and the interaction between these latter two variables, we found a significant positive effect of knowledge (b = .28, p < .007) on adoption intention. We also detected a significant negative interaction effect between knowledge of BT and privacy concerns (b = -.17, p = .032). By looking at the conditional effects of knowledge at different levels of privacy concerns, we found that knowledge significantly influences the intention to adopt BT when privacy concerns are low (M-1SD; b = .48, p < .001, Figure 2). However, we also found that the positive effect of knowledge disappears when privacy concerns are high (M+1SD; b = .07, p = .589).

## 4. Conclusion

This study investigated how BT knowledge, uncertainty about BT benefits and privacy concerns, affect SMEs' intention to adopt blockchain-based traceability systems. Through two empirical studies in different national contexts, we offer a view of the challenges and opportunities associated with BT adoption by agri-food SMEs. Study 1 demonstrated that

greater BT knowledge reduces these companies' uncertainty about BT characteristics and this, in turn, contribute to boost their intention to adopt BT-based traceability systems. Study 2 offers another interesting insight on the influence of knowledge on adoption intention by showing that this factor enhances SMEs' intention to adopt BT only when their concerns about possible privacy-related risks are low; when such concerns are high, the beneficial effect of knowledge vanishes. Theoretically, this research contributes to the literature on BT adoption by showing that knowledge of this technology is an important requisite for its adoption. Yet, factors such as uncertainty about the benefits of BT and privacy concerns weaken this effect and hinder BT adoption. Practically, our findings emphasize the need for targeted interventions to reduce SMEs' uncertainty: policymakers, industry bodies, and BT service providers are recommend to deliver clear and objective information in order to reduce SMEs' uncertainty and privacy concerns. They could promote BT as a risk-free innovation that not only supports compliance with traceability standards but also enables strategic differentiation in the food market.

## Abstract

Artificial intelligence (AI) is making a deep change in the healthcare sector, providing new opportunities to improve efficiency, diagnosis and personalisation of treatment. In the field of healthcare management, several studies have focused on the adoption of AI by healthcare professionals, highlighting benefits in terms of decision support and optimisation of clinical processes. However, its impact on patient experience and involvement throughout the patient journey is still poorly explored.

The aim of this ongoing research is to offer a comprehensive literature review on AI adoptions in the healthcare sector, to identify the main patient-centred applications and highlight existing gaps.

Methodologically, this study combines bibliometric analysis and thematic content analysis to explore how AI is applied in healthcare, particularly in relation to patient engagement.

Based on the findings of the analysis, a strong prevalence of studies focusing on the clinical and organisational point of view emerges, while the patient-side implications in terms of engagement, empowerment and acceptance of technologies are still not much explored.

In conclusion, this study proposes a critical discussion on the need to integrate more participatory and patient-centred approaches in the study of AI in healthcare.

Future research should focus on the study of solutions that involve patient in the process of co-creating the healthcare services. Patient experience must be enriched by the adoption of AI solution, as this should be a driver to increase patient engagement and involvement.

*Keywords: Artificial Intelligence, healthcare, patient journey, patient experience, patient engagement, patient empowerment*

## 1. Introduction

Over the past few years, the adoption of AI has expanded rapidly across different economic sectors such as finance, logistics, retail and public administration (CyhanBowles, 2024). These new AI-supported systems are transforming business models and interactions, creating new challenges and opportunities in terms of efficiency, personalisation and innovation. (Giuggioli & Pellegrini, 2023; Mayer et al., 2024). In particular, the healthcare sector, due to its structural characteristics such as the high complexity of processes (WHO, 2024), the centrality of the human factor (Rathore et al., 2023) and the growing demand for personalisation of care (Maher et al., 2023) acts as a particularly fertile context for a vertical integration of AI tools (Zhang et al., 2022).

Furthermore, these new methodologies can help improve operational efficiency, support clinical decision-making and foster a more proactive and predictive management of the care pathway (Schiavone & Ferretti, 2021; Tursunbayeva & Renkema, 2023; WHO, 2024). However, the introduction of these technologies also raises relevant questions about the impact on the patient experience, active involvement and maintenance of the doctor-patient relationship, which are key elements in personcentred healthcare models (Kannelønning, 2023; Rathore et al., 2023).

Mapping and identifying the patient journey is a complex issue. However, it is an essential process for identifying critical areas, improving the quality of care and customising services (McCarthy et al., 2016). It refers to all the experiences, interactions and processes that an individual goes through during their care pathway, spanning from prevention to diagnosis as well as treatment and follow-up (Davies et al., 2023). This non-linear journey includes interdependent activities across diverse actors, technologies and contexts.

The aim of this short paper is to explore how AI is applied throughout the patient journey to identify from a marketing perspective the most critical touchpoints. This enables targeted improvements in engagement and perceived service quality (Cronin Jr. et al., 2000), without delving into clinical or diagnostic areas. This approach could be particularly relevant for non-urgent conditions, where patient experience can influence treatment adherence, satisfaction and trust.

Subsequently, the study focuses on the role of AI in patient engagement to analyse how this aspect is addressed in the literature. For example, the adoption of AI-systems for administrative tasks such as appointment scheduling, patient communication or medical history data collection can simplify access to services, reduce waiting times and improve the overall experience (Rathore et al., 2023). Automation tools can handle repetitive activities such as filling out forms or managing diaries, freeing up staff for more value-added and relational activities (Youn et al., 2022). Moreover, logistical activities such as dynamic bed management (Landa et al., 2018), intervention planning and resource allocation (Chuang et al., 2018) can benefit from this approach. The use of predictive algorithms to anticipate peaks in demand or optimise the allocation of resources helps improving overall patient journey.

Literature focuses on service design and diagnostic accuracy often considering patient engagement as a secondary positive side effect (Rathore et al., 2023). There is a lack of structured marketing perspective in the patient journey, where AI can add value through engagement, empowerment and quality of experience. (Dai & Tayur, 2022). This paper takes a broader perspective focusing on administrative and logistical touchpoints rather than clinical or diagnostic processes.

## 2. Review methodology

This study combines bibliometric (Broadus, 1987; Paul et al., 2021) and content analysis in the form of thematic analysis (Lim et al., 2022) to explore the applications of AI in the healthcare sector, with reference to patient engagement.

### *2.1 Data collection method and procedure*

The data were collected through the Scopus database. It included articles published from the earliest possible date until March 2025. The search query was designed to identify studies that addressed together the topics of AI, patient and engagement. The keyword search was conducted in the items title, abstract or keywords. This was done to answer the next research question: What are the research directions on AI in healthcare and to what extent do patients and their involvement feature in them? In particular, the following search string was used: *( TITLE-ABS-KEY ( "patient" OR "patient journey" ) AND TITLE-ABS-KEY ( "engag" OR "involv" ) AND TITLE-ABSKEY ( "artificial intelligence" OR "AI" OR "machine learning" OR "deep learning" ) ) AND ( LIMIT-TO ( SUBJAREA , "BUSI" ) ).*

The search returned 225 papers from 154 sources. While most items are classified as articles (91) and conference papers (68), a significant portion also includes book chapters (48), while the remaining items (18) comprise books, reviews, editorials, and other formats. Although the topic is widely discussed, it remains under-explored from a marketing and management perspective. For this reason, no rigorous checks have been made on ANVUR or ABS rankings to avoid excluding relevant contributions published in sector-specific journals. Items with mistakes or with missing themes were removed and 222 items survived. The bibliometric part of the review included the keyword co-occurrences analysis, which was conducted over all 222 articles in VOSViewer. The content analysis in the form of thematic analysis was the second methodological step.

## 3. Findings

### 3.1 The results of keyword co-occurrence analysis

The co-occurrence analysis resulted in the identification of five clusters (see Table 1). The aim of this phase was to recognise the existing research fronts on AI in the healthcare sector. For clusters 1–5, the study identified the key nodes in VOSviewer and based on these, it attributes a theme name to each cluster.

Moreover, to support the selection of articles, an automatic classification algorithm was developed in VBA language and directly integrated into the Excel file containing the bibliographic references. Keywords, organised by cluster, are compared with the text of the articles. The classification is based on the number of matches, applying decreasing thresholds to ensure a balance between accuracy and non-classification of the articles. If no threshold is reached during the first analysis, which only takes place on keywords, the algorithm analyses the abstract. This approach was done in the first phase to reduce subjectivity of the classification. Subsequently, a content analysis was carried out in the form of thematic analysis, following the methodological framework by Braun & Clarke (2006).

Clusters 2 and 3 emerged as the most consistent with the research question and showed significant semantic and conceptual overlap. Specifically, cluster 2 shows an orientation towards the use of AI to optimise the management of data and clinical processes. However, a distinctive element is the presence of the theme of patient engagement. On the other hand, cluster 3 focuses on the operational integration of AI in healthcare processes, with a focus on decision support tools, patient monitoring and automated interaction through chatbots.

This cluster reflects a more technological and application-oriented approach. Thus, the choice to analyse both clusters is driven by their thematic complementarity.

| Cluster | Main topic | Main keywords (listed based on the number of occurrences) | Main contributors to this cluster |
|---|---|---|---|
| **1** | AI for diagnosis and treatment | deep learning, diagnosis, convolutional neural networks, medical imaging, diabetic retinopathy, breast cancer, image processing | Loh E. (2018); Liu X., Zhang B., Susarla A., Padman R. (2020); Gourisaria M.K., Das S., Sharma R., Rautaray S.S., Pandey M. (2020); Sharma S., Guleria K., Kumar S., Tiwari S. (2023) |
| **2** | AI for clinical decision support and personalized healthcare | healthcare, electronic health record, patient engagement, personalized medicine, clinical decision support, predictive analytics, medical informatics | Kamel Boulos M.N., Wilson J.T., Clauson K.A. (2018); Tursunbayeva A., Renkema M. (2023); Zovko K., Šerić L., Perković T., Belani H., Šolić P. (2023); Youn S., Geismar H.N., Pinedo M. (2022) |
| **3** | AI for intelligent healthcare systems and process optimization | artificial intelligence, decision support systems, internet of things, patient monitoring, data privacy, behavioral research, chatbots | Jussupow E., Spohrer K., Heinzl A., Gawlitza J. (2021); Panigutti C., Perotti A., Pedreschi D. (2020); Osei-Frimpong K., Wilson A., Lemke F. (2018); Agarwal P., Swami S., Malhotra S.K. (2024) |
| **4** | AI for predictive modelling and classification | machine learning, classification, decision trees, support vector machines, prediction, heart disease, data mining | Desai F., Chowdhury D., Kaur R., Peeters M., Arya R.C., Wander G.S., Gill S.S., Buyya R. (2022); Mumtaz W., Vuong P.L., Xia L., Malik A.S., Rashid R.B.A. (2016); Chen Y., Lee J.-Y., Sridhar S., Mittal V., McCallister K., Singal A.G. (2020); Chuang M.-T., Hu Y.-H., Lo C.-L. (2018) |
| **5** | AI for covid19 | covid-19, pandemic, data analytics | Davazdahemami B., Zolbanin H.M., Delen D. (2022); Sharma S., Tripathi M.M., Mishra V.M. (2022) |

**Table 1:** Keyword co-occurrence analysis results

## 3.2 The results of content analysis in the form of thematic analysis

This preliminary analysis is based on eight scientific articles. Five belong to cluster 2, which emphasises the importance of personalisation and patient engagement (Dai &

Tayur, 2022; Maher et al., 2023; Mele et al., 2022; Rathore et al., 2023; Tursunbayeva & Renkema, 2023). The remaining ones are part of cluster 3, which delves into the technological solutions that enable their implementation (Basharat & Shahid, 2024; Osei-Frimpong et al., 2018; Swan et al., 2024). The choice to include a limited number of contributions is intentional. The aim is to prioritise quality and theoretical relevance to specifically address a complex topic. While these contributions represent significant technical and organizational advances, they often overlook the relational and participatory role of the patient, treating it as secondary.

Dai and Tayur (2022) propose a useful model for understanding the necessary conditions for an effective AI-integration by identifying four key elements (4Ps):

physician involvement, patient acceptance, provider investment and funder support.

Engagement is often seen as a side effect of technology adoption, rather than something that could be designed preventively. Some contributions have a more relational approach, particularly towards patients with fragile conditions (Mele et al., 2022). Furthermore, digital access to information has been shown to be a potential lever for increasing patient awareness while enhancing active participation and improving patient trust and satisfaction (Osei-Frimpong et al., 2018).

The analysis identifies four main areas for AI intervention along the patient journey: early diagnosis and prediction, remote monitoring, personalization of care and communication. Among these, interaction mediated by chatbots and virtual assistants

(Basharat & Shahid, 2024) are areas particularly relevant to the content of this study. However, perceived reliability of these tools is critical to successful patient acceptance.

There is still little integration between the different phases and still a segmented view of the patient journey. Few studies consider the care continuum from prevention to follow-up as a space of co-creation enabled by AI tools (Osei-Frimpong et al., 2018; Rathore et al., 2023). Furthermore, personalisation and remote monitoring methodologies are promising but their use is limited by the absence of a clear regulatory framework (Maher et al., 2023).

## 4. Conclusions and future research perspectives

The ongoing work shows the need for a framework that links human-centered AI with co-creation models of service marketing. It is crucial to adopt a relational perspective in which value comes from the interaction between actors, technologies and contexts. Within this approach, AI can help transform healthcare by enabling more participatory, predictive and personalized solutions.

Given these considerations, future research perspectives are outlined. Firstly, it is recommended to develop qualitative studies focusing on the patient and citizen perspective through interviews, focus groups or even ethnographic techniques aimed at an in-depth understanding of the dynamics of acceptance, trust and participation in AIdriven technologies. Secondly, it is suggested to promote the co-creation of AI-driven services from a multidisciplinary perspective, integrating expertise from engineering, medicine, marketing and service design.

Finally, the Italian context allows to explore how different regional digital infrastructures and multi-level governance can support AI-based services. It is possible to identify specific areas where participatory AI solutions are most effective by actively involving citizens in the design and evaluation of services. Subsequently, a comparison between different contexts can help leverage local experiences, identify best practices and develop adaptable and shared models.

This can foster integrated solutions and reduce the gap between technological innovation and patient-centred care.

# GenAI as a Product: An Empirical Perspective on Productisation's Key Dimensions

Andrea Sabatini[1], *, and Gian Luca Gregori[1]

[1] Università Politecnica delle Marche, Dipartimento di Management, Ancona, Italy

* Corresponding author: a.sabatini@staff.univpm.it

## Abstract

Given the transformative impact of Generative AI (GenAI) on contemporary society, the objective of this paper is to illuminate the implications of GenAI as a product, underscoring the necessity for a re-evaluation of the concept of productisation. The present study analyses a single case study of a software firm specialised in legal technology aiming to unveiling the key dimensions of productisation when an innovative GenAI product is developed and commercialised. The study provides a novel perspective on the key dimensions of productisation, demonstrating how these can be viewed from a twofold perspective, the customer and the seller. The study also suggests that the process of productisation can be viewed in two distinct ways: either as a high or low degree of productisation. These key dimensions entail the capacity to influence the future offerings of the firm. The study provides a novel perspective on productisation and the development of GenAI innovations literature. It contributes to the enhancement of management understanding of how to effectively leverage GenAI technologies, which are characterised by their boundless and shapeless nature.

*Keywords: GenAI, product development; innovation; productization; servitisation.*

## 1. Introduction

The advent of artificial intelligence, and more specifically, GenAI, is having a profound effect on the world in which we live. GenAI and its associated technologies is poised to unfold a paradigm shift in our daily lives. Cooper (2025) further asserts that artificial intelligence will have an unprecedent impact on the economy. It is anticipated that the contribution of AI to the global economy will exceed 15.7 trillion dollars by 2030, while the AI market is predicted to reach 100 billion dollars. The compound annual growth rate (CAGR) of the AI market is estimated to be approximately 40%, and it is projected to generate more than 100 million jobs worldwide, thereby contributing to the rapid growth of the AI industry (MIT Education, n.d.). The advent of GenAI technologies engenders a series of novel challenges for the management and marketing of professional services, particularly with regard to operational management and the communication, promotion, and pricing of services (Jaakkola, 2011).

GenAI is a major field of research in the present era, and nonetheless the most dominant technological paradigm. Consequently, both the technological and business communities are paying increasing attention to GenAI: a form of AI that has the capacity to drive innovation through new product discovery and development (Mariani and Dwivedi, 2024). As a shapeless and amorphous technology, GenAI has the potential to transform various software, services and technologies. These technologies, in turn, are poised to become future

products. In order to facilitate the sale of these products, it is essential to enhance the offering's clarity, both internally within a company and externally towards customers (Harkonen et al., 2015). Consequently, the notion of productization could witness a resurgence among both scholars and practitioners. Furthermore, the productisation area of study is traditionally overlooked and neglected (Lahy et al., 2017; Li et al., 2023; Dubois et al., 2025; Leoni, 2015; Harkonen, 2021; Wirtz et al., 2021; Wirtz, 2021), while a stronger focus has been usually placed on the concept of servitisation (Vandermerwe and Rada, 1988; Kohtamäki et al., 2019; Gebauer et al., 2021). Productisation is a pertinent concept when considering the context of the heterogeneity of services, which is inherent to the nature of services. Subsequent to the findings of Gronroos (2020), it is acknowledged that services should be regarded as concrete objects in order to enhance marketing and sales performance. Indeed, customers frequently encounter difficulties in comprehending the value of boundaryless services such as software and new technologies (Wirtz et al., 2021; Jaakkola, 2011). Despite the assertion by Leoni (2015) that productization and servitisation are antithetical, the extant literature continues to demonstrate a paucity of clarity with regard to the conceptualisation of productization. However, the manner in which this concept is currently positioned within the field of service, and its role in relation to service offering and processes, remains somewhat unclear (Harkonen et al., 2017).

The notion of productisation is becoming increasingly pertinent in the context of GenAI technologies and the associated services. Thus far, the focus of service delivery has been oriented towards the competencies of employees. However, what implications might ensue if the provision of services were to be entrusted to GenAI (Shamsuzzoha et al., 2024)?

Indeed, GenAI offers services that are not inherently consistent with service "anatomy": GenAI services are not subject to expiration and are not "perishable", are ubiquitous, scalable, and standardized, and are not strongly influenced by customer co-creation (Shamsuzzoha et al., 2024). It is imperative to acknowledge the notion that, despite their intangibility, the services facilitated by emerging technologies must be regarded as tangible entities, akin to those offered by physical commodities (Shamsuzzoha et al., 2024). Extant studies has thus far demonstrated that, in order to produce a service that is fit for purpose, it is necessary to specify it (i.e. to formalise and standardise its value proposition), brand it (i.e. to assign it a name, term, symbol or design that is externally identifiable), and price it (i.e. to clearly state and communicate its pricing) (Wirtz et al., 2021). However, the present study contends that the advent of GenAI opens up further key dimensions to be addressed when observing the productisation of GenAI technologies (Mariani and Dwivedi, 2024), claiming that GenAI-enabled product innovation is calling for new contributions. In this section, the research also addressed the suggestion of Jaakkola (2011) to further examine the use of the productization discourse as a translation mechanism; in this case deployed to enact new GenAI technologies.

The present study employs a single-case study qualitative methodology, analysing the case of a firm developing a GenAI chatbot for courts. The objective of this initiative is to facilitate the processes involved in the auctioning of real estate and other types of registered goods, with a particular emphasis on user and citizen assistance. The present case study focuses on the development of the GenAI chatbot product and the subsequent support provided for its commercialisation.

The objective of this study is to provide a novel perspective on the concept of productization in the post-GenAI technological era. Indeed, the utilisation of GenAI in the domain of new product development and commercialisation has hitherto been underappreciated. The predominant studies on GenAI and innovative products concentrate on the development processes of new products (Cooper, 2023, 2024, 2025). In order to comprehend the process

of productisation in the context of GenAI, it is necessary to draw upon the findings of extant studies and to consider the case of a novel GenAI product for legal services. The objective of the study is to ascertain which variables/dimensions can be managed during the productisation of GenAI technology. The objective of this study is to address the following research question:

RQ: *What dimensions characterise the productisation of GenAI technology?*

The present study provides a framework with the key dimensions that emerge from the case study for GenAI productisation, thus contributing to both theory and practice. The study has particularly enriched the concept of productisation and has created the possibility for further research in this field.

## 2. Literature Background

### 2.1 Conceptualising productization

In the extant literature on productisation, two major streams can be identified. The first of these streams focuses on a process in which relevant elements are combined to form product-like objects. The second stream is concerned with a reverse approach to servitisation (Harkonen, 2021).

To date, the concept of productization has been regarded as a:

- strategy to adding tangible products to a service offering (Lahy et al., 2017)
- related to the development of Product-service systems (Lahy et al., 2017)
- related to service development in service-based companies (Shamsuzzoha et al., 2024)
- service-based organisations develop and add physical products to their service offerings or bundle their services with physical products (Li et al., 2023).

The concept of productization is still underdeveloped. A common conceptualization is still missing. Few authors specialise and developed relevant studies in this field (Harkonen et al., 2015; 2017; Harkonen, 2021; Wirtz, 2021; Wirtz et al., 2021). The researchers who undertook the development of the research on the concept frequently encountered a range of conceptualisations, from a close relationship with service to a more precise conceptualisation. The prevailing conceptualisations identified in the extant literature are as follows:

- "The productisation of professional services means service definition, design, development, and description to maximise the benefit for the customer and achieve the set objectives concerned with the firm's performance" (Shamsuzzoha et al., 2024, p. 1154)

- "Productisation is the process of analysing a need, defining and combining suitable elements, tangible and intangible, into a product-like object, which is standardised, repeatable and comprehendible. Productisation activities cover those for a product to be ready commercially, so it can be produced, delivered, sold, purchased and used" (Harkonen et al., 2015, pp. 70-71)

- "the process of transforming a service company offering by adding tangible products or by decomposing service components into combinable modules. Moreover, productization and servitisation need to be considered as "two faces of the same coin", which acting reversely lead to considering the existence of a new company type: the solution provider" (Leoni, 2015, p. 1)

- "productizing a service helps to transform it into a more concrete albeit still virtual product. With a productized service, consumers can better grasp what the service comprises (e.g. what are its key elements), how it is created (e.g. what are the main phases of the process and experience, and what will happen when) and what value they will receive (e.g. what is delivered, what is the experience and outcome, why it works and what is so special about it). Productization goes beyond making services more tangible, more standardized and improved quality. Specifically, productization of service translates an abstract service and its creation into concrete products and controllable processes" (Wirtz, 2021, p. 266)

Productization can be defined as the process of standardising services in order to create a product for sale. Consequently, the present manuscript draws from extant literature focusing on the processes by which customized offerings become product-like (Dubois et al., 2025, pp. 122): "productization a multistep process that implies analyzing customers' needs, combining tangible and intangible elements into a product-like offering, and codifying knowledge related to its delivery. It describes a shift from customized offerings to commoditised goods and has been investigated in a range of sectors, including services and software".

The concept of productisation has also been applied to the domains of software and technological development. Software productization can be defined as the process of creating a software product, which consists of computer programs, procedures, and associated documentation and data intended for delivery to users. The concept of productization has been employed in relation to technological frontiers and the development of technologies that are currently underdeveloped (Harkonen et al., 2015).

Research on productisation has already been conducted, and this has revealed both the advantages and disadvantages of the process. In particular, when dealing with the benefits, these have been identified from the perspectives of both the 'seller firm' and the 'users/customers'. The following section presents a summary of the benefits derived from the extant studies (Shamsuzzoha et al., 2024; Harkonen et al., 2015; Harkonen, 2021).

- Benefit for the firm
    - Consistency with customer needs
    - Pricing, more transparent and understandable
    - Communication
    - Customer service
    - Scalable and commercialisable
    - At the frontier of technological knowledge
    - Higher profitability and competitiveness
    - Internal understanding and effectiveness
    - Reducing dependency on single employees

- Benefit for the customers/users
    - Better understanding
    - Value perception
    - Pricing perception e willingness to pay

With regard to the disadvantages observed, these have been collectively examined in the study by Harkonen (2021).

- Customer being neglected since the product is standardized

- Lower value perception due to itemization
- Since the company sells a standardized product there is less emphasis and care on customer care and understanding

Productisation has also been conceptualised as a process. In this respect, scholars have identified four principal stages (Dubois et al., 2025): analysis, specification, delivery and marketing.

In addressing the fundamental dimensions of the phenomenon, the study by Wirtz et al. (2021) identified over 30 key dimensions of productization. However, it should be noted that these are not related to GenAI products but rather emerge from their analysis addressing the hotel and hospitality sectors. The following are some examples of key dimensions: pricing, branding, standardisation, packaging, customer needs, replicability, family of services, knowledge transfer and specification. As asserted by Wirtz et al. (2021), the notion of productisation can be conceptualised as a continuum, wherein the extent of productisation within the service sector is contingent upon the shifting of key dimensions from a state of minimal to a state of maximal productisation. These dimensions, which were previously mentioned, encompass variability in delivery and the presence of a brand, along with a clearly indicated price.

### 2.1 Brief notes on GenAI product

GenAI is frequently regarded as a technology comprised of models (e.g. Large Language models, LLMs). Nevertheless, it is important to note that a model cannot be regarded as a product, and in most cases, it is not. It is posited that the model may be regarded as the 'back-end' of a product that utilises GenAI. Consequently, the product is the result of the utilisation of GenAI. However, a GenAI product is predicated on the utilisation of GenAI as its core technological mechanism. The identification of a "GenAI product" is predicated on the capacity for the product to execute tasks in a manner analogous to that of a human. The process should be customisable in order to develop capabilities, as opposed to utilising a predetermined set of information. Furthermore, the decisions should be made by AI rather than by a predetermined scheme of rules (Enterprise Project, 2022).

Indeed, as posited by the foundational delineation of AI, the concept pertains to the manifestation of human intelligence by machines (Cooper, 2023; Mariani and Dwivedi, 2024). Moreover, the capacity to learn and adapt distinguishes GenAI from traditional algorithms. Indeed, traditional algorithms are typically rule-based and require explicit programming for each scenario (Cooper, 2023, 2024, 2025). However, the extant corpus of knowledge presents several research studies on how GenAI is shaping the new product development process (Cooper, 2023, 2024, 2025). Nevertheless, these studies do not provide sufficient insight into how new products emerge from the adoption of this technology.

## 3. Methodology

### 3.1 Case study and case context

The present study employs a qualitative approach (Yin, 2014) by means of a single case study. As posited by Shamsuzzoha et al. (2024), the industry of legal services may be subject to the repercussions of productisation. The study identified a software house specialising in the development of Generative AI-based legal applications. The company is headquartered in the northern Italian region, with a workforce of 50 individuals and an annual revenue of approximately 12 million euros.

The company was founded in Italy in 1995 and operates within the legal tech sector, providing specialised digital services to support the modernisation of the judicial system. It plays a pivotal role in the management of online judicial auctions, legal advertising and digital enforcement and insolvency proceedings. It has been observed that, over time, the organisation has come to be regarded as one of the most prominent entities within the nation, distinguished by its proficiency in integrating legal acumen with technological innovation.

The organisation's primary activities are centred on the operation of a government-sanctioned online platform that facilitates the publication and administration of court-mandated auctions. This platform has facilitated transactions amounting to billions of euros and is directly integrated with the judicial system, thereby ensuring secure, transparent and traceable transactions. In addition to providing auction services, the company offers legal advertising for official court notices and develops software that is utilised by law firms, courts and legal professionals for the management of complex legal procedures in a more efficient manner.

By operating in collaboration with over 80 Italian courts and serving a network of more than 40,000 professionals, the company has helped to standardise and digitise traditionally paper-based processes. The company has invested in emerging technologies such as blockchain, artificial intelligence, and augmented reality with a view to making legal procedures more reliable and accessible. These innovations are a response to the growing public and institutional demand for transparency, speed and efficiency in judicial sales and related processes.

Situated at the intersection of law and technology, the company has become a pivotal entity in an era where the digitisation of justice is not merely an option, but an imperative.

### 3.2 Data collection

The data presented herein has been collected through a series of meetings with the company to discuss the new product, from the technology to the customers and how it will be sold. The company's involvement commenced at the close of 2024, with the relationship gradually evolving through a series of meetings. To date, the development of more than 10 meetings has been accomplished. These meetings facilitated interaction with the entrepreneur, the CEO, the marketing manager, the sales manager, the IT manager and the GenAI developers of the firm. The evolution of these meetings, which can be categorised as participant observation, has yielded documentation in the form of notes and meeting reports. These records serve as the foundation for the present research (Yin, 2014; Cheong et al., 2023). Moreover, the authors have been granted privileged access to confidential and public documentation developed by the firm, including strategic documents, brochures, websites, offers, and customer communications (Yin, 2014). The technology's inherent characteristics and the manner in which it interacts with the firm do not permit the implementation of more structured data collection methodologies. The authors concede that this constitutes one of the primary limitations of the study, as has been previously highlighted.

### 3.3 Data analysis procedure

The data has undergone abductive analysis (Dubois & Gadde, 2002; Thompson, 2022). The present study drew parallels between the case study data collected and extant literature on the subject. The analysis procedure was focused on the identification of the key dimensions that are managed by the firm in order to create a product from the GenAI technology developed. The study thus identified a list of seven key dimensions from two sides (e.g. customer and seller sides) as suggested by the literature. In the context of the extant literature, a comparison has been made of these key dimensions according to a high or low level of

productisation. The results of the data analysis procedure are illustrated in Figure 1 below, which systematises the seven key dimensions for both sides.

## 4. Findings description

Statista (2025) asserts that the primary objectives of GenAI implementation within legal firms encompass documentary summary (19%), document analysis (17%), drafting (17%), translation (17%), and search functionality (13%). The same research suggests that the greatest barrier is related to limited knowledge and skills. Conversely, the impact of these law firms on increased productivity and margins has been demonstrated.

The case company software house is among the Italian leaders in the creation of solutions for courts regarding the sale of houses at auction and the execution of court cases in this field. The company's extensive network, which encompasses over 80 courts in Italy, has facilitated the acquisition of substantial expertise in enforcement procedures and the operational dynamics of the judicial system.

Concurrently with an emphasis on pioneering technologies, the company has developed a GenAI software, with the specific features of a RAG (Retrieval Augmented Generation). The software will be complemented by a chatbot, which will be accessible to citizens and court users. It is worth noting that the product lying on a robust knowledge base of regulations, judgments and court documents collected over more than 30 years that allows the firm to create a uniquely specialized product for the professional legal community.

A further aspect that emerges is the relationship between the firm, the court and the final users. The firm has a direct relationship with the court, which is the buyer of the software. But the users of the software have a direct relationship with the court, and never met with the software house. Hence, the court is in charge of the choice and the collaboration with the software house to create and deploy the GenAI technology, but the users are the citizens that need the court's services information. The firm suggests that the courts are slightly involved in the development of the product since they are not scarcely knowledgeable about the technology.

In this sense, it appears crucial to understand that the key decision-maker for the court is the magistrate. It is not difficult to imagine that the magistrate is usually a person whose background, skills and temperament are not close to innovations or new technologies. It is important to note that the utilisation of a technology like GenAI could potentially result in a significant discrepancy in language, jargon and skill sets. This discrepancy could be so substantial that it would render the introduction of such technology within the court's context almost virtually impossible.

Consequently, the company orchestrated a series of initiatives to facilitate the manufacturability of the new technology. The brand was conceived for the Rag/Chatbot technology, a space was created for the product within the existing portfolio of products and services offered to the courts, a pricing logic consistent with the addition of the service in question was developed, and finally, a whole series of "standard" communication aids to support the sales network in promoting the new product was created.

As was discussed with the company, this approach enabled the promotion of a technology that would otherwise have been very difficult to understand. Concurrently, it facilitated the work of the sales staff and sales network in proposing the new technology to these customers.

The product under discussion is an AI RAG technology that aims to assist users in obtaining information about the website. The product under discussion adopts the form of a chatbot. The hypothesis is that this product will enhance customer interaction with the platform,

thereby increasing customer satisfaction and the conversion rate of users from advertising campaigns. The hypothesis is that the technology will enhance the interaction with customers and users by providing rapid and precise responses. The product employs artificial intelligence to interpret natural language, thereby providing precise responses and facilitating navigation of the website. Furthermore, this facilitates the court's capacity to provide enhanced assistance to users on a 24/7 basis, thereby augmenting the level of service provided. Consequently, the court stands to benefit from enhanced interactions with customers, thereby acquiring a substantial amount of information from them and, ultimately, expanding the range of services offered through the provision of enhanced customer support.

## 5. Discussion of the Findings

The firm hypothesised that the productisation of the technology resulted in enhanced clarity with regard to its value proposition and offering. Indeed, prior to the commercialisation of the technology, custom projects are typically initiated with specific and selected customers. It is evident that this approach was effective when dealing with customers who possessed a certain level of technological expertise and familiarity with its application. Consequently, from a customer perspective, a productised approach facilitates reduced knowledge and involvement requirements for utilisation and comprehension. In the context of GenAI RAG technology integrated within a chatbot, the involvement of the buyer is not a requisite component of the process, as the development of this technology is undertaken by the technology provider. In conclusion, the process of productisation has been shown to engender an increase in price sensitivity among consumers. This is attributable to the fact that customers are now able to consider a product and its cost in a clearer way.

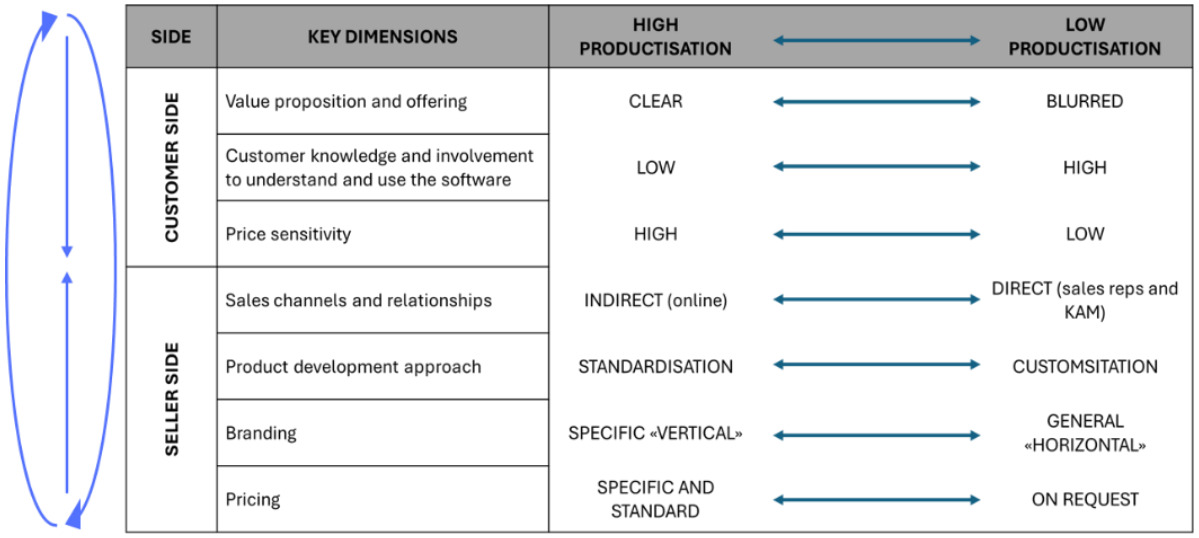

**Figure 1:** Key dimensions of GenAI productization (our elaboration)

From a seller-side perspective, the adoption of technology has the potential to enhance the efficacy of sales processes and facilitate the establishment of business partnerships. Furthermore, the endeavours undertaken for the purpose of product development diverge from the preceding methodology. Prior to the present moment, the firm cultivated a bespoke approach for each individual buyer, meticulously engineering the technology that was specifically demanded by that particular buyer. The development of a product incorporating

this technology has now been achieved. Consequently, there was a transition from the brand of the firm as a software house to the creation of a specific brand of the product. It is important to note that the pricing strategy also underwent modification. The initial approach, which involved the implementation of a price on request when developing custom software, was substituted with the creation of a specific pricing list. The pricing list has been meticulously designed to facilitate the sale of the new product. Below, a table has been developed to summarise the discussion of the findings (See Figure 1 above).

The findings suggest that the key dimensions evolve simultaneously and reciprocally (see the blue arrows in Figure 1 above), creating a recursive mechanism that allows the firm to develop both customer- and seller-side key dimensions. However, the research suggests that the firm should prioritise developing a comprehensive understanding of the customer dimension. This ensures that new technologies are developed to align with customer preferences, avoiding the creation of unsuitable technologies. Furthermore, the study found that the firm had previously demonstrated an understanding of customer, user, and decision-maker preferences through an examination of technological developments and investments. Understanding customers is also crucial for the commercialisation of new products.

## 5. Theoretical and Managerial Implications

### 5.1 Implications for theory

The present paper serves to reinforce the positioning of productization in the innovation and new product development literature (Harkonen et al., 2017). The research suggests that the concept of productization, which has historically been overlooked, should be reconsidered in the context of the emergence of GenAI. The paper discusses the theoretical and managerial implications of generative AI (genAI), emphasising its potential for productisation and the vast array of opportunities this presents given its unique, boundless and formless nature. These opportunities are also relevant to any similarly flexible technology. This novel approach to productisation has been developed through the utilisation of a case study that presents the output of a GenAI RAG Chatbot developed for legal and juridical institutions, such as courts (Lahy et al., 2017; Li et al., 2023; Dubois et al., 2025; Leoni, 2015; Harkonen, 2021; Wirtz et al., 2021; Wirtz, 2021). The paper also extends the meaning of productization, which should not be limited to an opposite meaning of servitization (Leoni, 2015) but addressed as the process of creating a product from a shapeless and boundaryless technology such as GenAI. The study also provides a novel perspective on the buyer involvement in the development of the GenAI product. Differently from the previous perspective where GenAI technology is seen as co-created, in line with previous studies of Sabatini et al. (2023) the gap in technological understanding between the firm and its buyer demand the firm in proceed alone in the development of the product.

The objective of the research was to ascertain the primary dimensions through which GenAI can be productised. The extant literature provided a plethora of dimensions, while the main were identified in the creation of a distinct brand, pricing and value proposition (Wirtz, 2021; Wirtz et al., 2021). Consequently, the present study provides a concise overview of the pivotal dimensions of productisation with respect to GenAI products (Wirtz, 2021; Wirtz et al., 2021). The present study unfolds how productization can be addressed according to two perspectives, the buyer and the seller. Consequently, the dimensions identified in the study are revealed. The study thus identified three dimensions on the customer side and four dimensions on the seller side. The customer-side dimensions are as follows: "value proposition and offering", "customer knowledge and involvement to understand and use the software", and "price sensitivity". Moreover, the study identified four dimensions on the 'seller side', namely: the “sales channels and relationships”; the “product development approach”; the “branding”; and the “pricing” (see Figure 1 above). Consequently, the buyer

and seller perspective is original for the productization literature, since productization is often viewed from the seller side (Cfr. Wirtz et al., 2021). The study posits that customer-side key dimensions should be addressed and defined prior to the seller-side dimensions.

The research introduces a further dimension of productisation, in addition to the "hardly to highly productised" scale developed from Wirtz et al. (2021). The study introduced a scale of productisation ranging from a low to a high degree, with the low degree of productisation corresponding to a product with not well-defined boundaries, and the high degree of productisation corresponding to a product with clearly defined boundaries and shape. This scale emerged from the case study when considering the firm's transition from the provision of custom-made software to GenAI products. In the context of customer-side value proposition and offering, this transitioned from being indistinct to being unambiguous. Indeed, the value proposition of a software house is characterised by its blurred and centred focus on firm capabilities, in contrast to the value proposition of a GenAI product, which is characterised by its clarity and focus on the product features or solution offered to the customers/users' needs (Cfr. Harkonen et al., 2017). The same principle applies to the aspect of 'Customer knowledge and involvement to understand and use the software'. This shifted from a high level of involvement, knowledge and effort to use a custom-made software to a very low level of knowledge and involvement in the use of a single app, a chatbot, in the context of this study. The study revealed that price sensitivity is reduced when negotiating the purchase of custom-made software, in comparison to the higher levels observed during the procurement of a tangible product. This phenomenon can be attributed to the delineated boundaries that characterise custom-made software, which facilitate a more precise understanding and easier comparison with other alternatives. Consequently, this reduced price sensitivity has a direct impact on the impact of supplier relational capabilities. From a seller-side perspective, the provision of a product necessitates the extension of sales channels and business relationships by leveraging online indirect sales channels extensively. This is because the focus is on increasing sales volume rather than on the development of a small number of large custom-made projects. In terms of product development approach, the firm transitioned from a "customisation" approach in the custom-made projects to the necessity of high standardisation in the case of productisation. In terms of branding, the study aligns with prior research (Wirtz, 2021; Wirtz et al., 2021) by proposing that, in the context of productisation, a distinct "vertical" brand should be developed for the new product, as opposed to utilising a more general "horizontal" brand, such as that of the software house. In conclusion, the present study corroborates extant literature on the subject of pricing (Wirtz, 2021; Wirtz et al., 2021; Shamsuzzoha et al., 2024; Dubois et al., 2025; Harkonen et al., 2017). It demonstrates that, in the process of developing a product, a firm must formulate a distinct and standardised pricing strategy and pricing list, as evidenced by the case study. Furthermore, it is important to consider that not all dimensions need to be on a high level of productisation to have a productised GenAI software. Finally, the study suggests that the key dimensions of productisation should be prioritised in accordance with those on the customer side, followed by those on the seller side. It is important to recognise that this is not a linear process, but rather a recursive one that continues until the key dimensions reach a mature stage that is validated by commercialisation. The study also has theoretical implications for research into GenAI. The study under discussion highlights how GenAI becomes the subject of innovation and new product development rather than a facilitator, booster or tool (Cooper, 2023; 2024; 2025). The enhancement of the role of GenAI in innovation and product development management has the potential to reveal further theoretical avenues that should be investigated (Mariani and Dwivedi, 2024). The study also posits that GenAI is a technology that can be productised by managing the key dimensions identified in the present study. In addition, the study suggests that GenAI productization should be considered as dynamic and evolutive. Even if the product has clear boundaries,

thanks to the continuous evolution of the underlying technology and knowledge base (e.g. new norms, new judgments) it evolves and update continuously over time.

### 5.2 Implications for managers

The study also presents implications for managers and entrepreneurs. Firstly, the study posits the notion that the utilisation of GenAI technology should be pursued through productisation, with the objective of comprehending the advantages inherent in this process. Secondly, the study proposes the commercialisation of the technology through its development on the key dimensions previously outlined and presented in Figure 1. The calibration of these pivotal parameters may vary from instance to instance; nevertheless, they can indubitably serve as a pragmatic approach to orientate management endeavours. Thirdly, in order to understand how to commercialise GenAI technology, it is first necessary for managers to gain an understanding of customer preferences. Following the effective definition of customer-side preferences, the subsequent development of seller-side key dimensions is possible. From a managerial perspective, the key dimensions initiate a process of recursive productisation, necessitating a constant oscillation between the perspectives of the customer and the seller. The question arises as to whether these dimensions can be calibrated in a manner analogous to a gauge, with a view to identifying the optimal equilibrium between high and low levels of productisation. The manner in which each gauge is calibrated is contingent upon business strategy, business model, sales and marketing strategy, and other strategic elements of the firm that should direct the entire process.

## 6. Conclusion

The objective of the present study was to provide novel insights into the relationship between GenAI and productization. The study elucidates the manner in which the domain of GenAI is enhanced by the adoption of a productisation approach, thereby augmenting the capacity to generate and commercialise new products that are underpinned by GenAI. This perspective is novel insofar as the majority of extant studies have focused on GenAI as an enhancer of NPD processes. In order to furnish this innovative perspective, the study adopted a case study of a software house specialising in the legal and court sector that was developing a new product for courts. The objective of the present study was to ascertain the fundamental dimensions of GenAI productization.

The study's findings, derived from the responses to the research question, identified seven key dimensions characterised by a dual perspective, namely that of the customer and the seller. The study posits that, in the context of productising GenAI, the prioritisation of the customer experience over that of the seller should be a paramount consideration. The study revealed three dimensions from the customer perspective. The following factors were identified as being of particular importance: "value proposition and offering", "customer knowledge and involvement to understand and use the software", and "price sensitivity". The study identified four dimensions from the perspective of the seller. The following are to be considered: “sales channels and relationships”, “product development approach”, “branding” and “pricing”. The study posits that a certain degree of productization is present, ranging from minimal to substantial. The study posits that these dimensions can be managed in order to achieve the optimal productisation of the GenAI subsequent product. The study ultimately determined that in order to produce GenAI, it is not necessary for all the dimensions to be on a "high productisation degree".

## 7. Limitations and future research opportunities

The present study is not without its limitations. Firstly, it should be noted that the study is still ongoing, and the collection of data is still in progress. Therefore, the results presented

are somewhat partial and incomplete. Secondly, the study adopts a single case study that is bounded in time and context, thus limiting the explication of phenomena that cannot be seen in the selected case. Thirdly, the study employs an unstructured analytical approach despite adopting a systematic combining methodology. It is recommended that further efforts be made to strengthen the data analysis procedure with a view to reinforcing the validity of the results obtained.

Nevertheless, the study offers several avenues for further research. Firstly, the study suggests opening to further studies on productization within the software field, and in particular on GenAI, to verify whether the results presented are confirmed. Secondly, the study suggests that the present study can be complemented by a customer-side analysis of productization. Thirdly, the study posits that future research opportunities lie in the understanding of the implications of the productization approach on business model innovation when deploying innovative GenAI software products. Fourthly, the study posits the notion that productisation might benefit from the execution of specific marketing studies pertaining to branding, pricing and sales channels, in accordance with the key dimensions identified by the present study.

# Trust in the metaverse: a literature review

Ginevra Testa[1], *, Giorgia Profumo[1], and Roberta Scarsi[1]

[1] University of Genova

*Corresponding author: ginevratesta@icloud.com

## Abstract

The metaverse represents an immersive and interactive virtual environment capable of redefining numerous industries, from retail to tourism. In this context, trust emerges as a key element to foster consumer adoption and use of metaverse platforms. However, the scientific literature on the topic of trust in the metaverse is still fragmented and in an emerging stage. Therefore, this study proposes a systematic literature review aimed at mapping the state of the art on the topic by identifying the main research strands through an analysis of keyword co-occurrences in papers tracked on the Scopus scientific database. The co-occurrence analysis, carried out using the VOSviewer software, led to the identification of four thematic clusters: (1) the role of trust in human relationships within the metaverse; (2) trust in consumption behaviors and virtual shopping experiences; (3) trust related to the security provided by technologies such as blockchain and NFT; and (4) trust in the adoption of new technologies, with a specific focus on the tourism sector. The results highlight how trust building depends on multiple factors, including privacy protection, platform usability, perceived credibility of brands, and the quality of virtual interactions. Finally, theoretical and managerial implications are discussed to outline potential areas for future research to build experiences in the metaverse that are increasingly trustworthy and secure.

*Keywords: trust, metaverse, systematic literature review, keyword co-occurrence*

## 1. Introduction

The metaverse is a virtual world that has attracted increasing attention for its social implications and potential development (Dionisio *et al.,*2013; Maden & Yücenur, 2024; Riva & Wiederhold, 2022). This is a phenomenon that can revolutionize multiple industries, such as retail, fashion, tourism, and healthcare (Parker & Saker, 2020). More specifically, it is a three-dimensional space in which users can interact and collaborate using their avatars, developing new opportunities for value creation through immersive and engaging experiences (Mystakidis, 2022).

Within this virtual environment, trust is a crucial factor to explore to understand the public's perceived trustworthiness in adopting and using these technology platforms (Gupta *et al.,* 2023; Lee *et al.,* 2021). Building and managing trust in online shopping platforms based on the Internet, social media, virtual reality, and augmented reality can be a critical challenge (Choi, 2019; Haumer *et al.,* 2020; Plotkina *et al.,* 2022; Tan & Saraniemi, 2023; Wongkitrungrueng & Assarut, 2020; Zhou *et al.,* 2018). In particular, in the metaverse, trust becomes an important aspect to explore because of the multiple risks that can arise such as, for example, identity theft (Qamar *et al.,* 2023), cyber attacks (Kuo *et al.,* 2023), and various inappropriate behaviors (Zytkoand & Chan, 2023).

Despite the wide and growing attention on the topic, the role of trust in the adoption and use of the metaverse still remains underexplored (Lee *et al.*, 2024; Pragha *et al.,* 2024), highlighting the need to achieve a comprehensive understanding of the role of trust in the metaverse. To fill this gap, a review of the literature on the topic was conducted by exploring publications in the Scopus scientific database, analyzing bibliographic data through a keyword co-occurrence analysis using VOSviewer software, which led to the definition of four main research strands.

## 2. Literature Review

The metaverse can be described as an immersive environment resulting from the combination of multiple enabling technologies, such as virtual reality (VR) and augmented reality (AR) (Nasongkhla & Sujiva, 2023), as well as physical components (Cheah & Shimul, 2023).

Due to the profound uncertainty that dominates the online world, trust becomes increasingly important in the digital context (Luhman, 1979; McKnight *et al.,* 1998; Mishra, 1996). In a digital environment, trust can be defined as the confidence people place in technology and, therefore, the level of trustworthiness a user attributes to a given technology and the comfort associated with using certain digital channels online (Hassan & Iqbal, 2020).

Trust can be observed in the personal perspective from a personality trait perspective, that is, whether a person is more or less likely to trust someone or something (Patent & Searle, 2019), rather than being observed dynamically, depending on experience and situation (Gefen, 2002). This second perspective includes trust toward organizations, governments, and entities.

Therefore, trust greatly influences technology adoption, especially in environments where sensitive information is involved, such as that related to consumers' payment methods or health (Hatane *et al.,* 2023; Alkhowaiter, 2022). As perceived trust is a key determinant of acceptance of new technologies (Lin *et al.,* 2011), consumers need to trust the metaverse platform and online payments to reinforce their intention to adopt transactions in the metaverse (Pragha *et al.,*2024). When users perceive a metaverse platform as trustworthy due to consistent positive experiences, clear governance, and transparent transactions, they are more likely to extend this trust to activities such as buying, selling, and trading in the metaverse (Lee *et al.,* 2024). The platform's reputation for trustworthiness and its ability to provide a safe environment for digital interactions foster a sense of familiarity and comfort among users, reinforcing the safety and legitimacy of transactions on this platform (Jim, 2023).

## 3. Methodology

In order to explore the role of trust in the metaverse, a literature review was conducted through the Scopus scientific database, using the following search query: (TITLE-ABS-KEY ("metaverse") AND TITLE-ABS-KEY (trust)). From a total of 225 papers, using filters for the subject areas (Business Administration, Management and Accounting; Decision Sciences; Social Sciences; Economics, Econometrics and Finance; and Psychology), a sample of 106 papers was extracted. On these papers, excluding only 11 irrelevant or untraceable papers, an analysis based on bibliographic data, particularly keyword co-occurrence, was performed using VOSviewer software (Figure 1). From this analysis, four potential clusters were identified around the theme of metaverse and trust: 1) Cluster 1 (blue); 2) Cluster 2 (red); 3) Cluster 3 (yellow); 4) Cluster 4 (green):

- Cluster 1 (blue): The role of trust in the metaverse in human relationships
- Cluster 2 (red): Confidence in consumer behaviours
- Cluster 3 (yellow): Trust in security provided by blockchain
- Cluster 4 (green): Trust in new developments in the tourism industry

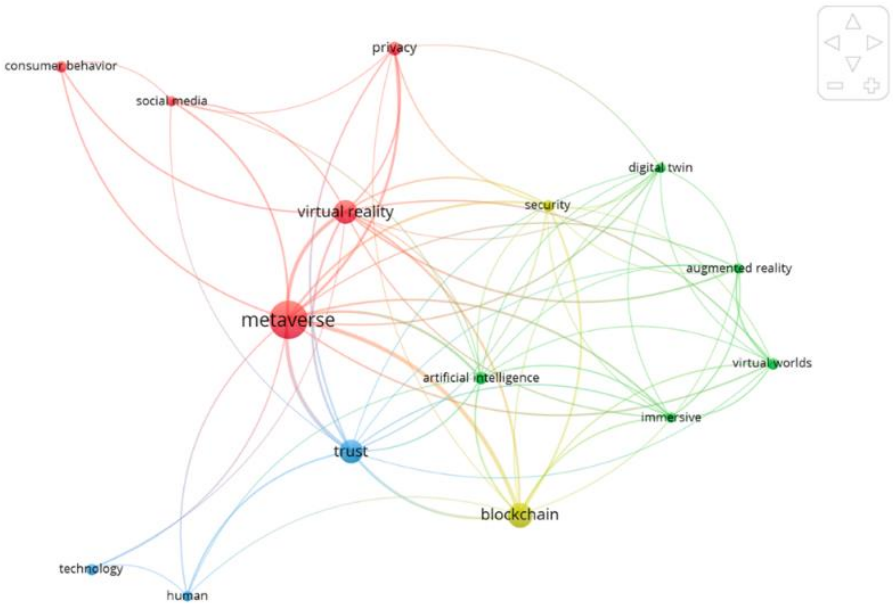

**Figure 1:** Keywords Co-occurrence Analysis on VOSviewer (Authors' Elaboration)

## 4. Findings and Discussion

### Cluster 1 (blue): The role of trust in the metaverse in human relationships

The metaverse is affecting multiple domains and in particular the interaction between individuals as the boundary between reality and virtuality tends to be increasingly blurred (Jahankhani *et al.*, 2023), shaping a virtual world in which the human experience is enriched (Riva *et al.*, 2024). The metaverse not only facilitates communication between humans (Oppermann *et al.*, 2024) but also offers unprecedented opportunities in terms of interaction, requiring the need to introduce security measures (Al-Kfairy *et al.*, 2023). Individuals perceive the value of the metaverse when it offers them fun and entertainment as well as safety (Pragha *et al.*, 2025). However, to maximize the true potential of this technology, it is necessary to ensure security and privacy by overcoming numerous public concerns (Chaudhuri & Anand, 2023) and openly communicating security protocols to nurture trust (Pragha *et al.*, 2025). Among the means of fostering the trust-building process and influencing brand evangelism, perceived avatar anthropomorphism, likeness, intelligence, likability, and attractiveness have been highlighted all of which can reduce co concerns (Gulan *et al.*, 2025; Khan *et al.*, 2025; Huang & Yu, 2023; Tang & Bahir, 2023).

### Cluster 2 (red): Confidence in consumer behaviors

The metaverse has profoundly redefined the world of shopping and the way consumers can navigate virtual environments with their avatars (Kim, 2021). The atmosphere associated with the virtual store and the in-store experience can influence consumers' brand perceptions

(Basu *et al.,* 2022; Kumar & Polonsky, 2019) and generate different effects on shopping behavior (Tan *et al.,* 2023). These virtual browsing experiences enable a more engaging and immersive encounter between the consumer and the product and between the consumer and the context, which is particularly difficult to achieve in the physical world (Alcan~iz *et al.*, 2019). Aspects that affect not only customers' cognitive trust, but also their emotional and sensory trust (Kumar & Polonsky, 2019). Therefore, trust plays a key role in building customer relationships, influencing many behavioral factors, including purchase intention (Gefen *et al.*, 2003) and satisfaction level (Punyatoya, 2019). According to Qalati *et al.* (2021), in fact, online trust is a crucial aspect of corporate strategy suitable for reducing perceived risk and promoting positive word of mouth. Brand trust is defined as customers' confidence that the brand will act in a certain way (Ha & Perks, 2005; Gefen, 2000) and comes from positive interactions between the brand and customers (Akrout & Nagy, 2018; Garbarino & Johnson, 1999; Morgan & Hunt, 1994). Customer experiences and interaction with the brand community in the metaverse can lead to the creation and nurturing of brand trust (Zhang *et al.,*2023; Flavian *et al.,* 2006; Park *et al.,* 2002; Sashi, 2012). Thus, trust is a particularly valuable resource to protect in the metaverse, an environment that is particularly vulnerable and subject to multiple privacy and security risks (Barth *et al.,*2022; Fernandez & Hui, 2022; Jeon & Lee, 2022; Lata & Singh, 2022; Schomakers *et al.,* 2021; Soumelidou & Tsohou, 2021).

### Cluster 3 (yellow): Trust in security provided by blockchain

In the metaverse, thanks to various technologies, it is possible to monitor and collect multiple pieces of information about users' behavior and thus collect very personal and sensitive information compared to traditional systems, easily and quickly putting users' privacy and security at risk (Fineman & Lewis, 2018). Therefore, it becomes critical to protect users' privacy and security by establishing appropriate rules for handling such information (Zhang *et al.,* 2022). To this end, blockchain technology can make exchanges between parties more secure and fuel users' trust in the metaverse platform on which the transaction takes place (Ali *et al.,* 2023). Blockchain technology appears particularly relevant for increasing security, resilience, and multiplying relationships within supply chains. Therefore, it is particularly important to maintain expectations related to the metaverse platform and digital payment methods (Kulviwat *et al.,* 2009) with the use of, for example, NFTs to ensure the ownership and authenticity of goods exchanged on various platforms such as Decentraland, Roblox, and SecondLife (Scheiding, 2022).

### Cluster 4 (green): Trust in new developments in the tourism industry

Trust is a crucial factor to consider regarding public acceptance processes of a new technology (Gefen, 2000; Pavlou, 2003; Pavlou & Gefen, 2004; Schierz *et al.,* 2010). Individual attitudes toward the metaverse and trust in metaverse technologies significantly influence the intention to use the metaverse itself (Chakraborty *et al.*, 2025). Individuals who develop trust toward these platforms will be more likely to use metaverse technologies (Arpaci *et al.,* 2022) for a variety of different activities, such as those related to the world of hospitality, e.g., virtual tours, online booking, and immersive experiences (Slevitch *et al.,* 2022). Trust is a crucial resource especially in transactions governed by risk, a typical situation in the purchase of online tourism services and products (Wen, 2009). In such situations, the ability to observe a destination through a virtual representation can provide the audience with a realistic experience that can contain fears and concerns (Chan *et al.,* 2023). Thus, the integration of technology can foster travellers' confidence, especially in the pre-trip stage when the tourist still knows little about the destination and the facility. The metaverse allows users to preview an accommodation and choose a facility after navigating with their avatars within digital spaces (Buhalis *et al.,*2023a). Users have the opportunity to evaluate in advance aspects such as room views, location, hotel services, staff expertise and

availability, and the quality of goods and services offered (Dwivedi *et al.,* 2022), greatly reducing uncertainty and risk related to the transaction. Thus, new technologies can help in solving long-standing problems in the tourism industry, such as the need to establish trust with certain actors (e.g., travel agents), ambiguity in decision-making, and time spent searching for information about a particular destination in addition to fostering new opportunities such as increased accessibility even for people with physical disabilities.

## 5. Conclusions and Implications

In conclusion, the results note the importance of designing experiences in the metaverse that are perceived as safe, authentic, and trustworthy, i.e., capable of nurturing trust. Trust becomes a real strategic lever to foster engagement and stimulate purchase behavior or interaction between users on platforms. Trust can enable the alleviation of uncertainty and increase the sense of security, fostering positive behavioral intentions in the metaverse (Luna-Nevarez & McGovern, 2021). Brands, with careful design of their interactive, immersive, and co-creative experience, can foster the creation of virtual communities around certain brands, also stimulating brand advocacy in the metaverse. Once trust is created, customers will more easily and actively participate in all experiences developed by brands in the metaverse, fueling the number of interactions (Bhandari & Rodgers, 2020). In addition to this, the multiple security and privacy concerns dictated by this technology need to be carefully considered. Therefore, there is a need to appropriately manage this technology to minimize negative effects and try to strike the right balance by enhancing consumer trust and emphasizing consumer protection (AlShehhi & Otoum, 2023).

## Abstract

This study investigates how startups contribute to implementing circular economy strategies in the context of smart cities. Existing literature has largely emphasised technological infrastructures and policy frameworks. This paper fills a gap by focusing on startups as operational agents of change that help implement circular principles in real-world urban contexts. The research uses a synthetic approach, integrating secondary data, insights from the IMD Smart City Index 2025, and a custom-designed 10-question survey. The survey was administered to 12 synthetic personas, composite stakeholder profiles representing startup founders, urban planners, and sustainability experts. Each persona provided Likert-scale responses (1–5) and qualitative comments, enabling a comparative analysis across roles and perspectives. Results were synthesised into a matrix highlighting convergences and divergences (e.g., technology use and policy perceptions). Findings confirm a broad consensus on the strategic value of startups in enabling clever circular transitions, primarily through the use of 4.0 technologies and reuse-based business models. High alignment was observed on technological potential and sectoral relevance, while divergences emerged around public-private collaboration effectiveness, inclusivity, and the perceived adequacy of public policy support. Open data access was seen as a promising but unevenly implemented enabler. The paper contributes a structured, stakeholder-based analysis of how circular-oriented startups are perceived and positioned in the innovative city ecosystem. It offers actionable insights for designing more inclusive, adaptive, and innovation-friendly urban policies.

*Keywords: Startups, Circular Economy, Smart Cities, Urban Sustainability*

## 1. Introduction

In recent years, the urbanisation process and the parallel rise of ecological and digital imperatives have contributed to redefining the vision of smart cities as integrated ecosystems oriented toward sustainable innovation (Dizdaroglu & Yigitcanlar, 2016; Komninos & Mora, 2018). Traditionally centered on technological infrastructure and operational efficiency (Harrison et al., 2010; Silva et al., 2018), the smart city paradigm is now increasingly intertwined with the goals of environmental sustainability, social inclusion, and adaptive governance (Giffinger & Gudrun, 2010; Bonab et al., 2023). Within this evolving framework, the circular economy (CE) has emerged as a key model to address resource scarcity and climate challenges through systemic approaches based on reuse, regeneration, and collaborative innovation (Beretta, 2018; Macarthur et al., 2019; Carlos et al., 2024). While scholarly attention has widely focused on technological infrastructure and top-down urban planning, less emphasis has been placed on the entrepreneurial dimension of the circular

transition, particularly the role of startups as active enablers within innovative city ecosystems. This oversight constitutes a significant research gap, as startups increasingly demonstrate the capacity to operationalize circular economy principles through agile, tech-driven, and impactoriented business models (Roshan et al., 2024; Petri et al., 2025). Their contribution ranges from developing smart mobility solutions and digital sharing platforms to innovations in waste, energy, and data-driven urban services (Mattoni et al., 2015; Appio et al., 2019; Mylonas et al., 2024). Several recent studies emphasize the potential of startups to accelerate the integration of circularity in cities by leveraging digital technologies and engaging in co-designed governance processes (Kristoffersen et al., 2020; Amoako et al., 2023). Startups act not only as adopters of innovation but also as key connectors within digital entrepreneurial ecosystems (Langley et al., 2023), often collaborating with public institutions, citizens, and corporations to develop inclusive and resilient urban solutions (Grossi et al., 2024; Kuzior et al., 2025). Despite this growing relevance, the academic literature still lacks a systematic and comparative understanding of how different urban actors perceive how diverse stakeholders perceive the role of startups in advancing CE within smart cities. This paper addresses that gap by adopting a synthetic and theory-informed methodology to map such perceptions across a diverse stakeholder landscape. Building on the structured method of MacInnes (2011), the research integrates theoretical analysis, literature synthesis, and empirical simulation through personas. The IMD Smart City Index 2025 insights were also incorporated to anchor the investigation in current strategic priorities. Based on this foundation, a structured questionnaire developed, comprising 10 questions aligned with key themes such as technological integration, data openness, reuse practices, cogovernance, and enabling policies. The instrument was applied to 12 synthetic personas representing archetypal stakeholders within the smart circular city ecosystem, including startup founders, planners, sustainability advisors, corporate innovation managers, and academic experts. Each persona was asked to respond using a Likert scale (1–5) and provide short qualitative motivations. This dual-level approach allowed for identifies areas of strong convergence, particularly regarding the enabling role of 4.0 technologies and the strategic relevance of startups in core urban sectors, as well as divergences around inclusivity, open data, and public-private collaboration. By combining theoretical and simulated data, the study contributes a novel lens for understanding how circular-oriented startups are positioned, valued, and potentially empowered within smart urban transitions.

## 2. Methodology

This study adopts a synthetic methodology, articulated in several phases, aimed at systematically understanding the contribution of startups to the circular transition strategies in smart cities. The approach combines theoretical analysis, deductive development of operational implications, and data collection through simulation with personas. The first phase involved an in-depth analysis of the scientific literature and the most relevant international reports on smart cities, circular economy, and innovative entrepreneurship. The analysis was conducted following the structured method proposed by MacInnes (2011), which supports the structured synthesis of secondary sources. The main insights from the Smart City Index Report 2025, created by IMD (International Institute for Management Development), were also included, with particular attention to the technological and strategic components of the urban transition. Starting from the selected literature, a table of key implications related to the role of startups in circular-oriented smart city contexts towards circularity was constructed. The implications identified concern aspects such as technological integration, social inclusion, co-design, data openness, reuse models, public-private partnerships, urban resilience, and enabling policies. The content of Table 1 was developed through a structured synthesis of the literature, following the approach of MacInnes (2011). This involved identifying recurring themes and implications across the reviewed academic and institutional sources related to smart cities, circular economy, and entrepreneurial

ecosystems. Each implication was derived by clustering and cross-referencing concepts that appeared consistently in the literature. The table aggregates these implications and links them to key references that support their relevance and theoretical foundation. Based on the implications, a structured questionnaire was developed, consisting of 10 questions, each directly linked to a specific implication identified in the previous phase, in a dual-response format:

- A Likert scale from 1 to 5 (1 = strongly disagree, 5 = strongly agree), aimed at measuring the intensity of the perception concerning the implication;
- An open field for a short comment or motivation, to collect qualitative insights, examples, or motivations supporting the numerical response.

The questionnaire was applied to 12 personas representing key roles within the circular and innovative urban ecosystem (e.g., Circular Economy Startup Founder, Urban Policy Innovator, Smart Waste Tech CEO, etc.). These synthetic personas were developed based on current literature and plausible urban actor profiles to ensure internal coherence and role-specific validity. Responses were generated through synthetic data to reflect the plausible strategic visions of each archetype. This design enables controlled comparisons between stakeholder perspectives. The collected data were synthesised in a comparative matrix capturing quantitative (Likert scale) and qualitative (commentary) responses across personas. This enabled the identification of recurrent patterns, significant divergences, and potential policy or innovation levers to strengthen the integration between startups and smart cities oriented towards resilience and circular sustainability. To ensure a robust and representative simulation, the 12 synthetic personas were developed through a literature-based typology of strategic urban actors. The selection process ensured representativeness across key domains— such as entrepreneurship, innovation policy, urban planning, and sustainability— by drawing on academic classifications and institutional frameworks describing the smart city ecosystem. While not based on a specific geographic location, the profiles were designed to reflect roles applicable in both large and mid-sized cities across different national contexts. The approach aimed to simulate generalizable stakeholder perspectives, while remaining grounded in plausible role-based behavior as defined in recent literature.

## 3. Background

### 3.1 Smart Cities

The COVID-19 pandemic has accelerated awareness of the need for a double transformation in cities: digital and sustainable (Mahadevia et al.,2025). This need highlights how cities must evolve through innovative technologies and sustainable urban development models that integrate social, environmental, and economic aspects (Dizdaroglu & Yigitcanlar, 2016). The smart city concept was born as a response to these challenges, configuring itself as a dynamic and complex process that requires harmonizing efficient use of resources, technological investments, institutional innovation, and participatory governance. However, scholars often focus mainly on technological aspects, neglecting an explicit treatment of sustainability (Bonab et al., 2023). Despite numerous government interventions and projects to develop smart cities and sustainable urban environments, there is still no universally shared definition of "smart city" in the scientific and institutional literature (Gil-Garcia et al., 2015; Yigitcanlar et al., 2019). Some scholars emphasize the role of infrastructures in smart cities, in particular their ability to ensure efficient and accessible transport, stable energy, and water supplies, and widespread use of ICT (Harrison et al., 2010; Toppeta, 2010; Silva et al., 2018; Abu-Rayash & Dincer, 2021). Other authors instead highlight smart cities' innovative and entrepreneurial potential, considering them spaces capable of attracting human capital and promoting cultural and creative activities, emphasising the active participation of

communities (Kummitha, 2018; Mittal & Sethi, 2018). This has stimulated a broad debate on the fundamental dimensions of smart cities, the basis for an integrated conceptualisation of the phenomenon. According to Giffinger and Gudrun (2010), among the six distinctive characteristics of a smart city, there is environmental sustainability, a goal that can be achieved through the development of low-impact infrastructures and the rational use of resources. In addition to this aspect, the dimensions most frequently considered in the literature include: Smart Economy, Smart Governance, Smart Environment, Smart Mobility, Smart People, and Smart Living. Most of the contributions highlight that to build a sustainable smart city, it is necessary to integrate all these dimensions, avoiding sectoral approaches and promoting a synergic action between technology, governance, and social participation (Komninos, 2018). This variety of definitions leads to considering the smart city as a network of attributes aimed at stimulating sustainable economic growth and the birth of a competitive business environment, while promoting the quality of life and inclusion of citizens (Komninos & Mora, 2018; Antonov et al., 2021). In contemporary urban literature, however, several challenges related to sustainability emerge, such as eco-cities or green cities, which emphasize the importance of carefully integrating natural regions and environmental resources into urban planning (Bonab et al., 2023). Therefore, the urban environment is conceived as an integrated ecosystem of innovative resources and services, oriented towards the co-creation of value, long-term sustainability and continuous transformation (Enquist et al., 2016). Implies the systemic capacity of the city to proactively adapt to complex challenges through collaborative governance, experimentation (e.g. Urban Living Labs) and active participation of citizens. A fundamental element is the capacity of cities to provide efficient and effective public services, especially in a context of growing and accelerated urbanization (Wataya et al., 2019). Smart cities employ technologies such as the Internet of Things (IoT) and Big Data to monitor and optimize the use of urban resources: from energy management to water distribution, mobility planning, and noise pollution control (Bonomi et al., 2016). Therefore, sustainable smart cities integrate the technological dimension with sustainability, recognizing that urban development must combine three fundamental pillars: economic, social, and environmental (Elgazzar et al., 2017). The main objectives are to improve the quality of life, promote a dynamic local economy with job opportunities, ensure social well-being, responsibly manage natural resources, build efficient and resilient infrastructures, and implement equitable and inclusive governance mechanisms (Elgazzar et al., 2017). This paradigm has influenced urban planning for an efficient, technologically advanced, ecological, and socially inclusive city (Yigitcanlar, 2016). Although many smart cities were born from technological and operational optimization drives, today it is recognized that achieving sustainability requires a more profound change, which also involves organizational and institutional innovation, capable of transforming not only products and services, but also governance models and social practices (Tura et al., 2022; Adams et al., 2016). These sustainability-oriented innovations include interventions to improve energy management, promote low-carbon economies, and promote ecological solutions for pollution control and waste management (Beretta, 2018; Angelidou et al., 2018; Akbarpour et al., 2021). The role of stakeholders is fundamental. Collaboration between local governments, universities, businesses, citizens, non-profit organizations, and other actors is essential for the success of these initiatives (Amoako et al., 2023). Participatory and inclusive management ensures that solutions are sustainable and respond to community needs, strengthening urban resilience and adaptive capacity.

### 3.2 Circular Economy in Smart Cities

The Circular Economy (CE) concept is gaining growing relevance in strategic, operations, and technology management (Macarthur, 2013). It calls for companies to rethink and redesign their business models, encompassing value networks, relationships with supply chain partners, and value propositions, around a new sustainable development paradigm to

minimize resource consumption (Carlos et al., 2024). The circular economy is becoming an increasingly relevant pillar in innovative city strategies, aiming at production and consumption models based on reuse, recycling, remanufacturing, refurbishment, sharing and waste reduction (Macarthur et al., 2019; Möslinger et al., 2023). Urban policies oriented towards circularity translate into initiatives for the reuse of materials, the creation of digital sharing platforms, and the sustainable management of resources (European Commission, 2020). The convergence between smart cities and the circular economy is now central. According to Mylonas et al. (2024), combining digital solutions and circular principles generates "smart and circular cities", reducing operating costs and maximizing resource efficiency. Smart cities are characterised by a growing demand for resources and services, which often exceeds the available environmental limits, making adopting innovative urban management and planning practices necessary. In this context, the circular economy model is proposed as a strategic response to promote a more efficient use of resources, reduce waste, and promote environmental, economic, and social sustainability (Beretta, 2018). The adoption of sustainability-oriented innovations is essential to transform urban systems. These innovations include strategies for energy management and the transition to a low-carbon economy, as well as advanced solutions for waste management and pollution control (Angelidou et al., 2018; Akbarpour et al., 2021). Creating smart infrastructures, such as efficient energy networks and sustainable water systems, is key for more innovative and resilient urban environments (Tura et al., 2022).

The role of digital technologies and ICT is central in monitoring and integrated management of resources, optimizing efficiency, and promoting sustainable practices with measurable positive impacts on the urban environment and quality of life (Bibri & Krogstie, 2017; Appio et al., 2019; Bencsik et al., 2023). In this context, the Digital Entrepreneurial Ecosystem (DEE) concept becomes increasingly relevant, especially considering how digital infrastructures and technologies foster circular startups and innovation. Existing literature has explored key components of DEE, such as digital infrastructure (Langley et al., 2023), the use of digital technology by local communities and digital citizenship, digital sharing platforms (Schwanholz & Leipold, 2020), and the adaptation and absorption of emerging digital technologies (Kristoffersen et al., 2020). These are recognized as distinct drivers of circular entrepreneurship and the emergence of circular startups (Roshan et al., 2024). Circular economy startups are newly established businesses that adhere to CE principles, including reuse, refurbishment, remanufacturing, repair, recycling, and regeneration (Linder & Williander, 2017; Roshan et al., 2024). These ventures exemplify how entrepreneurship, supported by digital enablers, is transformative in implementing circularity within urban and economic systems.

### 3.3 The Role of Startups in Sustainable Urban Processes

As cities increasingly adopt innovative technologies and seek to foster innovationdriven economies, it is vital to understand how innovative city development relates to the strength of local startup ecosystems (Kuzior et al., 2025). Startups emerge as key actors in the transition towards urban sustainability and circularity (WEF, 2023; OECD, 2024). Compared to established companies, they show greater innovation and rapid adaptation capacity, developing creative solutions for waste management, sustainable mobility, circular logistics, and local energy production (Petri et al., 2025). The academic community has widely debated the interplay between innovative city development and the growth of startup ecosystems. Some scholars argue that smart cities foster entrepreneurship by providing technological infrastructure and policy incentives, while others highlight institutional and regulatory barriers that may inhibit startup growth (Kuzior et al., 2025). The literature has focused more on startups' circular business models (Petri et al., 2025), without delving into their specific role within smart cities. This represents a relevant gap, which this study aims to fill, analyzing

how startups can act as key enablers of the circular economy in smart cities. Thanks to their flexibility and innovative capacity, startups play a key role in cities' technological development and sustainable transition. They contribute to ICT, energy, transport and healthcare innovations, create jobs and promote urban economic growth, particularly through green and circular initiatives. They foster the automation and efficiency of urban infrastructure, supporting climate neutrality through digital solutions, advanced energy technologies, waste management systems and responsible consumption models. In this way, they favor the transition towards circular urban models, based on the reuse and regeneration of resources. In a context characterized by complexity and the need for continuous innovation, startups offer advanced technological solutions, flexible business models, and a capacity for experimentation that makes them essential for implementing smart cities (Amoako et al., 2023). Collaboration between startups, local governments, universities, and other stakeholders is crucial to favour the diffusion of innovative technologies and develop more sustainable and efficient urban systems. Startups integrate economic, social, and environmental sustainability into their business models, ensuring the ability to attract investments and ensure their resilience in the long term (Cricelli & Strazzullo, 2021). Several studies suggest smart cities catalyze startup growth, offering a conducive technological innovation and business expansion environment. Integrating digital infrastructure, open data policies, and innovative governance frameworks enhances business opportunities and facilitates collaboration between governments, corporations, and startups (Kuzior et al., 2025). The adoption of circular business models by startups allows them to develop solutions that reduce waste, promote reuse and regeneration of resources, facilitating the transition to a low-carbon economy in cities. This role is enhanced by the ability of startups to exploit digital technologies to create innovative services and connect different actors within the urban ecosystem, favoring an integrated and participatory approach to the governance of smart cities (Mattoni et al., 2015). Startups can foster the circular economy in smart cities in various ways. First, they develop innovative digital technologies and platforms for sharing resources and data, creating new business models based on sustainability. Secondly, they collaborate with local governments and ICT companies to create customized solutions for the urban context. These dynamics lead to circular entrepreneurial ecosystems integrating startups, public bodies, and citizens, favoring co-design and participatory governance practices (Grossi et al., 2024; Mylonas et al., 2024). However, the enabling role of startups in the urban circular transition remains little explored in academic literature; hence, there is a need to formulate theoretical propositions that fill this gap and guide future research. Urban startups are characterized by their ability to innovate in the product or service and business models. Adopting circular models, which emphasize regeneration, reuse, and sharing, responds to cities' environmental and social sustainability needs (Petri et al., 2025). The literature distinguishes between technological innovations (new devices, software, systems) and process or organizational innovations (new forms of collaboration, governance models, partnerships) (Adams et al., 2016; Tura et al., 2022). These innovations are essential for startups to create shared value, improve resilience, and respond quickly to complex urban dynamics (Cricelli & Strazzullo, 2021). Startups also develop entrepreneurial ecosystems that connect different actors (universities, research centers, local governments, businesses), favoring innovative technologies and circular strategies (Grossi et al., 2024). These ecosystems help overcome regulatory and cultural barriers, facilitating the integration of startups into urban processes and strategic planning. Startups' digital technologies allow real-time environmental and social performance monitoring, improving transparency and citizen participation in decisions (Appio et al., 2019; Bencsik et al., 2023).

### 3.4 The role of startups as key enablers of the circular economy in smart cities

The lack of a univocal and universally accepted definition of smart city (Gil-Garcia et al., 2015; Yigitcanlar et al., 2019) opens the space to reinterpret this concept in the light of

collaborative governance and sustainability, offering a flexible framework in which circular startups can be integrated as strategic actors. The critical analysis of the imaginative city literature highlights implications that can guide future theoretical and applicative developments, especially about the potential of startups as key enablers of the circular economy in smart cities.

**Table 1:** Implications revealed by the analysis of the articles (Source: Authors' processing)

### 1) Startups can enable circular economy models in smart cities, integrating technological innovation and sustainability

Startups can combine adopting advanced technologies with developing sustainable and inclusive business models (Gorelova et al.,2021). While some literature does not explicitly address the circular economy, it underscores the foundational role of entrepreneurship in fostering urban innovation (Komninos & Mora, 2018; Antonov et al., 2021). This suggests that startups, especially those oriented towards circular models, can actively contribute to creating more resilient and environmentally efficient cities. Some authors highlight how many startups have developed business models based on the sharing economy and solutions that respond to local problems, thereby generating localized socio-economic impact aligned with sustainability goals. (McLaren & Agyeman, 2015; Cohen et al., 2016; Silva et al., 2022; Roshan et al., 2024). This reinforces the idea that smart cities improve urban management and foster new forms of entrepreneurship that integrate technology, economy, and society (Kummitha et al., 2019). According to Hnedina, Soroka, and Mazur (2023), startups represent a key driver for the progress of smart cities, thanks to their flexibility, rapid adaptation, and vocation for experimentation. Furthermore, the study by Sabiha and Saida (2024) shows that startups play a crucial role in developing smart cities, thanks to their dynamic, technologically advanced, and innovation-oriented nature. Their distinctive characteristics, such as rapid growth, adaptability, and high technological content, make them effective urban transformation agents.

### 2) Human dimensions (creativity, inclusion, knowledge) are levers that startups can activate for a circular transition in smart cities

Several authors have highlighted the importance of human factors within the smart city (Nam & Pardo, 2011; Gil-Garcia et al., 2015). Recent literature proposes a "peoplecentric" vision in which technology is at the service of people and not vice versa (Trencher, 2019; Kummitha, 2018). In this context, startups often act as intermediaries, translating digital solutions into socially inclusive services, especially in underserved urban communities. Furthermore, literature suggests that startups can integrate practices of participation, inclusion, and co-design (Närvänen et al., 2021). The latest evidence emphasizes that the digital dimension can significantly enhance these human factors: the Digital Entrepreneurial Ecosystem and digital infrastructures (Langley et al., 2023; Schwanholz & Leipold, 2020) play a crucial role in amplifying the creativity and inclusion potential of circular startups (Roshan et al., 2024). This implies that urban innovation ecosystems should valorize circular startups as tools of active inclusion, promoting collaborative spaces and co-design networks, especially in less-represented neighborhoods or communities (Van Opstal & Borms, 2023).

### 3) Smart cities involving circular-oriented startups as strategic partners and public-private collaborations improve urban life efficiency and quality

The most recent theoretical models (e.g., Smart City 2.0 and 4.0) propose a decentralized, participatory, and entrepreneurially oriented vision of the smart city (Trencher, 2019; Yun & Lee, 2019), in which entrepreneurial initiatives not only stimulate economic development but can also support social and environmental innovation. The virtuous interaction between public policies and private initiative, represented by the action of startups, can thus constitute a fundamental engine to accelerate the transition towards sustainable and smart cities (Gorelova et al., 2021). All the actors involved, from large companies to individual citizens, must work together to develop innovative technologies and solutions that respond to the real needs of the territory (Munoz & Cohen, 2016; Almirall et al., 2016). This also implies the creation of urban ecosystems capable of supporting corporate entrepreneurship, i.e., large

companies, and civic entrepreneurship, represented by small businesses and start-ups that arise from the bottom up (Oberg & Graham, 2016; Kummitha & Crutzen, 2019). Synergies between these private and public sector allow sharing resources, skills, and know-how, favoring the emergence of scalable and sustainable solutions (Pozdnyakova, 2019; Mazur et al., 2023). The impact of startups is also evident in optimizing essential urban services: mobility, energy, waste management, and resources. Digital solutions implemented by startups improve the efficiency of urban systems, reducing costs and increasing citizens' quality of life (Hnedina, Soroka & Mazur, 2023). One of the key points of startups' contribution concerns their collaboration with the public sector. The agility and ability to innovate quickly of startups prove particularly effective when supported by adequate public policies and governance attentive to digital transformation. This public-private partnership is considered strategic to accelerate urban progress, favoring the creation of an ecosystem favorable to experimentation and scalability (Sabiha & Saida, 2024). Public-private partnerships emerge as practical tools to create synergies between different sectors, thus favoring urban innovation (Kummitha, 2019; Almirall et al., 2016). This approach is in countries where smart cities are seen as a strategy to attract investments and improve quality of life (Paroutis et al., 2014; Hoskisson et al., 2011).

### 4) Startups can play a key role in implementing circular economy principles in smart cities by integrating 4.0 technologies and emerging circular strategies

Literature highlights the contribution of ICT companies to developing smart cities (Mazzetto et al., 2024), especially in providing technological solutions for urban efficiency (Kruhlov et al., 2024). Digital startups can overcome the passive role of large technological companies, developing solutions oriented to the circular economy, for the efficient use of resources, waste management, shared mobility, and renewable energy. In this sense, startups become active agents of urban transformation, in line with the principles of smart city 3.0 and digital transformation (Grossi et al., 2024). Startups have demonstrated a greater ability to integrate Industry 4.0 technologies (such as additive manufacturing and digital traceability) with the principles of the circular economy (Silva & Sehnem, 2022; Roshan et al.,2024; Alqassimi, 2025). Urban innovation policies should incentivize hybrid experiments, in which circular startups can co-develop solutions with public bodies and research centers, reducing technological and regulatory barriers (Van Opstal & Borms, 2023). Such interventions strengthen cities' environmental and social sustainability, making smart cities more inclusive, accessible, and efficient (Sabiha & Saida, 2024).

### 5) Integrating startups into urban decision-making processes (co-design, participatory governance) contributes to more effective and flexible circular solutions

The contemporary approach to urban management focuses on participatory models to create new types of interaction between stakeholders (Kandt et al., 2021). Startups are ideal for being involved in co-design and collaborative governance processes allows for the co-creation of urban solutions that align with the needs of citizens and the territory, generating more effective circular and sustainable responses (Mazzetto et al., 2024). Such involvement can foster integrative and adaptive urban solutions when formalised within participatory governance frameworks. (Grossi et al., 2024; Roshan et al.,2024) Moreover, help reduce the gap between innovation and inclusiveness. The lack of a univocal and universally accepted definition of smart city (Gil-Garcia et al., 2015; Yigitcanlar et al., 2019) opens the space to reinterpret this concept in the light of collaborative governance and sustainability, offering a flexible framework in which circular startups can be integrated as strategic actors. This lack of consensus favors a greater openness towards multidimensional and participatory approaches, in which entrepreneurial initiatives can influence urban governance models. The

model proposed by Gil-Garcia et al. (2015) comprises four main elements: technology and data, physical environment, society, and government.

### 6) Circular-oriented startups promote business models based on sharing and reuse, which help address urban challenges

With increasing urban density and environmental pressures expected by 2050, urban contexts must develop alternative consumption and production strategies (Mazzetto, 2024). Circular startups can respond to these challenges by implementing models based on the sharing economy, reuse, open data, and regenerative design. According to the literature, an integrated and digitalized urban management of resources, from mobility to waste (Lazaroiu et al., 2012; Ejdys et al., 2020), is essential to ensure sustainability and quality of life. The ability of startups to adopt circular strategies from the early stages makes them privileged actors in the urban transformation towards regenerative and sustainable models (De Mattos & De Albuquerque, 2018; Roshan et al., 2024). The study by Van Opstal and Borms, (2023) confirms that many startups perceive sustainability as a competitive advantage and adopt "inner circle" strategies such as using renewable materials and maintenance

### 7) The opening of data in smart cities fosters the creation of innovative businesses with a social impact, as data collected by smart infrastructures offers new opportunities to develop digital services that are useful to citizens and communities

Kummitha's article (2019) highlights how smart cities represent a fertile ground for entrepreneurship development, thanks to the large amount of data generated by technological infrastructures. While public agencies utilize open data for service optimization, startups leverage these datasets to design citizen-centric solutions with economic and social value. (Berrone et al., 2016; Snow et al., 2016). In this sense, city administrations' opening of data is essential to stimulate a dynamic and inclusive entrepreneurial ecosystem (Cohen et al., 2016). The literature emphasizes that datadriven innovation is a key factor for circular entrepreneurship as well, enabling circular startups to create services and platforms that combine economic and social value (Langley et al., 2023; Schwanholz & Leipold, 2020; Roshan et al., 2024).

### 8) Startups are key players in developing smart cities thanks to their ability to introduce innovative solutions in strategic urban sectors

One of the most relevant aspects concerns the contribution of startups to environmental sustainability. They develop low-emission technologies and green solutions that reduce the environmental impact of cities, contributing to the construction of a low-emission and climate-neutral future (Hnedina, Soroka & Mazur, 2023). Through projects aimed at accessibility and responding to the needs of the most vulnerable segments of the population, they contribute to ensuring greater social equity within urban spaces (Hnedina, Soroka & Mazur, 2023). To ensure the continuity and stability of these interventions, startups must be able to evolve into scaleups, growing companies with sustainable development models. Scaleups represent a strategic option for cities, as they provide long-term solutions, reducing the risks related to the fragility of the early stages of startups' life (Hnedina, Soroka & Mazur, 2023). They develop technologies for the prevention, monitoring, and management of natural disasters, improving the capacity of cities to react to extreme events (Hnedina, Soroka & Mazur, 2023). In parallel, smart cities represent a concrete opportunity for developing green jobs. Startups can be protagonists in creating new professional figures in renewable energy, energy efficiency, sustainable construction, and waste management (Hnedina, Soroka & Mazur, 2023). However, it is essential to create incentives for innovation and overcome the regulatory barriers that often hinder the experimentation and adoption of new technologies (Hnedina, Soroka & Mazur, 2023). Only through a favorable regulatory

framework and innovation-oriented public policies will it be possible to create innovative, sustainable, and inclusive cities. This vision is also shared by Pozdnyakova (2019), who highlights the pioneering role of startups in driving digital urban transformation processes.

### 9) Startups facilitate the creation of inclusive smart cities, improving accessibility and responding to social needs for urban resilience, developing technologies for preventing and managing natural disasters

Startups ensure greater social equity within urban spaces (Hnedina, Soroka & Mazur, 2023). In this sense, technological innovation also becomes a tool for social justice. Another area in which startups play a decisive role is urban resilience. They develop technologies for the prevention, monitoring, and management of natural disasters, improving the capacity of cities to react to extreme events, as demonstrated by numerous international examples, including Japan (Hnedina, Soroka & Mazur, 2023). These solutions, often based on artificial intelligence, the Internet of Things, and big data analytics, allow timely interventions and effective adaptation strategies. By adopting 4.0 technologies and aligning them with circular economy principles, startups represent key actors in addressing resource scarcity and enhancing resilience during emergencies (e.g. pandemics, climate change to economic crises and natural disasters) (Silva et al., 2022).

### 10) Targeted public policies (fiscal, regulatory, training) are essential to break down barriers and incentivize innovative and circular entrepreneurship:

Circular startups face complex barriers: lack of access to finance, shortage of circular skills, and unfavorable regulations (Toxopeus et al., 2021; Van Opstal & Borms, 2023; Kuzior et al., 2025). Evidence shows low uptake of circular skills training and high demand for innovation and liquidity support. This suggests the need for integrated and multi-level policy interventions, combining: (1) easier access to finance and guarantees, (2) training programs for technical and entrepreneurial skills, and (3) regulatory simplification for emerging strategies such as sharing and waste recovery. The study by Van Opstal and Borms indicates that founders with a migrant background show greater optimism in building a profitable circular business (Van Opstal & Borms, 2023). The results of the study confirm the heterogeneity of circular startup profiles and strategies adopted, excluding the possibility of a single model ("no such thing as 'the' circular startup") (Van Opstal & Borms, 2023). This is also reflected in recent literature, which proposes a taxonomy of circular startups (Henry et al., 2020). Public policies play a crucial role in incentivizing the adoption of innovative technologies through tax benefits and investments in dedicated infrastructures (Carvalho, 2015; Kummitha, 2019; Silva et al., 2022). Finally, Sabiha and Saida (2024) recommend a series of strategic interventions to maximize the potential of startups. These include: regulatory simplification, targeted economic support, adequate infrastructure for entrepreneurship (such as incubators and technology hubs), and policies to attract investors and innovative entrepreneurs. Recent research highlights three strategic policy priorities to further strengthen the circular startup ecosystem. First, sector-specific support programs should be developed, particularly in operationally complex logistics and ecommerce sectors where circular startups face distinct challenges (Alqassimi, 2025). Second, regulatory frameworks should be simplified and tailored to reduce entry barriers and encourage innovation in high-impact circular economy sectors. Third, policymakers should actively promote collaboration and innovation networks, encouraging synergies between startups, large enterprises, and research institutions to facilitate knowledge transfer and resource pooling (Alqassimi, 2025).

## 4. Discussion

Based on the theoretical implications, a 10-item questionnaire was developed to evaluate the perceived role of startups in the circular transition of smart cities. To test these implications systematically, a persona-based methodology was adopted, through the definition of 12 synthetic profiles representing strategic actors in the urban ecosystem and sustainable innovation: 1. Circular Economy Startup Founder; 2. Innovative Mobility Entrepreneur; 3. Urban Policy Innovator; 4. Innovation Hub Director; 5. Circular Sharing Economy Platform Founder; 6. Smart Waste Tech CEO; 7. Circular Energy Strategist; 8. Sustainable Urban Planner; 9. Sustainable Investment Advisor; 10. Academic in Smart Circular Systems; 11. Corporate Innovation Manager;

12. Urban Sustainability Advisor. Each persona received the same structured questionnaire. The profiles represent strategic actors across urban and sustainability ecosystems. The questionnaire was divided into two response levels:

- A 5-point Likert scale, measuring the degree of agreement with the proposed statement, with the following values: 1 = Strongly Disagree; 2 = Slightly Agree; 3 = Fairly Agree; 4 = Strongly Agree; 5 = Fully Agree.

- An open qualitative comment is helpful to motivate or contextualize the numerical response through examples, experiences, or subjective considerations. Synthetic responses were created based on plausible priorities and viewpoints of each persona, allowing exploratory comparison while maintaining methodological control. The objective of this phase is to explore comparatively how the different actors interpret the opportunities, levers, and critical issues related to the circular transition in the urban context. The results obtained were subsequently summarized in a comparative table, useful to highlight convergences, divergences, and potential areas of collaboration between the different actors involved. The questions are as follows:

***1.*** *To what extent do you think startups are key players in transitioning to a circular and smart urban model?*

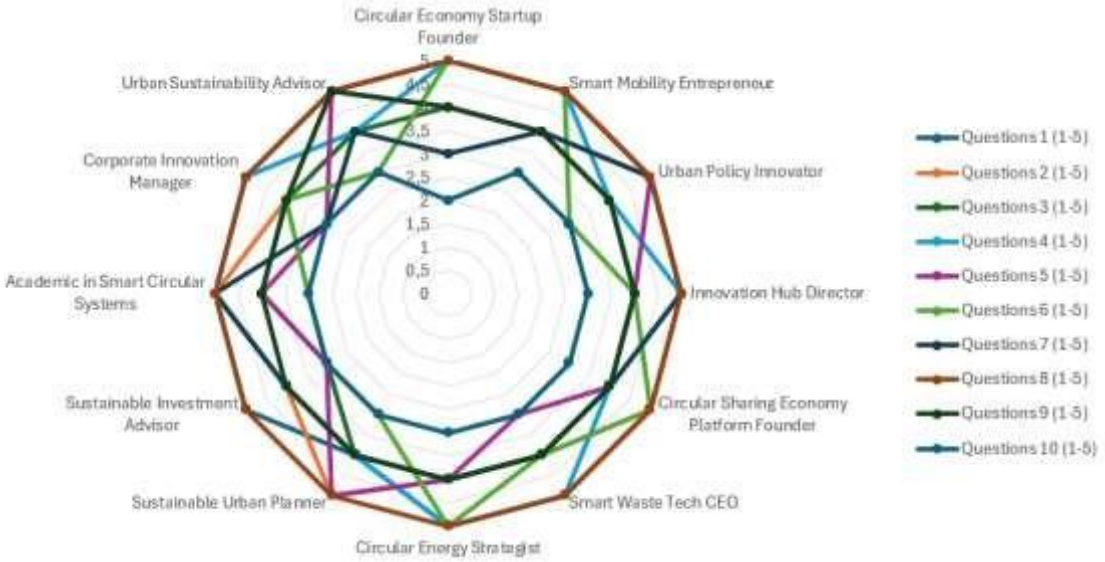
***2.*** *How important do you think levers such as creativity, inclusion, and knowledge sharing are in promoting an urban circular transition through startups?*

***3.*** *To what extent have the public-private collaborations you have participated in improved the efficiency or quality of urban life circularly?*

***4.*** *How relevant are 4.0 technologies in your business to implement circular economy principles in smart cities?*

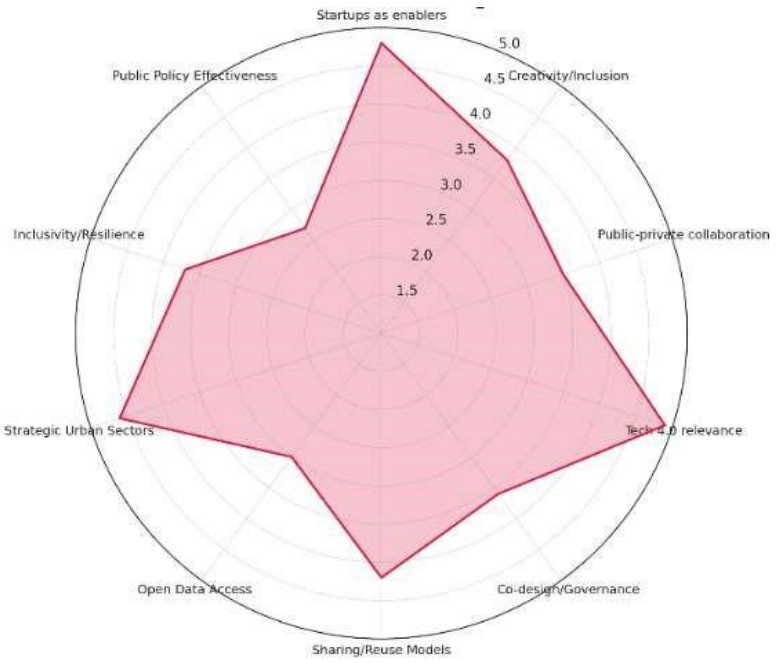
***5.*** *How effective do you think the involvement of startups in co-design or urban governance processes is in developing circular solutions?*

***6.*** *How much is your business model based on sharing and reuse practices to address urban challenges?*



***7.*** *How much do you think that access to open urban data favors creating entrepreneurial solutions with social impact?*

***8.*** *How much do you think startups are protagonists in the development of innovative solutions in strategic sectors of smart cities?*



***9.*** *How much does your initiative contribute to making the city more inclusive and resilient from a social and environmental point of view?*

***10.*** *How effective do you think public policies (fiscal, regulatory, training) are today in supporting circular and smart entrepreneurship?*

The comparative analysis of the simulated answers reveals both significant convergences and marked divergences among the ten key dimensions investigated. A clear consensus emerges on the strategic role of startups in the urban circular transition: in all profiles, their capacity for experimentation, agility in implementing solutions, and alignment with emerging urban needs are recognized as enabling factors. Were elaborated two summary graphs to allow a visual compression of the results of the synthetic data processed.

**Graph 1:** Summary of Likert scale responses (Source: Authors' processing)

**Graph 2:** Common themes and divergences highlighted from comments (Source: Authors' processing)

The transformative potential of 4.0 technologies is also unanimously acknowledged—particularly AI, IoT, and blockchain—although some urban planners and advisors point to infrastructural limitations and uneven adoption across territories. Conversely, softer dimensions such as creativity, inclusion, and knowledge sharing reveal a more fragmented picture: academic, planning, and advisory personas value these as central levers for systemic change, while several CEOs and entrepreneurs perceive them as supportive but not core to their operational priorities. Public-private collaboration received a heterogeneous evaluation, with institutional actors describing structured partnerships as key enablers. At the same time, startup founders often report obstacles such as bureaucratic inertia and limited follow-up in co-designed initiatives. Similar divergence emerges regarding participatory governance processes: although broadly supported in principle, many profiles express skepticism toward their concrete impact on decision-making. Regarding business models, actors operating circular platforms or waste tech solutions report having embedded sharing and reuse practices at the core of their value proposition, whereas investors or corporate managers tend to view them as promising yet not fully scaled. Open urban data remains a highly debated issue: while some respondents highlight successful cases of data-enabled services, others denounce the lack of standardized, updated, and accessible datasets. The role of startups in key strategic urban sectors, such as energy, mobility, and waste, is widely affirmed, emphasizing their contribution to optimization, decentralization, and lifecycle innovation. However, a divergence is evident when addressing inclusivity and resilience: socially oriented profiles consider these as guiding principles, whereas more product-driven actors tend to frame them as indirect effects of innovation. Lastly, public policies are the most critically assessed area: across the board, respondents cite regulatory rigidity, lack of incentive alignment, and fragmented training infrastructures as significant barriers to developing circular and innovative entrepreneurship. These findings confirm strong consensus on the transition's technological and entrepreneurial drivers, while exposing persistent tensions regarding socio-institutional dimensions and enabling conditions. These findings confirm that startups are widely recognized as strategic enablers of circular innovation in smart cities, particularly for their capacity to rapidly deploy digital solutions, experiment with disruptive models, and respond to sector-specific challenges. However, while technological and entrepreneurial drivers enjoy broad consensus, the results reveal enduring tensions around socio-institutional dimensions, such as inclusivity, participatory governance, and public policy alignment, which remain unevenly integrated into startup strategies and urban innovation frame.

## 5. Conclusions and Implications

This study confirms the strategic contribution of startups to advancing circular economy principles within smart city contexts, adopting a synthetic methodology that combines theoretical implications, synthetic personas, and a structured questionnaire. It is important to emphasise that the interviews and responses analysed in this study derive from simulated interactions, not from real individuals. All data were generated through the ChatGPT-4 model based on carefully constructed prompts and role-based scenarios. The method represents an exploratory phase and a solid basis for future field validations. The personas were designed to reflect plausible stakeholder profiles grounded in the literature, and the questionnaire aimed to elicit differentiated perspectives across domains. The comparative analysis of responses highlights a strong convergence across stakeholders regarding the technological and entrepreneurial potential of startups, particularly their ability to experiment rapidly, adapt to emerging urban challenges, and implement circular solutions through 4.0 technologies such as AI, IoT, and blockchain (Silva et al., 2022; Van Opstal & Borms, 2023). However, the study also uncovers persistent tensions in how various actors perceive and

operationalise softer dimensions such as creativity, inclusion, and knowledge sharing (Kummitha, 2018; Langley et al., 2023). These aspects are highly valued by academic, planning, and advisory profiles, but are often regarded as supportive rather than central by startup founders and corporate actors. Divergences also emerge around participatory governance and co-design processes, which are widely endorsed in principle (GilGarcia et al., 2015; Grossi et al., 2024), yet perceived as challenging to implement due to institutional inertia and limited follow-through. Open data is another area of contrast: while some personas refer to its potential to enable innovation, others stress barriers such as limited accessibility and lack of standardisation (Schwanholz & Leipold, 2020). Public policy is consistently rated as the most problematic dimension, with obstacles including regulatory rigidity, poor alignment of incentives, and fragmented support structures (Carvalho, 2015; Toxopeus et al., 2021). It must be reiterated that these findings, while aligned with academic discourse and grounded in literature, are derived from a digitally simulated environment. The insights presented result from an indirect investigation conducted through ChatGPT-4 and should therefore be considered hypothetical and exploratory. Overall, the findings confirm the essential role of startups in advancing smart and circular cities, but also call for more cohesive policy, governance, and infrastructural conditions to unleash their full potential. The study reinforces the view that smart cities should be interpreted as technological environments and socio-technical systems in which startups act as co-drivers of transformation (Gil-Garcia et al., 2015; Komninos & Mora, 2018). Future investigations could explore hybrid models where entrepreneurial, institutional, and civic actors co-evolve circular solutions. To fully harness the transformative potential of circular startups in smart cities, participatory governance mechanisms should evolve from symbolic involvement to forms of structural integration, ensuring continuity and actual decision-making capacity. At the same time, digital infrastructures require consolidation to support scalable innovation processes. Public policies must also become more targeted, flexible, and aligned with the specific needs of circular entrepreneurship. These dimensions should be core pillars of smart urban strategies, a call that future city planning and entrepreneurship policy must consider. From this perspective, concrete urban policy tools (e.g. innovation vouchers for circular experimentation, regulatory sandboxes, and urban data trust platforms) could play a decisive role in supporting early-stage ventures and accelerating deployment. From a managerial standpoint, startups should prioritise developing adaptive capabilities for engaging with institutional complexity, leveraging open data, and integrating participatory design approaches. Such strategies would greatly benefit from validation. The next step in this research should involve field-based research and direct engagement with real-world stakeholders, paving the way for more grounded and empirically validated insights.

## Abstract

The technological advancements of the Fourth Industrial Revolution are disruptive, altering the market dynamics within healthcare and influencing adjacent markets. In particular, the ongoing technology revolution is swiftly transforming the healthcare industry landscape and reshaping how customers interact with it. Today's customers are more informed and educated, enjoying the freedom to choose the most suitable digital solutions for their needs. Healthcare industries are compelled to align with these changing dynamics by meeting customer demands, satisfying their expectations, and empowering them with decision-making authority and control over their care. As concerns the healthcare sector, there has been a recent paradigm shift towards prioritising patientcentric approaches, to meet patients' needs and improve care quality. In this research, we conducted a qualitative analysis through multiple case studies, focusing on four industrial cases that prioritise the centrality of patients through Artificial Intelligence solutions. The goal of this research is to identify the pillars upon which industries must build their business models to improve an effective customer-centric approach to enhance patients' lives through innovative solutions which prioritise their needs and well-being. This study introduces fresh management perspectives by emphasising the importance of examining digitisation from the patient's viewpoint. It highlights innovations as catalysts for social change and offers insights for policymakers, advocating the adoption of advanced clinical technologies, improved information processes, and enhanced communication coordination among stakeholders. Lastly, it recommends the formulation of regional and national policies to facilitate the integration of digital health practices.

*Keywords: Artificial Intelligence; Healthcare; Customer-centricity; Multiple case study; Explorative analysis.*

## 1. Introduction

The challenges posed by the pandemic have intensified the existing critical issues within the healthcare system, placing additional strain on the health system.

The healthcare industry has changed the way of manages its business model for two reasons. The first one is to extend life expectancy, while the second is the increasing number of people affected by chronic diseases.

The traditional model of care is undergoing radical transformations to face current challenges (Schiavone and Ferretti, 2021; Durrani, 2016). In this context, the emerging paradigm of

healthcare delivery will be underpinned by technological disruptors equipped with extensive data and profound insights into the behaviours of patients, now viewed as consumers. These disruptors will play a pivotal role in the consumerization of healthcare (Schiavone and Ferretti, 2021). Indeed, the patient is progressively being likened to a consumer, and the robust technological tools of the industrial revolution are poised to facilitate this transition toward a consumer-centric model (Castro, Van Regenmortel, Vanhaecht, Sermeus, and Van Hecke, 2016).

Patients actively contribute as co-producers of health services and co-creators of value in the healthcare system (Palumbo, 2016). The pivotal focus of this transformation lies in the adoption of Value-Based Healthcare (VBHC) (Porter, 2013), where the patientcentricity prioritises the value and outcome. The European Commission characterizes Value-Based Healthcare (VBHC) as a multidimensional concept rooted in providing tailored care to fulfil patients' objectives (Personal value), attaining optimal outcomes considering resource constraints (Technical value), equitably allocating resources across all patients (Allocative value), and promoting social participation and connectedness (Social value) (Toni et al., 2023).

The foundation of the customer-centric paradigm relies on a diverse range of enabling technologies, including the Internet of Things, Additive Manufacturing, Big Data, Artificial Intelligence, Cloud Computing, Augmented and Virtual Reality, and Blockchain (Rindfleisch, O'Hern, & Sachdev, 2017). AI has the potential to enhance efficiency, accuracy, and decision-making in healthcare, ultimately leading to improved patient care and outcomes (Ahmed, Z., et al. 2020). Examples of AI applications in healthcare include image analysis for medical imaging, natural language processing for extracting information from clinical notes, predictive analytics for identifying at-risk patients, and virtual health assistants for patient engagement. Recently, the concept of "One Health" has been introduced, signifying a collaborative, interdisciplinary approach that acknowledges the interconnectedness of human health, animal health, and environmental well-being. It advocates for a unified strategy to address health challenges that span humans, animals, and ecosystems, recognising the close link between human health, animal health, and the shared environment.

The "One Health" approach highlights the importance of collaborative research and extensive disease monitoring, integrating data from various sources to attain a more comprehensive understanding of the dynamics of global health.

AI stands as a critical pillar in the construction of a resilient and secure healthcare ecosystem (Vishwakarma et al., 2023). Its capabilities extend to delivering invaluable insights, conducting intricate data analysis, and offering decision support through mechanisms such as Decision Support (DS), Continuous Monitoring (CM), and Communication and Awareness (CA) (Božič & Dimovski, 2019). By harnessing AI's power, healthcare systems can enhance their efficiency, make informed decisions, and establish a proactive approach to continuous health monitoring, ultimately fostering a safer and more effective healthcare environment. Furthermore, AI plays a crucial role in offering emotional support and enhancing the mental well-being of patients (Inkster et al. 2018). It provides continuous and accessible assistance by offering information and encouragement. Additionally, AI monitors behavioural patterns to identify early indications of mental health issues, facilitating timely interventions (Luxton et al., 2015).

This background forms the basis for our motivation to explore the topic of this paper, namely, how a customer-centric approach oriented to customer-centricity contributes to co-creating value at different levels, particularly by health service enterprises using AI. Our research question is *"How does AI foster the adoption of a customer-centric approach in healthcare?"*. To answer this question, an explorative analysis of apps based on AI development in

healthcare was conducted by using a multiple case study of Medisafe, Easeydoctor, Patchai and Buoy Health that offer services and help to patients.

The paper is organised as follows. Section 2 reviews the relevant literature on Digital technologies in healthcare and a paradigm shift in healthcare: from hospitals to patients. Section 3 describes the research methodology, including the multiple case study analysed and the research setting. Section 4 presents the study results. The final section discusses the findings and the implications of our study. Limitations and future research are analysed in the conclusion.

## 2. Theoretical Background

### 2.1 Digital technologies in healthcare

Digital transformation (DT) is the engine of change in 21st century society because of its massive impact on business processes (Li et al., 2016; Verhoef et al., 2021) and, more in general, on individuals and organizations and the several ways through which they are now able to interact and operate (Vial, 2019; Verhoef et al., 2021; Balta et al., 2021). Indeed, the heart of DT is the profound revolution that the use of digital technologies is leading in society persistently (Agarwal et al., 2010; Vial, 2019). According to Verhoef et al. (2021), DT encompasses three phases which are digitization, digitalization, and digital transformation; this perspective is also widely supported by literature (e.g. Loebbecke & Picot, 2015; Matt, Hess, & Benlian, 2015; Parviainen, Tihinen, Kääriäinen, & Teppola, 2017). However, even though *digitization* is "the action to convert analog information into digital information" (Ritter & Pedersen, 2020; Verhoef et al., 2021) and digitalization, through the application of digital technologies, optimizes existing business processes and creates additional customer value through enhancing user experiences (Pagani & Pardo, 2017; Verhoef et al., 2021), DT still is something greater. In fact, it is something that has to do with the deep change of business models of companies because of the implementation of digital technologies (Iansiti & Lakhani, 2014; Verhoef et al., 2021) and that goes beyond transforming the whole firm system from the operational level (e.g. Ramaswamy and Ozcan, 2016) to the strategic one (e.g. Nambisan et al. 2019; Baptista et al., 2020; Morton et al., 2020; Balta et al., 2021). Hence, it is not hard to find the reasons why all the industries are somehow affected by this phenomenon, even though there could be several differences between them. One thing is sure: the main goal of digital solutions is to reduce the complexity of real-life processes. It is not a case, thus, that the healthcare system, which is highly complex because of the large amount of data, actors and tasks involved in it (Laurenza et al., 2018), is one of the sectors mostly impacted and helped by DT (Agarwal et al., 2010; Laurenza et al., 2018; Marques & Ferreira, 2020). According to Balta et al. (2021), digital health (DH) "made the lives of patients and healthcare providers easier, safer, longer, and efficient". In line with what was previously mentioned, Kostkova (2015) defined DH as "the use of information and communications technologies to improve human health, healthcare services, and wellness for individuals and across population" which is also evidently confirmed by the fact that, since the middle of 20th century, ICT are increasingly and constantly becoming part of the HC sector (Ford et al., 2017; Kraus, Schiavone et al., 2021). In this regard, it can be possible to affirm that some radical innovations over the years are changing the HC sector deeply thanks to "disruptive technologies such as blockchain, big data, Internet of things, artificial intelligence, autonomous vehicles, remote sensing (satellite imagery and drones), wearables, robotics, genome editing, augmented reality (AR), 3D printing and biotechnologies" (Sharma & Kshetri,2020) which refer to the Fourth Industrial Revolution (4IR). This is way more understandable if contextualised within Marques and Ferreira's (2020) review, through which they analysed the literature about DT in HC. They identified, indeed, seven potential categories of perspectives to adopt in this specific area: Integrated Management of

Information Technology in Health; Medical Images; Electronic Medical Records; Information

Technology and Portable Devices in Health; Access to E-Health; Telemedicine and Privacy of Medical Data (Marques & Ferreira, 2020; Kraus, Schiavone et al., 2021). More specifically, in the last years, it has been given particular attention to Artificial Intelligence (AI) and to all the solutions that can be provided in the healthcare field using it. AI is significantly shaping the HC system, being a digital tool used as an augmented intelligence that does not replace professionals but expands their capabilities (Chen, M., & Decary, M., 2020) so that AI platforms, products, and services support and enhance DH across the world. In this regard, lately, the number of companies that design AI healthcare applications is increasing, and this type of solution can be categorised into four areas: patient-facing, doctor-facing, research, and telehealth (Chen, M., & Decary, M., 2020). Moreover, AI supports the great revolution of DT: the systematic change of roles within the specific sector digitalised (Parviainen et al., 2017; Kraus, Schiavone et al., 2021). Essentially, the effects of it in the HC sector are the heart of the present work. In fact, as concerns the HC structure, the main actor who has been most empowered by this change is the patient, with all their needs and expectations. It can be stated, indeed, that DH enables and facilitates the implementation of the customer-centric approach in HC organisations using AI applications.

### 2.2 A paradigm shift in healthcare: from hospital to the patients

In our market context, there has been a significant shift where the user has been placed at the centre of decision-making across all industries for many reasons, including cultural changes and the enhancement of technologies.

Currently, has gained relevance the customer centricity which is a business approach that prioritises creating a positive customer experience and aligning business processes with the needs and preferences of customers (Witell, et al. 2020). This business approach involves placing the customer at the centre of decision-making and focusing on building strong, long-term relationships with them (Fader, 2020).

Businesses, through a customer-centric approach, aim to satisfy and exceed customer expectations. This involves actively anticipating and addressing customer desires, fostering loyalty beyond individual transactions. The goal is to create an environment where customers not only find what they need but also experience high engagement and satisfaction, building lasting relationships (Khan, 2023).

This commitment to customer-centricity is viewed as crucial for long-term success, recognising that a delighted and loyal customer base is a fundamental driver of business growth and sustainability in today's dynamic markets (Di Ruscio, 2021).

The approach of centrality has also assumed value in the health sector, indeed in the 21st century, healthcare has undergone a paradigm shift, aligning with the ideas presented by Thomas Kuhn in his 1962 classic, "The Structure of Scientific Revolutions" (Kuhn, 1962).

In the past, in the health field, practitioners thought only of reducing the cost and time and not of focusing on the patient (Buse & Hawkes, 2015).

For centuries, the prevailing belief has been that patients cannot actively contribute to their care, particularly in making medical decisions related to their condition (Meskó & deBronkart, 2022).

The concept of patient empowerment has undergone an evolution over the decades, but it has experienced significant growth in the 21st century, largely propelled by increased

information availability and widespread access to technology (Meskó, B., & deBronkart, D., 2022).

Providing healthcare that is centred around the needs and preferences of the patient is widely recognised as a fundamental aspect of ensuring high-quality care (Ismail *et al.*, 2014).

Cultural digital transformation in the health field has aided this paradigm shift and currently fuels the development of patient-centricity (Mäenpää, 2023). AminololamaShakeri and Lopez (Aminololama-Shakeri & López, 2019) argue that AI is the next step toward a more patient-centred care system in breast imaging.

The doctor-patient relationship is founded on trust (Chin, 2001) and the use of IA can enhance the trust in their relationship. Many practitioners argue that artificial intelligence could lead to a more productive doctor-patient relationship by increasing the transparency of the decision-making process (Edison, 2023).

Patients now use artificial intelligence to access health-related information, leveraging this advanced technology to deepen their understanding of their specific medical conditions and gain a complete view of their overall well-being (Sujith *et al.* 2022). To improve interactions between the many players in the healthcare ecosystem, moving to a "patient-centred" perspective is necessary. This will ensure the exchange of knowledge and experiences in real-time. The patient experience, a crucial idea in the new digital health ecosystems, may thus be revolutionised using digital advances (Buccoliero, 2010).

In patient-centric healthcare, the focus extends beyond merely providing information and assisting individuals in managing their health; it also encompasses the availability and delivery of tangible healthcare services (HIN 2016).

The transition from a hospital-centric to a patient-centric model in healthcare represents a profound paradigm shift, signifying a transformative approach that aspires to reshape the entire landscape of medical services. This transformative paradigm extends beyond a mere reconfiguration of service delivery, encompassing a fundamental redefinition of the relationships between healthcare providers and recipients. The pivotal components of this paradigmatic evolution include an intensified focus on mental health, the implementation of Data-driven personalisation strategies, the integration of Remote and Home-Based Care, and the prioritisation of Preventive and Proactive Care.

This paradigm shift finds its theoretical underpinnings in a rich tapestry of key frameworks, each contributing to the holistic restructuring of traditional healthcare practices. As we traverse this evolutionary path, the goal is not merely to adapt but to strategically bridge the gap between established healthcare norms and the untapped potential offered by advancements in AI (Khan et al. 2023). By weaving together these theoretical foundations, healthcare professionals aim to navigate the complexities of this transformation, ensuring that patient-centricity is a guiding principle shaping a healthcare landscape that is responsive to medical needs and attuned to individuals' holistic well-being (Toni & Mattia 2022).

Patients desire increased reliability and visibility in their healthcare, along with enhanced interaction with their referring physicians. This fosters a sense of involvement, making them active participants in the decision-making process.

## 3. Method

To tackle the research question, we conducted an exploratory analysis using the multiple case study approach (Eisenhardt, 1989; Yin, 2017). The main focus was to explore how integrating AI technologies facilitates adopting a customer-centric approach within the healthcare sector.

Adopting a multiple case study approach allows for more precision in examining phenomena within the society (Eisenhardt, 1989; Saunders et al., 2007). To triangulate data, we relied on primary and secondary sources (Yin, 2017). Particularly, data were gathered from: (1) public declarations, (2) online documentation and (3) archival data. The data were analysed using an inductive thematic analysis approach (Braun & Clark, 2006). The following sections detail the case studies' descriptions, the data collection and the analysis process.

### 3.1 Case studies description

The study delves into the realm of AI technology within the healthcare sector. Artificial Intelligence systems are increasingly being implemented in the healthcare sector to improve the quality of care while optimising costs. Consider the electronic health record, which gathers all patients' clinical information in digital format and creates a true database. The ability of such technologies to process a vast amount of data enables healthcare professionals to develop personalised care paths that consider patients' specific needs, surpassing any geographical distance. Furthermore, the application of AI in diagnostics enhances the accuracy of diagnoses and even enables the prediction of possible patient health scenarios. One of the most widespread manifestations of AI in healthcare is the development of apps and chatbots designed to provide constant support to patients, thereby increasing their engagement. Many companies have made the development of healthcare applications their core business to support the optimisation of patient care pathways. Our research aims to analyse digital solutions based on the use of Artificial Intelligence to support healthcare organisations, physicians, and patients. Particularly, we aim to analyse digital tools oriented to foster patient-centric approach adoption. We selected four digital tools as case studies: (1) Medisafe, (2) Easydoctor, (3) Patchai, and (4) Buoy Health. The following paragraphs describe the selected cases and their main characteristics.

#### 3.1.1 Medisafe

Medisafe, created by an American IT firm, is a mobile application designed to improve patient care experiences by offering prompts for taking medication, tracking doses, and overseeing drug interactions. Its additional goals include providing comprehensive drug information and enabling patients to monitor their health progress. The app allows for personalised customisation according to individual user requirements, such as tailoring reminders to specific medication schedules. Furthermore, it ensures careful monitoring of doses taken to minimise the potential dangers linked to drug interactions. These attributes play a crucial role in empowering patients, encouraging better treatment adherence, and amplifying the efficacy of prescribed treatments.

#### 3.1.2 Easydoctor

Established in 2021, Easydoctor stands as a secure, adaptable, and versatile Digital Patient Engagement platform dedicated to aiding healthcare institutions in guiding individuals through their health journeys. It facilitates effortless and efficient data collection while nurturing enhanced communication between doctors and patients. Tailored for both physicians and patients, the application offers the potential to create secure, user-friendly, and personalised digital interfaces. It aligns with the Value-Based Health Care model, striving to maximise value for patients, elevate clinical outcomes, and optimise care efficiency. A standout attribute of this platform is its incorporation of a patient-centric chatbot, ensuring a seamless and immediate communication experience. This enhances the efficacy of information dissemination and bolsters patient involvement with the healthcare facility. Patients can effortlessly and intuitively engage with their physicians and healthcare providers, resulting in an overall enhancement of interaction quality.

### 3.1.3 Patchai

Founded in 2018, Patchai is an Italian-based digital health technology firm specializing in smart solutions for engaging and empowering patients in both clinical research and care processes. Their offerings facilitate enhanced self-management of health conditions, bolster adherence to study protocols and care plans, and simplify care provision for healthcare providers through robust, up-to-the-minute data. At its core, Patchai has created an intelligent platform dedicated to fostering patient engagement and capturing real-time data, specifically tailored for decentralised clinical research and standard care settings. This innovation aims to humanize, interconnect, and streamline both clinical research practices and routine clinical procedures. Through Patchai's virtual assistant, patients benefit from personalized experiences, ensuring high satisfaction and retention within decentralized clinical trials.

### 3.1.4 Buoy Health

Developed by a team of doctors and data scientists at the Harvard Innovation Labs, Buoy Health guides individuals through the healthcare system, providing scalable triage and connecting them with appropriate care options based on their self-reported symptoms. It provides an AI-driven virtual assistant that assists users in evaluating their symptoms and making well-informed health decisions. By asking specific questions to comprehend a patient's symptoms, the app utilizes artificial intelligence to deliver a tailored assessment and guidance on managing those symptoms. Buoy combines symptom checking with up-to-date medical knowledge to furnish personalized insights into potential causes and treatments for illnesses or health issues. Additionally, it provides proactive recommendations for seeking care, resembling a conversation with a doctor without the associated judgment, wait times, or expenses.

## 3.2 Data collection and data analysis

To address the research query, we explored the implementation of AI technologies to promote adopting a customer-centric approach in healthcare services through an investigative qualitative analysis (Eisenhardt, 1989; Yin, 2017). We established an exploratory research methodology (Yin, 2017), employing multiple sources of evidence to triangulate our data (Yin, 2017; Eisenhardt, 1989). Our data collection involved various sources such as public declarations, archival records, and online documentation. Our research focuses on the impact of AI on adopting a customercentric approach in healthcare. We collected and analyzed several reports and documents from official company websites for archival records. Additionally, we utilized online documentation, analysing statistical data, public declarations, and specialised online trade press sources. According to Hox and Boeije (2005), collecting secondary data involved three key stages: (1) Selecting secondary sources aligned with research objectives, particularly focusing on AI, healthcare, and a customer-centric approach. (2) Obtaining data directly from official websites. (3) Giving priority to evaluating information quality to ensure the reliability of the secondary sources. The data were transcribed and analysed by conducting a content analysis using the NVivo software (Krippendorff, 2018). Thus, we classified the sentences into three categories:

(1) *AI to improve patient engagement*, (2) *AI to foster innovation development* and (3) *AI to improve quality of care from an economic perspective.*

## 4. Findings

As mentioned before, authors practised an inductive thematic analysis to highlight the potential impact of AI in boosting customer-centric approach adoption. Particularly, the

analysis revealed that AI act as a catalyst of: *1) patient engagement, 2) innovation development, and 3) quality of care from an economic perspective.*

### 4.1 AI to Improve Patient Engagement

All the selected case studies are based on AI solutions designed to improve patient engagement. Indeed, Medisafe's Digital Companion, supports patients and caregivers throughout their entire treatment journey by driving interventions to keep patients engaged, adherent, and persistent, as we can see in the declaration: "*Omri elaborates on how Medisafe sits at major junctions throughout the patient's continuum of care. In what ways does the company combine the tech, the AI, big data, etc., with the behavioural aspects of the patient's needs*". Moreover, the patients declare that: "*Medisafe has been a huge part of my story and what I've done to help me manage things on a day-to-day basis. And it's just made my life better and easier. I couldn't imagine my life without medisafe".* Hence, this app improves the satisfaction of the patient's needs and gives them freedom and a better quality of health.

This emerges also within the case named Easydoctor "*At Easy Health, we believe that through a Data-Driven and Evidence-Based approach we can best support health professionals in managing patients, their health and their quality of life*". The goal of Patchai is to engage patients in a complex journey; indeed in the declarations it is stated: "*The added value lies in the fusion of personalization, empathetic conversation and understanding of patient engagement through the "engagement score", crucial for therapy adherence. This score, derived from questionnaires and diaries, helps researchers anticipate patient compliance during the clinical trial.*".

In the end, Buoy is a Boston-based digital health company that provides personalized clinical guidance the moment an individual has a health concern and matches covered care options. Indeed, said Andrew Le, MD, CEO and Cofounder of Buoy in the declaration: "*At Buoy, we're creating an experience for consumers that is pushing the boundaries of choice and access in digital health,*". Indeed, *"Eric's background in value-based care and assisting Medicare seniors will be instrumental as we advance our vision of a patient-centric marketplace.*"

### 4.2 AI to foster innovation development

AI enhances the development of innovation. In particular, it may enhance and accelerate the process of innovation within various domains. In Easydoctor: "*Here the data becomes useful, saves us time and leads us to better diagnoses… and the data becomes shared knowledge, useful for research to identify patterns and correlations that can prove fundamental for the development of better therapies*". AI driving innovation also in Medisafe, indeed: "*Medisafe's Connected Health Platform, delivers meaningful data-driven insights on patient behavior and brand performance*", sending the alarm to the patient in order to remind them to take the medicine.

Buoyhealth has developed a chatbot that collects information of patients' symptoms that returns to researchers to have more details on the development of the disease and its symptoms.

Moreover, in the declarations reported in the case of Patchai: "The pandemic underscored the necessity for patient empathy, emphasizing the importance of not just digitization but intelligent digitization. Our innovation, the virtual assistant utilizing the GoPro method, effectively bridged this gap". Hence through the AI Patchai assists the patients with the virtual tools.

### 4.3 AI to improve quality of care from an economic perspective

In the sources of Medisafe we found the enhancement of the economic aspect and the quality of care, indeed in the declarations: *"The analysis showed an average annual cost reduction of $6,280*

*per MS patient and $4,600 per epilepsy patient using Medisafe to manage their therapeutic regimen. These cost reductions – which represent significant savings for patients and reduction in burden on the entire healthcare system – derived from reduced utilization of costly care services as a result of better medication management*".

Also, in the case of Buoy Health, in declarations we see that: "*Buoy Health is a healthfocused chatbot that helps people interpret their symptoms and suggests the level of care they should seek. The development team then worked to add coronavirus symptoms and provide information to combat people's fear. Individuals can tap into Buoy's AI-driven symptom checker for guidance on the state of their health, as well as discover care options on their own through Buoy's vast library of articles on symptoms, conditions, and treatments".* Hence, this approach allows Buoy to costeffectively provide solutions that serve historically underserved groups, conditions, or populations, such as women's health.

In Easydoctor AI helps to reduce costs by improving the diagnosis and right care, indeed the following declaration reports: "*Here is the data that becomes useful, saves us time and leads us to better diagnoses and not only that: once digitized and shared - in the right ways and with respect for privacy - the data becomes shared knowledge*". Finally, Patchai improves the entire patient experience, leading to better health outcomes and reducing trial times and costs through the support of patients enrolled in the clinical experiments of drugs.

## 5. Discussion, Implications and Conclusions

The global economic systems have been significantly altered by the Fourth Industrial Revolution (Verhoef et al., 2021; Kraus et al., 2021; Horváth & Szabó, 2019). Businesses worldwide are increasingly concentrating on adjusting their business models to comply with new market demands brought about by the integration of advanced and digital technologies (Horváth & Szabó, 2019). This trend is transforming the business landscape.

Healthcare has long been a prominent sector embracing Digital Transformation (Marques & Ferreira, 2020). This evolution has unlocked new opportunities for care delivery and value creation (Elton & O'Riordan, 2016). Healthcare institutions need to adopt innovative approaches to address evolving patient needs in an increasingly digitised and technologically advanced world. The entire healthcare ecosystem necessitates a significant shift in perspective that prioritises patients and their requirements as digitisation continues to expand. Digital technologies like blockchain and Artificial Intelligence enable the implementation of technical, organisational, procedural, and governance modifications within the healthcare ecosystem. A crucial idea in the digital industrial scenario is the concept of digital health, which may thus revolutionise care provision (Moro Visconti & Morea, 2020; Schiavone, 2020; Buccoliero, 2010). In this context, it is necessary to embrace a significant change in perspective to address the evolving requirements of patients. Healthcare organisations shift from a hospital-centric approach to a patient-centric one, putting individuals at the center of the decision-making process.

This paper demonstrates that implementing an Artificial Intelligence-based solution can help in this revolutionary care approach. Indeed, as shown in the conceptual framework (Figure 1), using Artificial Intelligence improves the adoption of a customer-centric approach in the healthcare ecosystem. New technologies present numerous opportunities for enhancing patient care procedures. Specifically, the integration of AIdriven solutions strengthens patient engagement. Patients actively participate in their care processes, assuming the role of value co-creators. For instance, virtual assistants actively engage patients, fostering a sense of belonging within the healthcare service. This shift implies the development of increasingly tailored care paths based on individual characteristics. Consequently, healthcare professionals can anticipate potential health scenarios, facilitating the implementation of high-quality predictive medicine. The vast data furnished by these new digital systems enables physicians

to continuously monitor their patients' metrics in real-time and adapt their interventions accordingly.

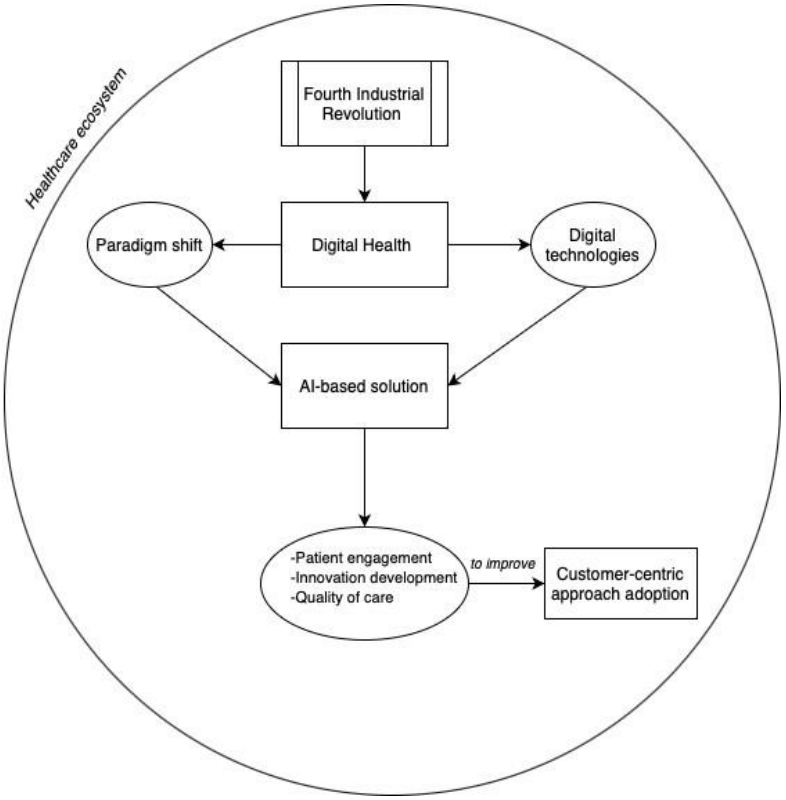

**Figure 1:** AI's role in driving the customer-centric approach's adoption.
Source(s): Authors' research

A further example is provided by the application of AI to imaging. Ingenious diagnosis and imaging will utilise DNA, nanobots and Artificial Intelligence (AI) to speed up diagnosis, imaging and, importantly, subsequent care decisions (Van den Heuvel et al., 2018). Already, Google is working on using deep learning, a branch of AI, to recognise patterns in many digital representations of images to detect signs of cancer in breast cancer biopsies. The technology is still in its nascent stage of R&D, but it has the potential to make a significant impact on the imaging segment. Through tools like biostamps and smart inhalers, medicine administration and patient monitoring will be personalised and less intrusive. The ongoing advancement of innovation drives the widespread adoption of these technologies in the healthcare industry, compelling organisations to embrace patient-centred approaches that prioritise and cater to their needs.

The economic benefits of emerging technologies are evident. AI-based solutions enable the optimisation of resources throughout the different stages of the care delivery process, leading to reduced costs.

The findings yield numerous theoretical, managerial, and policy implications. In terms of theory, the research provides fresh perspectives that could be valuable for scholars in the field of management. The papers highlight the need to analyse digitalization from a patient perspective. Looking at it from a managerial angle, the findings suggest that healthcare managers must prioritize investment in technological innovations while considering their

potential to enhance the patient experience and the quality of care. These technological advancements should be regarded as catalysts for social innovation. Additionally, this paper offers food for thought for policymakers. As digitalization becomes more widespread, there is an opportunity to adopt state-of-theart clinical technologies, enhance information processes, and enhance coordination and communication among various stakeholders. Furthermore, this sets the stage for developing regional and national policies that facilitate the integration of digital health practices.

# Track 8
# Digital Marketing

Coordinators: Carmen Donato & Stefania Farace

L'emergente economia digitale pone una sfida al marketing contemporaneo i cui confini ed ambiti applicativi sono in continua evoluzione. Il digital marketing - inteso quale integrazione di tecnologie e paradigmi digitali con il marketing - è in grado di fornire agli attori economici la capacità di raggiungere i clienti attraverso la formulazione di approcci innovativi che rispondono in questo modo alle nuove esigenze del mercato. Le imprese sempre di più sono consapevoli dell'importanza di creare una relazione digitale ed omnicanale con il cliente; in effetti le tecnologie digitali, i device ed i touchpoints - come ad esempio smartphone, smart products, IoT, Intelligenza artificiale e deep learning - pongono le basi per significative trasformazioni nella vita dei clienti (business e consumer) in un prossimo futuro.

Obiettivo di questa sezione tematica è quello di comprendere come gli sviluppi nella tecnologia digitale stiano ridisegnando il processo e le strategie di marketing, unitamente a tutte le implicazioni che questa trasformazione comporta sia per le imprese sia per i consumatori. La sezione è pertanto dedicata agli studi teorici ed empirici connessi alla digitalizzazione del marketing sotto il profilo dell'offerta e della domanda con particolare attenzione alle dinamiche di relazione ed integrazione tra i due profili.

Dal punto di vista dell'offerta, sono accolti i contributi volti ad un'analisi scientificamente rigorosa dell'utilizzo delle tecnologie e device digitali per il perseguimento degli obiettivi di marketing, unitamente ai vantaggi che un approccio al marketing digitale è in grado di apportare rispetto ad un'ottica di marketing tradizionale. Dal lato della domanda, si invita la comunità dei ricercatori a contribuire con l'approfondimento dell'impatto delle tecnologie digitali sulle percezioni, le attitudini, la propensione all'utilizzo e relative resistenze e i comportamenti dei consumatori a livello individuale e sociale.

L'attività di questa sezione tematica è aperta agli accademici e ai professionisti che, grazie ad un'analisi in profondità di questi aspetti, contribuiscano a stimolare un ricco dibattito sulle implicazioni teoriche e manageriali derivanti dai risultati della ricerca.

The digital economy is redefining the boundaries of marketing. Digital marketing—integrating digital technologies into marketing activities—allows firms to reach customers through innovative, omnichannel approaches supported by tools such as smartphones, smart products, IoT, AI, and deep learning. The section aims to explore how these technologies transform marketing processes and strategies, and what this means for firms and consumers. It welcomes theoretical and empirical studies on the digitalization of marketing, examining both how companies use digital tools to achieve marketing goals and how such technologies influence consumer perceptions, attitudes, adoption, and behaviors. The section invites academics and practitioners to contribute analyses that enrich the discussion on the theoretical and managerial implications of digital transformation.

# Designing Smarter Nudges: Cognitive Load Theory in Sustainable Checkout Choices

Jacopo Ballerini [1],*, and Francesca Buggio [2]

## Abstract

E-commerce's exploding "last-mile" deliveries already emit millions of tons of $CO_2$, yet checkout interfaces still treat home drop-off as the default. While sustaina- bility nudges can redirect orders to lower-carbon pickup points, designers lack evidence on how much information such prompts should convey—a critical gap, given shoppers' limited cognitive bandwidth. Grounded in Cognitive Load Theory, the author predicts an Inverted-U link: moderate message complexity maximizes click-and-collect uptake, but richer detail overloads working memory and backfires. A first empirical test—re- analyzing a public field experiment with 980 observations—supports this curve. Two additional studies (a lab and a field experiment) are planned to confirm causality, trace the mediating role of cognitive load, and probe age and internet-literacy boundaries. The work pinpoints a lean "sweet spot" for green checkout cues and offers an adaptive, skill-aware blueprint for cutting last-mile emissions.

*Keywords: Last mile delivery; Click & Collect; Online shopping; Digital Nudging*

### 1. Introduction and research aim

E-commerce keeps booming, but each "home-drop" parcel still adds ≈164–883 g $CO_2$ in the "last-mile" and already generates ≈19 Mt per year—a figure projected to rise another 32 % by 2030 (Coppola, 2023; Niemeijer & Buijs, 2023). While cleaner vans and e-cargo bikes help, changing checkout behaviour is cheaper and immediately scal- able. Digital nudges—small interface tweaks that steer choices without limiting free- dom—have been shown to shift orders toward pickup points, potentially cutting sector- wide emissions by one-third if adopted at scale.

Nevertheless, nudges come in many shapes. Informational variants range froma single green-leaf icon to dense numeric data, demanding different levels of mental effort. Mar- keting research recognizes that online shoppers already face information overload; ac- cording to Cognitive Load Theory, excessive detail can exhaust working memory and backfire (Plass et al., 2010). Few prior field experiments have compared "lean" versus "rich" messages, but they have stopped short of testing whether effectiveness rises and then falls as complexity increases (Nijssen et al., 2023). Moreover, early evidence hints that older consumers—who form the fastest-growing online segment—react differ- ently, partly because lower internet literacy magnifies cognitive strain.

The author addresses these gaps by proposing and empirically examining an inverted U-shaped relationship between the informational complexity of a sustainability nudge and the likelihood that shoppers opt for click-and-collect. The author theorizes that this effect operates through the shopper's experienced Cognitive Load Degree (CLD) and is contingent on demographic skills: ageing heightens overload, while internet literacy buffers it. Figure 1 visualizes the conceptual model.

## 2. Hypotheses Development

*Informational complexity and sustainable choice.* Moderate detail can aid evaluation, but beyond a threshold, added cues overwhelmworking memory and trigger avoidance. Therefore: **H1**. The relationship between a nudge's informational complexity and the probability of choosing click and collect presents an inverted U-shaped curve.

*Cognitive load as the explanatory mechanism.* Higher complexity consumes more at- tentional resources, raising CLD, which in turn pushes consumers toward the cogni- tively simpler default (often home delivery). Hence: **H2**. Cognitive Load Degree me- diates the curvilinear effect of informational complexity on the choice of click and collect.

*Age as a boundary condition.* Normal cognitive ageing reduces processing capacity;

thus, the same complexity level should feel more taxing to older adults. **H3**. Age posi- tively moderates the path from informational complexity to CLD: the overload effect is stronger for older consumers.

*Internet literacy as a chained mediator.* Ageing often coincides with weaker digital skills, which themselves raise CLD during online checkout. **H4**. Internet literacy medi- ates the relationship between Age and CLD.

By integrating cognitive-load principles with demographic contingencies, our study advances digital-nudge scholarship and offers actionable guidance for designing lean, age-sensitive interventions that maximize sustainable last-mile choices.

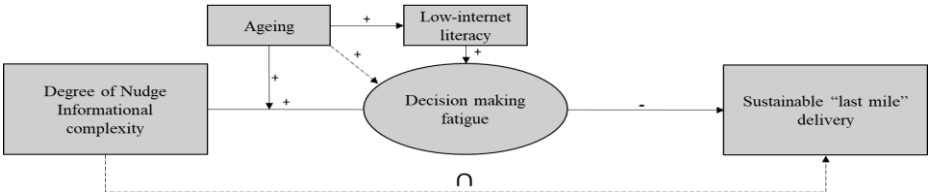

**Figure 1:** Proposed framework

## 3. Methodology

### 3.1 Study 1 – Re-analysis of an open RCT dataset

*Data & sample.* The author re-examined the publicly available dataset released by Nijs- sen et al. (2023)[20]. After excluding the default-nudge arm, 980 observations remained, distributed

[20] https://osf.io/q3t5r/

across three informational-nudge variants and one no-nudge control. The independent variable, Informational Complexity, was already coded on a 1–4 scale (higher = richer message). The delivery choice was recorded as 1 for 'click & collect' and 0 for 'home-delivery options'.

*Measurements.* To keep the model parsimonious and readily reproducible, the author focused on a core set of demographic and behavioural covariates that were consistently labelled in English: age, gender, education, self-reported financial situation, online pur- chase frequency, number of online purchases in the past year, and social concern ori- entation.

*Analysis.* A single-equation path model was estimated in SMARTPLS 4 with bias-cor-rected bootstrapping (5,000 subsamples). Informational Complexity entered both as a linear term and its squared value to test the proposed curvature; the dependent variable was treated as reflective.

*Preliminary Findings.* Table 1 reports the bootstrapped coefficients (Std. β) for all paths. The positive linear term(+0.026, p = .015) and negative quadratic term(–0.030, p = .022) support an inverted-U effect. Online-purchase frequency (–0.040, p = .001) and social concerns (+0.036, p = .002) were also significant, whereas the remaining controls and the Age × Treatment interaction were not. The model explains 4.1 % of the variance in delivery choice ($R^2 = 0.041$), a modest yet acceptable figure for an in- tentionally simple, preliminary test that isolates the focal relationship.

| Variables | Std.Beta | Std.Dev | T-value | P-value |
|---|---|---|---|---|
| Informational Nudging | 0.026 | 0.011 | 2.435 | 0.015 |
| (QE) Informational Nudging | -0.030 | 0.013 | 2.287 | 0.022 |
| Online purchase last year | -0.017 | 0.076 | 0.225 | 0.822 |
| Online purchase frequency | -0.040 | 0.012 | 3.429 | 0.001 |
| Social concerns | 0.036 | 0.012 | 3.063 | 0.002 |
| Gender | 0.034 | 0.022 | 1.535 | 0.125 |
| Financial_situation | 0.016 | 0.011 | 1.376 | 0.169 |
| Education | 0.019 | 0.012 | 1.539 | 0.124 |
| Age x Treatment | -0.000 | 0.010 | 0.046 | 0.963 |
| Age | 0.007 | 0.012 | 0.630 | 0.529 |

*Note: QE = Quadratic effect*

**Table 1:** Analyses with SmartPLS4

### 3.2 Study 2 – Scenario-basedexperiment (in preparation)

*Design.* A 4-cell between-subjects experiment will be administered on Qualtrics[21], sim- ulating the checkout of an online store selling children's sports jerseys. Participants (anticipated N

[21] Preview link: https://vuamsterdam.eu.qualtrics.com/jfe/preview/previewId/6f8a97_f1-7189-41_fc-905_f-ab4c8ef4bcd8/SV_6msLXRfMEXkGJhA?Q_CHL=preview&Q_SurveyVersionID=current

≈ 400) will randomly encounter one of three informational-nudge con- ditions: icon only (low complexity), percentage $CO_2$ reduction (medium), and com- bined icon + text (high). Figure 2 shows the checkout simulations in Qualtrics.

*Measurements*. After selecting a jersey, respondents choose a delivery mode and then complete: Cognitive Load Degree (CLD) – assessed with established mental-demand items drawn from the cognitive-load literature (e.g., NASA-TLX adaptations); manip- ulation checks for perceived nudge complexity and sustainability salience; the same demographic and behavioral controls used in Study 1, plus a 3-item Internet-Literacy scale. Qualtrics' timing function records the latency frompage load to delivery choice, providing an unobtrusive behavioral proxy for CLD.

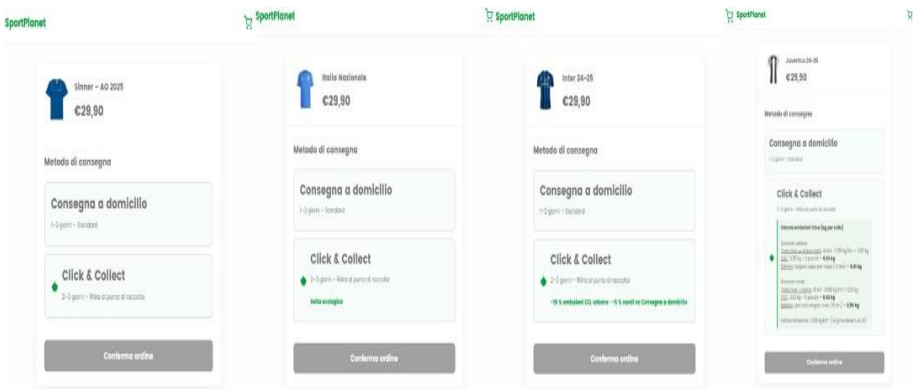

**Figure 2:** Manipulations on Qualtrics

### 3.3 Study 3 – Field A/B test with e-tailers (planned)

Context. Partner e-commerce retailers will embed the same four informational nudges in their live checkouts. Randomallocation occurs server-side and remains active until each nudge condition accumulates at least 5,000 completed checkouts, limiting both exposure time and seasonal bias.

*Measurements*. The binary outcome is the adoption of real click & collect. Basket value, product category, and delivery fee act as covariates. Moreover, the Physiological CLD capture will be performed through checkout pages that incorporate Morphcast Emo- tion-AI, which analyses facial micro-expressions locally in the browser and streams anonymized affective metrics (attention, fatigue) in real-time. Aggregated fatigue scores acrossthe decision window yield an objective CLD index that complements be- havioral data.

## 4. Expected findings (Studies 2 & 3)

Using the same logistic-regression framework with linear and squared terms for infor- mational complexity and bootstrapped tests of mediation, the author expects both the online scenario (Study 2) and the live A/B test (Study 3) to replicate the Inverted-U pattern. In both settings, higher informational complexity is anticipated to increase Cognitive-Load Degree, which in turn lowers the likelihood of choosing click-and-col- lect, yielding a significant indirect (mediated) effect. Age is expected to amplify this load, making the downturn on the right side of the curve steeper for older shoppers, while better Internet literacy should buffer

the effect. The author anticipates the same qualitative pattern in Study 3, albeit with smaller effect sizes, as real-purchase contexts introduce price sensitivities and habitual behaviour. Nevertheless, the physiological fa- tigue index(Morphcast) should still confirmthe mediating role of cognitive load.

## 5. Discussion and Expected Contributions

Our multi-method research is poised to show that the persuasive power of an informa- tional nudge is not monotonic but inverted-U shaped, with the inflexion driven by the consumer's cognitive load. In Study 1, the curve emerged after basic controls, suggest- ing a robust behavioral regularity. Study 2 should replicate the pattern under contro led conditions and reveal that self-reported load—and its latency proxy—transmits the ef- fect; importantly, older participants are expected to tip into overload sooner, unless their internet skills are high. Study 3 will test whether these mechanisms survive in a high-stakes, real-money context, using facial-expression analytics to capture cognitive strain unobtrusively. Should the live A/B test confirm even attenuated versions of the indirect and age-contingent effects, the evidence would jointly imply that what matters is not environmental concern per se but the mental effort required to process the mes- sage. This constraint becomes salient in segments with lower digital fluency.

### 5.1 Theoretical contributions

Extending Cognitive Load Theory to Digital Sustainability Nudges. Prior work has treated load mainly as a cost of learning; The author positions it as the central mecha- nismgoverning eco-friendly checkout choices, thereby linking educational psychology with behavioral sustainability.

Clarifying the roleofmessage complexity. Whereas earlier studies (e.g., Nijssen et al., 2023) compared "simple" versus "rich" cues, the author demonstrates a curvilinear re- sponse and isolates the turning point, refining design prescriptions for choice architec- ture research.

Integrating demographic skills into nudgetheory. By demonstrating that age influences load through lower internet literacy, the author introduces a skill-based pathway to the literature on demographic moderators, complementing explanations based on values or motivation.

### 5.2 Managerial and policy implications

Designing leaner, age-sensitive nudges. E-tailers should favour moderately rich mes- sages—e.g., a single icon plus percentage $CO_2$ reduction—and avoid dense numeric data for older or low-literacy users. A brief digital-skills check or device-type heuristic can trigger adaptive message formats in real time.

Monitoring cognitive strain in the wild. Tools like Morphcast enable retailers to con- tinuously audit nudges, replacing guesswork with objective load metrics and allowing A/B tests that respect user privacy while fine-tuning complexity levels.

Regulatory guidance. Consumer-protection bodies advocating for sustainability prompts can set maximum information thresholds rather than minimum disclosure rules, ensuring that well-intentioned messages do not backfire among vulnerable groups.

Taken together, our findings promise a more nuanced, evidence-based playbook for reducing last-mile emissions: steer shoppers with just enough information, calibrate for skill gaps, and verify cognitive comfort.

## Abstract

In the digital age, online customer reviews have become a critical source of information guiding consumer purchase decisions. As the volume of user-generated reviews increases, e-commerce platforms have begun to implement generative AI (GenAI) to synthesize these reviews into concise summaries. This study investigates how consumers perceive and adopt AI-generated review summaries and whether such adoption influences their purchase intention. Drawing on the Information Acceptance Model (IACM), the study examines the predictive role of information-related variables and consumer attitudes in the context of AI-mediated electronic word of mouth (eWOM). A quantitative survey of 153 Gen Z online shoppers was conducted and analyzed through structural equation modeling (SEM). The results indicate that, contrary to prior assumptions, information quality and credibility do not exhibit a significant influence on perceived usefulness. Instead, informational needs and consumers' attitudes toward the information emerge as the primary drivers of perceived usefulness in the context of AI-generated review summaries. Moreover, perceived information usefulness emerges as a strong predictor of information adoption, which subsequently exerts a significant positive influence on purchase intention. These findings suggest that AI-generated summaries may trigger heuristic rather than systematic information processing, highlighting a shift in the determinants of eWOM effectiveness in AI-mediated environments.

*Keywords: eWOM; Digital marketing; Generative Artificial Intelligence; Purchase Intention; Information Acceptance Model*

## 1. Introduction

The current market offers consumers multiple offline and online channels for better product familiarity and eventual purchasing (Verma & Yadav, 2021). In this context, the Internet has evolved into a participatory environment where individuals actively collaborate and share information, effectively becoming "the media" themselves (Li & Wang, 2011). This transformation is evident across a wide range of user-accessible platforms and websites—including blogs, review sites, e-commerce platforms,

and social media networks—where users continuously generate and exchange content (Cheung & Thadani, 2012; Erkan & Evans, 2016). Hence, customer feedback on products and services has become increasingly important when potential consumers seek information to evaluate their purchase decisions. Within this evolving digital landscape, electronic word of mouth (eWOM) has emerged over the past decade as a prominent topic of investigation in disciplines such as information systems and marketing. It is broadly defined as any positive or negative statement regarding a firm or product that is publicly shared online by potential, current, or former consumers (Hennig-Thurau, 2004; Dwivedi et al., 2021). Indeed, what differentiates eWOM from traditional word of mouth (WOM) is the diversity, quantity, and scalability of information (Cheung & Thadani, 2012), being accessible by anyone without any time or place restriction (Ismagilova et al., 2017; King et al., 2014; Verma et al., 2023). Within this status quo, other people's opinion on the Internet has become so crucial that consumers now perceive eWOM as more trustworthy and valuable than commercial advertising (Pihlaja et al., 2017; Verma et al., 2023). As a result, eWOM has become a critical component in consumer decision-making and has led to firms and actual eWOM platforms asking their consumers to share their opinion (Burtch et al., 2018; Liu et al., 2016; Verma et al., 2023). On the other hand, people choose to provide eWOM communications for different reasons (Ismagilova et al., 2020), such as altruism (Tong et al., 2013; Zhang & Lee, 2012), self-enhancement (Wang et al. 2014; Yap et al. 2013), venting feelings (Yen and Tang 2015), social benefits (Munzel et al. 2014), and economic incentives (Ahrens et al. 2013). As a result, Tripadvisor, one of the leading platforms for travel reviews and bookings, has already surpassed 1 billion reviews, covering nearly 8 million businesses (Tripadvisor). At the same time, Amazon states that in 2023, more than 100 million customers provided one or more reviews on the platform (Amazon).

As previously mentioned, the growing relevance of eWOM for both customers and firms has led to an enormous and still increasing volume of online information. As noted by Erkan and Evans (2016) in the context of eWOM on social media platforms, the overwhelming volume of available information complicates its potential influence on consumers' purchase intentions, as individuals must first assess and filter the messages they encounter before deeming them reliable or actionable. This same argument could be valid for any other context or platform where eWOM's value has highly permeated, creating what could be considered an overload of information that consumers may struggle to process. This exponential growth in online content can lead to information overload, making it difficult for consumers to extract meaningful insights. Generative Artificial Intelligence (GenAI) emerges as a potential solution, helping to synthesize vast amounts of user feedback into concise and structured summaries. Similar to the functioning of Google AI Overviews—which synthesizes content from multiple sources to deliver concise and informative summaries (Google Search Central)—GenAI is increasingly being integrated into various platforms, such as Amazon and Tripadvisor, to distill large volumes of online reviews into accessible and easily interpretable summaries (Paypal Editorial Staff). For example, Amazon has introduced a section on product pages featuring AI-generated summaries and curated highlights of the most relevant product characteristics from hundreds, sometimes thousands, of user-generated reviews. This way, customers can make informed purchase decisions without scrolling through large quantities of online reviews.

The purpose of these AI-based solutions may seem straightforward, such as providing advantages in terms of reduced consumer uncertainty and cognitive effort when buying. However, there is a lack of knowledge about how such AI-generated content is truly perceived and adopted, as well as the way it impacts people's decisions. Numerous literature reviews have emphasized the significance of eWOM adoption by examining its key antecedents, associated consumer behaviors, and underlying behavioral intentions within the broader body of eWOM research (Akbari et al., 2022; Ismagilova et al., 2020;

Moradi & Zihagh, 2022; Verma & Yadav, 2021). More specifically, the Information Adoption Model (IAM) developed by Sussman and Siegal (2003) proposes that information adoption occurs via two distinct cognitive pathways: a central route, which involves careful consideration of the core message, and a peripheral route, which is influenced by cues not directly related to the message content (Cheung et al., 2008; Erkan & Evans, 2016; Petty & Cacioppo, 1986). While this perspective has been widely adopted over the years, the advent of AI may reshape many contexts dealing with eWOM. Consumer behavior, sales dynamics, and, by extension, eWOM are continuously evolving in response to the increasing complexity and fluidity of today's marketplace, i.e. an environment that is itself being profoundly reshaped by the rapid advancement of artificial intelligence (Akbari et al., 2022). Hence, this scenario implies testing whether previous findings remain valid when AI comes into play. More specifically, this research aims to unfold the elements predicting the adoption of AI-processed online reviews and whether such impacts purchase intention. The following research questions can summarize the purpose of the paper:

- **RQ1:** *Which variables predict the adoption of AI-generated online review summaries?*
- **RQ2:** *Does the adoption of AI-generated online review summaries influence purchase intention, and in what way?*

While AI-generated summaries have the potential to improve decision-making by reducing information overload, it remains unclear how consumers perceive and adopt such tools. To address this gap, the present study applies the Information Acceptance Model (IACM), an extension of the original IAM in the context of eWOM in social media. Compared to the traditional IAM, the IACM provides a more refined framework by incorporating constructs such as information credibility and attitude towards information, which are especially pertinent in AI-mediated environments (Erkan & Evans, 2016).

The study reveals that, unlike traditional eWOM contexts, perceived information quality and credibility do not significantly predict information usefulness, whereas consumers' informational needs and attitudes toward information play a more prominent role. These findings suggest that AI-generated summaries may foster heuristic rather than systematic processing of information. The paper is structured as follows: Section 2 presents the literature review and research hypotheses; Section 3 outlines the methodological approach; Section 4 reports the empirical findings; Section 5 discusses key insights, highlighting the shift in eWOM processing dynamics in AI-mediated environments and its implications for theory and practice; finally, Section 6 concludes with a discussion of limitations and avenues for future research.

## 2. Literature Review & Hypotheses Development

### 2.1 EWOM and AI eWOM

eWOM, which emerged with the rise of Web 2.0, refers to any user-generated statement—positive or negative—shared online about products or services (Hennig-Thurau et al., 2004). However, the concept has since expanded to include not only customers but also other actors from those platforms where eWOM occurs, such as media personalities and social media influencers (Daniel et al., 2018; Thorson & Rodgers, 2006). Compared to traditional WOM, eWOM presents several advantages, such as more diverse, abundant, and scalable information (Cheung & Tadhani, 2012), as well as being more dynamic and easily accessible from anywhere at any time (Ismagilova et al., 2017; King et al., 2014; Verma et al., 2023; Xun & Reynolds, 2010). Across the different types of websites and platforms,

eWOM can take place in the form of likes, comments, ratings, reviews, video testimonials, tweets, or blog posts (Babic Rosario et al., 2016; Donthu et al., 2021; Nam et al., 2020) and has acquired higher credibility than traditional media (Cheung & Tadhani, 2012). More specifically, opinions shared online by people who have already purchased a product or experienced a service, known as online consumer reviews (OCRs) (Dwivedi et al., 2021), represent a form of eWOM that has become particularly prominent in online shopping contexts. Hereafter, we will refer to OCRs as online or customer reviews for simplicity reasons. E-commerce platforms like Amazon and online review websites like Tripadvisor allow consumers to share their experiences with past purchases, helping others assess products and services they are considering and make informed buying decisions. As a result, consumers heavily rely on online reviews when shopping on websites, as they help reduce search efforts and risks (Fernandes et al., 2022).

On the other hand, the growing popularity of eWOM has caused a significant increase in the volume of online information. In terms of online reviews, customers may stumble upon hundreds or even thousands of opinions for a single product, making it more challenging to process all the available information and identify the most relevant elements to support purchase decisions. To tackle this issue, some firms such as Amazon, Tripadvisor, and Etsy have started implementing AI within their platforms to help consumers make better decisions. By capitalizing on one of AI's core capabilities, i.e. text summarization, these solutions distill extensive collections of online reviews related to a product or service into concise, easily interpretable summaries. Furthermore, they can categorize customer opinions and identify, for instance, the product attributes most liked or disliked by customers (Koo et al., 2025). Based on the leading online shopping websites that provide such feature, most AI-generated online review summaries include combinations of the following elements: a label serving as a section header, a disclaimer about the content being AI-generated, a summary of all online reviews, and a list of the most mentioned themes across all reviews. This configuration supposedly allows to quickly grasp the overall sentiment and key points without reading many reviews. Nevertheless, it is essential to highlight that these AI-generated summaries work as a supplement and do not replace the real reviews made by consumers, which continue to be entirely available for users to consult.

Given the novelty of such feature, open questions about its effectiveness and reception arise. While these summaries are derived from original customer reviews, an established form of eWOM, it remains unclear whether consumers positively receive synthesis through AI and whether it can impact their decision making. To the best of the authors' knowledge, there is currently no concrete empirical research addressing these issues, likely because of the novelty of such tools. Furthermore, dynamics linked to trust in AI, which can be determined by different variables, including, for instance, socio-ethical and specific individual elements (Bach et al., 2024), may influence the reception and adoption of AI-generated online review summaries. Although related and highly relevant concerns, they fall outside the scope of this specific study, which focuses on the core aspects linked to information characteristics and consumers' behavior towards information.

### 2.2 Information Adoption Model & Information Acceptance Model

This study builds upon the Information Acceptance Model (IACM) proposed by Erkan and Evans (2016), which extends the Information Adoption Model (IAM) developed by Sussman and Siegal (2003) by incorporating elements from the Theory of Reasoned Action (TRA) formulated by Fishbein and Ajzen (1975). More specifically, while the IAM only includes characteristics related to the eWOM information, the IACM expands it by adding variables concerning the individual consumer and their behavior towards information (Erkan & Evans, 2016).

### 2.2.1 Information Adoption Model

The IAM was developed based on the integration of the Technology Acceptance Model (TAM) by Davis (1989) and the Elaboration Likelihood Model by Petty & Cacioppo (1986). On one hand, the TAM explains the acceptance of information systems and technology by including concepts such as "perceived usefulness" (Erkan & Evans, 2016; Wang, 2016). However, it neglects the social processes involved in information development and implementation (Riffai et al., 2012). To overcome this limitation, the Elaboration Likelihood Model (ELM) (Petty & Cacioppo, 1986) explains how individuals are affected by the information within the message through a dual process. More specifically, it posits that informational influence occurs in the central and peripheral routes. While the central route concerns the core of the message, the peripheral one represents those issues indirectly related to the core of the message (Cheung et al., 2008; Erkan & Evans, 2016; Petty & Cacioppo, 1986). With these premises, the IAM is composed of four constructs, namely argument quality, source credibility, information usefulness and information adoption, as shown in Figure 1 (Fig. 1). Over time, this model has revealed to effectively fit eWOM studies, being conceived to observe information on computer-mediated communication platforms (Erkan & Evans, 2016). Over time, the IAM has been used in different eWOM contexts, from online customer communities (Cheung et al., 2008) to online reviews (Leung, 2020; Tapanainen et al., 2021).

On the other hand, the IAM presents one limit. Indeed, it only considers characteristics of the information itself, namely quality, credibility, and usefulness. To make up for this flaw, Erkan and Evans (2016) have developed the IACM, which merges the original IAM with elements from the TRA, adding variables related to consumer behavior towards eWOM information.

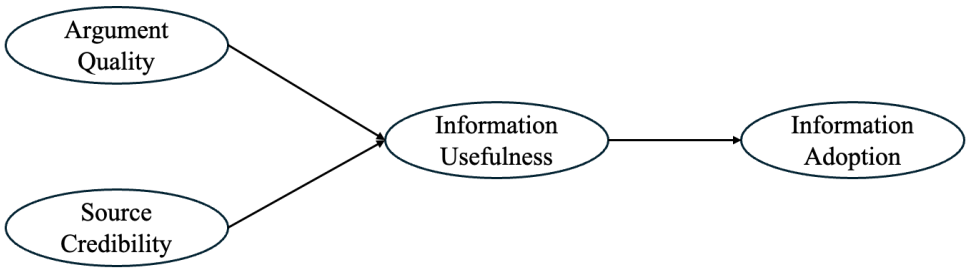

**Figure 1:** Information Adoption Model (Source: Sussman & Siegal, 2003)

### 2.2.2 Information Acceptance Model

Based on Erkan and Evans' argument (2016), the characteristics of eWOM information are not enough to explain how eWOM influences consumers' purchase intention. Hence, the behavior of consumers towards eWOM information is an essential element that should be included. Drawing on Fishbein and Ajzen's (1975) Theory of Reasoned Action, the IACM also includes attitude and behavioral intention. Indeed, the IACM extends the IAM to purchase intention and adds attitude as one of its predictors, which is in line with the TRA. Hence, while the components from the IAM concern the characteristics of eWOM information, the TRA variables are related to consumers' attitude towards information. The original IACM from Erkan and Evans (2016) is composed of the following variables: information

quality, information credibility, needs of information, attitude towards information, information usefulness, information adoption, and purchase intention (Fig. 2).

In its original study (Erkan and Evans, 2016), the IACM was tested to observe the determinants of eWOM information influencing purchase intention in social media. While it has been known for a long time that eWOM can indeed have an influence on the purchase intention of consumers (Chan & Ngai, 2011; See-To & Ho, 2014), the results have further shown that in social media, both characteristics of eWOM information and consumers' behaviours towards eWOM information have a positive impact on purchase intention, except for the relationship between attitude towards information and information usefulness. Over the years, the model has been tested in different contexts and with proper extensions (e.g., Ngarmwongnoi et al, 2020; Park, 2020; Singh et al., 2025). Cuong (2024), for instance, tested the IACM for eWOM on e-commerce websites, concluding that information usefulness is influenced both by information characteristics and behavior towards information.

With the advent of a new form of eWOM, originating from consumer reviews but generated by AI, new questions arise regarding how this information will be received and eventually adopted by consumers (Akbari et al., 2022). For this study, the IACM will be tested to assess which variables of AI-generated online review summaries can impact information adoption and purchase intention. The choice of the IACM is motivated by the fact that it considers multiple dimensions related to information adoption, specifically characteristics of the information and individual's behaviour towards information. This dual perspective may prove to be relevant in the AI context. Indeed, since AI has synthesized the information, credibility and usefulness may be evaluated differently and may have a different impact on information usefulness and consequently, adoption and purchase intention. Furthermore, the response to AI-generated online review summaries may also vary depending on an individual's attitude towards eWOM information.

## 2.3 Hypotheses

### 2.3.1 Information Quality and Information Credibility

In traditional eWOM contexts, given that any user is free to generate eWOM information online, the quality and credibility of information becomes highly important (Erkan & Evans, 2016; Xu, 2014). On one hand, information quality measures the efficiency of an informative communication's message (Cuong, 2024) and represents the perceived value of the information, judged by other users (Yeap et al., 2014). Furthermore, it was found that consumers approach a product or service more eagerly when their information demands are satisfied (Olshavsky, 1985). Hence, it involves the way the information may influence the consumer's purchase intention (Ismagilova et al., 2020). Previous research has indeed shown that the information quality of online reviews has a positive effect on the usefulness (Peres & Silva, 2021; Sànchez Torres et al., 2018) and consumers' purchase intention (Lee & Shin, 2014; Park et al., 2007; Reddy et al., 2022). The IACM states that eWOM information quality is positively related to information usefulness (Erkan & Evans, 2016). Regarding the object of this study, specifically AI-generated online review summaries, the authors aim at testing the same hypotheses from the original IACM model within this new context, presuming that the same implications of traditional eWOM are also valid for AI-generated forms of eWOM. Therefore, the first hypothesis states that:

*H1: The information quality is positively related to the information usefulness in AI-generated online review summaries.*

On the other hand, credibility of information, which refers to its dependability and trustworthiness perceived by a person, is considered crucial in the initial stages of persuasion (Ismagilova et al., 2020;

Wathen & Burkel, 2002). Research has shown that information credibility is linked to purchase intention and information adoption (Nabi & Hendriks, 2003; Prendergast et al., 2010), along with information usefulness according to the IAM (Erkan & Evans, 2016). Thus, following the IACM:

H2: *The information credibility is positively related to the information usefulness in AI-generated online review summaries.*

### 2.3.2 Needs of Information & Attitude towards Information

Needs of information and attitude towards information represent the customer behaviour of consumers towards eWOM information (Erkan & Evans, 2016). Need for information drives seeking guidance (Hennig-Thurau et al., 2004), as buyers may look for comments or opinions about products, for instance, before purchasing (Leong et al., 2021; Peres & Silva, 2021). Indeed, clients are more likely to make online purchases when actively searching for product information (Tjongirin et al., 2020). Erkan & Evans (2016) added needs of information into the IACM arguing that people seeking information - in their case in social media – have a higher chance of finding useful information that would lead them to purchase. In AI-generated online review summaries, such information needs may be more easily satisfied when AI supports information retrieval by summarizing the vast quantity of online reviews published. Hence:

*H3: Needs of Information positively influences Information Usefulness in AI-generated online review summaries.*

Attitude towards eWOM information, on the other hand, draws on the TRA (Fishbein & Ajzen, 1975), referring to a consumer's predisposition to use eWOM information for a purchasing behaviour. According to Erkan & Evans' IACM (2016), attitude towards information is linked to the information usefulness and purchase intent. Moreover, further theories, namely the Theory of Planned Behavior (Ajzen, 1991) and the TAM (Davis, 1989), support the relationship between attitude and behavioural intention. Therefore:

*H4: Attitude towards Information positively influences Information Usefulness in AI-generated online review summaries.*

*H5: Attitude towards Information positively influences Purchase Intention in AI-generated online review summaries.*

### 2.3.3 Information Usefulness

As individuals look for information perceived as useful to them (Cuong, 2024), information usefulness represents consumers' perception that using the information will boost their performance (Cheung et al., 2008). Hence, the adoption of information is more likely to occur if other users' opinions are considered valuable (Cuong, 2024; Erkan & Evans, 2016; Leong et al., 2021). AI-generated online review summaries aim to help consumers by creating digestible summaries of large quantities of online reviews and sorting out the main product dimensions discussed. With these considerations:

*H6: Information Usefulness positively influences Information Adoption in AI-generated online review summaries.*

### 2.3.4 Information Adoption & Purchase Intention

In the eWOM domain, information adoption pertains to the process of providing consumers with helpful information to be used as a resource for future purchases (Hussain et al., 2017; Moradi & Zihagh, 2022; Shen et al., 2016). As posited by H6, when information is perceived as useful, this may result in adopting such information. Thus, if AI-generated online review summaries provide valuable insights in the eyes of consumers, this information is more likely to be accepted and used to evaluate

an online purchase. Indeed, adopting eWOM information has resulted in higher chances of buying intentions (Sànchez Torres et al., 2018). Moreover, Erkan & Evans (2018), following their study on social media platforms (2016), found that anonymous reviews on shopping websites have an even greater impact on purchase intention than opinions posted by acquaintances on social media. With these premises, and since AI-generated online review summaries draw on this type of eWOM, the following hypothesis is posited:

*H7: Information Adoption positively influences Purchase Intention in AI-generated online review summaries.*

The final model tested in this study is shown in Figure 2 (Fig. 2).

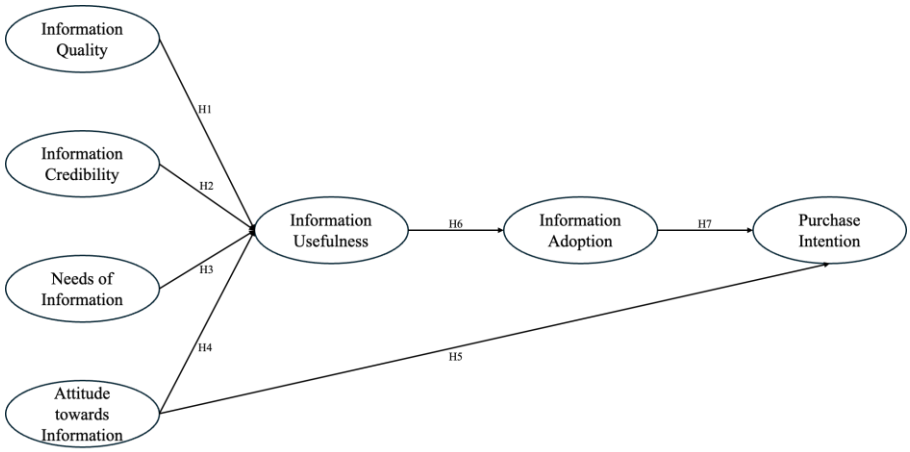

**Figure 2:** Information Acceptance Model

## 3. Methodology

The study aims to understand which variables of AI-generated online review summaries influence information adoption and consumers' purchase intentions by testing the IACM.

Data was collected using a web-based questionnaire administered via social media to online shoppers belonging to Gen Z. Gen Z online shoppers are digital natives, who are characterized by a deep integration with technology, constant online connectivity and by a search for authenticity and sustainability in their shopping journey (Francis & Hoefel, 2018; Priporas et al., 2017; Turner, 2015). Moreover, previous studies show that Gen Z is more optimistic and inclined to accept AI (Babu et al., 2024; Chan et al., 2023). Therefore, this study focuses on Gen Z online shoppers as a suitable sample for assessing the impact of AI-based eWOM on customer purchase intention.

The questionnaire, in which respondents self-reported their answers, was developed and divided into two sections. The first section was dedicated to the study constructs, while the second part was dedicated to the respondents' demographic characteristics.

From May to June 2025, 153 questionnaires were returned in a completed form.

The study uses a five-point Likert scale to measure all the constructs' items. Based on the research of Park et al. (2007), the study adapts and measures Information Quality and Attitude towards

Information using a three-item scale for each. By adapting the scale proposed by Prendergast et al. (2010), the study investigates Information Credibility using a four-item scale. Drawing from Chu and Kim (2011), the study adapts and measures Needs of Information using a two-item scale. Moreover, the study adapts and uses three-item scales to measure Information Usefulness (Bailey and Pearson, 1983; Cheung et al., 2008; Erkan and Evans, 2018; Gökerik et al., 2018) and Information Adoption (Cheung et al., 2009). Finally, the study uses a four-item scale to measure purchase intention by adapting the scale proposed by Coyle and Thorson (2001).

The structural equation modeling (SEM) technique was performed using LISREL 8.80 to empirically test the proposed conceptual model.

## 4. Results

### 4.1 Measurement model

To assess the reliability, convergent validity, and discriminant validity of each construct, the study checks for Cronbach's alphas (CA) and confirmatory factor analysis (CFA) by using SPSS and LISREL 8.80 (Anderson and Gerbing, 1988; Jöreskog and Sörbom, 2006).

All the Cronbach's α values are greater than 0.70, suggesting acceptable reliability of each of the study's constructs (Bagozzi and Yi, 1988; Nunnally and Bernstein, 1994).

Furthermore, the convergent and the discriminant validity of each of the study's constructs are supported. All item loadings are greater than the recommended threshold of 0.50 (Hair *et al.*, 2013), all the composite reliability values (CR) are higher than the minimum threshold of 0.70 (Bagozzi and Yi, 1988; Nunnally and Bernstein, 1994), and all the average variance extracted values (AVE) exceed the recommended threshold of 0.50 (Fornell and Larcker, 1981), except for information credibility. The AVE value of the information credibility construct is 0.487, which, according to Fornell and Larcker (1981), still corresponds to acceptable convergent validity. Table 1 shows reliability and CFA results.

| **Constructs** | **α** | **CR** | **AVE** |
|---|---|---|---|
| Information Quality | 0.803 | 0.816 | 0.598 |

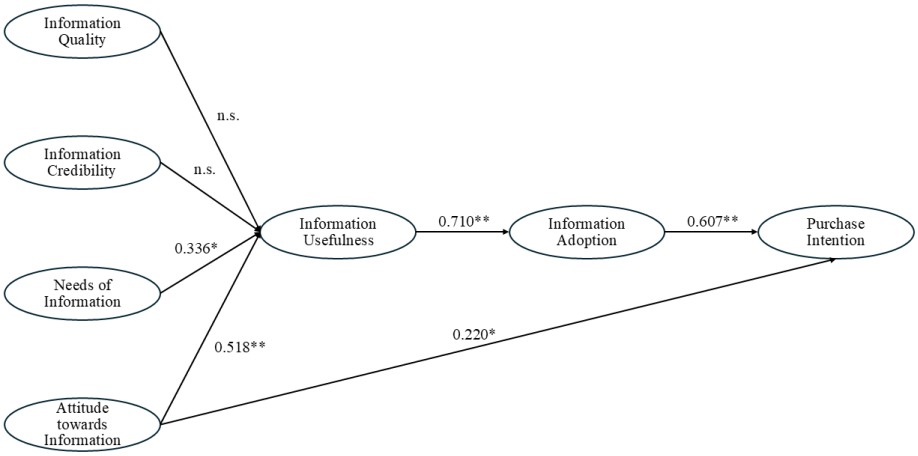
| Purchase Intention | 0.827 | 0.821 | 0.536 |

**Table 1:** CFA – Reliability, convergent, and discriminant validity examinations

### 4.2 Structural model

The structural model's fit is acceptable, with $\chi 2$ 361.479; degrees of freedom 196; $\chi 2/df$ 1,844; root mean square error of approximation 0.0699; comparative fit index 0.962; standardized RMR (SMRM) 0.082; and all items loading significantly on their assigned latent constructs.



The study's findings reveal that information quality and information credibility seem not to directly affect information usefulness ($\gamma = 0.214$, $t = 0.814$; $\gamma = 0.060$, $t = 0.278$), rejecting H1 and H2. The relationships between the need for information and information usefulness and between attitude toward information and information usefulness are positive and significant ($\gamma = 0.336$, $t = 2.453$, $p < 0.05$; $\gamma = 0.518$, $t = 5.826$, $p < 0.01$), supporting H3 and H4. Furthermore, information usefulness exhibits a positive and significant influence on information adoption ($\beta = 0.710$, $t = 7.935$, $p < 0.01$), supporting H6. About purchase intention, both information adoption and attitude toward information positively and significantly affect purchase intention ($\beta = 0.607$, $t = 6.337$, $p < 0.01$; $\gamma = 0.220$, $t = 2.550$, $p < 0.05$), supporting H7 and H5.

Table 2 shows the results from the SEM analysis, namely the relationships among constructs, overall explanatory power, completely standardized coefficients, and t-values.

Finally, the structural model explains 66.3% of the variance in information usefulness (R2 = 0.663), 50.5% in information adoption (R2 = 0.505), and 53.1% in purchase intention (R2 = 0.531) (Figure 3).

| **Path** | **Completely std β and γ** | **t value** | **Hypotheses test** |
|---|---|---|---|
| *H1:* Information Quality → Information Usefulness | 0.214 | 0.814 | Not Supported |
| *H2:* Information Credibility → Information Usefulness | 0.060 | 0.278 | Not Supported |
| *H3:* Needs of Information → Information Usefulness | 0.336 | 2.453* | Supported |
| *H4:* Attitude towards Information → Information Usefulness | 0.518 | 5.826** | Supported |
| *H5:* Attitude towards Information → Purchase intention | 0.220 | 2.550* | Supported |
| *H6:* Information Usefulness → Information Adoption | 0.710 | 7.935** | Supported |
| *H7:* Information Adoption → Purchase intention | 0.607 | 6.337** | Supported |

## 5. Discussion

Based on the results from the IACM structural model, information quality and information credibility surprisingly do not significantly influence information usefulness. As these elements represent the variables related to the characteristics of the information itself, such result are not in line with the expectations and previous findings on eWOM's impact on adoption and purchase intention (e.g. Cuong, 2024; Erkan & Evans, 2016; Sànchez Torres et al., 2018). This implies new avenues for eWOM research within the context of AI's advent as a future key actor in consumer decision making. Although further studies and validation are needed, these results may be related to the nature of GenAI as a supporting tool for consumers. Indeed, the advantage of this technology lies in aiding decision making through reduced cognitive cost/effort (Zhang et al., 2024), as it tries to understand consumers' needs and provide alternative ways to sort information (Gupta & Mukherjee, 2025). Hence, the usefulness and subsequent adoption of information from AI-generated review summaries may stem from needs different from traditional eWOM, more specifically, online reviews. Traditional anonymous online reviews shared on shopping websites are appreciated for several reasons, such as quantity of information, detailed information, as well as dedicated information (Erkan & Evans, 2018). These mentioned aspects may relate to the quality and credibility of the received information, at the cost of scrolling through a large quantity of online reviews and higher cognitive effort. In this regard, the aim of AI-generated online review summaries significantly reduces cognitive effort. Chaiken & Ledgerwood (2012) propose two types of information thinking: systematic and heuristic. The first type occurs when an individual can and wants to devote a certain amount of attention to an issue, to understand lots of information through deep thinking, effort, and intensive reasoning, as may be the case of a consumer spending some time to know more about an item through online reviews. On the other hand, heuristic processing is less demanding in cognitive effort and depends less on the ability and motivation to think about information carefully. Its judgment focuses on heuristics, intuitive and straightforward rules that function as shortcuts to decrease thinking. In this sense, AI-generated online review summaries reduce the need for information elaboration, offering speed and convenience,

favoring heuristics-based judgement rather than intense cognitive effort. Hence, AI-generated online review summaries may act as an enabler of heuristic processing, as consumers' attention shifts from the content itself to the way their information need is efficiently met.

Furthermore, needs of information show to positively influence information usefulness, in line with previous research on other traditional eWOM types (Cuong, 2024; Erkan & Evans, 2016; Sànchez Torres et al., 2018). Indeed, the greater the need for information, the more the information will be perceived as useful in the eyes of a consumer (Cuong, 2024). Moreover, attitude towards information also reveals a positive relation with information usefulness, contrary to Erkan & Evans' findings (2016). However, context may influence this relation, as the mentioned study's setting was social media. For instance, Cuong (2024) examined online reviews on e-commerce platforms and found that attitude towards information does indeed have a positive influence on information usefulness. Furthermore, the arguments regarding AI-generated online review summaries triggering heuristic processing may support these results, suggesting that consumers may engage with such feature primarily for practical and goal-oriented reasons, rather than to analyze information in depth. Attitude towards information also positively influences purchase intention, which is in line with previous findings (Cuong, 2024; Erkan & Evans, 2016; Sànchez Torres et al., 2018).

Finally, information usefulness positively impacts information adoption, which in turn has a positive influence on purchase intention. Hence, as confirmed by previous findings, information adoption is favored when the information from others' opinion is considered useful and valuable (Cuong, 2024; Erkan & Evans, 2016; Leong et al., 2021), also in the case of summarization by GenAI. Consequently, when information is acknowledged, consumers will have more knowledge, which can be used as a resource for an eventual purchase (Hussain et al., 2017; Moradi & Zihagh, 2022; Shen et al., 2016). Hence, adopting useful eWOM helps consumers develop an opinion about a specific product, which impacts their purchase intention (Bae et al., 2017; Tien et al., 2018).

To sum up, while the IACM remains a valid framework for evaluating eWOM adoption and purchase intention dynamics, the relevance of its components is reshaped when AI is involved as a facilitator of information retrieval and processing. In AI-generated online review summaries, consumer behaviour towards information appears to prevail in determining information usefulness, adoption, and purchase intention, compared to the properties of the information message itself. These insights may suggest that AI-generated online review summaries are processed more heuristically than systematically, which could be caused by prioritizing efficiency and accessibility over message scrutiny. Thus, information quality and credibility may become less influential in this new context.

## 6. Conclusions

This study sought to investigate the drivers of eWOM information adoption and purchase intention in the context of AI-generated online review summaries, using the IACM as the guiding framework. The findings contribute to the literature on how AI may reshape eWOM dynamics and consumer decision making in digital environments.

The results reveal a significant shift from traditional predictors of information usefulness — such as quality and credibility — toward behavioral and attitudinal factors, particularly information needs and attitudes toward eWOM. Indeed**,** while prior literature has consistently highlighted information quality and credibility as key drivers of eWOM adoption and purchase intention (Cuong, 2024; Erkan & Evans, 2016; Ismagilova et al., 2020; Verma et al., 2023), the findings of this study indicate that, within AI-mediated contexts, the predictive influence of these variables may be not significant. On the other

hand, aspects linked to consumers' behavior towards information, specifically needs of information and attitude towards information, emerge as more significant predictors of perceived usefulness and the subsequent behavioral outcomes of information adoption and purchase intention. This shift can be interpreted through the lens of heuristic information processing (Chaiken & Ledgerwood, 2012), suggesting that the adoption of AI-generated online review summaries may be driven by consumers' preference for efficiency and convenience over systematic evaluation. These findings underline the need to revisit and adapt the current theory about eWOM to reflect the new implications of AI-generated content consumption.

These results have important implications for both researchers and practitioners. Theoretically, they challenge existing models of eWOM by calling for an update that accounts for AI's role in shaping information reception and consumers cognitive processing. Managerially, the findings suggest that firms implementing AI-based summaries should focus on user experience and the perceived utility of synthesized information rather than merely emphasizing the credibility of original reviews.

As AI becomes increasingly embedded throughout the customer experience, future research should further investigate how technological design can be aligned with users' expectations, while also accounting for the contextual factors that shape interactions between AI systems and consumers. In this sense, the current findings provide a helpful starting point for new research endeavors. For instance, other consumer groups may be considered. Moreover, the generalizability of the results may be limited by the fact that this study did not account for contextual factors that could influence the way information from AI-generated online review summaries is processed. Indeed, variables such as product type (Wien & Peluso, 2021) or users' trust in AI (Bach et al., 2024) may influence information adoption and purchase intention processes in AI-mediated contexts.

## Abstract

Instagrammability has emerged as a buzzword in digital marketing, yet its meaning often remains superficial and tied to aesthetic appeal alone. This exploratory study reframes Instagrammability as a multidimensional lens through which social media managers design and evaluate firm-generated content (FGC) on Instagram. Drawing on twelve in-depth interviews with professionals across industries, the study reveals that Instagrammability functions as a context-sensitive decision filter, balancing platform logics, brand identity, and audience resonance. Rather than equating to virality, Instagrammability shapes content that is technically optimized while fostering meaningful, brand-aligned connections within the scroll-intensive Instagram environment. By unpacking the operational compromises and creative strategies behind Instagrammable content, this study advances theoretical clarity on the construct. It offers insights for practitioners seeking to design successful and instagrammable social media content.

*Keywords: instagrammability; social media management; digital marketing; exploratory study; qualitative research.*

### 1. Introduction and overview of literature

Instagram is the third most popular social media platform worldwide, with over 1.6 billion users (Data Reportal, 2025). In terms of usage, one in two active users reports using the platform to discover new brands (IPSOS, 2021). This figure becomes particularly significant when considering that, especially among individuals aged 16 to 34, Instagram is a primary source of brand awareness (Data Reportal, 2025).

Nevertheless, delivering effective marketing communications on Instagram remains a considerable challenge for brands. The platform hosts over 40 billion photos and videos, with approximately 95 million new pieces of content uploaded daily (Lister, 2024), including both user-generated content (UGC) -i.e., content spontaneously created by users - and firm-generated content (FGC) - i.e., product-oriented messages disseminated by companies through their official social media channels (Kumar et al., 2016). Thus, firms are called to develop and implement their ability to craft compelling FGC that captures users' attention, which is crucial for firms seeking to leverage the platform's potential regarding visibility and brand awareness (de Vries et al., 2012).

A growing body of research (e.g., Ballester et al., 2021; Kwon et al., 2022; Pozharliev et al., 2025) has explored the factors that enhance the efficacy of FGC on Instagram. For instance, Pozharliev et al. (2025) demonstrate that incorporating multiple arguments into utilitarian product-related FGC can reduce users' perceived psychological risk, increasing engagement and purchase intention. Similarly, Kwon et al. (2022) examine the role of color, showing that cool tones elicit more positive comments and stimulate a favorable word-of-mouth toward the brand. Ballester et al. (2021) further highlight how if a FGC is perceived as original and entertaining, it can trigger affective engagement, ultimately encouraging positive behavioral responses toward the brand.

Against this backdrop, the notion of Instagrammability has recently gained traction. According to Miguel et al. (2024, p. 1543), instagrammability is "an umbrella term which implies the likelihood of successful engagement levels of any content posted specifically on Instagram, encompassing the characteristics of successful content on the platform, most notably the tailoring of content to suit features and algorithms specific to the Instagram platform, to appeal to a given audience that is active on Instagram, the overall quality of media presented and the acknowledgment of qualities specific to a particular online community."

Prior studies have examined what makes content Instagrammable, analyzing its features in specific domains such as food (e.g., Miguel et al., 2024), leisure (e.g., Arts et al., 2022), and tourism and hospitality (e.g., Dragin-Jensen et al., 2024; Liu & Li, 2021). These investigations highlight key attributes, such as environmental styling (Campbell et al., 2022), aesthetic appeal (Liu & Li, 2021), and perceived authenticity (Arts et al., 2022), as drivers of Instagrammability.

However, three main limitations emerge from the existing literature on Instagrammability. First, most studies focus on engagement dynamics and users' responses to content viewing. In this regard, Instagrammability may conceptually overlap with the notion of virality. According to Mills (2012, p. 163), viral marketing refers to "the strategic release or seeding of branded content into the socially networked online consumer ecosystem, followed by the potentially multiplicative spread of the content through the ecosystem as hosts (consumers) receive the content and are motivated to share the branded content with other consumers". The author identifies four key drivers of virality: (a) spreadability, or the content's likability and shareability; (b) propagativity, or the ease of dissemination; (c) integration, or amplification through multi-platform strategies; and (d) nexus, or the progressive reinforcement of a campaign via a sequence of viral content. These overlapping features blur the boundaries of Instagrammability, weakening its theoretical precision.

Second, prior studies (e.g., Dragin-Jensen et al., 2024; Liu & Li, 2021; Miguel et al., 2024) examine Instagrammability considering UGC or influencers-generated content - third-party actors who have cultivated extensive relevance among organizational stakeholders through content creation, distribution, interaction, and online visibility (Enke & Borchers, 2021). Consequently, the findings may not be generalizable to FGC, which is typically constrained by brand guidelines and strategic consistency yet still aims to engage audiences effectively.

Third, existing studies are essentially context-specific. As acknowledged by various authors (e.g., Miguel et al., 2024), prevailing explanations related to Instagrammability are often confined to narrow domains, such as food, leisure, or tourism, thereby limiting the theoretical generalizability of the concept.

In response to these limitations, the present study aims to redefine the concept of Instagrammability, specifically about FGC, by identifying its distinctive features and clarifying its boundaries vis-à-vis

related constructs, such as virality. Moreover, this research aims to identify the core characteristics that make FGC instagrammable, regardless of specific industry sectors, thereby providing a broader and more theoretically robust conceptualization.

The central research question guiding this study is: How is the concept of Instagrammability constructed and interpreted in firm-generated content posted on Instagram, regardless of the relevant product sector? By addressing this question, the study contributes to advancing theoretical understanding of FGC effectiveness on social media platforms, particularly within the distinctive affordances of the Instagram ecosystem.

## 2. Methodology

Given the exploratory focus of this research and the limited prior investigation of the topic, a qualitative approach was deemed most suitable (Creswell, 2009), providing an effective means for generating new insights (Eisenhardt, 1989). To conceptualize Instagrammability, the authors conducted semi-structured interviews with social media managers, primarily recruited through the National Association of Social Media Managers (ANSMM), between May and June 2025. This ensured access to professionals actively creating and managing Instagram content across various industries. Before the interviews, participants were asked to share examples of content they considered Instagrammable. These examples served as discussion prompts during the interviews, enabling participants to reflect on concrete practices and interpretations of Instagrammability.

Interviews were conducted via Zoom, recorded with participants' consent, and transcribed verbatim. Each session lasted between 30 and 75 minutes, allowing participants to elaborate on their perspectives while ensuring a comprehensive exploration of key themes. Anonymity and confidentiality were guaranteed, with participants informed that anonymized excerpts might be used in academic publications. Data saturation was reached after the twelfth interview, as no new themes or significant insights emerged in the final sessions (Braun & Clarke, 2021).

The authors employed a reflexive thematic analysis for data analysis (Braun & Clarke, 2006). After reading all transcripts multiple times to facilitate familiarity with the data, each researcher independently and inductively generated initial codes and refined them collaboratively through iterative discussions to ensure consistency and a shared understanding of emerging patterns. Investigator triangulation was applied to enhance the credibility of the analysis and mitigate individual bias. Through this process, the authors identified core themes reflecting how social media managers interpret and apply the concept of Instagrammability when designing and evaluating FGC.

## 3. Preliminary results and discussion

The findings indicate that Instagrammability, as defined by the social media managers interviewed, is not regarded as an inherent property of FGC or the level of engagement it will stimulate (Miguel et al., 2024), nor as a merely aesthetic or technical attribute tied to the product or its digital representation. Instead, it seems to be a "strategic process" of FGC encoding, intentionally activated by an organization (or its intermediaries), aimed at conveying a message aligned with the brand and enhancing its value within the specific logic of the Instagram platform and its audience, as well as that of the brand itself.

From this perspective, Instagrammability emerges as a multidimensional concept that guides the design of digital FGC. Far from being a singular or rigidly defined category, it functions as a mobile evaluative

lens that social media managers employ to make effective communicative decisions in an environment marked by intense symbolic and visual competition.

Based on the qualitative analysis, five core dimensions through which Instagrammability is constructed and enacted within the context of FGC can be identified:

Decision filter: Instagrammability operates as a pre-publication evaluative framework. In other words, it is suggested to be a form of design thinking that informs decisions about what to post, how to post it, and when to post it. Social media managers use it to anticipate how content will be received, assessing its alignment with audience expectations and the platform's algorithmic logics.

Compositional assemblage: Instagrammable FGC is not defined by a single trait (e.g., visual appeal) already identified in the literature (e.g., Arts et al., 2022; Liu & Li, 2021) but instead emerges from the coherent assemblage of multiple elements (visual, textual, auditory, and emotional). Its effectiveness is measured by the ability to create an integrated and recognizable experience for the user engaging with the FGC.

Situated practice: Instagrammability is suggested to be a context-dependent practice, and what "works" varies by sector, audience type, and the specific characteristics of a given Instagram channel (Miguel et al., 2024). In addition, the results seem to suggest that this practice is related to the "hic et nunc": the FGC's ability to capture a moment that resonates meaningfully with individuals. Therefore, the same image may be highly Instagrammable in one context and time and entirely ineffective in another.

Brand performativity: FGC deemed Instagrammable should also effectively present the brand's identity in a clear, coherent, and compelling manner. Instagrammability, thus, becomes a semiotic tool for reinforcing the brand's positioning, values, and recognizability within users' feeds.

Operational compromise: Decisions regarding Instagrammability seem to arise from ongoing negotiations between creative intent and organizational constraints. External pressures, time limitations, resource scarcity, and bureaucratic rigidity within the organization all significantly influence what social media managers can produce and publish.

Therefore, in this exploratory research, Instagrammability emerges as a complex and situated construct, enabling professionals to strike a dynamic balance between what technically performs on the platform and what resonates socially with the brand's target audience. Thus, Instagrammability does not equate to virality, but instead represents a necessary, though not sufficient, starting point for broader processes of FGC diffusion. However, this final dimension warrants further investigation.

Within this context, social media managers seem not to evaluate the success of Instagrammable content based on absolute metrics such as virality or views. Instead, they assess it in relation to the organization's strategic objectives: brand awareness, sales, engagement, education, and relationship-building.

## 4. Conclusion and future research

This exploratory study suggests that the concept of Instagrammability may not be directly linked to engagement performance on social media platforms. By contrast, this concept appears to represent a multi-level construct that enables the creation of FGC-capable content, within specific contexts of time and space, that engages users by fostering novel and original consumption experiences of such content.

The study, which is still ongoing, presents certain limitations, including the nationality of the respondents (Italian) and their professional role (limited to social media managers). However, these limitations highlight potential gaps that future research could address—for instance, by incorporating social media, marketing, and brand managers from non-Italian companies. Moreover, this study may offer practitioners valuable insights into designing Instagrammable FGCs to achieve their business outcomes. However, to achieve this, further analysis and in-depth examination of the data are essential.

## Abstract

This study explores consumer preferences for services provided by online grocery shopping (OGS) platforms, aiming to uncover cross-cultural similarities and differences between Italian and U.S. users. Drawing on a quantitative survey conducted in both countries, the analysis applies multivariate statistical techniques to segment consumers according to key sociodemographic and behavioral factors. The results reveal how cultural and usage patterns influence service expectations and priorities in digital grocery environments. By adopting a comparative and segmentation-driven approach, this research contributes to the e-grocery literature and offers practical guidance for tailoring personalized service strategies across diverse international markets.

*Keywords: online grocery shopping, consumer preferences, cluster analysis, segmentation*

### 1. Introduction

The global Food & Grocery (F&G) e-commerce market showed a substantial growth of 22.8 per cent in 2024, attaining a value in excess of $680 million. F&G e-commerce penetration in the European market is consistent with that of the global market, with per capita spending reaching over $359 million (Netcomm, 2024). It is projected to undergo considerable growth during the five-year period 2025-2029, with forecasts indicating a surge to over $491 million.

This positive trend can be attributed to changes in the lifestyle and consumption patterns of the population, which now recognizes a number of advantages in online shopping: the possibility to compare numerous products, which are not always available in physical shops, to shop at any time of the day and receive them directly at home, and the associated, potential savings in time and money (Shankar et al., 2003; Chu et al., 2010). The extant literature has highlighted how cultural, socio-demographic, regulatory and technological differences between countries significantly influence consumers' perceptions of the usefulness, risk and value associated with online grocery shopping (OGS) services, as well as the related shopping attitudes and behavior (Hood et al., 2020; Jiang et al., 2024; Olumekor et al., 2024).

However, despite the increasing focus on the role of context, there remains a paucity of in-depth comparative studies between culturally and digitally heterogeneous markets. Authors have so far paid

little attention to the integration of consumption preferences and socio-demographic variables from a cross-national perspective.

This evidence underscores the necessity to conduct investigations that extend beyond the analysis of individual markets, thereby facilitating a more profound comprehension of the moderating influence of geographical context on behavioral patterns associated with the use of OGS services.

In view of the aforementioned considerations, this study aims to analyze the distribution of preferences of users of OGS services in relation to frequency of use, gender, age group, educational qualification and professional status, comparing Italian consumers with US consumers.

In Italy, the online F&G market was valued EUR 4.6 billion in 2024, experiencing a 6.2% increase compared to the previous year. This growth accelerated in the two-year period 2020-2022, when the share of buyers increased by 32%, partly due to the driving effect of the pandemic (Netcomm, 2023; 2024).

In contrast, the United States market is projected to exceed USD 257 billion in estimated revenues for 2024, with a growth forecast that is expected to reach over USD 422 billion by 2028. This is supported by a base of approximately 138 million active consumers (ExportUSA, 2025).

The comparison between the two countries is particularly relevant as they represent markets characterized by different levels of digital maturity, food e-commerce penetration and online shopping habits. This diversity offers a valuable opportunity to explore the similarities and differences in OGS-related shopping behavior.

The objective of this study is twofold: firstly, to contribute theoretically to the understanding of the factors influencing OGS adoption in different geographical contexts; secondly, to offer practical insights that are useful for more accurate market segmentation and greater customization of the offer. It is imperative for companies to comprehend the variances in attitudes, values and expectations that exist among different generations and geographical locations. This profound understanding enables them to refine their strategic approaches, thereby facilitating more targeted customer journeys.

From a methodological perspective, this study adopts a quantitative and exploratory design, which combines descriptive statistics, exploratory factor analysis, and clustering to segment consumers based on their attitudes and preferences toward online grocery platforms.

## 2. Theoretical Background

Concurrently with the rapid growth of OFD, there has been a marked increase in the academic community's interest in the phenomenon (Khalek et al., 2024; Wolniak et al., 2024; Monoarfa et al., 2024). The extant literature has focused particularly on product and seller characteristics that influence purchase intention (Chu et al., 2010; Sheehan et al., 2019). According to several authors the primary attributes which determine customer satisfaction in the context of online food shopping are as follows: the ease of use of the e-commerce platform (Tomar, 2023); the completeness and clarity of product information (Prastito & Wardi, 2024); the convenience of the offer (Eriksson & Stenius, 2023); the breadth of the assortment (Eriksson & Stenius, 2023; Maltese et al., 2021); delivery flexibility (Eriksson & Stenius, 2023); site design (Daffodil & De Rose, 2023); and customer service quality (Singh & Söderlund, 2020). As Daffodil and De Rose (2023) contend, the integration of an intuitive interface, expeditious web loading, the existence of reviews and ratings, the presence of high-quality images and detailed descriptions serve to construct a personalised shopping experience. This, in turn, has the

capacity to engender heightened customer engagement, which consequently results in an increase in sales.

In addition to this, the extant literature on consumer behaviour in OGS has investigated the impact of situational conditions on online purchasing behaviour (Hand et al., 2009). In recent years, an increasing number of studies have highlighted how cultural, socio- demographic, geographical and infrastructural differences profoundly affect the perception of utility, risk and value associated with OGS services, significantly influencing consumer attitudes and behaviour. The geographical dimension, in particular, has been identified as a crucial factor in several contexts. In Great Britain, Hood et al. (2020) emphasize the role of location and spatial infrastructures in shaping the utilization of services, noting distinctions in adoption between home delivery and click & collect models that are contingent on population density and spatial characteristics. A similar phenomenon is observed in Belgium, where Beckers et al. (2022) demonstrate that the adoption of e-commerce exhibits significant variations between urban and rural regions. This finding underscores the pivotal role of spatial dynamics in the propagation of the online channel.

These aspects are closely intertwined with socio-economic dimensions. Research conducted in the United States (Olumekor et al., 2024) and in Italy (Dominici et al., 2023) highlights the influence of factors such as income, age, household composition, Internet access and familiarity with digital technologies in determining online purchasing choices. In this sense, digital infrastructure and level of digital literacy not only enable or constrain access to services but also contribute to outlining highly heterogeneous adoption profiles even within the same country.

Variability also assumes a cultural dimension. Through a comparison of Chinese and Korean consumers, Jiang et al. (2024) demonstrate how cultural values, expectations and priorities profoundly shape perceptions of the value of OGS and, consequently, purchase preferences. Conversely, in emerging markets, factors such as trust in the system, available supply, and local social norms may act as barriers or catalysts for adoption (Al Nawayseh & Balachandran, 2023).

The extant literature indicates that the adoption of OGS is neither uniform nor universally replicable but rather is deeply situated in the specific contexts in which it occurs. The differences observed at territorial, social and cultural levels therefore suggest the need for analytical and strategic approaches that can intercept the specificities of the target markets and promote more accurate consumer segmentation.

## 3. Methodology

This study investigates cross-cultural differences in consumer preferences for OGS services between Italian and American users. The research design is structured to identify preference patterns, sociodemographic influences, and emergent consumer segments using quantitative and unsupervised learning techniques.

The questionnaire was distributed online via Prolific to individuals residing in Italy and the United States who had used an OGS service at least once. A total of 489 valid responses were collected, evenly split between the two countries (199 each). Each participant evaluated the importance of 21 distinct OGS service features on a Likert scale from 1 (not important) to 9 (extremely important). In addition, respondents provided sociodemographic information including age, gender, education level, occupation, and frequency of OGS platform usage.

The 21 features included in the questionnaire (labeled S1–S21) were identified through a prior content analysis of 20 widely used OGS platforms in the international market (Table 1). Features that appeared in at least 11 of these services were retained, resulting in a robust and representative list spanning traditional (e.g., customer support, delivery speed), functional (e.g., privacy, payment methods), and emerging digital services (e.g., 3D avatars, live chat) (cf. Dholakia et al., 2010; Huang & Oppewal, 2006).

| | |
|---|---|
| S1 | Personal area for product and order management |
| S2 | Pre- and post-sales customer support service |
| S3 | Virtual assistance service with operator or chatbot |
| S4 | Toll-free number |

| S19 | Chat to interact with other customers |
| S20 | Customer care via a mobile instant messaging app |
| S21 | Fast delivery |

**Table 1:** OGS services (Source: Authors' own creation)

To explore consumer typologies, the data were first standardized and subjected to Principal Component Analysis (PCA) to reduce dimensionality. Subsequently, a KMeans clustering algorithm (MacQueen, 1967) was applied to identify groups of respondents with similar patterns of service preference. Visual inspection of the PCA- cluster map and within-cluster variance informed the selection of three clusters. The analysis was performed using Python (v3.10) and the scikit-learn library.

## 4. Results

A heatmap was generated to visualize average ratings for each service feature by country (Figure 1). The following heatmap shows the average rating of each service feature as evaluated by Italian and US respondents. Color intensity reflects the importance attributed to each feature. Distinct patterns are visible, particularly concerning preferences for personalization, privacy, and technological features.

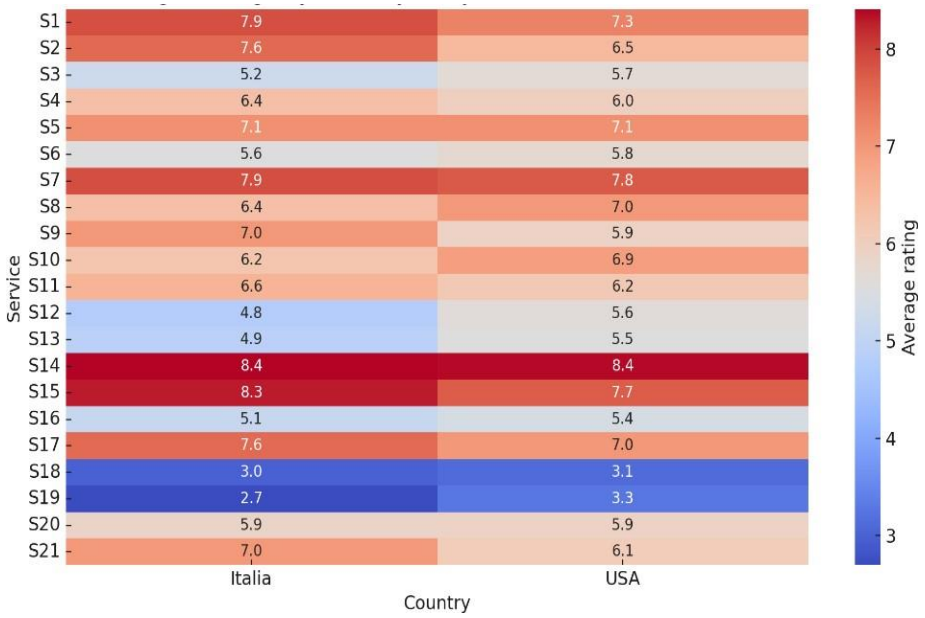

**Figure 1:** OGS Average ratings by Country (Italy vs USA) – Services S1-S21 (Source: Authors' own creation)

Italian respondents attributed higher importance to services ensuring reliability and privacy, such as punctual delivery (S1), order tracking (S3), and data protection (S14). In contrast, American participants displayed stronger preferences for digital interaction and personalization, particularly customer reviews (S10), personalized promotions (S16), and support via mobile messaging (S20). These results align with prior studies indicating greater digital readiness and innovation receptivity among U.S. consumers (Andrews & Bianchi, 2013).

Consumers were segmented into clusters using Principal Component Analysis (PCA) and KMeans clustering based on their responses to the 21 service features. The Figure 2 shows the cluster

membership in 2D PCA space, with colors representing different clusters and shapes distinguishing nationalities.

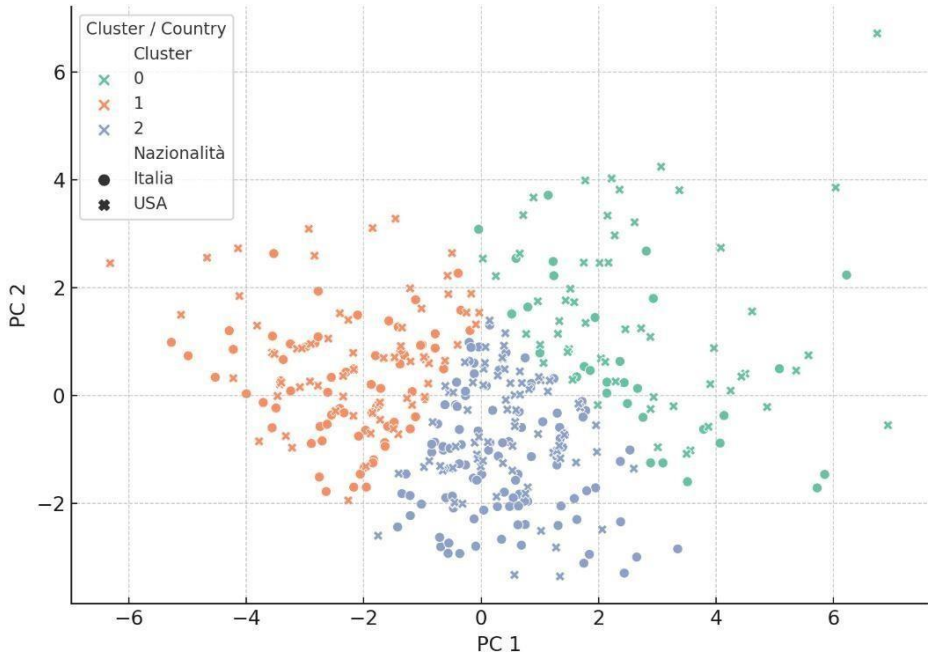

**Figure 2:** Consumer clustering (PCA 2D) – Including Services S1 – S21 (Source: Authors' own creation)

Three distinct consumer profiles emerged:

- *Cluster 0 – Efficient Traditionalists* - This cluster prioritizes core services: reliable delivery (S1), order transparency (S3), and privacy (S14), while expressing limited interest in digital or social interaction tools. The cluster is predominantly composed of Italian consumers (70%), particularly women aged 31–50 with mid-level education (high school or bachelor's degree). Their online grocery usage is occasional. These findings suggest a cultural preference for utility and security, reflecting Italy's more conservative e-commerce landscape (Statista, 2023).

- *Cluster 1 – Digital Innovators* – This cluster is characterized by high enthusiasm for interactive and customized features, this cluster values user-generated content (S10), dynamic promotions (S16), and immersive technologies such as avatars (S18) and live chat (S19). It includes mostly U.S. respondents (65%), younger males (25–30), with high education levels (master's or above), and frequent OGS users. Their profile reflects broader trends in digital adoption and social commerce within the U.S. market (Kumar & Reinartz, 2016).

- *Cluster 2 – Practical Utilitarians* - Members of this cluster express pragmatic preferences centered on product range (S6), discounts (S9), and flexible payments (S13, S15). While open to innovation, their emphasis is on features that directly enhance efficiency and cost-

effectiveness. The group is cross-national, balanced by gender, aged 25–50, and largely composed of employed professionals. Their behavior suggests convergence in functional expectations across markets, consistent with findings on globalization of consumer behavior (Hofstede, 2001). Key cultural distinctions emerged among the two samples. Italians tend to favor simplicity, security, and essential features, while Americans embrace personalization, innovation, and interactivity. The identified clusters provide actionable insights for e- grocery platforms aiming to tailor services across culturally diverse markets.

## 5. Conclusions and implications

This study provides empirical insights into how consumers in Italy and the United States prioritize different service features when engaging in OGS. The findings reveal some national differences in preferences, such as the greater emphasis on reliability and data protection among Italians, and the stronger demand for personalization and digital interaction among Americans, but also commonalities that transcend national borders, particularly among more pragmatically oriented users.

The identification of three distinct consumer clusters (Efficient Traditionalists, Digital Innovators, and Practical Utilitarians) demonstrates the heterogeneity within and across countries. These clusters differ not only in the types of services they value but also in their sociodemographic composition, frequency of use, and openness to digital innovation. Such segmentation confirms that cultural and technological contexts continue to shape how consumers engage with e-grocery platforms.

Furthermore, the emergence of a mixed-nationality, functionally driven cluster suggests that digital transformation is fostering a partial convergence in consumer expectations globally, especially around price sensitivity, service breadth, and convenience. From a practical point of view, this study suggests that e-grocery platforms operating internationally should tailor their service design to cultural preferences. For example, in the Italian market, platforms should emphasize trust-building elements such as transparent order tracking, secure payment methods, and data protection assurances. In contrast, U.S.-focused services may benefit more from offering highly interactive features like customer reviews, chatbot assistance, and AI-driven recommendations. Given the heterogeneity of consumer needs, platforms should consider allowing interface personalization—enabling users to prioritize or hide features according to their preferences. For instance, Practical Utilitarians may prefer a streamlined interface focused on promotions, product comparisons, and payment flexibility.

Moreover, businesses expanding across borders must avoid assuming homogeneity in digital readiness or expectations. Localization efforts should include not only language adaptation but also a reconfiguration of feature offerings in line with culturally specific consumer values.

Finally, the cluster profiles identified in this study could serve as training input for machine learning models used in adaptive recommendation systems. Dynamic segmentation would allow platforms to update user categories based on evolving behavior, thereby improving personalization without intrusive data collection.

## Abstract

Greenfluencers, regarded as significant promoters of sustainable behaviors and eco-friendly consumption, have begun to adopt a dual and, in some respects, controversial approach. They simultaneously encourage the purchase of green products while advocating for reduced consumption (de-influencing), raising questions about the effectiveness and direction of their influence in fostering sustainable consumption. This study investigates the antecedents of consumers' intention to follow the advice of greenfluencers and examines which type of advice - temperance oriented behavior or green purchase behavior - consumers are more likely to adopt.

Using an online survey with 500 Italian consumers who follow greenfluencers, we tested a structural model assessing the influence of trust and similarity on intention to follow the advice, and the subsequent impact of this intention on temperance-oriented behavior and green purchasing behavior. The results support all the research hypotheses, demonstrating how greenfluencers are able to influence followers' decision-making patterns in a two-fold way: encouraging both green purchasing behaviors and underconsumption behaviors.

Theoretically, findings extend the literature by introducing similarity as a key antecedent of behavioral intention in the greenfluencer context and highlighting de-influencing as an important area for further research. Managerially, the study suggests that greenfluencers, brands, and content creators should emphasize temperance oriented communication strategies to more effectively promote sustainable consumption.

*Keywords: Greenfluencers, De-influencing, Sustainable Behavior, Temperance, Underconsumption*

## 1. Introduction

Greenfluencers, also known as eco-influencers (Pittman & Abell, 2021; Bentley et al., 2021), represent a type of social media influencer who has a significant role on promoting sustainable behaviors and eco-friendly choices (Olbermann et al., 2024; Ballestar et al., 2022; Kapoor et al., 2023).

Despite their commitment to sustainability, greenfluencers have recently faced criticism (See Gerrath et al., 2024) because the consumption model they endorse, although centered around the promotion of green products, still reproduces consumerist patterns leading to the consumption of unnecessary goods (Pellegrino & Shannon, 2021; Pellegrino et al., 2022; Townsend, 2024). This raises important

questions regarding the actual effectiveness of greenfluencers' marketing in mitigating unsustainable consumption behaviors (Hudders & Lou, 2023). These contradictions have led some greenfluencers to reassess their communication strategies, adopting de-influencing techniques as part of a more critical and conscious approach to consumption. De-influencing promotes a shift in consumption habits, encouraging followers to critically reflect on their purchasing choices and discouraging the impulsive acquisition of unnecessary goods (Ekvall & Mellberg, 2023). This practice, also called "underconsumption core", is becoming increasingly popular among online users all over the world, who proudly display their commitment to more moderate consumption. By combining de-influencing with green products promotion strategies, greenfluencers exhibit a dual behavior: on one hand, they encourage a more temperate consumption (Gupta & Sheth, 2024) and, on the other, they still promote consumption (Pellegrino et al., 2022).

This study aims to deepen understanding of the dual role played by greenfluencers in driving responsible purchasing or non-purchasing behaviors. Previous research in greenfluencer marketing has largely focused on purchase intention as dependent variable, investigating possible antecedents such as audience engagement (König & Maier, 2024), relationship with influencers (Johnstone & Lindh, 2022), and trust (Pittman & Abell, 2021). However, no study has gone beyond intention, nor has the dual role of greenfluencers, who often both promote and discourage consumption, been thoroughly explored. This is especially relevant in the context of emerging trends like "de-influencing" which challenges traditional influencer dynamics and may reshape the impact of sustainability advocacy online contributing to the *bright side* of influencer marketing (Hudders & Lou, 2023).

Therefore, the aim of the present study is twofold: (a) expand the understanding of the factors that strengthen consumers' intention to follow the advice of greenfluencers, and (b) investigate the type of advice that consumers tend to follow: are they influenced in both purchasing eco-friendly products and adopting more moderate purchasing behaviors? If so, which behavior is most encouraged?

## 2. Hypotheses Development

The proposed conceptual model builds on a path of causal relationships including four key dimensions of the user-influencer interaction: similarity, trust, intention to follow the advice, and behavioural intentions. Similarity refers to the perception that the consumer shares characteristics, values, or experiences with the influencer (Kim & Park, 2011). This element increases the effectiveness of communication, as consumers tend to be more receptive when they perceive that the endorser they interact with has traits similar to their own (Lou & Yuan, 2019) and are more likely to intent to purchase the products they promote (Schouten et al., 2021). In light of this evidence, the perceived similarity with greenfluencers could further strengthen intention to follow the advice (H1).

In the context of marketing and exchange, Moorman et al. (1993) described Trust as "a willingness to rely on an exchange partner in whom one has confidence". With reference to the user-influencer relationship, trust in the source is a fundamental element as, without it, the message is unlikely to be internalized and, most importantly, applied by the audience (Pittman & Abell, 2021). Therefore, it is hypothesized that trust may be a significant antecedent of intention to follow the advice of greeninfluencer (H2).

As described, greenfluencers exhibit a dual behavior. On the one hand, they promote consumption of green products. On the other hand, they promote underconsumption through de-influencing. These two actions can, therefore, translate into two different approaches to consumption by individuals, which can jointly contribute positively to changing purchasing habits and that have been

operationalized as green purchase behavior and Temperance oriented behavior. In the literature, temperance is considered "the virtue of moderation and control over excess" (Gupta & Sheth, 2024). For this reason, it is considered a variable capable of capturing the de-influencing enacted by greenfluencers and the corresponding underconsumption behavior. Green purchase behavior refers to consumer behaviors motivated by sustainable development values, where individuals choose products or services that reduce environmental impact, such as reducing resource consumption or pollution (Roman et al., 2015). The Theory of Planned Behavior (TPB) suggests that intention is one of the main indicators of future behavior, and it often directly leads to the adoption of the desired behavior (Ajzen, 1991). In the context of the present research, the intention to follow the greenfluencer advice could directly lead to sustainable behaviors, such as purchasing green products (H3) or having a more temperate oriented behavior (H4).

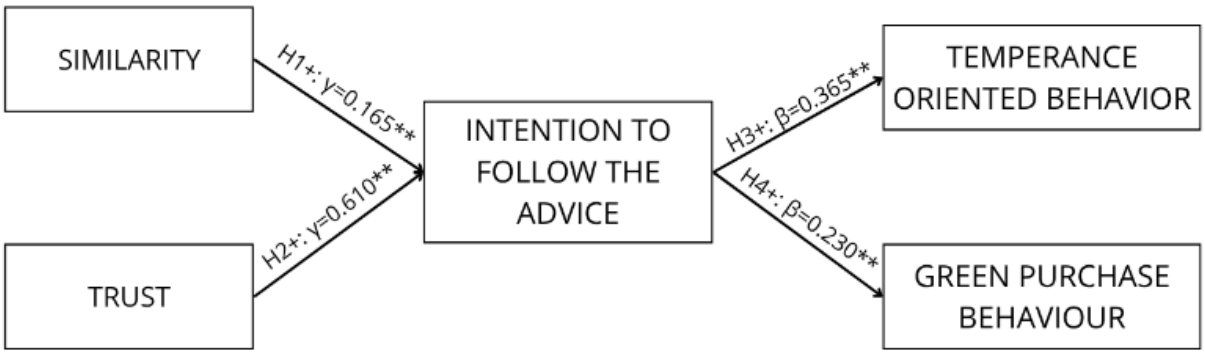
## 3. Methodology

To test the research model, an online survey with a sample of Italian participants has been conducted. Convenience sampling was adopted to recruit participants online through the most widely used social media platforms (Facebook, Instagram, WhatsApp). To avoid biases due to common method bias, preliminary measures were taken during the design phase (Podsakoff et al., 2024). In total, 500 useful questionnaires were retained for analysis, which far exceeds the 200 observations recommended by Hair et al. (2006) for Structural Equation Modeling (SEM).

The theoretical constructs were measured using scales that have been well validated in the academic literature. Similarity was measured using a four-item scale developed by Chang (2011). Trust was evaluated through a four-point scale proposed by Kennedy et al. (2001). Intention to follow the advice was operationalized with a four-point scale by McKnight et al. (2002). Temperance was measured with by Gupta and Sheth's (2024) scale. Finally, green purchase behavior was measured using a three-item scale proposed by Han (2020). Both convergent and discriminant validity have been achieved for all the measurement scales.

## 4. Results

### 4.1 Sample characteristics



The initial sample consisted of 753 respondents. Following a thorough data cleaning process, participants were excluded if they (1) did not follow any greenfluencer or (2) failed the attention check included in the questionnaire. Based on these criteria, 500 valid questionnaires remained (92% Females, 2% Males, 1% non-binary, 2% nd; mean age = 35 years, min = 18 max = 69).

A large majority of participants followed greenfluencers who focused on sustainable lifestyles (89%) and creative recycling or zero waste practices (82%). Other popular topics included sustainable fashion (63%), environmental scientific dissemination and natural cuisine (60%), organic or biological food (59%) and natural cosmetics (43%). Interest in sustainable tourism was more marginal (22%).

### 4.2 Test of structural model

The results indicated an acceptable fit for the proposed model: $\chi^2 = 414.05$, df = 130, $p = 0.000$, CFI = 0.968, RMSEA = 0.071, GFI = 0.907, SRMR = 0.098. Examination of the path coefficients and t-values showed that both similarity and trust had a positive influence on intention to follow the advice

of a greenfluencer (β = 0.165, $p < 0.01$; β = 0.610, $p < 0.01$), thus supporting H1 and H2. In turn, intention to follow the advice had a significant effect on both temperance oriented behavior and green purchase behavior (β = 0.365, $p < 0.01$; β = 0.230, $p < 0.01$), supporting H3 and H4. Figure 1 visually illustrates the relationships among the constructs in the structural model.

$^{**}p < 0.01$

**Figure 1:** Research model and standard coefficients

## 5. Discussion

The present study aimed to enrich the literature on users' engagement with greenfluencers and explore the antecedents and consequences of the intention to follow their advice (McKnight et al., 2002). Moreover, starting from the dual influential role of greenfluencers, the interest was focused on the different types of advice consumers are more likely to follow: underconsumption (temperance) or purchasing green products.

First, the results showed that trust emerged as the most influential factor in shaping consumers' intention to follow the advice of greenfluencers, followed by similarity. Second, the intention to follow the advice positively and significantly affects both temperance oriented behavior and green purchase behavior. In particular, users are more likely to be influenced by de-influencing practices (underconsumption behavior) compared to the promotion of green purchasing. These results are highly relevant from both a theoretical and managerial perspective. From a theoretical standpoint, the study first confirms the importance of trust as an antecedent of the intention to follow greenfluencers' advice, thereby extending the existing literature (Pittman & Abell, 2021). Moreover, it introduces the role of perceived similarity as an additional antecedent of intention in greenfluencer context. Finally, the phenomenon of de-influencing, defined as the encouragement to reduce consumption to what is strictly necessary, emerges as a relevant and underexplored area warranting further investigation within consumer behavior and influencer marketing research (Ekvall & Mellberg, 2023).

From a managerial perspective, the study offers valuable insights for brands, content creators, and greenfluencers on how to optimize their communication and marketing strategies. Notably, promoting temperance oriented behaviors (i.e., consumption moderation) appears to be as relevant as promoting

green purchasing behaviors. This suggests that recent trends in online communication, such as de-influencing, can address consumers' growing sensitivity towards sustainable practices aimed at underconsumption. Therefore, green product promotion techniques can be effectively combined with de-influencing activities that should be an equally appropriate strategic lever for positively influencing sustainable consumption behaviors. Depending on the situation and the behavior to be encouraged, influencers and brands should closely monitor and adapt their strategies to this dual dynamic.

In synthesis, trust and perceived similarity are key to creating a bond with greenfluencers and encouraging users to rely on their advice. This can result in dual behavior: making responsible purchasing choices and exercising self-control to avoid unnecessary purchases. Despite the initial evidence produced, longitudinal studies may be useful to gain a better understanding of how this phenomenon evolves and its impact over time. Furthermore, focusing the analysis on specific sectors (e.g. clothing, cosmetics and food) could highlight differences in purchasing behavior patterns more effectively.

# Growing Up Online: How Adultification Impacts the Engagement of Child Influencers on Social Media

Martina Di Cioccio[1], Ernesto Cardamone[2],*, and Peeter Verlegh[3]

## Abstract

Child influencers are an increasingly prominent presence on social media, attracting millions of followers and forming partnerships with global brands from an early age. While their popularity raises ethical questions, their content remains highly engaging.

Drawing on the concept of *adultification* – the attribution of adult aesthetics to children – this study examines the engagement outcomes of such portrayals among top child influencers on Instagram. Using a large-scale dataset of 14,341 posts, manually annotated for adultification cues, we find that adultified portrayals (i.e., mature clothing, makeup, or adult-like poses) are associated with significantly higher engagement. However, this effect disappears when the post also includes more explicit signs of exploitation, such as the presence of brand sponsorships or adults. These findings contribute to ongoing conversations in influencer marketing and childhood online representations, revealing a troubling tension: while adultification may boost engagement metrics, it raises concerns about the commodification of childhood in digital spaces.

*Keywords: child influencers, adultification, social media engagement*

## 1. Context And Purpose

In the past decade, influencer marketing has transformed the landscape of digital communication, reshaping how consumers engage with brands and how firms generate revenues from their online presence (Beichert et al., 2024). While much of the scholarly focus has centred on adult influencers, recent years have witnessed the emergence of *child influencers*. They are defined as "children who have large followings on social media platforms which can come from a social media page for the child themself or the child's family" (Masterson, 2021). Despite platform policies technically prohibit users under 13, recent studies show that 40% of children in this age group are already active on Instagram (Business Insider, 2021). Moreover, social media platforms generate over $11 billion in annual advertising revenue from underage users (Raffoul et al., 2023). The growing presence of child-centred content has led to increasing concern about the ethical implications of exposing children to influencer culture. For instance, a research on parent influencers from Sarvan et al. (2025) revealed that posts

featuring children receive nearly twice as many likes as those without, highlighting their potential exploitation and the need to protect their privacy. Further validating this trend, survey data show that a majority of adults in the United States believe child influencers are being exploited by their guardians or commercial stakeholders (Statista, 2024).

A key issue in this debate relates to how children are visually portrayed online. Previous research in childhood studies has examined the phenomenon of *adultification*, a process through which children are presented in ways that mimic adult appearances, often involving mature clothing, makeup, hairstyle, and confident posing (e.g., Firinci Orman, 2020). These portrayals blur the line between childhood and adulthood, contributing to what scholars such as Postman (1982) and Tirocchi (2014) have described as the "disappearance of childhood".

While adultification has been examined in traditional media formats (e.g., Valtorta et al., 2023), its presence and implications in the influencer marketing landscape remain underexplored. In particular, little is known about whether such portrayals affect the social media performance of child influencers, and under what conditions. The present study aims to fill this gap by investigating how adultification influences engagement on Instagram, and how this relationship is moderated by contextual cues such as presence of promotional activities or adult involvement in the content. Figure 1 provides concrete examples of adultified portrayals of child influencers.

**Figure 1:** Examples of Adultified Child Influencers

## 2. Theoretical Background

The widespread use of the Internet and social media in daily life is increasingly eroding the boundaries between childhood and adulthood (Meyrowitz, 1985), contributing to emerging phenomena such as the adultification of child influencers. Adultification refers to the process by which children are depicted in ways that align with adult standards of appearance, including the use of bold makeup and adult hairstyles, mature clothing, and confident posing. Scholars have long observed how traditional media encourages such portrayals, particularly among young girls (O'Donohue et al., 1997; Firinci Orman, 2020). With the advent of social media, these patterns have intensified and gained new commercial dimensions, as child influencers become increasingly embedded in monetized digital ecosystems.

On one hand, adultified content may enhance engagement by making child influencers appear more entertaining and playful, traits that are often rewarded within the influencer economy (McShane et al., 2021). Furthermore, audiences may engage with adultified portrayals even when they recognize them as ethically problematic. In this regard, the Moral Disengagement Theory (MDT, Bandura, 1999) posits that individuals can cognitively detach from their internal moral standards in order to justify actions or support behaviours they might otherwise perceive as problematic. In this context, audiences may temporarily suppress ethical concerns about the portrayal of children to enjoy the entertainment value of the content.

On the other hand, adultification may undermine the perceived innocence and authenticity of child influencers, thus raising moral concerns. For instance, prior studies have shown that excessive self-branding or promotional activities can lead to decreased engagement (e.g., Tripp et al., 1994; Cheah et al., 2024), suggesting that adultification can have complex, context-dependent effects on audience responses. Indeed, we suggest that when adultification is accompanied by more explicit signs of exploitation – such as visible brand sponsorships or the presence of adults in the content – this suspension of moral judgment may no longer hold. Formally, we hypothesize that:

*H1: The presence of adultified portrayals of child influencers will generate higher social media engagement compared to non-adultified portrayals.*

*H2: The positive effect of adultification on engagement will be attenuated when the post includes the presence of brand sponsorship.*

*H3: The positive effect of adultification on engagement will be attenuated when the post includes the presence of adults.*

## 3. Field Study

*Method.* In February 2025, we collected data from top child influencer accounts on Instagram. Using listings from specialized agencies such as FeedSpot, we identified 63 accounts with a minimum of 100,000 followers. From these accounts, we gathered all content posted from 2020 onward, including media type, number of likes and comments, captions, and publication timestamps. For the analysis, we focused solely on image and video posts, excluding sidecar posts due to their mixed-media format and single aggregated engagement metric. The final dataset consisted of 14,341 posts. *Econometric models.* The main independent variable, adultification, was coded as a binary variable (1 = post with an adultified child influencer, 0 = post without an adultified child influencer) based on manual annotations conducted by a trained research assistant. Each post was evaluated to determine whether the child influencer exhibited adult-like characteristics in appearance (e.g., makeup, mature hairstyles, or age-inappropriate clothing) or behaviour (e.g., posing in ways typically associated with adult fashion models). In addition, the number of children depicted in the post, the presence of sponsorship, and the presence of adults were also manually annotated to serve as control variables in the analysis. We examined the effect of adultification on social media engagement using a series of regression models. The dependent variable, engagement, was calculated as the sum of likes and comments divided by the number of followers for each account. To address heteroskedasticity, confirmed by the BreuschPagan test, all models were estimated using robust standard errors. In the initial OLS model without control variables, adultification showed a positive and statistically significant effect on engagement ($b$ = .045, $SE$ = .006, $t$ = 8.15, $p$ < .001). In a subsequent model, we introduced fixed effects for Instagram usernames to control for individual characteristics of each child influencer. The effect of adultification remained positive and significant ($b$ = .028, $SE$ = .006, $t$ = 4.85, $p$ < .001). In a third model, we added a comprehensive set of control variables, including post type (video vs. image), number of children

featured, presence of adults, presence of sponsorship, and time fixed effects at the year, month, and day levels (Kanuri et al., 2018). The positive effect of adultification on engagement remained robust and statistically significant ($b$ = .027, $SE$ = .006, $t$ = 4.88, $p$ < .001).

*Robustness tests*. To test the robustness of our findings, we estimated alternative model specifications. First, we used the total number of likes and comments as the dependent variable, including the number of followers as a control. The positive effect of adultification remained significant ($b$ = 18,041.58, $SE$ = 2,232.5, $t$ = 8.08, $p$ < .001). Additionally, we employed a negative binomial regression to account for the count nature of the engagement data. This model produced consistent results ($b$ = .548, $SE$ = .066, $z$ = 8.26, $p$ < .001), further confirming the reliability of our findings.

*Interaction effects*. In a sixth model, we examined the interaction between adultification and the presence of sponsorship and found a significant negative interaction effect ($b$ = –.039, $SE$ = .012, $t$ = –3.17, $p$ = .002). Specifically, adultification positively influenced engagement when no sponsorship was present ($b$ = .030, $SE$ = .006, $t$ = 5.03, $p$ < .001), but this effect became non-significant when the post involved sponsorship ($b$ = –.009, $SE$ = .011, $t$ = –.84, $p$ = .403). We observed a similar pattern when testing the interaction between adultification and adult presence. The interaction was significant ($b$ = –.030, $SE$ = .009, $t$ = –3.5, $p$ < .001), indicating that adultification increased engagement in posts without adults ($b$ = .032, $SE$ = .006, $t$ = 5.30, $p$ < .001), whereas the effect disappeared when adults were present ($b$ = .002, $SE$ = .008, $t$ = .28, $p$ = .78).

*Discussion*. Across all model specifications, posts featuring adultified child influencers consistently generate higher engagement compared to with featuring non-adultified children. This effect remains robust after controlling for account-level characteristics, time fixed effects, and other relevant covariates. However, the presence of sponsorship or adults in the post moderates this relationship, nullifying the positive impact of adultification on engagement.

## 4. Contributions And Implications

This research offers two main contributions. First, it advances the influencer marketing literature by identifying adultification as a critical factor driving engagement in child influencer content. While previous studies have examined the effectiveness of adult influencers (e.g., Leung et al., 2022), we focus on an unconventional yet relevant category of influencers, showing that adultified portrayals can increase audience engagement. Second, we contribute to the literature on childhood studies (e.g., Calvert, 2008; Sigirci et al., 2022) by empirically demonstrating how adultification functions as a commercial strategy within the digital economy.

Furthermore, this research offers important ethical and practical implications for brands and content creators operating in the child influencer industry. While adultified portrayals can increase engagement, our findings also suggest that this effect disappears when signs of potential exploitation become salient (such as the presence of brand sponsorships or adult involvement), indicating a threshold beyond which audiences may perceive the content as morally concerning rather than entertaining. For marketers, this underscores the importance of carefully framing sponsored content to avoid triggering perceptions of exploitation. Likewise, content creators and guardians should be mindful to minimize overt adult presence in posts.

# Sconsigliare si! ma non troppo! Il ruolo della credibilità e omofilia sullo user engagement e l'influencer purpose nel fenomeno del deinfluencing

Letizia Lo Presti[1],*, Valentina Cucino[1], and Gennaro Iasevoli[1]

[1] Università LUMSA, Italy

## Abstract

Il fenomeno del deinfluencing ha preso piede negli ultimi anni assumendo forme e connotati differenti nel contesto dei social network. Il deinfluencer nasce come conseguenza dell'influencer marketing con l'obiettivo di scoraggiare consumi inutili ed eccessivi all'insegna del risparmio e dell'austerità. Nonostante la letteratura inizi a studiare il fenomeno, poco si sa ancora sulle conseguenze del deinfluencing sul coinvolgimento, sulla percezione dell'influencer purpose e sull'adozione delle informazioni con riferimento alle differenti tipologie di deinfluencer. L'obiettivo del paper è quello di investigare gli effetti congiunti che la qualità dei contenuti, la credibilità, e l'omofilia possono esercitare sull'engagement e la percezione dell'influencer purpose. Inoltre, la ricerca esamina l'influenza esercitata da queste ultime due variabili sulle intenzioni di seguire i suggerimenti del deinfluencer. Un modello di equazione strutturale e un modello di moderazione su un campione di 177 individui dimostra che la credibilità del deinfluencer impatta positivamente sull'engagement solo quando l'influencer resta autentico alla sua missione di "influenzare" e quindi quando utilizza il deinfluencing solo come un'estensione etica del suo ruolo. Mentre l'omofilia non impatta sull'engagement quando il deinfluencer utilizza il deinfluencing come una strategia volta a promuovere altri prodotti. L'engagement attivato dalla qualità del contenuto e il purpose attivato anche dalla credibilità e dal senso di omofilia con il deinfluencer sono in grado di spingere il consumatore ad adottare i suggerimenti che sconsigliano di comprare prodotti/servizi.

*Keyword: deinfluencing, purpose, omofilia, credibilità, follower engagement*

## 1. Background

L'abnorme uso di contenuti sponsorizzati ha determinato, conseguentemente, l'emergere di una sorta di "contro-movimento": il De-influencing. Tale fenomeno, che ha fatto la sua comparsa ed ha trovato da subito terreno fertile sulla piattaforma TikTok, risulta essere una forma di risposta critica e consapevole data dagli influencer e dai consumatori a quelle che sono le dinamiche meno chiare dell'influencer marketing (The Guardian, 2023). Il De-influencing si esplicita, dunque, in un atto comunicativo dissuasivo, finalizzato a scoraggiare l'acquisto di determinati prodotti o servizi, talora ritenuti inutili, sopravvalutati o dannosi, e a promuovere un consumo etico, trasparente e autentico.

La contrapposizione tra influencing e de-influencing, pur tuttavia, non deve essere interpretata come una separazione netta, piuttosto come le due facce di una stessa medaglia. In molti casi, infatti, il de-influencing non si manifesta in un rigetto assoluto del consumo, ma in una revisione del concetto stesso di valore. È per tale ragione, per esempio, che frequentemente dei creator sconsigliano l'acquisto di prodotti di tendenza nonostante siano influencer e come tale "promotori" di prodotti e servizi sponsorizzati oppure promuovano alternative più accessibili, funzionali o sostenibili Belanche et al., 2023). Questa modalità d'azione mette in risalto una crescente sensibilità nei confronti dell'etica del consumo e della responsabilità sociale dell'influencer e, sotto questo profilo, il de-influencing può anche essere interpretato come una strategia evolutiva in seno al personal branding. Riuscire a posizionarsi come influencer "etico", in grado di schivare le logiche della sponsorizzazione acritica e del profitto immediato, può aumentare la credibility e rafforzare l'engagement con la propria community (De Veirman et al., 2023). Alcuni autori sottolineano l'ambiguità delfenomeno perchè, come osservano Scott e Smith (2023), è possibile che il de-influencing venga risucchiato dalla stessa logica commerciale che intende criticare, divenendo una forma di anti-marketing funzionale al sistema capitalistico (Scott et al., 2023).

Il de-influencing, dunque, diventa un nodo cruciale nell'interpretazione dell'evoluzione delle dinamiche comunicative nell'attuale panorama digitale. Nonostante sia innegabile il suo ruolo di risposta critica all'eccesso di consumo e alla promozione indiscriminata dei brand, pur tuttavia pone interrogativi di rilievo riguardo la credibilità, le finalità sociali, l'empatia e l'effettiva capacità trasformativa degli influencer nella relazione con i suoi follower.

La qualità della scrittura incide sulla percezione di affidabilità dei post da parte dei follower. Informazioni credibili, come esperienze personali o contenuti ben curati, possono influenzare le scelte dei turisti leisure (e.g. Choi e Lee, 2021). La qualità del contenuto ha un impatto positivo sull'engagement e sul divertimento dei follower (Sarmiento Guerde et al., 2021), oltre a favorire la fiducia e la credibilità dell'influencer (Duffy e King, 2020). Si ipotizza, quindi, che una maggiore qualità informativa migliori la percezione di credibilità del travel influencer e il coinvolgimento della sua community.

L'engagement è un fattore che attiva la relazione tra consumatore e brand (e.g. Hollebeek et al., 2014). La letteratura evidenzia un effetto positivo tra user engagement e intenzione dei follower di seguire i consigli dell'influencer (Wang, 2012). Si ipotizza quindi che un maggiore coinvolgimento rafforzi il legame con l'influencer, favorendo l'adozione delle informazioni e la continuazione del rapporto (blog e suggerimenti inclusi).

La credibilità dell'influencer è in grado di influenzare positivamente le intenzioni future del follower soprattutto quando il follower risulta soddisfatto e divertito (Choi e Lee, 2021; Hsiao et al., 2013). È stato confermato che, quando il follower percepisce l'influencer come altamente credibile, allora ci sarà un atteggiamento positivo nei loro confronti (Lee e Eastin, 2020). Partendo da tali evidenze e al fine di contribuire alla conoscenza della credibilità dei travel influencer sugli atteggiamenti dei followers, si formulano le seguenti ipotesi.

## 2. Metodology

Il modello di ricerca proposto mira a verificare l'ipotesi di fondo secondo la quale l'omofilia dei follower, la qualità delle informazioni postate, e la credibilità del deinfluencer esercitano un impatto

positivo sull'intenzione di adottare l'informazione condivisa dal deinfluencer (information adoption) e questo grazie alle finalità morali del deinfluencer (purpose) e al coinvolgimento suscitato (user engagement) presso la community di riferimento. Dal punto di vista strutturale, il modello mette in relazione sei costrutti: a) homofilia, che si riferisce al fenomeno per cui le persone tendono a interagire e formare legami più frequentemente con individui che percepiscono come simili a loro per atteggiamenti, valori, background o caratteristiche (Lou and Kim, 2019); b) argument quality, ovvero la percezione da parte del target che il contenuto dei post sia fortemente o debolmente persuasivo (Filieri e McLeary, 2013); c) influencer credibility, intesa come la capacità del deinfluencer di essere percepito affidabile ed esperto su una specifica tematica (Cosenza et al., 2015); e) user engagement, definibile come il livello di coinvolgimento cognitivo, emotivo e comportamentale che il follower ha nei confronti dell'attività dell'influencer (Shiau e Luo, 2013); perceived purpose, riferito alla percezione del follower che l'influencer sia spinto da una genuina aspirazione a contribuire positivamente alla società, un'intenzione che guida le sue decisioni e funge da fonte di ispirazione nelle sue azioni quotidiane (Jasinenko & Steuber, 2023); f) information adoption, interpretabile in termini di accettazione, e successivo utilizzo, da parte del follower, dell'informazione veicolata dall'influencer dopo averne valutato intenzionalmente la validità (Riquelme e Saeid, 2014). Inoltre il modello misura l'effetto moderatore della preferenza per una tipologia di deinfluencer sulle relazioni sopra menzionate.

Per perseguire gli obiettivi conoscitivi dello studio è stato somministrato un questionario strutturato online a un campione di 177 utenti. Il questionario è stato veicolato per l'auto-somministrazione attraverso la pubblicazione di un post informativo su alcuni profili di diversi social network. La raccolta dei dati si è svolta nel periodo Marzo-Maggio 2025.

Dopo aver fatto vedere tre video differenti di tre diverse tipologie di deinfluencer (deinfluencer puro, influencer che usa il deinfluencing ogni tanto solo come estensione etica del suo ruolo, deinfluencer con scopi commerciali che sconsiglia prodotti con la finalità di consigliarne altri), è stato chiesto all'intervistato quale deinfluencer lo rappresentava di più. Le variabili strutturali sono state misurate attraverso scale sviluppate e validate dalla letteratura scientifica. Le risposte a ciascun item sono state misurate su scala di accordo autoancorata (da 1= fortemente in disaccordo a 7= fortemente d'accordo).

L'analisi del modello di misurazione, in aggiunta all'Alpha di Cronbach, ha dimostrato la validità dei costrutti e l'affidabilità delle scale ($\alpha > 0{,}90$) (Nunnally, 1978). Il modello di equazione strutturale (SEM) riporta buoni fit degli indici. ($\chi 2 = 271$; df= 158; $p < 0{,}001$; CFI= 0,987; RMSEA= 0,064; RMSEA p=0.041; NNFI= 0,999; SRMR= 0,045) e tutti i parametri delle variabili osservate sono risultati significativi. I valori di average variance extracted (AVE) e composite reliability (CR) superano le soglie raccomandate, rispettivamente, di 0,50 (Fornell e Larcker, 1981) e 0,70 (Steenkamp e Van Trijp, 1991).

## 3. Preliminary results

I risultati dimostrano come la qualità delle informazioni fornite dal deinfluencer influenza l'engagement e la purpose percepita. In altre parole, maggiore è la qualità riconosciuta alle informazioni ricevute e maggiore è il grado di engagement attribuito al deinfluencer ($\beta = 0{,}428$; $p < 0{,}01$) e alla percezione del suo purpose che l'utente percepisce dai contenuti prodotti dal deinfluencer ($\beta = 0{,}263$; $p < 0{,}01$). Le ipotesi H2a, H2b risultano supportate. Parallelamente, emerge una relazione positiva e significativa tra l'omofilia e la purpose attribuita al deinfluencer ($\beta = 0{,}401$; $p < 0{,}01$) mentre la relazione non risulta significativa tra omofilia e user engagement ($\beta = 0{,}770$; $p < 0{,}01$). Pertanto l'ipotesi H1a è supportata e la H1b risulta non supportata. Al contrario, la credibilità del deinfluencer se da una parte influenza positivamente la purpose percepita ($\beta = 0{,}158$; $p < 0{,}05$) confermando l'ipotesi H3a, esercita un impatto significativo ma negativo sull'engagement, non supportando del tutto l'ipotesi H3b. Il purpose

percepito del deinfluencer ha un effetto positivo sul coinvolgimento (β= 0,627; p < 0,01) confermando l'ipotesi H4. Da ultimo e d'accordo con quanto ipotizzato nelle ipotesi H5a e H5b, l'intenzione di continuare ad affidarsi in futuro alle indicazioni fornite dal deinfluencer per pianificare i propri acquisti è direttamente e positivamente influenzata dalle due dimensioni perceived influencer purpose (β= 0,379; p < 0,01) e, con maggiore intensità, dallo user engagement (β= 0,543; p < 0,01).

Il modello di moderazione misurato ha dimostrato che l'identificazione verso una differente tipologia di deinfluencer modera la relazione tra credibility ed engagement e spiega l'assenza di relazione tra omofilia ed engagement. In particolar modo si nota che, mentre l'effetto della credibilità del deinfluencer sull'engagement è debole per chi si identifica con il deinfluencer a scopi commerciali (coeff=-0,45; p <0,01), l'effetto dell'omofilia sullo user engagement è positiva solo quando lo user si riconosce nell'influencer che adotta il deinfluencing ogni tanto come un'estensione etica del suo ruolo) (coeff=0,02; p <0,01).

## 4. Conclusioni e implicazioni

La ricerca estende la conoscenza sul deinfluencing tenendo in considerazione le multi-sfaccettature del fenomeno e dimostra come la credibilità continua ad essere un fattore imprescindibile quando l'influencer non usa il deinfluencing come strategia di comunicazione o di vendita. In quest'ultimo caso, infatti, esso non è in grado di attivare l'engagement. Un altro elemento che contribuisce alla conoscenza sul deinfluencing è l'importanza ricoperta dal perceived influencer purpose nell'attivare l'engagement e le intenzioni comportamentali. Ad oggi il purpose era stato studiato per lo più in ambito manageriale ma è di fatto, come la ricerca dimostra, un fattore imprescindibile per garantire che il follower segua i suggerimenti del deinfluencer. Questa ricerca invece offre nuance interessanti sul ruolo che esso può avere sulle finalità di comunicazione veicolate attraverso i media. Inoltre, la ricerca estende la letteratura sui fattori che attivano lo user engagement nell'ambito dell'influencer marketing dimostrando il ruolo positivo del purpose nella relazione follower-deinfluencer. Dal punto di vista manageriale gli influencer dovrebbero usare con parsimonia la strategia del deinfluencing poiché essa potrebbe non attivare l'empatia e di conseguenza l'engagement dei follower. Dall'altro lato se il deinfluencer non è percepito come credibile è possibile che esso produca effetti inversi come apatia o evitamento. Le aziende pertanto devono attenzionare il modo con la quale producono i contenuti sui social anche per mezzo degli influencer soprattutto se questi sfruttano il paragone con altri prodotti concorrenti per elicitare risposte comportamentali nel consumatore.

# When Advertising Speaks Honestly: The Role of AI Usage Declaration in Shaping Consumer Perception and Behavior

Veronica Marozzo[1],*, Fabrizio Cesaroni[1], Tindara Abbate[1], and Augusto D'Amico[1]

[1] University of Messina, Italy

* Corresponding author: veronica.marozzo@unime.it

## Abstract

This study examines how disclosing the use of Generative AI in social media advertising influences consumer perceptions and engagement. Based on the Persuasion Knowledge Model, two experiments tested the effects of AI disclosure on ad credibility, language comprehension, and users' willingness to like or share the ad. Study 1 (N=230) found that declaring AI use improves perceived credibility and comprehension. Study 2 (N=324) confirmed these effects across product categories and showed that AI disclosure boosts engagement intentions. Mediation analyses revealed that perceived credibility fully explains the link between AI disclosure and consumer engagement. These findings highlight transparency as a key factor in enhancing consumer trust and behavioral responses in digital advertising. The results align with regulatory initiatives advocating for AI disclosure, showing that transparency not only supports ethical communication but also drives strategic benefits.

*Keywords: Artificial Intelligence; Advertising Credibility; Consumer Engagement; Generative AI; Social Media Advertising*

### 1. Introduction and Hypotheses Development

The increasing digitalization of firms, combined with widespread social media use, has made platforms, like Instagram and TikTok, central to advertising strategies. As users spend over two hours daily on these platforms, brands are leveraging them for consumer engagement.

Within this context, Artificial Intelligence—especially Generative AI (gen-AI)—is transforming marketing by autonomously creating content once produced by humans. While gen-AI enhances efficiency and personalization, its integration into advertising also raises concerns about transparency and content authenticity. Although gen-AI tools enhance efficiency, they also introduce ethical challenges. The risk of deceiving consumers through AI-generated content has raised concerns about trust in advertising. Campbell et al. (2022) highlight the growing relevance of transparency in AI-driven communication. Additionally, the emergence of technologies like deepfakes has led to regulatory and industry responses. The Coalition for Content Provenance and Authenticity (C2PA)[22], for example, developed a digital watermarking tool—the "Content Credentials" icon (CR)—which enables users to verify the origin of AI-generated content. In parallel, legal initiatives, such as the U.S. "AI Disclosure Act of 2023",[23] propose mandatory disclaimers for AI outputs, aiming to ensure accountability and consumer awareness.

Despite these developments, little empirical research has addressed how AI disclosure influences consumer perceptions and attitude. This study aims to fill that gap by examining the psychological impact of declaring AI involvement in the creation of social media advertisements. It focuses on perceived advertising credibility and language comprehension as key outcomes of transparency. To

22 https://c2pa.org/

23 https://www.ilsoftware.it/adobe-lancia-un-nuovo-logo-per-taggare-le-immagini-generate-con-lia/

frame this investigation, the study adopts the Persuasion Knowledge Model (Friestad & Wright, 1994), which argues that consumers develop knowledge of persuasive intent over time and use this knowledge to interpret marketing messages. When they recognize attempts at manipulation, they tend to resist persuasion efforts.

In the context of AI-generated ads, transparency can produce varied effects. On one hand, some studies indicate that disclosing the use of AI may reduce perceived credibility and weaken the ad's persuasive impact (Kietzmann et al., 2021; Campbell et al., 2022). On the other, recent evidence shows that context and content framing play a moderating role: when AI-generated content serves functional purposes and is clearly presented, disclosure does not necessarily harm consumer attitudes (Kirkby et al., 2023; Kim et al., 2021). These mixed findings point to the need for further research on how AI disclosure influences advertising effectiveness in specific contexts.

Two constructs are central to understanding consumer responses to advertising: perceived credibility and language comprehension. Advertising perceived as credible is more persuasive (MacKenzie & Lutz, 1989; Eisend, 2006), and clear, well-adapted language enhances message processing and retention (Puntoni et al., 2009). From the Source Credibility Theory perspective (Fogg et al., 2001), AI itself can act as a credible source when transparently presented, influencing consumers' trust and reactions (Khan & Mishra, 2024). Moreover, genAI's ability to tailor language may improve comprehension—especially when its use is clearly disclosed (Gao et al., 2023; Al Tawalbeh et al., 2024).

Beyond these cognitive aspects, transparency may also influence behavioral outcomes, such as consumers' willingness to like or share ads. Honest communication fosters engagement (Berger & Milkman, 2012; Suraña-Sánchez & Aramendia-Muneta, 2024), whereas concealed AI use may trigger skepticism and reduce interaction. Within this framework, perceived advertising credibility may act as a mediator, linking AI disclosure to engagement. Prior studies demonstrate that credible content promotes user interaction and behavioral intentions (Soh et al., 2009; Appel et al., 2020; Xiao et al., 2018), suggesting that AI transparency could foster positive engagement through enhanced trust. Based on these considerations, the study formulates the following hypotheses:

***$H_1$:*** *Declaring the use of AI (vs. not declaring it) in the creation of advertising positively influences consumers' perception of advertising credibility.*

***H2:*** *Declaring the use of AI (vs. not declaring it) positively influences consumers' comprehension of the advertising's language.*

***H3:*** *Declaring the use of AI (vs. not declaring it) positively influences consumers' a) willingness to like and b) willingness to share the advertising.*

***H4:*** *The effect of declaring the use of AI (vs. not declaring it) on consumers' a) willingness to like and b) willingness to share the advertising is mediated by perceived advertising credibility.*

## 2. Methodology and results

We conducted 2 experimental studies. Study 1 aimed to test whether the AI's use declaration affects the credibility and the language comprehension of the advertising. The use of AI (not declared vs. declared) was manipulated in a between-subjects design, holding constant all other elements in social

media advertising[24]. Study 2 aimed to obtain additional support for the previous results, by providing evidence of the generalizability of the proposed effect against a different product category[25], and to test the effects of AI's use declared (vs. not declared) on consumers' dispositions, such as willingness to like and willingness to share the advertising. Advertising credibility was captured by three 7-point items (Kim et al., 2017;

Study 1 α=.88; Study 2 α=.86); while advertising language comprehension was captured by three 7-point items (Lin & Wang, 2016; Study 1 α=.80; Study 2 α=.80). In Study 2, user's willingness to like and to share the advertising were captured, respectively, by a 7-point item ("To what extent are you willing to put "like" at this advertising?", and "To what extent are you willing to put share this advertising?"), both ranking from 1 "At all" to 7 "Very much".

Two hundred and thirty Italian users (50.4% females; $M_{age}$=26.50; $SD_{age}$=6.80) took part in Study 1 and were randomly assigned to one of the two conditions. Results of a first oneway ANOVA showed that the advertising credibility was significantly higher in the case of AI'use declared compared to not declared ($M_{AIdeclared}$=4.225, SD=1.49; $M_{AInotdeclared}$=3.554, SD=1.323; F(1, 228)=12.94, p < .000). Results of a second one-way ANOVA showed that the advertising language comprehension was significantly higher in the case of AI'use declared compared to not declared ($M_{AIdeclared}$=4.296, SD=1.208; $M_{AInotdeclared}$=3.747, SD=1.186; F(1, 228)=12.05, p < .000). Overall, these findings provide support for the effect of AI's use declared (vs. not declared) on consumers' perception of advertising credibility and consumers' attitude toward the advertising language comprehension.

Three hundred and twenty-four Italian users (58.3% females; $M_{age=}$25.94; $SD_{age}$=7.12) took part in Study 2 and were randomly assigned to one of the four conditions in a 2 (AI's use: not declared vs. declared) by 2 (product category: wine vs. body wash) between-subjects design. Results of a first two-way ANOVA on advertising credibility with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as between-subject factors confirmed a significant main effect of AI's use ($M_{AIdeclared}$=4.227, SD=.106; $M_{AInotdeclared}$=3.699, SD=.107; F(1, 320)=12.36, p <,000). The results also showed a significant main effect of the product category ($M_{Wine}$=4.14, SD=.107; $M_{BodyWash}$=3.787, SD=.106; F(1, 320)=5.51, p =.019). Finally, no significant interaction effect between AI's use and product category was found (F(1, 320)=.028, p =.866). Results of a second two-way ANOVA on advertising language comprehension with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as between-subject factors confirmed a significant main effect of AI's use ($M_{AIdeclared}$=4.379, SD=.090; $M_{AInotdeclared}$=3.869, SD=.091; F(1, 320)=15.867, p < .000). They also showed a significant effect of the product category ($M_{Wine}$=4.298, SD=.091; $M_{BodyWash=}$3.95, SD=.090; F(1, 320)=7.391, p =.007). No significant interaction effect between AI's use and product category was found (F(1, 320)=.884, p =.348). Overall, these findings suggest that the effect of AI's use declared (vs. not declared) on consumer perception of advertising credibility and consumer attitude toward the advertising language comprehension holds regardless of the product category, then provide preliminary evidence of the generalizability of the proposed effects.

24 The stimulus consisted of an Instagram advertisement for a wine product, entirely generated using AI tools—ChatGPT for the text and DeepAI for the visual. The manipulation of AI disclosure (declared *vs.* not declared) was implemented by adding two labels in the declared condition: a "created with AI" logo on the bottom right of the image, and a "Content created with Artificial Intelligence" note at the end of the ad's text. (see Appendix).

25 Body wash. The use of AI (not declared *vs.* declared) was manipulated as in Study 1.

Finally, we tested the user's dispositions (i.e., willingness to like and willingness to share the advertising). Results of a first two-way ANOVA on willingness to like the avd, with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as betweensubject factors showed a significant main effect of AI's use ($M_{AIdeclared}$=3.658, SD=,146; $M_{AInotdeclared}$=3.122, SD=.146; F(1, 320)=6.741, p=.01). The results also showed a significant main effect of the product category ($M_{Wine}$=3.733, SD=.146; $M_{BodyWash}$=3.007, SD=.146; F(1, 320)=13.752, p=.000). Finally, no significant interaction effect between AI's use and product category was found (F(1, 320)=.011, p=.915).

Results of a second two-way ANOVA on willingness to share the advertising, with the use of AI (not declared vs. declared) and product category (wine vs. body wash) as betweensubject factors confirmed a significant main effect of AI's use ($M_{AIdeclared}$=2.67, SD=.129; $M_{AInotdeclared}$=2.288, SD=.130; F(1, 320)=4.365, p=.037). The results also showed a significant main effect of the product category ($M_{Wine}$=2.774, SD=.130; $M_{BodyWash}$=2.183, SD=.129; F(1, 320)=10.437, p=.001). Finally, no significant interaction effect between AI's use and product category was found (F(1, 320)=.003, p=.956). Overall, these findings indicate that users are more willing to like and share the advertising when the use of AI is declared.

To test whether the effect of declaring AI usage in advertising influences consumers' engagement disposition (i.e., willingness to like and to share the advertisement) through the mediator perceived advertising credibility, two separate mediation models were conducted using PROCESS Model 4 (Hayes, 2018). Each model used 5,000 bootstrap samples with 95% bias-corrected confidence intervals. In both models, the independent variable (AI disclosure *vs.* no disclosure) significantly predicted the mediator. Specifically, AI disclosure led to higher levels of perceived advertising credibility (β=.5066, p=.0009, 95% CI [.2098; .8035]).

For the first model, where the dependent variable was consumers' willingness to like the advertisement, perceived advertising credibility was a significant predictor of liking behavior (β=.7764, p<.001, 95% CI [.6496; .9032]). The direct effect of AI disclosure on liking was not significant (β=.0957, p=.5904, 95% CI [–.2536; .4449]), while the indirect effect through perceived credibility was statistically significant (indirect effect=.3934, BootSE=.1196, 95% BootCI [.1636; .6352]). These results indicate that perceived credibility fully mediates the effect of AI disclosure on willingness to like the advertising.

For the second model, in which the outcome was willingness to share the advertisement, perceived credibility again significantly predicted the outcome (β=.6865, p<.001, 95% CI [.5749; .7981]). As with the previous model, the direct effect of AI disclosure on sharing was not significant (β=–.0019, p=.9905, 95% CI [–.3093; .3056]), but the indirect effect through perceived credibility was again significant (indirect effect=.3478, BootSE=.1090, 95% BootCI [.1393; .5719]).

Taken together, these findings provide robust support for $H_4$, demonstrating that the positive effect of AI disclosure on consumer engagement—both in terms of liking and sharing—is fully mediated by the perceived credibility of the advertising. This suggests that credibility serves as a crucial mechanism through which transparency in AI usage influences behavioral responses.

## 3. Conclusion and implications

The findings of this research provide compelling evidence that disclosing the use of AI in advertising plays a crucial role in shaping consumer perceptions and behavioral responses. Across 2 experimental studies, we observed that when the use of AI is openly communicated, consumers perceive advertisements as more credible and linguistically comprehensible. These perceptions are not merely

cognitive—they translate into behavioral intentions, i.e. users are more willing to like and share advertising content when AI usage is declared.

A central contribution of this research lies in identifying perceived advertising credibility as a key mediating mechanism. Mediation analyses confirmed that the relationship between

AI disclosure and consumers' willingness to engage with the advertising (liking and sharing) is fully explained by increased credibility perceptions. This finding underscores the psychological importance of trust and transparency in digital communication and supports the application of the Persuasion Knowledge Model (Friestad & Wright, 1994) to AI-generated advertising. When consumers recognize transparency and ethical intent, they are more receptive and less resistant to persuasive attempts.

From a theoretical perspective, this study enriches the growing literature on human–AI interaction in marketing, especially within the domain of generative AI. While previous research has shown mixed results regarding the impact of AI disclosure on consumer trust, our findings clarify that, under certain conditions—such as consistent messaging and contextually relevant content—disclosure can foster more favorable evaluations. Moreover, the generalizability of the effects across different product categories (wine and body wash) suggests the robustness of these dynamics beyond specific contexts

The implications for practitioners are equally significant. Marketers and communication professionals are increasingly leveraging generative AI to streamline content production, yet many remain uncertain about how to manage transparency. Our results clearly indicate that proactively declaring AI use does not harm brand perception—on the contrary, it strengthens consumer trust and enhances engagement. Brands that embrace transparent practices may benefit from deeper emotional connections with audiences, greater content virality, and more ethical reputations.

Finally, these findings support recent policy efforts—such as the AI Disclosure Act and initiatives like the C2PA standard—that advocate for clearer labeling of AI-generated content. Regulators and industry leaders should consider integrating disclosure guidelines as part of broader strategies to ensure accountability, protect consumers, and foster responsible AI adoption in marketing communication. Transparency, in this regard, is not just a matter of compliance, but a strategic advantage.

Future research should examine boundary conditions under which the disclosure effect may attenuate or even reverse—for example, contexts in which omitting an AI label does not undermine credibility. Because labels occupy scarce visual space and may draw disproportionate attention, identifying when disclosure is unnecessary would be theoretically and practically valuable. To isolate disclosure effects from attention-based confounds, future experiments should include a comparable, non–AI label in the non-disclosure condition (e.g., "created by a designer"), enabling a cleaner test that differences in outcomes are attributable to disclosure content rather than mere label visibility

## Abstract

The consumption of podcasts is on the rise. At the same time, the phenomenon of loneliness is increasingly attracting attention as major relevant societal issue. As people may seek social comfort and connections through media figures, those two phenomena may have a common ground. Taking cues from previous literature about loneliness in consumption and media consumption, we studied the phenomenon of loneliness and podcast consumption through an experimental study. Results show that consumers that listen to podcasts in which the podcaster engages (vs. not engages) in self-disclosure are more likely to develop a positive attitude towards the podcast and are more willing to listen to future content. Furthermore, this effect is mediated by the perception of a parasocial relationship with the podcaster. Finally, the effect of podcasters' self-disclosure on consumers' perception of a parasocial relationships is greater for people experiencing loneliness.

*Keywords*: *loneliness, podcast, media consumption, parasocial relationships, self-disclosure.*

### 1. Introduction and Conceptual Development

In the early months of the Covid-19 pandemic, as daily life shifted into isolation and remote connection, psychologist and Harvard lecturer Richard Weissbourd launched a new line of research focused on loneliness, as he observed the extent to which it had become widespread, "*in the solitude of quarantine, in the darkened windows of the buildings on campus, in the Zoom squares*" (Shaer, 2024). However, loneliness was already on the rise before the pandemic. Scholars had begun referring to an "*epidemic of loneliness*", noting that nearly half of American adults reported high levels of social isolation (Coleman, 2023).

Loneliness is commonly defined as a divergence between one's desired and achieved levels of social relations (Perlman & Peplau, 1981). Yet it is also a complex, multidimensional, and inherently subjective emotional state, often entangled with feelings of sadness, anxiety, fear, and heartache. Young adults (ages 19–29) appear especially vulnerable, reporting some of the highest rates of loneliness despite being highly connected through digital media (Maese, 2023). This paradox, *being more*

*technologically connected than ever, yet increasingly isolated*, highlights the complexity of contemporary on- and offline-life.

The pandemic only amplified this dynamic, making mediated forms of connection essential when face-to-face interaction became difficult or impossible. During lockdowns, in fact, many individuals turned to virtual media for social gratification. In this context, the behavior of seeking companionship in media figures grew more salient. This phenomenon is well explained by media psychology frameworks such as uses and gratifications theory, suggesting that people actively consume media to fulfil emotional or social needs (Katz & Blumler, 1974).

Among the various media, podcasts stand out for their intimate format (Funk et al., 2023). Their nature of "closeness-enhancers", being often consumed alone, through headphones (Lieberman et al., 2022) can offer comfort to individuals who feel alone. During periods of social isolation, many listeners formed parasocial relationships with podcast hosts, using these asymmetrical bonds as substitutes for real-life interaction (Jarzyna, 2021). While not a full replacement for human contact, these relationships have the potential to reduce feelings of isolation by offering a sense of presence, care, and routine companionship.

The convergence of three key topics, the popularity of podcasting, the growth of parasocial host–listener relationships, and the persistence of loneliness, points to a relevant area for academic investigation. Thus, the contribution of this study lies in the investigation of this convergence, as this research explores the role of podcaster self-disclosure in shaping parasocial relationships, and whether this effect is moderated by the listener's level of loneliness.

Loneliness, in fact, is a compelling variable to take into account in the development of parasocial relationships, particularly in the context of host self-disclosure. A listener experiencing social isolation may be more receptive to intimate messages from a podcast host, finding them emotionally compelling. In contrast, individuals with rich social lives may engage with the same content without the same depth of involvement. In this sense, loneliness may amplify the effects of self-disclosure on parasocial relationship formation.

Prior research supports this argument. Recent work on internet celebrity fans found that higher levels of loneliness were associated with stronger parasocial bonds, partly due to a warmer desire for belonging and emotional comfort (Liu & Lee, 2024). Earlier studies have also identified correlations between loneliness and parasocial interaction strength in traditional media contexts (Tsao, 1996; Wang et al., 2008). Scholars have long theorized that parasocial relationships serve as an outlet for loneliness, potentially increasing both engagement and susceptibility to influence (Jarzyna, 2021). Yet, despite these findings, little research has directly tested how these variables interact in the podcasting context, that is, an intimate and increasingly relevant media environment. We fill this gap by studying the phenomenon of parasocial relationships in a podcast scenario and its relationship with self-disclosure and loneliness. We do so through an experimental study that takes cues from previous research. In particular, supported by literature on loneliness (Shrum et al., 2023) and parasocial interaction (e.g., Wang et al., 2008) we propose that:

**H1**: Podcasters' self-disclosure positively influences consumers' a) attitude towards the podcast and b) likelihood of listening to future content.

**H2:** The effects of self-disclosure on a) attitude and b) likelihood of listening to future content are mediated by the perception of a parasocial relationship between the user and the podcaster. In

particular, self-disclosure leads to higher levels of parasocial relationships, that, in turn has a positive effect on the dependent variables.

**H3**: The effect of podcasters' self-disclosure on parasocial relationships is moderated by loneliness, such that the proposed positive effect is stronger among consumers experiencing higher levels of loneliness.

## 2. Methodology

***Method***. We adopted an experimental approach to test our hypotheses. Specifically, we recruited a total of 94 participants (58 females, $M_{age}$ = 33.62, *SD* = 12.92) who were randomly assigned to one of the two conditions (self-disclosure: presence vs absence) according to a between-subjects study design. We manipulated self-disclosure by crafting a fictitious podcast episode (narrated by an Italian American amateur actress), focused on movie reviews. In the *presence of self-disclosure* condition, the actress narrated the plot of a thriller movie while also sharing personal memories, anecdotes, and preferences, thereby embedding self-referential content into the review (Umar et al., 2019). In the *absence of self-disclosure* condition, the actress simply reviewed the thriller movie without including any personal information. The manipulation check for self-disclosure was successful ($M_{selfdisclosure}$=5.99, *SD*=1.25, vs $M_{no\_selfdisclosure}$=2.19, *SD*=1.25, t (92) = 14.75, p < .001).

***Measures***. We collected data on parasocial relationship by asking participants the extent to which they agreed with statements such as "*The podcaster and I could have been good friends*" (adapted from Labrecque, 2014; α = .949). Attitude toward the podcast was measured using three bipolar items (from Muehling, 1987; α = .927), while the likelihood of listening to future content was measured with a single-item ("*How likely is it that you would listen to content narrated by this podcaster in the future?*"). We collected data on loneliness by asking participants to indicate their level of agreement with statements as "*I feel that I am often part of a group of friends*", such that higher scores are associated with people that feel less lonely (adapted from Cai & Wang, 2023 and Russell, 1996; α = .972).

***Results***. We ran two moderated mediation analysis (Hayes, 2022). Both had self-disclosure as the independent variable, parasocial relationship as the mediator and loneliness as a moderator on parasocial relationship.

In one model, we tested these variables effects on attitude as dependent variable, in the other we incorporated users' likelihood of future listening as dependent variable. We found a significant index of moderated mediation on both attitude (b=-0.53, 95% CI=-0.89, -0.21) and likelihood of future listening (b=-0.66, 95% CI=-1.07, -0.27). Specifically, results revealed that the positive impact of self-disclosure on parasocial relationship (b=4.03, SE=0.86, *t*=4.67, *p* < .001) was characterized by the significant interaction with participants' level of loneliness (b=-0.66, SE=0.19, *t*=-3.45, *p* < .001). Individuals experiencing higher levels of loneliness (i.e., loneliness scores below 2.5) were more likely to perceive a stronger parasocial relationship with the podcaster when self-disclosure was present (b=2.44, SE=0.45, *t*=5.42, *p* < .001). However, this difference disappeared for people with lower levels of loneliness (i.e., loneliness scores above 5; b=0.25, SE=0.39, *t*=0.64, *p* = .526). Finally, parasocial relationship had a positive impact on both attitude (b=0.80, SE=0.07, *t*=12.17, *p* < .001) and likelihood of future listening (b=0.99, SE=0.10, *t*=10.24, *p* < .001). These findings support all the predicted effects (H1a, H1b, H2a, H2b, H3).

## 3. General Discussion

To summarize, the results of this study show that podcasters' self-disclosure leads listeners to create a parasocial relationship with the podcaster. This, in turn, can lead to positive outcomes in terms of attitudes and behavioural intentions (likelihood to listen to future content). Furthermore, the elicitation of parasocial relationship promoted by self-disclosure is greater for listeners experiencing loneliness.

This research contributes to the literature about parasocial relationships (e.g., Liu & Lee, 2024) by studying the phenomenon of parasocial bonds in the podcast context and shedding lights on the role of self-disclosure (and its interaction with listeners' loneliness) in the process. This work also contributes to the literature that examines the role of loneliness in consumption. Past research claims that people experiencing loneliness can engage in consumption processes that creates indirect connections with the purpose of satisfying social needs, such as developing bonds with brands or anthropomorphising products (Shrum et al., 2023). We explored how this phenomenon can be also applied to podcast consumption. In particular, the data collected shows that people experiencing loneliness are more susceptible to podcasters' self-disclosure, resulting in higher likelihood of developing parasocial relationships.

One relevant result of this research is the process of podcast consumption that people experiencing loneliness can engage in. However, it is important to observe that the effects of this process are not yet examined. Future research can further explore this process and understands possible effects that consumers can experience in the short, and especially long term. Loneliness research in consumption contexts, indeed, mainly focuses on the short-term effects, leaving the long-term ones (that are arguably more relevant) unexplored. We call for further investigations in that sense.

# Digital Platforms, Physical Emissions: Investigating the Environmental CDR in Social Media and AI Practices

Francesca Negri

Università Cattolica del Sacro Cuore, Italy

francesca.negri1@unicatt.it

## Abstract

This study investigates how leading Social Media companies address Corporate Digital Responsibility (CDR) from an environmental perspective, with a particular focus on the role of Artificial Intelligence (AI) in amplifying energy consumption and emissions. While the literature on CDR is growing, little attention has been paid to its concrete application in specific sectors, especially in service-oriented digital platforms such as social media. To fill this gap, a Qualitative Document Analysis (QDA) was conducted on publicly available documents (sustainability reports, investor communications, and official corporate disclosures) from major Western Social Media Companies. An analytical framework was developed to map how environmental CDR is articulated across the three foundational layers of corporate culture (Schein, 2004; Lobschat et al, 2021): shared values, specific norms, and observable artifacts and behaviors. The findings highlight a significant gap between strategic intentions and operational implementation, with most companies concentrating their efforts on the normative level while neglecting strategic vision and measurable outcomes. The analysis identifies three clusters of companies based on their level of CDR integration and highlights key priorities and implementation gaps, referencing Herden et al. (2021) framework. The study contributes to advancing sector-specific CDR research and provides actionable insights for firms seeking to align their digital growth with environmental sustainability goals.

*Keywords Corporate Digital Responsibility, environmental impact, AI, Qualitative Document Analysis (QDA)*

## 1. Introduction and theoretical background

Discussions around the Digital sphere are increasingly accompanied by growing attention to issues of ethics and sustainability, particularly with regard to topics such as privacy, security, surveillance, trustability, accessibility, and inclusion. At the same time, environmental concerns linked to this growth are also intensifying.

In March 2024, Amazon.com purchased a nuclear-powered data center from Talen Energy. In September 2024, Microsoft and Constellation Energy signed a power agreement aimed at reviving a unit of the Three Mile Island plant in Pennsylvania—the site of the worst nuclear accident in U.S. history in 1979. Shortly thereafter, Alphabet became the first company in the world to sign a corporate agreement to purchase energy from small modular reactors, in an effort to meet the tripled electricity

demand driven by artificial intelligence (AI). The agreement with Kairos Power aims to bring the first Kairos small modular reactor online by 2030, with further deployments planned through 2035. Meanwhile, ByteDance purchased over 100,000 high-integrity carbon credits from Rubicon Carbonha to offset its emissions and meet its carbon neutrality goal by 2030[26].

Such topics are also beginning to establish their place within Academic research and agenda. In a context of ever-increasing digitalisation, and growing awareness of the opportunities and risks associated with it, Corporate Digital Responsibility (CDR) not only has been addressed and defined by many authoritative scholars (Table 1), but it is also considered to become the path to gain and maintain stakeholder trust and competitive advantage (Harden et al., 2021; Koch and Windsperger, 2017).

It starts with the need to conform to legal requirements and standards—for handling customer data, confidential, intellectual property and so on—but it also extends to wider ethical considerations and the fundamental values that an organization operates by." | Driesens (2017) |
| "Expanding the remit of CSR to address the impact of the digital tools and environments that businesses operate in." | Ampofo (2016) |

**Table 1:** Conceptualization and definitions of CDR

Across the many, the definition we are going to apply in this contribution is the one proposed by Lobschat et al. (2021), starting from the business ethics and defining CDR as the set of values and specific norms that govern an organization's judgments and choices related to four main processes related to digital technologies and data. Also, if there is some overlap with Corporate Social

[26] https://esgnews.com/it/Bytedance-acquista-100000-crediti-di-carbonio-ad-alta-integrit%C3%A0-da-Rubicon-Carbon/
https://www.ilsole24ore.com/art/google-nuovi-reattori-nucleari-alimentare-l-intelligenza-artificiale-AGEiBnY

Responsibility, the (1) exponential growth of digital technologies, the (2) malleability of digital technologies and the (3) pervasiveness of digital technologies impose to consider separately from CSR this perspective. In particular, the environmental point of view will be the one adopted in this study, trying to highlight an understudied field of CDR.

Moreover, CDR has been developed at the firm and society levels (Lobschat et al. 2021; Mihale-Wilson et al. 2022), and has been explored more deeply in the broad service context (Wirtz et al., 2022): service companies tend to have deeper relations with users, more touchpoints (like in the case of Meta and Google, for instance), and are dealing with much more customer personal data than any other kind of companies. The potential ethical concerns can be found, in a special way, in the Social Media environment: they are deeply rooted in people's lives of every age and generation (not only online), but they also collect generate and manage tons of data and insights (used in profit business models), with many vulnerabilities such as data breaches. Moreover, this sector, dangerously characterized by an oligopoly of companies, increasingly involves AI usage and development, and, as for many other service companies "we do not yet have a good understanding of the potential harms associated with these technologies" (Wirtz et al., 2022).

The aim of this contribution is to apply the principles of Corporate Digital Responsibility (CDR) to the Social Media sector, with a particular focus on the environmental impact of the core activities of Social Media platforms and the AI technologies they employ. While CDR is increasingly well-defined in the literature, there is still a lack of concrete approaches that outline its practical implementation—particularly through sector-specific perspectives that move beyond the traditional distinction between product-based and service-based companies

## 2. Methodology

To outline the characteristics of Environmental CDR in the context of Social Media, it was necessary to begin with an examination of the official documentation produced by the companies that develop and manage these digital platforms

Document Analysis is a systematic procedure for reviewing or evaluating documents and like other analytical methods in qualitative research, and requires that data be examined and interpreted in order to elicit meaning, gain understanding, and develop empirical knowledge (Corbin and Strauss, 2008; Bowen, 2009). Document analysis involves skimming (superficial examination), reading (thorough examination), and interpretation.

In particular, the research path followed these phases:

1. Definition of the corpus. The research protocol followed the following steps to collect the documents to be analysed for each of the major social media platforms in the Western world: search for sustainability reports, investor relations materials, newsroom content, and corporate website sections dedicated to sustainability, commitment, news, environment, and AI. Selected documents were written in English.

2. Analytical framework. To navigate this highly heterogeneous corpus, an analysis grid was developed to assess: (a) the presence or absence of themes related to Corporate Digital Responsibility (CDR) concerning the environmental impact of Social Media and the AI technologies they employ; (b) the narrative strategies used; and (c) the stated objectives.

3. Interpretation. In the light of Schein (2004) and Lobschat (2021) contributions, in evaluating the gap between theory of CDR and Practice we assume that CDR culture exists at three fundamental layers that vary in their grade of accessibility and visibility to the observer but that also are strongly interrelated. These layers are (1) shared values, (2) specific norms, and (3) artifacts and behaviours. Shared values are fundamental and general principles that guide the organization. They are abstract and not easily visible, but deeply embedded in the company's philosophy and goals. Specific norms are more concrete rules that translate values into desired behaviours. They are context-specific and serve as operational guidelines. Artifacts and behaviors are tangible manifestations of the CDR culture. These include technologies, products, practices, processes, and language. All the information extracted in the created corpus and assessed trough the analytical framework has been organized in Table 2, where for each Social Media have been inserted the major themes/narratives/goals.

## 3. Findings and discussion

| Social Media | Shared Values | Specific Norms | Artifacts and behaviors |
|---|---|---|---|
| Facebook/Instagram *(Meta)* | For a better reality | We see our role as protecting people and the planet through responsible operations — reducing our emissions and the energy and water used to power our data centers that enable access to our technologies — while protecting workers and the environment in our supply chain.<br>We set expectations with respect to the environment, labor and human rights in our operations and supply chain. This means ensuring that suppliers that produce and procure hardware adhere to standards that support safe, healthy and fair working conditions.<br>At the same time, we acknowledge we will not realize this vision on our own. We continue to collaborate with multi-stakeholder groups, community members, climate action leaders and scientists to innovate beyond what is possible today and work to achieve net zero emissions across our value chain and become water positive in 2030. | Since 2020, we have maintained net zero emissions across our global operations.<br>We have publicly committed to achieving net zero emissions across our value chain and becoming water positive in 2030.<br><br>Reduce our Scope 1 and 2 emissions by 42% in 2031 from a 2021 baseline.<br>• Enable at least two-thirds of our suppliers to set science-aligned emissions reduction targets by 2026.<br>• Not exceed our 2021 baseline Scope 3 emissions by the end of 2031.<br>• Restore 200% of the water we consume in high water stress regions and 100% of the water we consume in medium water stress regions.<br>• Continue to match 100% of our electricity use with renewable energy to support our operations.<br>• Positively impact the communities and environment where we operate.<br>• Expect supply chain partners to uphold high human rights and environmental standards.<br><br>We work with policy makers, partner organizations, trade groups and industry peers to |

**Table 2:** Social Media Platforms and CDR: the environmental footprint

From the layers point of view, it is perhaps surprising to have highlighted how the first and third layers are the least discussed. The missing of the first layer represents evidence of a non-strategic approach to the CDR issues in terms of environmental effort for service companies in the sector analysed, while the absence of the third layer demonstrates a difficulty/lack of concreteness in implementing solutions to support the second layer.

In essence, it seems that many companies are implementing tactical actions (second layer) without a strategic vision of CDR (first layer), nor the ability to translate planning into concrete actions and measurable outcomes (third layer).

An in-depth analysis of specific corporate cases in table 2 shows that X is perhaps the company with the least information related to CSR and CDR. Most of the content, still mixed between Twitter and X, is related in particular to policies that protect "security and privacy", and to promote "civic integrity" and the health of the public conversation by investigating and mitigating material related to spam, platform manipulation, API abuse, and information operations, seeking to make it safe for most users. The lobbying disclosure section has been stuck since 2021, many corporate website sections are stuck in 2023. There are no sustainability reports of recent years. There are companies like Google and Meta, which absolutely recognize the quantum lip of AI in support of their services/social media platforms, and build sustainability objectives and reporting around it, working on infrastructure, reducing waste, creating sustainable supply systems and implementing the use of green solutions, covering all three layers. On the other side, companies like Snapchat and TikTok didn't mention the role of Ai in defining their environmental impact. In the middle, for example, there is Linkedin, which has a more traditional approach to environmental sustainability, addressed and told at a corporate level (Microsoft) and less of Social Media.

On the other hand, there are Social Media Companies that do not even mention the effort towards sustainability, like X or TikTok, with fragmented and outdated information.

It is interesting to note how, in the case of Pinterest, an original and distinctive way of approaching the issue of environmental impact has also been found, such as the effort to limit misinformation and the spread of fake news on climate and the environment.

In this challenge, emerged at least two approaches: companies that tend to move alone, and companies that instead seek many partnerships and alliances with stakeholders and partners (Meta, and Pinterest).

## 4. Conclusion and Managerial Implications

As pointed out by Kurtz and Wirtz (2024), despite the high risks involved, it seems that many companies still not prioritize strong and effective CDR practices, especially from the environmental point of view.

In theory (Schein, 2004; Lobschat at al. 2021), each layer reinforces the others in a circular dynamic: from shared values (e.g., sustainability), derive specific norms (e.g., use of low-energy AI systems), which are expressed through concrete artifacts and behaviors (e.g., choosing green cloud providers or developing lightweight algorithms).

The analysis of the leading social media platforms reveals the emergence of three distinct clusters of companies. The first cluster includes those that acknowledge the relevance of Corporate Digital Responsibility (CDR), including its environmental dimension, and address it across all three layers. Their strong focus on this issue appears to be driven by an awareness of the increased energy demands associated with AI technologies supporting social media operations.

The second cluster comprises companies that recognize environmental CDR as important but not strategic, seemingly underestimating the growing impact of AI deployment. These companies maintain a traditional approach to CDR, closely aligned with conventional CSR frameworks.

The third cluster consists of companies that show no awareness of, nor interest in, CDR. These organizations are currently exposed to the highest levels of risk. As Social Media Marketing becomes increasingly impactful in terms of environmental consequences, communicating—as TikTok does—about the use of AI solely in relation to new feature releases may prove to be the most effective way to miss the appointment with Corporate Digital Responsibility, which for many appears to be set for 2030

In the words of Lobschat, et al. (2021) "It is the responsibility of system designers and the organizations that use these systems to recognize that their technologies may be used in ways other than they had anticipated with unwanted consequences for different stakeholders and society at large" () and "organizations to develop a comprehensive, coherent set of norms, embedded in their organizational culture, to govern the development and deployment of digital technology and data." may result in overlooking a responsibility that can no longer be postponed.

In terms of managerial implication, in Table 3 are evaluated the gap theory/practice and priorities that seem to be most relevant for leading Social Media Companies among the dimensions identified by Herden et al. (2021 p. 24).

| Fase | Actions to perform | Gap/Priority |
|---|---|---|
| 1. Perform a Self-Assessment | i. Analyze the company's current state of digital maturity, including any existing CDR activities, and responsibilities across business units and work- | **Big gap** |

| | | |
|---|---|---|
| | stream processes.<br>ii. Determine why the organization wants or needs to be digitally responsible.<br>iii. Identify the drivers and potential benefits and determine how close digital responsibility is to the organization's business model.<br>iv. Identify the significance of digital responsibility for the organization in the context of its industry and the market(s) in which it operates.<br>v. Determine if corporate digital responsibility could provide a competitive advantage. | **High priority** |
| 2. Develop a Vision | i. Determine what the future of the company is in the field of digital responsibility.<br>ii. Identify what the organization ideally looks like in terms of operations, administration, and communication with a living culture of digital responsibility.<br>iii. Determine which new stakeholders will emerge and how they will be involved.<br>iv. Decide if the CDR strategy is in line with the organization's culture and overall strategy. | **Big gap**<br><br>**Medium priority** |
| 3. Identify the Gaps | i. Identify the gaps between the current state and the ideal future digital state.<br>ii. Knowing the gaps is crucial for setting priorities and strategic initiatives, which could include:<br>a. Revising IT infrastructure or replacement by a new one.<br>b. Getting relevant (IT) processes ISO-verified.<br>c. Assigning a Chief Digital Responsibility Officer (CDRO).<br>d. Setting limitations for AI: e.g., revising embedded assumptions in the algorithms or defining an AI policy.<br>e. Investing in data security training for employees and providing a common understanding of CDR across all subsidiaries. | **Small gap**<br><br>**Medium priority** |
| 4. Close the Gaps | i. Develop a scalable CDR strategy to implement the changes to fill gaps.<br>ii. Assign responsibilities to specific people: individuals, teams, or departments responsible for the digital touchpoints of the organization.<br>iii. Responsibilities could be linked to KPIs, targets, or incentives of individuals, teams, and domains to ensure digital responsibility.<br>iv. If a CDRO is hired, he or she needs to understand the organization and its internal and external activities before implementation.<br>v. Implementation of changes requires alignment with company guidance and its processes and a change in the mindset of employees. | **Small gap**<br><br>**Medium priority** |
| 5. Ensure the Gaps Stay Closed | i. Develop a governance plan to make sure that all gaps are filled, some oversight exists, and the company's strategic CDR targets are met.<br>ii. Establish a common understanding of CDR along with the risks and opportunities at stake and raise awareness throughout the company.<br>iii. Company boards must acknowledge their accountability and assume responsibility for CDR issues.<br>iv. Separate functions, where needed, to increase the flexibility of reporting and foster transparency in order to fulfill stakeholder demand and legal disclosure (e.g., GDPR).<br>v. Incorporate CDR into the risk management plan to ensure that risks related to CDR are identified, managed, and monitored. | **Medium gap**<br><br>**Medium priority** |

**Table 3:** Implementation guide

## 5. Limits and Future Research

The main limitation of this study lies in its reliance solely on publicly available online documents. To enhance its robustness, triangulation with industry experts could represent a valuable methodological addition.

In terms of future research directions, the most promising path appears to be the inclusion of perspectives from key stakeholders of social media platforms—particularly users (to the best of our knowledge, only one study – carl et al., 2024 - to date explores consumers' views on CDR, though not within the context examined here) and investors, who may perceive the topic as highly relevant in terms of Brand Safety (Johnson et al., 2023).

# Personalization Unboxed: A Framework for Strategic Application

Chiara Ottolenghi[1],*, and Gennaro Iasevoli[1]

[1] Department of Human Sciences, University of Rome LUMSA, Italy

* Corresponding author: c.ottolenghi@lumsa.it

## Abstract

This study develops a multidimensional taxonomy of personalization strategies that integrates fragmented theoretical models with emerging managerial practices. Drawing on a systematic review of eight frameworks, the study organizes personalization into three macro-dimensions: Client, Contest, and Chain, combining established concepts and new factors such as VR and phygital experiences. The framework provides a structured lens for designing and scaling personalization initiatives and offers practical guidance for balancing customer engagement and operational flexibility. While conceptual, it sets the stage for future empirical validation and cross-industry applications.

*Keywords: Personalization, Customization, Taxonomy, Virtual Reality*

### 1. Introduction

In recent years, consumer demand for personalized products and experiences has grown exponentially. Since 2015, interest in personalized offerings more than doubled, transforming personalization from a premium feature into a strategic necessity. Fueled by the digital revolution and an ever-expanding set of technologies, today's consumers expect companies to address their increasingly diverse needs. Standardized, one-sizefits-all approaches no longer suffice. Indeed, 89% of business leaders now view personalization as critical to their success in the coming years (Segment, 2024). However, effective personalization is not merely about delivering tailored experiences, it is about cultivating long-term customer relationships. As Peppers (2015) notes, when firms empower customers to specify how they wish to be treated, and consistently meet those expectations, they foster loyalty by reducing the friction of switching to competitors. Moreover, personalization operates across multiple levels: it transforms goods into services, services into experiences, and experiences into meaningful personal transformations (Pine, 2022). This study contributes to the personalization literature by offering a comprehensive framework that identifies and organizes the key variables involved in crafting effective personalization strategies for products and services. We argue that a persistent gap exists between abstract theoretical models of personalization and the concrete implementation methods used in practice, making it difficult for both researchers and practitioners to evaluate and refine their personalization efforts. Existing models in the literature tend to be fragmented and lack practical integration. To bridge this gap, we develop a taxonomy that synthesizes current theoretical perspectives

with the personalization strategies employed by managers in organizations actively pursuing such initiatives. In addition, we extend this taxonomy with new variables that capture the evolving dynamics of contemporary personalization practices.

## 2. Literature Background

Personalization has become an essential strategic approach as consumers increasingly expect tailored products and experiences rather than one-size-fits-all solutions (Piller, 2021). Foundational contributions have conceptualized personalization and mass customization as strategies to reconcile efficiency with individual relevance (Gilmore & Pine, 1997). In their seminal work, Gilmore and Pine (1997) identify four customization approaches—collaborative, adaptive, cosmetic, and transparent—differentiated by whether product and representation change. These frameworks established a basis for distinguishing between superficial adaptations and deeper forms of personalization integrated into product design. Lampel and Mintzberg (1996) and Da Silveira et al. (2001) further advanced this discourse by positioning personalization along a continuum of consumer involvement, ranging from pure standardization to full design-stage customization. Reus (2006) emphasized that meaningful customization can occur not only during fabrication and assembly but also during earlier stages of product design, while Cadenas USA (2025) developed configurators to operationalize such involvement by capturing functional and aesthetic inputs from consumers. Taxonomies of personalization have also examined the role of digital interfaces and configurators. Weinmann et al. (2013) underline the critical importance of user modeling and system adaptation, proposing seven dimensions to classify how personalization systems collect, interpret, and act upon user data. In parallel, RinconGuevara et al. (2018) highlight the relevance of product architecture—whether modular or integral—in determining the scope of personalization. Their taxonomy integrates product life cycle stages, technology flexibility, and assembly configuration to capture the complexity of customization decisions. Technological advances have also enabled new forms of personalization in service delivery. Abdulrazzaq Qasem Ali et al. (2019) discuss the challenges of customization in SaaS applications, where tenant-specific adaptations can impact performance and require complex code management. These insights underscore that personalization extends beyond product configuration to encompass broader operational and technological dimensions.

Building on this body of research, the present study develops a taxonomy that bridges abstract conceptualizations and practical implementation. While prior studies have examined personalization variables in isolation, few have systematically connected them to actionable frameworks that guide firms in designing, delivering, and scaling personalization strategies. Addressing this gap, this study aims to provide a structured classification of personalization approaches that can inform both academic inquiry and managerial decision-making.

## 3. Methodology

To develop a research framework that would be both academically robust and practically relevant for managers, we conducted an extensive review of existing literature on product and service personalization and customization. This review included both theoretical frameworks proposed in academic publications and practical frameworks developed by leading consulting firms. Our approach followed the taxonomy development method proposed by Nickerson et al. (2009), which combines inductive, deductive, and intuitive processes to ensure that the resulting framework meets key criteria of conciseness, inclusiveness, comprehensiveness, and extendibility.

In applying this method, we first identified eight theoretical and managerial models published since 2000 on personalization and customization. The selection criteria combined two considerations: coherence with the specific focus of this study and citation frequency, to ensure both thematic relevance and academic impact. In addition to highly cited frameworks, we also included other taxonomies and classifications of demonstrable practical relevance, even if they were not necessarily indexed or widely cited in Scopus, to capture emerging perspectives in the field. The process was conducted in three iterative phases: Phase 1 (Inductive): We systematically extracted and compared the variables and dimensions presented across the eight selected frameworks, highlighting both unique characteristics and common themes; Phase 2 (Deductive): Building on this comparative analysis, we synthesized a unified taxonomy that integrates the most significant and recurring variables into a structured framework, organized into primary and secondary dimensions; Phase 3 (Intuitive): Finally, we enriched the taxonomy by incorporating additional variables that reflect the evolving landscape of personalization strategies, informed by recent industry trends, technological advances, and insights from practitioner reports.

This structured approach ensures that the proposed framework is not only grounded in established theory but also responsive to the dynamic and rapidly changing nature of personalization practices in contemporary business environments.

## 4. Analysis and results

After a literature review of eight influential models in the personalization and customization literature (Gilmore & Pine, 1997; Da Silveira et al., 2001; Reus, 2006; Weinmann et al., 2013; Rincon-Guevara et al., 2018; Abdulrazzaq Qasem Ali et al., 2019; Piller, 2022; Cadenas USA, 2025), we synthesized the main dimensions and compared underlying assumptions and design variables (Phase1). This comparative analysis, summarized in Table 1, highlights the evolution of personalization strategies from early mass customization typologies (Gilmore & Pine, 1997) and modular architectures (Da Silveira et al., 2001) to dynamic approaches incorporating configurator technologies (Cadenas USA, 2025), user modeling (Weinmann et al., 2013), and SaaS-specific customization challenges (Abdulrazzaq Qasem Ali et al., 2019).

**Table 1:** Comparative analysis

Building on these insights, in phase 2 of the taxonomy development process, we applied a deductive approach to integrate the most significant and recurrent variables into a structured framework organized around three macro-dimensions: Client, Contest, and Chain. Each dimension represented in Figure 1, aggregates key main variables and associated sub-variables to capture the breadth of contemporary personalization practices. Specifically, the Client dimension consolidates Customization Approaches, Levels of Customization, and User Modeling, reflecting the degree and nature of customer involvement in configuring solutions. The Contest dimension groups variables relating to the consumption context, namely Product Environment and Layers/Assets, highlighting the growing relevance of delivery channels, experience modalities, and hybrid environments. Finally, the Chain dimension combines Product Architecture, Technology Flexibility, Value Delivery and System Adaptation, emphasizing the operational and technological backbone supporting personalized offerings. Phase three of the analysis adopted a deductive combined with an intuitive approach to enrich this structure with emerging variables inspired by recent industry trends and practitioner insights. These additions include sub-variables such as Virtual Reality and Phygital experiences. This expansion acknowledges the accelerating role of immersive technologies, modular SaaS infrastructures, and data-driven personalization, which were underrepresented in earlier frameworks. Artificial Intelligence emerges as a transversal enabling factor capable of enhancing each dimension of personalization. It facilitates adaptive customization and predictive profiling within the Client sphere, enables greater automation and flexibility in production and technological processes within the Chain,

and makes it possible to create contextual, immersive, and phygital experiences in the Contest dimension.

**Figure 1:** Personalization Taxonomy

To illustrate how these dimensions can guide practical design decisions, the study proposes a scalable continuum for each macro-dimension. For Client, the scale ranges from Passive, Informed, Interactive, and Collaborative, up to Co-Creative, reflecting increasing degrees of customer engagement in ideation and configuration. The Contest dimension progresses from Physical Only environments, to Digital Support to Physical, Phygital Integrated, Digital Only, and Immersive Virtual contexts such as VR-based configurations. Finally, the Chain dimension spans from fully Standardized Chains, through Modular Chains, Configurable Chains, and Flexible Chains, up to On-Demand Custom Chains, characterized by real-time, end-to-end personalization and adaptive architectures. By integrating classical perspectives (Gilmore & Pine, 1997; Da Silveira et al., 2001) with contemporary technological and operational dimensions, including AI-driven configurators and hybrid service models (Weinmann et al., 2013; Piller, 2022), this framework provides a multidimensional lens to systematically design and evaluate personalization strategies.

## 5. Conclusions

This study advances personalization research by integrating previously fragmented conceptualizations into a unified, multidimensional taxonomy. Drawing on Nickerson et al. (2009), we followed inductive, deductive, and intuitive approaches to ensure that the framework meets key quality criteria: conciseness, inclusiveness, comprehensiveness, and extendibility. These principles guided the development of the three macro-dimensions, Client, Contest, and Chain, which incorporate both established variables and emerging factors such as Virtual Reality and Phygital experiences. In this way, the framework reflects both the foundational perspectives in the literature and the evolving dynamics of contemporary personalization practices. By systematically mapping the principal and sub-variables of personalization strategies, spanning customer involvement models, contextual environments, production architectures, and enabling technologies, the framework offers a holistic perspective on

how personalization creates both value and risk across the customer journey. For practitioners, the findings underscore the importance of carefully calibrating personalization initiatives along all three dimensions. Firms should: Design configurations that balance flexibility and simplicity across the Client continuum, from passive to co-creative engagement; Actively manage the Contest dimension by integrating hybrid and immersive experiences without sacrificing clarity or usability; Develop adaptive Chain architectures capable of delivering scalable, on-demand personalization while maintaining operational efficiency and data integrity. This structured approach can improve adoption rates, enhance customer satisfaction, and sustain long-term loyalty in an increasingly dynamic market environment. The research remains conceptual and does not empirically test the relationships among variables. Furthermore, sectoral, cultural, and technological contingencies may moderate the framework's applicability. Future studies should empirically validate the proposed dimensions and scales across diverse industries and geographies. In addition, longitudinal research is needed to explore how emerging technologies—particularly AI-powered configurators and virtual environments—reshape customer expectations and the effectiveness of personalization strategies over time.

# The Brand Purpose–Authenticity Nexus: Leveraging Instagram Bios to Drive Word-of-Mouth

Marco Pichierri[1], *, and Martina Di Cioccio[2]

[1] Department of Management, Economics and Business Law, Aldo Moro University of Bari
[2] Department of Business and Management, LUISS Guido Carli University, Rome

## Abstract

Across three experimental studies, this research revealsthat including a brand purpose (BP) in Instagram bios enhances perceived brand authenticity, which in turn increases consumers' intention to engage in positive word-of-mouth (WOM). Study 1 confirms this mediation effect and shows that it is robust regardless of affective brand involvement or cause relevance. Study 2 shows that this effect depends on individual differences in long-term orientation (LTO) and abstract thinking, with stronger outcomes among those high in these traits. Study 3 highlights the moderating role of consumer skepticism, finding that more skeptical consumers perceive brands with BP statements as more authentic. Theoretical and practical implications for digital marketers are also discussed.<

*Keywords: brand purpose, Instagram bio, brand authenticity, word-of-mouth, long-term orientation, abstract thinking.*

## 1. Introduction, purpose, and background

Brand purpose, i.e., the brand's declared objective to achieve a higher-order, long term goal beyond profit (Williams *et al.*, 2022) is a crucial tool for businesses. It may serve as a vital signal of brand authenticity, fostering positive word-of-mouth (WOM) and strengthening brand-consumer relationships. Yet, little is known about its effect in digital micro-spaces such as Instagram bios. This paper seeks to fill this gap by investigating whether and how BP in Instagram bios enhance perceived authenticity, and, in turn, positive WOM. Across three experimental studies, we test the effect of BP presence on authenticity and WOM, considering moderators such as long-term orientation, abstract thinking, and skepticism.

Unlike brand activism, which involves visible stances on socio-political issues (Kotler & Sarkar, 2017), BP reflects a brand's foundational, long-term mission (Charles & Marciniak, 2021). By including BP in this space, brands may reinforce their societal commitment and enhance perceived authenticity (Dwivedi *et al.*, 2019), which prior works link to positive WOM (e.g., Morhart *et al.*, 2015; Spiggle *et al.*, 2012). We expect BP to increase authenticity perceptions, which mediate WOM intentions, with effects contingent on some individual dispositions: *i*) *long-term orientation* (LTO), defined as the tendency to prioritize future outcomes and enduring values (Bearden *et al.*, 2006); *ii*) *abstract thinking*,

i.e., the tendency to process information at a high level of generality (Trope & Liberman, 2010) and interpret distant or long-term goals more favorably (Fujita *et al.*, 2006); *iii*) *skepticism* toward marketing, defined as a tendency to doubt the truthfulness of brand claims (Obermiller & Spangenberg, 1998).

## 2. Method and results

Three between-subject experiments (*N*=110, 190, 180) on Prolific tested BP presence vs. absence in Instagram bios. Measures included brand authenticity, WOM intentions, and moderators (LTO, abstract thinking, skepticism). Each experimental study used a two-cell (BP in Instagram bio: presence vs. absence) between-subject experimental design, with participants randomly assigned to either a fictitious Instagram post featuring a bio containing a brand purpose statement (i.e., "Preserving art history and culture for future generations") or a bio with a conventional promotional message (i.e., "Unleash your style with our unique designs"). Stimuli were pre-tested for realism, and in each study, manipulation checks confirmed that participants correctly perceived the evaluation condition assigned to them. All multi-item scales were checked for unidimensionality, and reliability analyses were performed. PROCESS Macro (Hayes, 2023) was used to conduct the subsequent mediation and moderation analyses.

Study 1 confirmed that BP presence increased authenticity perceptions, which mediated WOM intentions, robust across brand involvement and cause relevance. Study 2 replicated the mediation and showed stronger effects for participants high in LTO and abstract thinking. Study 3 confirmed the effect and revealed that, contrary to expectations, skeptical consumers perceived brands displaying BP in their bios as more authentic.

## 3. Research implications

This paper adds to the literature on BP, perceived brand authenticity, and WOM in digital settings by demonstrating that concise BP statements, such as those placed on Instagram bios, can effectively signal authenticity and foster positive advocacy. Effects were strongest among consumers high in LTO and abstract thinking. Surprisingly, skeptical users also rated brands with BP as more authentic, suggesting a counter skepticism effect.

From a managerial perspective, the results highlight the strategic value of embedding BP in digital brand touchpoints. Purpose statements should emphasize long-term societal commitments and be tailored to resonate with audiences who are high in LTO, abstract thinking, or even skepticism.

Ultimately, this paper underscores the relevance of exploring the nexus between BP communication and consumer perceptions, particularly in an era of AI-generated content and digital overload. A simple digital message can help brands remain authentic, a challenge at the heart of future marketing innovation.

# Consumer Responsiveness to Influencer Marketing: A Mixed-Methods Approach

Savino Santovito[1], Raffaele Campo[1], *, Lucrezia Maria De Cosmo[2], Fabrizio Flavio Baldassarre[2], and Pierfelice Rosato[3]

[1] Department of Economics and Finance, University of Bari
[2] Department of Economics, Management and Business Law, University of Bari

## Abstract

This study investigates the influence of social media influencers on consumer behavior, comparing their impact with traditional media and non-celebrity online promotions. Data were collected via a bilingual questionnaire (Italian and English) from 113 respondents (56% female, 67% Italian), focusing on perceived similarity to influencers, engagement behaviors, and purchase motivations. Statistical analyses including correlation, cluster, regression, ANOVA, and Fisher's Exact Test were conducted using RStudio. Results reveal a weak positive correlation between perceived similarity to influencers and user engagement (likes, shares), with similarity emerging as the sole significant predictor of the perceived relevance of influencer product reviews. Cluster analysis identified three consumer segments varying in susceptibility to influencer marketing, enabling targeted strategy recommendations. No significant differences were found across age groups or between perceived similarity and social media usage frequency. A decision tree revealed that preferences for influencer marketing depend on product popularity and brand reputation. Implications and limits are finally discussed.

*Keywords: Influencer Marketing, Social Media, Self-Congruence, Segmentation*

## 1. Literature Review

Research on digital marketing increasingly focuses on social media influencers. Studies show self-congruity and identification play key roles in influencer marketing. Strong alignment between a consumer's ideal self and an influencer's image improves endorsement effectiveness, mediated by parasocial identification (Shan et al., 2019). While consumer-product congruence directly affects impulse buying, consumerinfluencer congruence requires wishful identification to influence behavior (Koay & Lim, 2024). Self-congruence has two dimensions: 1) actual self-congruence — how much an influencer matches a follower's current self-view, boosting trust and relatability; 2) Ideal self-congruence — how much an influencer reflects qualities the follower aspires to, driving aspirational purchases.

For virtual influencers, both actual and ideal congruence affect emotional attachment and reinforce influencer credibility, content usefulness, and consumer behavior (Venciute et al., 2023). Marketers should consider these psychological factors in influencer selection to improve campaign impact. Schouten et al. (2021) highlight influencers' stronger role than celebrities in building identification, trust, and credibility. Xu and Pratt (2018) emphasize influencer-consumer congruence's importance in tourism decisions. Identification with influencers also encourages product recommendations (Xiao et al., 2021). Zogaj et al. (2021) show actual selfcongruence fosters trustworthiness, while ideal congruence builds perceived competence, highlighting complex pathways to influencer credibility. Von Mettenheim and Wiedmann (2021) describe a triadic congruence model—brand-influencer, actual self-influencer, ideal self-influencer—whose effectiveness depends on consumer involvement. Higher involvement favors actual congruence; lower favors aspirational alignment. Torres et al. (2019) find influencer attractiveness and brand congruence shape positive attitudes and purchase intentions, mediated by affective responses. Farivar and Wang (2022) stress community identification and opinion leadership as key purchase drivers, with social identity being most influential.

Overall, congruence—across self-concept, brand fit, and community—is vital in influencer marketing, with important implications for targeting and messaging strategies. Premised that, this study is aimed at exploring how congruence between users and influencers can impact on their behavior and on marketing strategies. In particular, our research questions are:

1) How does perceived similarity between consumers and influencers (values, lifestyle) affect user engagement (likes, shares) and the perceived credibility of influencer product reviews?

2) Can consumers be grouped based on their perceived similarity to influencers and how much they value influencer content, and how can these groups guide marketing strategies?

3) Do factors like age or social media usage influence how consumers perceive the relevance of influencer reviews?

## 2. Methodology

A questionnaire was used to collect data on how influencers affect behavior compared to traditional media and non-celebrity campaigns. It was translated into English for nonItalian respondents. After data collection, invalid responses were removed, and country data was simplified to "Italy" or "Abroad." The final sample included 113 mainly young participants (56% female, most of the sample aged 18–24), with 67% Italian and 33% from countries like Germany, UK, and the US. No significant difference appeared in how much importance participants gave to influencer opinions (average score 2.6/5), showing general indifference. Purchase decisions were linked more to the content type, mainly product reviews (34.78%) and "Get Ready With Me" videos (27.54%).

## 3. Results And Discussion

Analyses were carried on with RStudio and showed:

***Correlation Analysis*:** There is a weak positive correlation between users' perceived similarity to influencers (values and lifestyle) and their likes/shares. This suggests similarity alone is not enough to boost engagement; content quality and authenticity also matter.

***Cluster Analysis*:** Three user segments were identified:

- Highly Susceptible Users—high perceived similarity and review value, likely very influenced by endorsements.
- Indifferent Users—low similarity and review importance, less responsive to influencer marketing.
- Moderately Susceptible Users—moderate scores, somewhat responsive.

This segmentation helps tailor marketing strategies per group.

***Multiple Linear Regression:*** Perceived similarity was a strong, significant predictor of the importance given to influencer reviews (coefficient 0.3898, $p < 0.001$). Likes and shares had no significant effect. The model explained 14.3% of variance in perceived review relevance and was overall statistically significant.

***Interaction Plots:*** As people felt more similar to influencers, they also saw them as more important. However, people in the middle range of similarity had mixed opinions. Those who felt very similar mostly agreed that influencers were important, but a few people who didn't feel similar still rated influencers as highly relevant, showing that opinions can be complex.

***ANOVA Test:*** No significant age effect on perceived review relevance ($p = 0.0768$), though a trend was observed. A t-test comparing age groups 18–24 and 25–34 confirmed no significant differences ($p = 0.2707$).

***Fisher's Exact Test:*** No significant link was found between perceived similarity and social media usage frequency ($p = 0.1229$). This suggests perceived affinity with influencers is influenced by factors beyond just social media engagement, such as psychological or cultural aspects.

**The Decision tree**

The analysis aims to optimize international marketing by segmenting consumers based on their media preferences—distinguishing between those more influenced by influencers versus traditional media. This helps tailor campaigns, allocate budgets efficiently, and use local influencers or traditional channels depending on regional trust. Using Weka for data mining, the most informative decision tree revealed that consumers uninterested in product popularity prefer traditional ads, while those influenced by popularity and brand reputation lean toward influencer marketing— especially when they actively engage on social media and feel similar to the influencers.

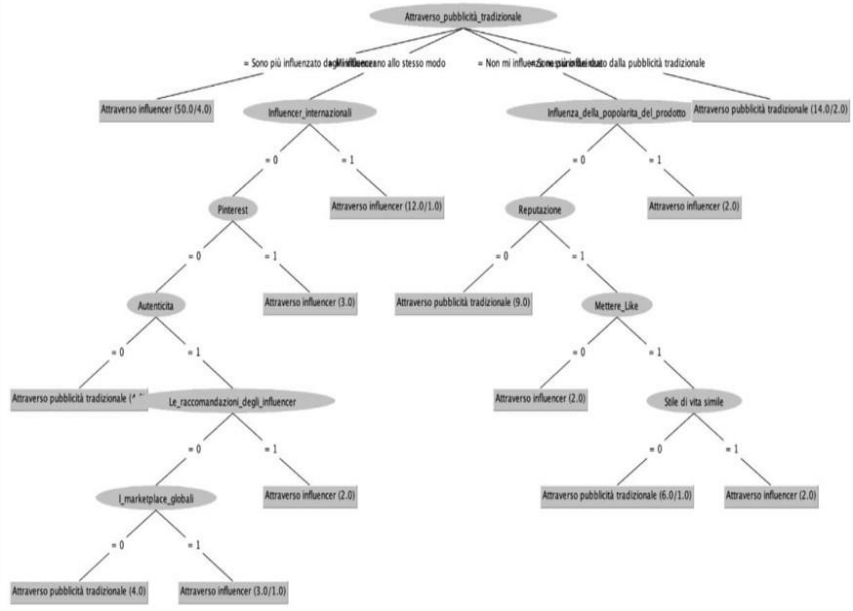

**Figure 1:** The most relevant Decision Tree (Source: Our own elaboration)

## 3. Implications, Limits And Conclusions

The findings highlight that perceived similarity between consumers and influencers significantly enhances the perceived relevance and credibility of influencer product reviews. This implies that marketers should prioritize the selection of influencers whose values and lifestyles closely align with their target audience to maximize promotional effectiveness. This means that it is necessary to invest by considering congruence.

Moreover, since purchase behavior correlates more strongly with specific types of influencer content—namely product reviews and "Get Ready With Me" videos— brands should tailor influencer collaborations toward these content formats to better stimulate consumer purchasing decisions. The cluster analysis reveals heterogeneity among consumers in their susceptibility to influencer marketing. This segmentation provides a valuable framework for firms to customize their strategies—allocating influencer-driven campaigns primarily toward highly susceptible clusters while deploying alternative tactics for more indifferent segments.

The results advocate for a nuanced segmentation of consumer audiences, acknowledging distinct susceptibility levels toward influencer marketing, and recommend a content-focused approach emphasizing authentic and value-congruent messaging. These findings, show, furthermore, that factors beyond social media usage frequency shape consumers' perceived alignment with influencers, encouraging further research into underlying psychological and sociocultural dynamics. Overall, this study provides actionable insights for marketers seeking to optimize influencer partnerships by emphasizing value congruence and content relevance while considering heterogeneity within target markets. The most important limits of this study is represented by the small sample and the prevalence of the 18-24 aged group which requires a more balanced sample in the future development of this research.

# Leveraging Mechanical AI to Optimize Advertising Performance: Evidence from TikTok Smart+ Campaigns

Piermario Tedeschi[1],*, Mihaela Giannelli[2], and Maria Vernuccio[3]

[1] Department of Management, Sapienza University of Rome, Italy
[2] Department of Management and Economics, University of Salento, Italy
[3] Department of Management, Sapienza University of Rome, Italy

* Corresponding author: piermario.tedeschi@uniroma1.it

## Abstract

This study investigates the impact of mechanical AI systems on the performance of social media advertising. Drawing on a multi-case qualitative design, the research explores the effects of Smart+, an AI-driven automation tool integrated into TikTok Ads Manager, on campaign effectiveness and efficiency. While AI's strategic potential in marketing has been widely recognized, less attention has been paid to its operational role, particularly in automating routine tasks such as bidding, pacing, and budget allocation. The study addresses this gap by analyzing campaign performance metrics (i.e., CTR, CR, CPC, CPA, and CPM) across three companies operating in the construction, home furnishings, and financial services sectors. Each company adopted Smart+ after running campaigns through manual management, offering a before-andafter comparison. Results show that Smart+ generally improves efficiency by lowering cost metrics (i.e., CPC, CPA), and in some cases enhances effectiveness (e.g., higher conversions and conversion rates). Notably, the study also identifies challenges and limitations related to the variability of AI performance depending on campaign complexity and data quality. However, the extent of improvement varies depending on industry context and campaign goals. These findings contribute to the literature on AI in digital advertising by providing an advanced understanding of the role of mechanical AI in operational marketing. From a managerial perspective, results suggest that companies can benefit from integrating AI tools like Smart+ to enhance campaign delivery. However, human oversight remains essential to ensure strategic alignment. Moreover, this research encourages marketers to adopt a balanced approach combining AI automation with human expertise for optimal results. The study highlights the need for more nuanced research into platform-native AI tools and their effects across different sectors and campaign types. Future studies could also explore long-term impacts and ethical considerations associated with AI-driven marketing automation.

*Keywords: Mechanical AI, Digital Advertising, Marketing Automation, Campaign Performance, TikTok Ads, Smart+ Automation*

## 1. Introduction

In recent years, the adoption of Artificial Intelligence (AI) in marketing has revolutionized the way companies manage and evaluate their advertising campaigns. AI systems are now commonly introduced in digital advertising platforms, offering automation capabilities that can enhance operational decision-making, campaign personalization, and resource optimization (Davenport et al., 2020). In this context, social media platforms like TikTok are adopting AI-powered tools to support companies in managing campaign parameters, such as targeting, bidding, and budgeting, in real-time.

Among social platforms, TikTok positions itself as a performance-oriented platform and explicitly promotes automation tools, such as Smart+, to help advertisers optimize delivery, targeting, and bidding processes. According to its official business documentation (TikTok for Business, 2025), Smart+ is presented as a solution to simplify campaign setup and improve both efficiency and effectiveness.

According to Khimich et al. (2021), digital advertising performance could be evaluated based on two dimensions: effectiveness and efficiency. Effectiveness refers to the degree to which campaigns achieve their communication goals as measured by indicators such as impressions, clicks, click-through rate (CTR), and conversion rate (CR). At the same time, efficiency is defined as achieving desired results with the lowest possible cost (Black, 2000). It is commonly assessed using other metrics, such as cost-per-click (CPC), cost-per-thousand (CPT), and cost-per-acquisition (CPA).

Among the various types of AI applications, mechanical AI tools refer to rule-based systems that automate repetitive and structured tasks, and have been identified as a key factor in improving efficiency in marketing campaigns (Huang et al., 2021). Despite growing interest in these AI tools, there is a lack of empirical research on their concrete effects on campaign outcomes in social media environments. Indeed, while the strategic role of AI in digital marketing is increasingly recognized (Dwivedi et al., 2021), its operational role, especially the task execution carried out by mechanical AI systems, remains relatively underexplored.

This study seeks to fill this gap by examining how campaign performance, measured in terms of both effectiveness (e.g., CTR, CR, conversions) and efficiency (e.g., CPC, CPM, CPA), changes after the adoption of a mechanical AI system. The analysis focuses on Smart+ as a critical case of such systems, integrated within the TikTok Ads platform. More specifically, Smart+ is an AI-driven automation tool integrated into TikTok Ads Manager, which affects the effectiveness and efficiency of the advertising campaigns. The study employs a longitudinal approach to investigate whether the use of Smart+ can enhance the effectiveness and efficiency of social media advertising campaigns. In this respect, while marketing automation has been widely studied in B2B content marketing (Järvinen & Taiminen, 2016), fewer studies have focused on comparing campaign performance before and after the adoption of automated AI systems on their social platforms. Therefore, the objective of this study is to investigate whether the adoption of a mechanical AI system, such as Smart+, enhances advertising performance in terms of both effectiveness and efficiency. To conduct this study, we adopted a qualitative case study approach (Yin, 2014), analyzing campaign data from three companies operating in different industries that share a common AI platform usage.

## 2. Literature Review

### 2.1 AI in Digital Advertising

AI has rapidly transformed the digital marketing landscape, reshaping the way companies design, execute, and manage advertising campaigns. Over time, the definition of marketing automation has evolved. Initially, it referred to the use of software to perform marketing actions without manual intervention, and this concept was traditionally associated with B2B workflows such as email drip campaigns or leadnurturing sequences (Järvinen & Taiminen, 2016). AI encompasses systems and algorithms that can execute tasks typically requiring human accuracy, such as data analysis, learning from data, and recognizing patterns to inform decisions (Davenport et al., 2020). In the context of digital advertising, AI technologies enhance the hyperpersonalization of messages, predictive analysis of user behavior, and real-time adjustment of campaign parameters.

Several studies have highlighted the potential of AI to improve marketing capabilities, specifically in automating repetitive and data-intensive tasks (Chatterjee et al., 2022). These capabilities are significant for platforms like TikTok because user-generated content and algorithm-driven distribution are both opportunities and challenges for advertisers. Despite these advancements, several studies have focused on the contribution of AI as a strategic tool to improve tasks such as content generation and personalization (Kumar et al., 2024), while only a few have examined its role in operational aspects, such as campaign performance optimization (Huang and Rust, 2021). This is particularly significant for tools like Smart+, which are embedded in the TikTok platform and aim to manage delivery processes rather than content or targeting. Within the field of artificial intelligence applications in marketing, Huang and Rust (2021) show a widely accepted theoretical framework that categorizes AI into three types: mechanical, thinking, and feeling. They define mechanical AI as a system designed to replicate mechanical human activities, by automating routine and rulebased processes without cognitive involvement, but with higher speed and accuracy. Contrasting thinking AI includes tools that support analytical decision-making, while feeling AI encompasses tools capable of simulating emotional understanding (e.g., chatbots with sentiment recognition). This taxonomy is crucial for framing the Smart+ tool as a mechanical AI. Its primary function is to manage delivery parameters such as campaign pacing (how the advertising budget is spent over time during a marketing campaign) (Xu et al., 2015), creative rotation, and audience targeting automatically, based on predefined algorithms and performance However, it does not operate at a strategic level and should not be considered "intelligent" in terms of decision-making. However, its scope has expanded with the expansion of AI-based tools capable of acting autonomously. In this context, mechanical AI represents a significant advancement, enabling not only automation but also dynamic adaptation to real-time campaign data.

## 2.2 Performance Metrics in Digital Advertising

In digital advertising, the evaluation of campaign success is very reliant on quantitative performance metrics. These metrics serve as Key Performance Indicators (KPIs) that allow marketers to measure the degree to which a campaign achieves its communication and business objectives. Previous literature distinguishes between two primary dimensions of campaign performance: effectiveness and efficiency (Khimich & Perfilova, 2021; Black, 2000). Effectiveness refers to a campaign's ability to generate the desired user actions or engagement, such as viewing an ad, clicking through to a landing page, or completing a conversion action (e.g., lead generation or purchase). According to Khimich and Perfilova (2021), effectiveness KPIs include:

- Impressions: The total number of times an ad is shown to users;
- Clicks: The number of times users interact with an ad by clicking;
- Click-Through Rate (CTR): The percentage of clicks relative to impressions, indicating the relevance and appeal of the ad content;

- Conversions: The number of actions completed by users;
- Conversion Rate (CR): The ratio of conversions to clicks, indicating the effectiveness of the campaign.

These metrics are crucial for evaluating the effectiveness of a campaign in engaging the target audience and driving business outcomes. However, they do not account for cost considerations, which are captured by the second dimension of performance: efficiency.

Efficiency, as defined by Black (2000), is the capability to achieve results with the lowest possible costs. In digital marketing, efficiency is typically assessed using costbased indicators like:

- Cost Per Click (CPC): The average cost incurred for each click;
- Cost Per Thousand (CPT): The cost per thousand impressions;
- Cost Per Acquisition (CPA): The average cost to generate a conversion. The digital marketing landscape has increasingly shifted toward database-driven approaches, where such KPIs are monitored and optimized in real-time (Khimich and Perfilova, 2021). This shift has made automated systems more attractive, as they can process vast datasets and adjust campaign parameters dynamically to improve both efficiency and effectiveness (Chintalapati et al., 2022).

Carrasco Gubernatis (2024) notes that KPI interdependence must be carefully considered, as improvements in one metric do not necessarily translate to holistic campaign success. For instance, a reduction in CPC may be accompanied by a decline in CR if the quality of traffic deteriorates. Therefore, evaluating campaign performance requires a composite view of both cost- and result-based metrics.

## 3. Methodology

We conducted this study adopting a qualitative, case-study method (Yin, 2014). In this context, Smart+ is framed as a mechanical AI tool (Huang et al., 2021) because it autonomously manages key campaign execution tasks, such as audience targeting, pacing, creative optimization, and budget allocation, within TikTok Ads Manager. Its integration as a native, default tool promoted by the platform, and its use across various campaign types (e.g., web, app, lead generation), make it a strategically informative case to study the executional implications of AI-driven automation in advertising (TikTok Business, 2025). Its use is expected to impact performance metrics by optimizing the executional components of ad campaigns.

In this study, we conduct an inter-case comparison between the level of performance achieved after the adoption of Smart+ in advertising campaigns and the level achieved before the introduction of the Smart+ system. The objective is to examine the differences in metric performance (impressions, clicks, click-through rate (CTR), conversions, conversion rate (CR), cost-per-click (CPC), cost-per-thousand (CPM), and cost-per-acquisition (CPA)) before the adoption of an automated system.

We analyzed three companies that manage advertising campaigns on TikTok, focusing on lead generation, which is the initiation of consumer interest or inquiry into a business's products or services (Järvinen and Taiminen, 2016).

While these three companies operate in different sectors, they are comparable in terms of campaign goals because each uses TikTok as its primary advertising platform. The cases were drawn from the

operational experience of a leading digital marketing agency (anonymized for confidentiality), characterized by a high level of technological adoption and specialization in integrated digital strategies.

The three companies, referred to as Case A, Case B, and Case C, show the following characteristics, as summarized in Table 1:

| Case | Sector | Campaign Period | Total Campaigns | Smart+ Campaigns | Manual Campaigns | Campaign Goal |
|---|---|---|---|---|---|---|
| Case A | Construction Materials | Jun 2024 – Mar 2025 | 4 | 2 | 2 | Generate qualified leads via instore appointment bookings for bathroom quotes. |
| Case B | Home Furnishing | May 2024 – Mar 2025 | 10 | 5 | 5 | Attract buyers by collecting contact info from users planning to buy furniture. |
| Case C | Financial Services | Jul 2024 – Mar 2025 | 10 | 5 | 5 | Capture loan prospects by driving form completions for personal loan applications. |

**Table 1:** Summary of company case characteristics

Data were gathered from TikTok Ads Manager, which provides us with objective indicators of campaign performance, reach, and engagement levels across different timeframes. Additionally, internal documentation, such as project reports, campaign briefings, and post-campaign evaluations, was considered to analyze processes related to Smart+-based advertising.

Furthermore, direct observation was conducted in collaboration with project managers and digital strategists involved in the development of AI-driven advertising initiatives for a period spanned between 9 and 16 months to enhance the internal validity of the intra-case comparison (Aguinis and Solarino, 2019), ensuring a longitudinal perspective and to capture variations in performance before and after the adoption of Smart+ in advertising campaigns.

To assess the performance of advertising campaigns, we utilized a set of digital marketing metrics commonly used in this field to measure visibility, conversion outcomes, and interactions. According to Carrasco Gubernatis (2024), the metrics analyzed include CPC, CPM, Clicks, CTR, Conversions, CPA, and CR.

To support our intra-case comparison, we present Tables 2, 3, and 4 below, which contain the performance data for each company's campaigns aggregated over the entire observation window: the totals for all months before Smart+ adoption and the totals for all months following Smart+ adoption. Each table, therefore, enables a like-for-like comparison of every effectiveness and efficiency metric. These consolidated data serve as the quantitative foundation for the qualitative discussion in the next section.

| Case A |
|---|

| Campaign | S+ | Cost | CPC | CPM | Imps. | Clicks | CTR | Conv. | CPA | CR |
|---|---|---|---|---|---|---|---|---|---|---|
| Jun 2024 | no | €1,658 | €1.12 | €3.46 | 479,271 | 1,477 | 0.31% | 2 | €829.17 | 0.14% |
| Oct 2024 | no | €10,497 | €0.89 | €2.72 | 3,861,931 | 11,856 | 0.31% | 10 | €1,049.71 | 0.08% |
| Jan 2025 | yes | €4,993 | €0.85 | €1.73 | 2,880,914 | 5,850 | 0.20% | 18 | €277.39 | 0.31% |
| Mar 2025 | yes | €5,001 | €1.15 | €2.43 | 2,058,195 | 4,331 | 0.21% | 24 | €208.39 | 0.55% |

**Table 4:** Performance data collected for Case C

## 4. Results

In this section, we analyze the performance results from advertising campaigns across the three cases presented in the study. We focused on comparing key metrics before and after the adoption of the Smart+ automation system to assess potential improvements in both effectiveness (Conversions) and efficiency (CPA and CR) (Khimich and Perfilova, 2021).

The observations are based on the data previously reported in Tables 1, 2, and 3.

### Case A

Case A, a construction materials company, managed four campaigns from June 2024 to March 2025, of which two were handled manually, and Smart+ implemented two. The intra-case comparison reveals a significant improvement in efficiency-related metrics after the adoption of the Smart+ automated system.

Only four TikTok flights were run between June 2024 and March 2025, each with a different budget, so trend interpretation must remain cautious. The brand first launched a pilot in June 2024; the small test produced just two appointments and an extremely high CPA (€829). A larger-budget follow-up in October fared even worse, pushing the cumulative CPA for the two manually managed campaigns above €1,000.

When Smart+ was activated in January 2025, the picture changed markedly. Across the two automated flights (January-March),.The CPA decreased from €1,012.95 to €237.96, representing a 76.5% improvement; The conversion rate increased from 0.09% to 0.41% (+355.6%), and total conversions rose from 12 to 42, despite a 17.8% lower spend.

Thus, even in a short observation window and with uneven budgets, Smart+ delivered a far more efficient and effective lead-generation process than manual optimisation.

### Case B

Case B refers to a company operating in the home furnishing sector. Unlike Case A, this dataset spans nine consecutive months and shows a steady media budget of roughly €7.000 per flight, giving the comparison more reliability. The switch to Smart+ in January 2025 resulted in clear improvements, primarily driven by media-buying efficiency. The performance uplift stems almost entirely from cheaper traffic rather than a higher propensity to convert.

Smart+ reduced the average CPC by 37.7% (from €0.61 to €0.38) and the CPM by 29.3%, allowing the same monthly budget to yield far more visits and conversions. Even if the conversion rate slipped marginally, from 4.43% to 3.78%, thanks to the fact that every click now costs much less while each hundred clicks still generates roughly the same number of leads, the CPA dropped sharply by 26.9% from €13,72 to €10.03. In short, the efficiency gains come from buying clicks at a lower price, rather than increasing the likelihood that a click converts.

### Case C

Case C refers to a financial services provider. During the summer of 2024, it invested approximately €5,000 per month and, with manual optimization, achieved enviably low costs (CPA around €2.24 and €3.31, and a conversion rate of nearly 30%). However, the volumes were modest. In October, the company doubled the budget in an attempt to win more leads. The extra spend was effective, yet it immediately increased costs: the CPC jumped to €1.33 and the CPA to €4.27.

Smart+ was introduced the very next month. Even before the learning period, the algorithm clawed back a significant share of the lost efficiency: November's CPC fell to €1.10 (about 17% lower than the October peak) and CPA to €3.69 (-14%), while the conversion rate remained roughly steady. Encouraged by that result, the advertiser continued to increase the outlay, first to about €15,000 (+50%), then to roughly €20,000 (+100%), and finally to €2 5,000 (+150%) per month. Remarkably, as the budget continued to climb, the key cost metrics remained almost flat: CPC hovered around the €1 mark and later rose to €1.21 (nearly a 20% increase), and CPA fluctuated between €4.74 and €6.23, well below what would normally be expected when spending quintuples. The conversion rate did ease into the low - 20% range, yet the monthly number of leads almost doubled compared with the manual period.

In summary, Smart+ did not replicate the ultra-low CPAs of the initial low-budget months. Still, it allowed the brand to scale its media spend several times over without a proportionate rise in unit costs, something manual optimization had failed to achieve.

## 5. Discussion

The findings of this study contribute to a deeper understanding of how mechanical AI systems, represented here by Smart+, can impact the performance of advertising campaigns on social media platforms such as TikTok. Our inter-case analysis reveals that the adoption of Smart+ enhances both effectiveness (CTR, CR, conversions) and efficiency (CPC, CPM, CPA), reinforcing prior literature that highlights the positive impact of AI systems on digital marketing operations through automation (Davenport et al., 2020).

In this context, Smart+ operates within the definition of mechanical AI as proposed by Huang et al. (2021). This system automates routine, rule-based marketing tasks with high speed and accuracy, eliminating the need for cognitive processing. Its ability to manage delivery parameters, such as pacing, budget allocation, and creative rotation, autonomously aligns with the idea that mechanical AI can significantly optimize the executional aspects of digital campaigns.

While Case A experienced the most notable improvement in cost-efficiency (i.e., lower CPA and CPC), Cases B and C showed balanced gains across both dimensions. This supports the notion that the effectiveness of AI systems is not universally consistent but depends on contextual variables, such as campaign goals, creative assets, and audience segments (Chatterjee et al., 2022).

Crucially, the three cases originate from distinct industry verticals: home improvement, furniture retail, and consumer finance. This sectoral heterogeneity strengthens the analytic generalisability of our results (Yin, 2009), suggesting that mechanical AI can deliver performance gains across markedly different market contexts, not merely within a single niche.

Furthermore, as Dwivedi et al. (2021) emphasize, increasing reliance on AI systems raises concerns regarding explainability and control, particularly in data-driven environments where accountability and strategic flexibility are critical.

Lastly, the longitudinal and embedded nature of our data collection, which involved close collaboration with digital strategists and project managers over several months, adds depth to the findings and enhances internal validity (Aguinis & Solarino, 2019).

## 6. Conclusions and implications

From a theoretical perspective, this study provides an advanced understanding of the role of mechanical AI in operational marketing. While existing literature has concentrated mainly on AI's strategic or creative contributions (Kumar et al., 2024), our findings highlight the operational and executional benefits of AI-driven automation in campaign settings as argued by Huang and Rust (2021), who highlights that mechanical AI represents a foundational layer of marketing automation capable of optimizing repetitive, rule-based processes.

Furthermore, this study examined the impact of implementing a mechanical AI system (Smart+) on the efficiency and effectiveness of advertising campaigns, using a multicase qualitative design. Our results show that Smart+ generally improves both types of performance metrics, particularly in terms of reducing acquisition and click costs while increasing conversion outcomes.

By framing Smart+ within the theory of mechanical AI (Huang & Rust, 2021), we expand the academic understanding of how AI can function not only at the strategic or creative level but also at the executional layer of digital marketing. These findings support a growing consensus that AI tools are not just transformative at a conceptual level but are already delivering operational value in live marketing environments (Davenport et al., 2020).

From a managerial perspective, these insights suggest that companies can benefit from integrating AI tools like Smart+ to enhance campaign delivery, especially in environments like TikTok. However, companies must remain cautious of over-reliance on automation without human oversight. Decisions about budget allocation, targeting, and message framing still require strategic input, and whole delegation to AI may not always yield optimal results. Marketers should therefore treat Smart+ as a complementary tool, not a replacement for human decision-making.

Nonetheless, the study also reveals essential boundaries to these effects, suggesting that the impact of automation changes by industry context, campaign objective, and structure. While the automation offered by Smart+ shows promise, it is not a one-sizefits-all solution. Future research could expand on these findings through quantitative analyses or experiments comparing platform-native AI tools across different advertising platforms (e.g., Meta, Google Ads).

## Abstract

This study investigates the communicative effectiveness of virtual versus human influencers on Instagram, focusing on follower engagement and identity construction. Drawing on a mixed-method approach, we analyzed quantitative metrics—follower count and engagement rate (ER)—for the top 100 influencers in each category, complemented by qualitative observations of 20 influencer profiles. Results show that while human influencers retain broader reach, virtual influencers achieve significantly higher engagement rates, with more consistent interaction patterns across follower tiers. Qualitative insights reveal contrasting narrative styles: human influencers offer emotionally resonant, personal storytelling, while virtual influencers project carefully curated, brand-aligned personas with limited depth. These findings suggest that virtual influencers function as controlled media artifacts rather than relational agents, offering efficiency in brand messaging but requiring strategic narrative design to overcome limitations in perceived authenticity.

*Keywords: Engagement, Virtual Influencer, Influencer Marketing, Artificial Intelligence*

### 1. Introduction

In an ever-evolving digital environment, Artificial Intelligence (AI) has emerged as a transformative force in multiple sectors (Hossain et al., 2024), with digital marketing being one of the primary beneficiaries (Zaki, 2019; Islam et al., 2024). Accenture predicts that by 2035, AI could increase economic growth rates by 1.7% in all sectors and improve productivity by up to 40% (Pereira et al., 2023). Bartelt and Röser (2024) point out that, although AI finds application in numerous areas of marketing, its implementations focus mainly on the operational level. Rapid advances in AI have triggered a large-scale digital transformation, promoting the creation of avatars, automated content generation systems, and virtual environments that can enhance unprecedented levels of social connection (Ahn et al., 2022; Miao et al., 2022; Yu et al., 2024). Such innovations enable more realistic and large-scale digital interactions, significantly improving consumer engagement (Rahman et al., 2023). In this scenario, influencers play a central role. They are defined as individuals or social media users who, having developed a large follower base on one or more platforms, can generate engagement, stimulate conversations, and promote products or services to specific targets (Pick, 2021; Kim & Kim, 2021). An innovative typology based on AI has recently emerged: virtual influencers (Leighton, 2019;

Thomas & Fowler, 2021). These avatars represent an alternative and effective way for brands to reach the public, offering advantages in terms of reputation management and reduction of relational risks compared to human influencers. The influencer marketing sector has experienced extraordinary growth, with forecasts indicating that the market will expand to 32.55 billion dollars by 2025, compared to 24 billion in 2024 and just 1.4 billion in 2014. This compound annual growth rate (CAGR) of 33.11% demonstrates the sector's constant evolution and rapid expansion over the last ten years (InfluencerMarketingHub, 2025). According to a report by HypeAuditor, the global influencer marketing market is expected to grow from $19.8 billion in 2024 to $31.2 billion by 2027, reflecting brands' growing confidence in collaborating with influencers to increase engagement and sales (HypeAuditor, 2025). Most marketers (70.6%) believe AI can surpass human capabilities in key marketing tasks, while nearly 60% fear it could replace their roles (HypeAuditor, 2025). Despite the growing interest in influencer marketing, the literature still lacks systematic research on the role of AI in the perception of content quality. In particular, comparative empirical analyses between human and virtual influencers remain limited, especially regarding their performance on platforms like Instagram. This study addresses this gap through a mixed-method comparative analysis based on secondary data evaluating content creation, identity construction, and audience engagement in influencer communication.

## 2. Background The Impact of AI on Digital Marketing

The emergence of digital technologies has led to a transition from traditional marketing to digital marketing. AI has fostered the advancement of empirical studies, highlighting the growing interest in digital marketing and the adoption of emerging technologies in response to the transformations imposed by the pandemic (Sang, 2024). AI has long been expected to impact marketing strategies and customer behavior significantly (Davenport et al., 2020). A 2018 McKinsey study identified marketing and sales as areas with the most significant potential value from AI (Chui et al., 2018). In 2019, Salesforce predicted AI would become the most widely adopted technology by marketers, highlighting its use in segmentation, analytics, messaging, personalization, and predictive analytics (Columbus, 2019). This integration has given rise to AI-based marketing, defined by Overgoor et al. (2019) as the development of artificial agents that analyze consumer, competitor, and company data to suggest or implement marketing actions. AI has become a central element in transforming the digital marketing landscape by improving automation, customer engagement, and personalization (Keegan et al., 2024). Integrating AI into digital marketing automation allows companies to optimize operations, predict consumer behavior, and adapt marketing strategies to individual customer preferences (Islam et al., 2024). Studies show that thanks to AI tools, marketers can improve products, create more targeted advertising, and analyze audience data. Jarek and Mazurek (2019) and Olson and Levy (2018) also highlight other relevant aspects of AI, such as the introduction of new ways of interaction, a deeper understanding of the customer, improved decision-making and reasoning, automation of processes, increased innovation, the development of new skills, and the emergence of a new marketing ecosystem. The integration of AI positively influences consumer engagement and enables marketers to attract new customers (Bilal et al., 2024). Collecting and analyzing data helps reduce barriers between companies and customers (Dwivedi et al., 2021), while addressing information overload through automated solutions (Capatina et al., 2020; Bag et al., 2022). Consumer engagement has been strengthened by the increasing use of social media platforms (Chaouali et al., 2016; Akram et al., 2023), positively impacting satisfaction and product evaluations (Khamis et al., 2016; Loureiro et al., 2017). AI further enhances this engagement by personalizing online experiences (de Oliveira et al., 2020) and predicting purchasing behaviors (Duan et al., 2019). AI algorithms are particularly effective in analyzing large volumes of data from social media, identifying patterns and trends that can be used to define marketing strategies

(Wang et al., 2013; Lu et al., 2015). The main goal is to keep users engaged, foster their loyalty, and personalize content based on their interests, improving the overall experience on social platforms (Al Qaruty et al., 2023).

## 3. Human vs Virtual Influencers

In the evolving context of influencer marketing, a significant distinction emerges between traditional and virtual influencers. Traditional influencers are real-life social media figures valued for their expertise and ability to attract and influence audiences through authentic content (Hudders et al., 2021). In contrast, virtual influencers (VIs), computer-generated digital representations with human traits and personalities, are a new tool for brand promotion due to their increasing prevalence and economic relevance (Byun et al., 2023). VIs represent an innovative and rapidly growing niche within influencer marketing, distinguished by their reliance on computer technology or AI (Thomas & Fowler, 2021). AI plays a key role in facilitating interactions between VIs and consumers, helping to create a sense of realism in their behaviors (Gao et al., 2023; Miao et al., 2022; Yu et al., 2024). By simulating human actions, VIs facilitate the connection between virtual imagery and the real world, increasing consumer engagement in digital environments (Yu et al., 2024; Zhou et al., 2024). Being created entirely through 3D modeling and machine learning technologies, they are gaining popularity for their ability to be personalized, managed without time limits, and completely controllable by brands (Yu et al., 2024). Their artificial and stylized nature makes them perceived as less threatening and less subject to direct comparisons (Deng & Jiang, 2023), while still achieving comparable levels of engagement and visibility. Literature progressively deepens the public's perception of these figures, but the results remain heterogeneous. Some authors, such as Sands et al. (2022), describe them as "false idols", noting how interactions with artificial entities can generate annoyance or rejection. According to Harambašić and Škare (2024), the emergence of these virtual figures represents a response to the challenges related to managing traditional influencers, allowing companies to eliminate the risks related to behaviors not aligned with the brand's values. However, this research suggests that consumers are increasingly aware of the AI behind these figures and may require greater clarity on how content is created and managed, also raises questions of transparency and trust.

## 4. Method

To explore the communicative effectiveness of virtual versus human influencers, this study adopts a mixed-method approach, combining secondary data analysis with direct profile observation. The objective is to evaluate differences in reach, engagement, and interaction quality, while also capturing stylistic and behavioral nuances shaped by AIgenerated identity construction. We constructed two datasets comprising the top 100 human and 100 virtual influencers on Instagram, ranked by follower count. Sources included publicly accessible profile metrics and the HypeAuditor analytics platform, a validated tool for influencer performance benchmarking. Two quantitative variables were collected:

- Follower count, a proxy for popularity and reach;
- Engagement rate (ER), computed as (likes + comments) / followers × 100, indicating content resonance and audience interaction.

Additionally, qualitative observation of influencer content was conducted for a sample of 10 profiles from each category to interpret differences in style, persona, and interaction cues, complementing numerical data with communication patterns (Marwick, 2015).

Descriptive statistics were followed by:

- An independent-samples t-test to compare average followers and ERs between groups;
- Pearson's correlation to assess the relationship between follower count and ER;
- Visual inspection of content (captions, visual design, narrative tone) to contextualize quantitative findings, in line with mixed-method social media research practices (Djafarova & Rushworth, 2017; Suh, 2020).

## 5. Discussion

As expected, human influencers dominate in follower count, often surpassing 50 million (e.g., Cristiano Ronaldo, Kylie Jenner). In contrast, virtual influencers rarely exceed 6 million, a threshold consistent with their still-niche status. However, virtual influencers outperform humans in ER, with a mean engagement rate significantly higher ($t = -2.81$, $p < 0.01$). This suggests more responsive communities or algorithmically optimized content strategies. A negative correlation between follower count and ER was confirmed among human influencers ($r = -0.43$), consistent with prior findings (De Veirman et al., 2017; Casaló et al., 2020), reinforcing the idea that visibility can dilute engagement. For virtual influencers, correlation was weaker ($r = 0.17$, ns), indicating more consistent interaction levels across different audience sizes— likely due to their designed personas and content regularity. Content analysis reveals stark stylistic contrasts. Human influencers emphasize aspirational authenticity, often rooted in personal milestones, fashion, or lifestyle. Emotional tone varies and comments include both admiration and critique, suggesting parasocial intimacy (Abidin, 2015). Virtual influencers, such as Lil Miquela or Noonoouri, exhibit curated, often futuristic aesthetics. Captions are polished, brand-aligned, and socially neutral. These avatars rarely post controversial or intimate content. Notably, user comments tend to express curiosity or admiration but lack emotional complexity, echoing findings from Mirowska & Arsenyan (2023). This suggests that virtual influencers function more as branded media objects than individual personalities. Their communication is strategically sanitized, which enhances message control but may limit deep relational bonding (Sands et al., 2022). According to the findings, Virtual influencers offer a higher ROI in engagement, especially for niche audiences. However, their limited reach may constrain mass-awareness campaigns. Despite technical polish, virtual influencers still evoke skepticism (Franke et al., 2023). Brands must humanize avatars with storytelling and transparency (e.g., behind-the-scenes of their design or ethical messaging). The future may lie in hybrid campaigns that combine real influencers with virtual ones, balancing emotional depth and brand control (Harambašić & Škare, 2024). Conclusions

This study offers a multifaceted examination of how virtual and human influencers differ not only in performance metrics but also in the construction of digital personae and communicative functions. By combining quantitative data analysis with direct observation of influencer profiles, we have shown that virtual influencers are not simply algorithmic replicas of human influencers but represent a distinct communicative paradigm, one grounded in control, brand alignment, and emotional minimalism. From a quantitative standpoint, virtual influencers demonstrated consistently higher engagement rate than their human counterparts, despite their comparatively limited follower bases. This suggests that algorithmic design and narrative curation may enhance message efficiency, possibly due to novelty effects, audience segmentation, or aesthetic consistency. Yet, the reach gap between the two categories remains significant: real influencers dominate in scale, celebrity, and mainstream recognition. Thus, brands must weigh the tradeoff between broad visibility and targeted resonance when choosing influencer types. Qualitative analysis revealed deeper, structural divergences. Human influencers typically build relationships around emotional narratives, life moments, and parasocial intimacy, fostering trust and perceived authenticity. Their imperfections and unpredictability, once viewed as

liabilities, now serve as signals of realness in a media environment saturated with curated content. Conversely, virtual influencers operate as semiotic vessels: visually compelling, narratively neutral, and highly adaptable. Their communicative style tends toward sanitized branding, which reduces risk but also narrows the bandwidth for emotional engagement. These differences underscore a fundamental shift in digital culture: from identity-based persuasion (centered on individual experience) to aesthetic-brand logic (centered on design and control). Virtual influencers thus offer efficiency without exposure, making them attractive to riskaverse brands or campaigns operating in highly regulated environments. However, their limited relational depth may be problematic for causes that depend on trust, relatability, or moral authority, such as sustainability, social justice, or health. Looking forward, one of the most promising directions lies in hybrid influencer ecosystems. As virtual influencers become more sophisticated and emotionally expressive, and as human influencers adopt algorithmic tools to optimize content, we may see blended formats that integrate emotional authenticity with narrative control. Campaigns could alternate between human-led storytelling and virtual precision messaging, depending on context, target, and platform affordances. Moreover, this study highlights the importance of continuously monitoring digital personas, not just through engagement metrics, but through their stylistic evolution, audience feedback, and socio-cultural positioning. As users become increasingly media-savvy, authenticity will remain a key differentiator, whether it is biologically real or synthetically designed. In conclusion, while virtual influencers cannot yet replicate the relational richness of human influencers, they open new frontiers for brand storytelling, audience targeting, and identity construction in the digital age. Their impact should be understood not as a replacement, but as a transformation of the influencer economy, reflecting broader tensions between automation and emotion, control and connection, efficiency and empathy.

# Track 9
# Sustainable Marketing and Inclusivity

Coordinators: Giovanna Pegan & Barbara Masiello

I cambiamenti economici, sociali e ambientali, unitamente alle critiche spesso rivolte alla disciplina del marketing in tema di etica, hanno portato le imprese a rivedere negli anni le proprie politiche di mercato. Il nuovo obiettivo è quello di garantire la soddisfazione, anche nel lungo periodo, non solo del singolo consumatore ma di tutta la collettività. In questa prospettiva, si parla di "marketing sostenibile" per intendere un approccio strategico e un set di strumenti che possono essere adottati dalle aziende per conciliare la crescita economica con i vincoli ambientali e la tutela dei diritti dell'uomo. La track, attraverso la presentazione di ricerche teoriche, empiriche e casi di studio, intende fornire un avanzamento all'applicazione del concetto di sostenibilità ed evidenziare come l'implementazione di strategie di marketing possano fornire un contributo importante allo sviluppo sostenibile. In questo ambito sono sollecitati in particolar modo, ma non esclusivamente, contributi applicati ai diversi settori industriali, sui seguenti temi: CSR e creazione di valore condiviso nelle politiche di marketing; marketing sociale; sostenibilità e scelte di prodotto; green marketing; marketing nelle organizzazioni ibride (imprese sociali, B-corp); comunicazione ambientale.

Economic, social, and environmental changes—together with ethical critiques of marketing—have pushed firms to rethink their market policies, aiming to satisfy not only individual consumers but society as a whole. "Sustainable marketing" refers to strategies and tools that help companies align economic growth with environmental constraints and human rights protection.

This track seeks to advance understanding of sustainability in marketing through theoretical studies, empirical research, and case analyses, showing how marketing strategies can contribute to sustainable development. Contributions are especially invited on topics such as CSR and shared value in marketing policies, social marketing, sustainability in product decisions, green marketing, marketing in hybrid organizations (e.g., social enterprises, B-corps), and environmental communication.

## Abstract

The growing relevance of sustainability is prompting companies to integrate environmental and social dimensions into their communication strategies. However, the proliferation of environmental claims unsupported by objective evidence increases the risk of deceptive practices, leading the EU to introduce a new regulatory framework aimed at countering greenwashing. Directive (EU) 2024/825 represents a turning point, mandating transparency, traceability, and verifiability for all environmental statements directed at consumers. This short paper analyzes the implications of the directive for sustainable marketing, with the goal of understanding how companies can construct responsible narratives aligned with the new standards. It offers a theoretical-applied analysis integrating tools such as Life Cycle Assessment (LCA), ESG reporting, and ISO standards, highlighting the transition from emotional communication to one grounded in measurable data. Through two case studies of Italian companies operating in different sectors, emerging practices in claim management, the development of internal guidelines, and oversight of digital channels are explored. Findings suggest that regulatory compliance, if effectively managed, can evolve into a strategic opportunity. Sustainable marketing now plays a pivotal role in building trust, protecting corporate reputation, and strengthening competitive positioning.

*Keywords: environmental communication, sustainable marketing, greenwashing, European directive, environmental claims, ESG*

### 1. Introduction

Over the past two decades, sustainability has become a cornerstone of corporate strategy, evolving from an ethical driver to a structural component of competitiveness (Leonidou et al., 2013). Companies are being prompted by consumers, investors, and institutions to incorporate environmental and social dimensions into their business models and to communicate them using appropriate tools and language. In this context, sustainable marketing plays a critical role in translating ESG values into practice, acting as a bridge between technical data and corporate storytelling (Peattie & Crane, 2005).

However, the widespread use of unsupported environmental claims has eroded consumer trust, who are increasingly exposed to vague or misleading messages (Delmas & Burbano, 2011). Greenwashing has become a threat to the credibility of ecological transition and to the informative function of corporate communication (OECD, 2022). According to the European Commission (2020), more than 50% of environmental claims in the EU market are unclear or unverifiable.

In response to these concerns, the EU initiated a legislative process that culminated in Directive (EU) 2024/825, which introduces obligations of transparency, traceability, and verifiability for environmental declarations. The directive redefines the scope of environmental marketing and promotes regulated communication practices.

This paper aims to examine how companies can respond to these demands by developing strategies based on technical standards and measurable data. Through two Italian business cases, the paper reflects on emerging models of sustainable communication that comply with the new European regulations.

## 2. The European Regulatory Framework: From Transparency to Verifiability

In recent years, European legislation has strengthened consumer protection against greenwashing. Directive 2005/29/EC, the first reference on unfair commercial practices, prohibited misleading statements but left wide margins for interpretation (European Parliament, 2005).

Directive (EU) 2024/825, in force since March 26, 2024, marks a decisive turning point by amending Directives 2005/29/EC and 2011/83/EU. It prohibits the use of generic claims such as "green" or "climate neutral" if not supported by verifiable evidence (European Parliament, 2024). Article 6 assigns the burden of proof to the operator, who must provide evidence based on standards recognized at European or international level. Among the accepted technical tools there are Life Cycle Assessment (ISO 14040:2006), Type II and III environmental declarations (ISO 14021:2016, ISO 14025), and verification by accredited bodies (ISO/IEC 17065:2012) (ISO, 2023). The European Commission emphasizes that the data must be "clear, relevant, verified, and understandable" (European Commission, 2023).

In parallel, the ESRS standards introduced by EFRAG in 2023 enhance consistency between financial and non-financial data, promoting transparency, comparability, and verifiability (EFRAG, 2023).

Overall, the new European regulatory framework mandates an environmental communication approach based on standards, evidence, and accountability—shifting the function of communication from persuasion to demonstration.

## 3. Tools and Challenges in Environmental Communication

The evolution of environmental communication has driven the adoption of tools that support corporate sustainability declarations. Life Cycle Assessment (LCA) is one of the most established, as it evaluates environmental impacts across the product's entire life cycle (ISO 14040:2006). Today, LCA is used not only for eco-labels (e.g., EPDs), but also for technically validating green claims (Testa et al., 2018).

At the same time, ESG reporting has become central to stakeholder communication, integrating environmental, social, and governance metrics under standards such as GRI (2021) and SASB (Sullivan

& Mackenzie, 2021). However, without the support of clear language, even rigorously grounded content can be perceived as greenwashing (Nyilasy et al., 2014).

A critical challenge lies in the gap between technical validation and public perception: inconsistencies between corporate narratives and stakeholder expectations can breed distrust, even when certifications are present (Becker-Olsen et al., 2006). In this context, environmental marketing cannot be limited to technical dissemination but must reconcile regulatory language, value alignment, and communication clarity.

Finally, the absence of independent verification represents a vulnerability. According to Lyon and Montgomery (2015), self-regulation invites opportunistic risks, while the use of accredited certifications (e.g., ISO/IEC 17065:2012) enhances credibility. The effectiveness of environmental communication thus depends on integrating methodological rigor with responsible storytelling, in line with European legislation.

## 4. Analysis of Two Business Cases: Towards Verifiable Communication

Following the approach by Yin (2018), this section analyzes two Italian companies that have adopted structured approaches to environmental and social communication, in line with the principles of Directive (EU) 2024/825. The companies operate in different industries - one in healthcare technologies (Predict S.p.A.) and the other in agri-food (2 ERRE S.r.l.) - yet both are committed to developing internal sustainability communication guidelines.

Predict S.p.A. has drafted an environmental and social communication guide aimed at promoting transparent, consistent and regulation-compliant messages. Intended for the entire organization, the document is based on ISO 14021 and ISO 14063 standards and provides operational guidance on formulating truthful and evidence-based environmental claims. Emphasis is placed on using measurable data to substantiate terms like "compostable," "biodegradable," or "recyclable". Internal validation of content is recommended, overseen by a designated "Sustainability Officer". The guide also differentiates among communication channels (e.g., social media, press, events, promotional materials) and suggests criteria for integrated, reliable communication that ensures consistency and information accuracy.

2 ERRE S.r.l., by contrast, has implemented an Environmental Communication Manual which, in addition to incorporating the Green Claims Directive, includes a specific section on the careful use of environmental statements on labels and in marketing materials. The manual contains a glossary of accepted claims, examples of compliant wording, and specific references to ISO 14021. Moreover, the company has established a formal internal procedure to monitor both online and offline communications, overseen by a dedicated sustainability officer.

In both cases, a multidisciplinary approach to environmental communication emerges, rooted in a preventive rather than reactive logic. The development of internal policies and manuals is both a strategic response to regulatory complexity and a reputational investment. Although the companies differ in size and sector, they share a common goal: to ensure the quality of environmental information in order to reinforce value alignment and stakeholder trust.

## 5. Managerial Implications: Sustainability, Governance, and Communication

The case study analysis shows that alignment with Directive (EU) 2024/825 can become a strategic opportunity, extending beyond mere regulatory compliance. Defining internal policies allows

companies to transform regulatory obligations into competitive leverage, standardizing practices and reducing risks of inconsistency.

Developing manuals and guidelines, as seen in the cases examined, requires coordination across business functions: marketing, legal, technical, and ESG. Building "green marketing capabilities" demands trained personnel, dedicated tools, and an organizational culture oriented toward transparency (Papadas et al., 2017). Establishing specific roles to oversee environmental communication, as implemented by 2 ERRE S.r.l., strengthens governance and ensures continuity in monitoring practices. This approach aligns with GRI (2021) and ESRS (2023), both of which stress the importance of governance in non-financial disclosures. Proactive verification of environmental claims and the use of ISO protocols (e.g., 14021, 17065) enhance credibility with stakeholders and mitigate the perceived risk of greenwashing (Nyilasy et al., 2014; Lyon & Montgomery, 2015). Effective integration of technical verification and strategic storytelling helps reinforce trust and reputational positioning.

Finally, for SMEs, responsible communication requires efficient resource use: the analyzed cases demonstrate that even medium-sized companies can develop replicable and effective models.

## 6. Conclusions and Future Developments

The growing emphasis on sustainability has redefined the role of corporate marketing. Directive (EU) 2024/825 marks a critical shift, imposing new transparency and verifiability criteria on environmental communication.

This analysis demonstrates that tools such as LCA, ESG reporting, and ISO standards—when systematically integrated—can serve as a robust foundation for objective communication. The cases of Predict S.p.A. and 2 ERRE S.r.l. show that regulations can be translated into concrete practices, including operational guides, internal training, and communication oversight. This not only reduces the risk of greenwashing but also generates reputational value.

Looking ahead, marketing departments will increasingly be called upon to blend technical and narrative skills. The emergence of regulated marketing poses new challenges, but also opportunities for differentiation for those who can leverage compliance effectively.

Future research should assess the long-term impact of the directive, examine stakeholder engagement strategies, and extend the analysis to other sectors and contexts to identify scalable and verifiable models of sustainable communication.

# Communication of the SDGs in the Company's Mission Statement: The Effect on Performance

Lucia Barra[1],*, Michele Costagliola di Fiore[1], and Adele Parmentola[1]

[1] University of Naples "Parthenope", Department of Management and Quantitative Studies (DISAQ), Italy

## Abstract

Since sustainable development became a global priority, the UN 2030 Agenda has recognized companies as key agents of transformative change in advancing sustainability practices. Consequently, a growing number of firms started integrating sustainability into their core strategies and operations, incorporating the SDGs into their mission statements, to demonstrate alignment with global sustainability initiatives. Despite their symbolic and communicative importance, the actual impact of such references on sustainability performance remains underexplored. While mission statements are often viewed as communication tools, few empirical studies have assessed their impact on tangible outcomes such as ESG performance. This study addresses that gap by examining whether references to the SDGs in mission statements are associated with higher ESG performance. The results indicate a clear and positive correlation, suggesting that incorporating global goals into a corporate mission statement is more than a symbolic gesture and can drive real progress in sustainability outcomes. In addition, a controversial result was found as companies in countries with higher SDG ratings reported lower ESG scores. This research contributes to the broader discourse on corporate sustainability and strategic alignment, offering valuable insights for both business leaders and policymakers aiming to link organizational purpose, strategic communication, and measurable sustainability performance.

## 1. Framing of the research

Since the late 1970s, scholars in the field of management have made significant progress in exploring both the theoretical foundations and practical implications of mission statements within organizations (Toh et al., 2022; Alegre et al., 2018). This increasing academic interest aligns with a growing need among business leaders and consultants for a unified approach to corporate communication (Stallworth Williams, 2008). While a variety of interpretations of the term "mission statement" exist in scholarly discussions, it is widely understood to be a concise, formal declaration outlining an organization's core purpose and fundamental objectives (David, 1989). Often identified through interchangeably terms such as "credo", "purpose", "manifestos", "core values", mission statements shape an organization's identity and guide its operations (Babnik et al., 2014). Mission statements can be used for internal and external purposes (Klemm et al., 1991). Externally, they are tools for enhancing a company's public image, strengthening its brand, and improving relations with key stakeholders.

Because of their visibility, mission statements play a pivotal role in strategic corporate communication, offering insights into a firm's values, ethical stance, vision, and long-term commitments (Cochran et al., 2008). Internally, these statements act as motivational instruments, aligning employees around shared goals and fostering a sense of purpose. In this regard, mission statements function as internal guiding frameworks that help shape organizational behavior and decision-making (Bart, 1997). They contribute significantly to organizational culture, acting as a cohesive force that binds members together and reinforces a shared identity and direction (Campbell & Yeung, 1991). In recent years, the rise of innovative organizational models that combine financial objectives with social responsibility has revitalized scholarly interest in mission statements. This trend reflects a broader shift in corporate thinking, where sustainability is increasingly viewed as a core strategic element. Many firms now incorporate environmental, social, and economic considerations into their long-term planning. As a result, mission statements have evolved beyond mere declarations of intent, becoming essential instruments for expressing a company's dedication to inclusive and responsible growth, balancing profitability with a commitment to societal and environmental well-being. Furthermore, since the adoption of the 2030 UN Agenda, businesses are increasingly recognized as pivotal agents in fostering the achievement of the 17 Sustainable Development Goals by aligning their strategies with targeted global goals. Embracing these global objectives signifies a move beyond conventional corporate social responsibility toward a more comprehensive corporate sustainability framework. This shift demands a fundamental transformation in how organizations operate, encouraging the integration of sustainable practices across all levels (Jimenez et al., 2021). Consequently, companies are increasingly reevaluating their mission statements to incorporate sustainability priorities, recognizing stakeholders as part of a unified, interdependent system (León-Soriano et al., 2010). Within this evolving landscape, mission statements centered on sustainability are gaining prominence, often surpassing traditional missions in relevance to both corporate strategy and communication (Ding et al., 2023).

## 2. Purpose of the paper

Despite the recognized importance of mission statements as strategic communication tools, it remains difficult to discern to what extent the integration of the SDGs into mission statements reflects a genuine and transformative commitment of companies to sustainability or whether it results from rhetorical strategies aimed at improving public perception. The literature shows that while some companies are making significant changes, others are implementing only marginal contributions to their operational and strategic structure, demonstrating a superficial approach. This raises crucial questions about the actual role of the SDGs in driving substantial improvements in organizations' environmental, social, and economic performance, an issue that requires more in-depth investigation. Our study aims to fill this knowledge gap, providing a more nuanced investigation to understand the dynamics between stated commitment to SDG goals and actual business practices. Specifically, it seeks to answer the following research question:

**RQ:** How does communicating Sustainable Development Goals (SDGs) commitment into firms' mission statements influence firms' sustainability performance?

## 3. Methodology

To investigate the research question, a quantitative approach was adopted. Specifically, we applied a weighted least squares (WLS) regression using R software on a dataset of 340 European manufacturing firms. The manufacturing sector was selected due to its strong involvement in industrial activity and its significant environmental footprint. As a major driver of economic growth and employment, the industry is also deeply tied to sustainability challenges through its high consumption of energy, water, and raw materials. To evaluate references to the Sustainable Development Goals (SDGs) in the firm's mission statement, we conducted a content analysis. This method systematically categorizes textual data to produce numerical insights and is frequently used in mission statement research (Bartkus et al., 2004). We used an accredited keyword list of 876 terms provided by the Sustainable Development Solutions Network (SDSN), derived from United Nations documents, expert consultations, and internet searches (SDSN Australia, New Zealand, and Pacific, 2017). The content analysis was conducted using NVivo software to code and organize the data. Each mission statement was assigned a binary value: "1" if it included SDG-related terms, and "0" if it did not. The dependent variable was each company's ESG (Environmental, Social, and Governance) score, gathered from Refinitiv Eikon. This score serves as a comprehensive measure of a firm's sustainability performance, covering aspects such as ethical governance, environmental responsibility, and social impact. The ESG score reflects a company's overall sustainability performance, including governance, environmental, and social factors. Ratings range from A to D (or 0 to 100). Scores above 50 (A or B) indicate strong sustainability efforts, while scores below 50 (C or D) suggest limited engagement. To control for external factors that might affect ESG performance, two control variables were included. The first was the national SDG Index which evaluates country-level progress toward the SDGs. Created by SDSN in 2016, the index helps guide public policy and may indirectly influence business behavior. The second control variable was company size, measured by the number of employees, based on data from the ORBIS database. Larger firms generally have more resources and infrastructure to support sustainability initiatives, making size an important factor to consider.

## 4. Results

Findings reveal the existence of a significant positive relationship between the presence of references to the Sustainable Development Goals (SDGs) in companies' mission statements and their ESG scores. Specifically, each additional reference is associated with an enhancement of sustainability performance, controlling for SDG Index and company size, suggesting that companies that claim to be committed to the UN 2030 Agenda effectively tend to perform better in sustainability metrics. Additionally, the variable "company's size" was found to have a positive and modest impact on ESG score, indicating that larger firms, based on employee number, are associated with superior sustainability achievements, probably on the strength of their greater capabilities. Interestingly, the results show an inverse relationship between national SDG performance and company ESG scores, revealing that a country's progress on the SDGs does not necessarily translate to stronger corporate sustainability. Overall, the model used in the analysis proves to be highly reliable and explains nearly all the variation in ESG performance, confirming the robustness of the findings.

## 5. Implications and Limitations

This research offers practical insights for both managers and policymakers pursuing sustainable development. For companies, aligning mission statements with the SDGs is both a strategic and ethical move to boost performance and reputation. Clear, consistent communication of sustainability goals strengthen this impact. For policymakers, the gap between national SDG progress and corporate ESG performance signals the need for targeted measures such as incentives, stricter ESG guidelines, or public-private partnerships to better align business efforts with global goals. However, several

limitations should be considered. ESG scores, while widely used, may not fully capture the depth or authenticity of a company's sustainability initiatives, as they aggregate different dimensions and can overlook specific actions or the quality of communication. Moreover, the analysis is limited to European companies, which may affect the generalizability of the results to other regions. Future research could address these limitations by exploring patterns across industries, expanding the study to other geographic contexts with more detailed sustainability metrics, and conducting multiple case studies to assess whether stated SDG commitments are effectively implemented and embedded into corporate culture through consistent and impactful communication strategies.

Originality of the paper: Since little attention has been given to how the explicit integration of the Sustainable Development Goals (SDGs) into corporate mission statements may impact sustainability performance metrics, this study addresses this empirical gap by investigating whether explicit SDG integration in mission statements correlates with improved sustainability performance, shedding light on the effectiveness of mission statements as tools for strategic communication and sustainability performances. It provides empirical evidence that referencing the SDGs in companies' manifestos can be an effective strategy for aligning business objectives with global sustainability priorities. Moreover, the study reinforces the idea that organizations demonstrating explicit commitments to sustainability can play a pivotal role in advancing progress toward the Sustainable Development Goals by 2030.

# Fear That Protects: Integrating Eco-Emotions Into Protection Motivation Theory

Martina Bocchini[1], *, and Mario D'Arco[1]

[1] University of Sannio, Italy

*Corresponding author: m.bocchini@studenti.unisannio.it

## Abstract

This study applies Protection Motivation Theory to examine how threat and coping appraisals shape pro-environmental behavioural intentions, focusing on the role of eco-fear. Using structural equation modelling on survey data from 181 Italian respondents, results show that eco-fear significantly enhances protection motivation, leading to stronger intentions to act sustainably. While the geographic scope may limit generalizability, the findings suggest that leveraging eco-fear in communication strategies can effectively promote sustainable consumer behaviour. This is the first known study to explore the influence of eco-fear on environmental behavioural intent.

*Keywords: Eco-fear, Protection motivation theory, Pro-environmental intention*

### 1. Introduction

Climate change is one of the biggest threats of this century (Stanley et al., 2021). Climate is a complex system characterized by fluctuation, which has different implications for the ecological system, global economies, and human well-being (Scheffer, 2009). One of the last reports from the World Meteorological Organization (2022) underlined the severity of climate impacts, such as rising global temperatures, glacial melting, more frequent extreme weather events, biodiversity loss, and ecosystem collapse. Scholars refer to this global change as "anthropogenic climate change" because its acceleration is attributed to human activity, and it represents an environmental and psychological threat (Cianconi et al., 2023). Maibach et al. (2021) confirmed that "a stable climate is the most fundamental determinant of human health", but the psychological effects of climate crises are only at the beginning to be systematically understood. Increasing concern and awareness about the climate crisis increases the pro-environmental intention, so understanding the psychological mechanism that drives pro-environmental behaviour becomes urgent.

In recent years, researchers coined a new term to refer to the psychological experience of global climate change: *Eco-emotions* (Pihkala, 2022). From that moment, the number of words that begin with the prefix "*eco*" increased, often leading to confusion due to a lack of conceptual clarity in the field (Kalwak & Weihgold, 2022). Studies on this topic remain fragmented, and the way in which emotional responses relate to climate action is still unclear (Stanley et al., 2021). This study focuses on one of these eco-emotions: Eco-fear. The fear relates to climate change and environmental issues (Cianconi., 2023). While emotions have long been studied, the role of eco-fear remains under-investigated. This study

aims to advance the understanding of psychological mechanisms that drive pro-environmental intentions in response to climate change. By adopting the Protection Motivation Theory (PMT) by Rogers (1975), this study is, to the best of our knowledge, the first to investigate the role of eco-fear as an emotional antecedent that impacts the intention to act sustainably. Specifically, it addresses the following research question: Does eco-fear positively influence protection motivation in the context of pro-environmental behaviour?

In the next section, we introduce the theoretical background, followed by methodology, results, discussions, and final remarks.

## 2. Theoretical background

### 2.1 Protection motivation theory

PMT was introduced by Rogers (1975) and revised in 1983 (Rogers, 1983) to analyse the psychological mechanisms under the decision to act. The theory was elaborated for the healthcare context, and it is the first theory that focuses on psychological conditions that explain why people protect themselves from a threat (Rogers, 1975). PMT explains the effect on protection motivation of two cognitive appraisal processes: coping and threat appraisals. Both shape individuals' motivation to protect themselves by driving them to act. Specifically, protection motivation is considered the intention of individuals to engage in actions that protect them from threats, and in recent research, it has evolved into behavioural intention (Liu & Jiang, 2023). Protection motivation or behavioural intention is positively influenced by the perception that the threat is severe, that the individual is susceptible to it, that they can perform the recommended response, and that the response is effective. Conversely, it is negatively influenced by the perception that not performing the response is more beneficial, or that carrying it out would be expensive (Hedayati et al., 2023). Thus, for protection motivation, perceived severity, perceived vulnerability, self-efficacy, and response efficacy are positive predictors; meanwhile, maladaptive rewards and response cost are negative predictors. To empirically test the proposed model, we developed a set of hypotheses as follows:

H1: Perceived severity is positively associated with protection motivation.

H2: Perceived vulnerability is positively associated with protection motivation.

H3: Maladaptive rewards are negatively associated with protection motivation.

H4: Self-efficacy is positively associated with protection motivation.

H5: Response efficacy is positively associated with protection motivation.

H6: Response cost is negatively associated with protection motivation.

### 2.2 Eco fear as an emotional driver

Eco-fear, as defined by Fisher (2017), refers to a deep and extreme fear of disturbing natural events (Alex & Susan Deborah, 2019). Eco-fear belongs to the broader category of eco-emotions, which are defined as feelings and affective phenomena shaped by climate change and environmental injustices and, in addition, influenced by circumstances, temperament, and social dynamics (Galway & Beery, 2022). The literature categorizes eco-emotions as positive or negative (Pihkala, 2022). Fear is a negative eco-emotion characterized by heightened physiological arousal in response to an immediate threat. If left unmanaged, it can become eco-phobia, an intense aversion toward nature (Alex & Susan Deborah,

2019). Although their negative valence, emotions like fear play a crucial role in motivating action as an innate motivator for behavioural change to avoid danger (Chen, 2016). This study aims to analyse whether eco fear is an effective driver of action and if it has a direct effect as an antecedent on protection motivation (Ezati et al., 2021). By positioning eco-fear as an emotional antecedent within the PMT framework, this research contributes to a deeper understanding of how emotional responses to climate change can drive sustainable consumer behaviour.

H7: Eco-fear positively influences protection motivation.

By integrating eco-fear as a direct predictor, this study expands the PMT framework, highlighting the importance of emotional drivers in climate-related behavioural motivation.

## 3. Methodology

To test the research hypotheses, this study utilized an online survey technique. We collected 181 valid responses from a sample in Italy between May 24, 2025, and June 11, 2025. Measurement scales were mainly adapted from extant literature. To measure perceived severity (PS), we used six items adapted from Saleeby (2000) and Woon et al. (2005).To mesure perceived vulnerability (PV) we used six items adapted from Saleeby (2000).A protection motivation theory approach to home wireless security.The maladaptive rewards (MR) variable was evaluated using seven items adapted from Bax et al. (2021).To measure self-efficacy (SE) we employed six items adapted from Bax et al. (2021). Response efficacy (RE) was measured using four items adapted from Witte (1996). Response cost (RC) was measuring eight items adapted from Boss et al. (2015). Protection motivation (PM) was evaluated using six items adapted from Woon et al. (2005) and Bax et al. (2021).Finaly, to evaluate eco-fear (EF) we used five items adapted from Bax et al. (2021). Each item was measured on a 7-point Likert scale (1 = Strongly disagree to 7 = Strongly agree). To estimate the hypothesized relationship between variables, we performed a structural equation modeling (SEM) analysis using IBM SPSS AMOS 23.

## 4. Results

The majority of respondents were female (n = 107, 58.5%), followed by males (n = 69, 37.7%). The mean age of participants was 30.05 years (SD = 11.45). Most respondents held a master's degree (38.8%), followed by those with a bachelor's degree (32.2%) and a high school diploma. To evaluate the relationships among the variables proposed in the model, we followed the two-step approach recommended by Anderson and Gerbing (1988). First, we assessed the measurement model for reliability and validity. As shown in Table 1, all constructs exhibited strong internal consistency, with Cronbach's alpha (α) values exceeding the recommended threshold of 0.70. Composite reliability (CR) values were also above 0.80, and average variance extracted (AVE) values surpassed the 0.50 benchmark, indicating satisfactory convergent validity (Hair et al., 2010). Next, we tested the structural model using SEM anlysis in AMOS 23. The squared multiple correlations indicate that the model explains 68.4% of the variance in protection motivation. The SEM results revealed mixed support for the proposed hypotheses. Perceived severity (β = 0.323, p = 0.002) and self-efficacy (β = 0.313, p = 0.016) were found to be significant positive predictors of protection motivation, supporting H1 and H4, respectively. Most notably, eco-fear showed a strong positive effect on protection motivation (β = 0.500, p = 0.001), confirming H7 and emphasizing the role of emotional drivers in shaping pro-environmental intentions. In contrast, perceived vulnerability (β = -0.050, p = 0.732), maladaptive rewards (β = -0.209, p = 0.059), response efficacy (β = 0.029, p = 0.859), and response cost (β = -0.043, p = 0.645) were not statistically significant predictors, indicating a lack of support for H2, H3, H5, and H6.

## 5. Discussion

This study explored how cognitive appraisals and emotional responses, particularly eco-fear, influence pro-environmental intentions within the PMT framework. The findings offer important theoretical and practical insights. The significant role of eco-fear supports extending PMT to include emotional constructs, consistent with emerging evidence that emotions are key drivers of environmental behaviour (Pihkala, 2022; Stanley et al., 2021; Chen, 2016). While perceived severity and self-efficacy predicted motivation, other cognitive factors, such as perceived vulnerability, response efficacy, response cost, and maladaptive rewards, showed limited influence, suggesting these may be less relevant in climate contexts (Liu & Jiang, 2023). By positioning eco-fear as a validated antecedent to behavioural intention, this study helps bridge cognitive and affective models in climate psychology (Cianconi et al., 2023; Ezati Rad et al., 2021).

From a practical perspective, these results highlight the potential of eco-fear as a motivational tool when paired with constructive messaging. Fear-based appeals that also emphasize individual efficacy can encourage engagement without causing disengagement or anxiety (Chen, 2016; Pihkala, 2022; Kalwak & Weihgold, 2022). Given the importance of self-efficacy, communications should empower individuals by showcasing tangible, everyday actions. Moreover, the limited impact of cost-benefit perceptions suggests that emotional and moral appeals may be more effective than economic arguments in promoting sustainable behaviour (Stanley et al., 2021; Maibach et al., 2021). For organizations, aligning sustainability messaging with emotionally resonant narratives can enhance public connection to broader environmental goals.

## 6. Limitations and future research

While this study advances theoretical understanding, it has limitations. The sample, composed of Italian respondents, may limit generalizability to other cultures with differing environmental norms and emotional responses. Also, the cross-sectional design prevents establishing causal relationships. Future research should consider longitudinal or experimental designs to confirm the causal role of eco-fear. Moreover, future studies could explore the influence of other eco-emotions such as eco-anger, guilt, or hope, to understand the interplay between multiple affective states and cognitive appraisals in sustainability behaviour.

# The Communication of Sustainability and Mitigation in Manufacturing SMEs

Greta Buoso[1],*, Eleonora Di Maria[1], and Marco Bettiol[1]

[1] Department of Economics and Management, University of Padova, Italy

* Corresponding author: greta.buoso@phd.unipd.it

## Abstract

This study explores how manufacturing Small and Medium Enterprises (SMEs) communicate their sustainability and mitigation strategies in the context of reducing greenhouse gas emissions by 33% by 2030. SMEs are under increasing pressure to adopt and communicate sustainable practices, as global environmental concerns intensify. Previous studies have highlighted the importance of adopting sustainability and effectively communicating it to meet regulatory and consumer expectations. Our research addresses three key questions: Is there a difference between the communication of the mitigation and the sustainability strategy? Is there a relationship between the development of sustainability and mitigation strategies adopted by SMEs and their communication? Is there a relationship between the communication done by SMEs and their perception of being sustainability leaders? To investigate, we surveyed 1,500 SMEs in 2024 about their sustainability and mitigation practices, focusing on Scopes emissions. The survey responses were paired with web scraping analysis of company websites to assess qualitatively how these firms communicate their actions, followed by a quantitative analysis.

Findings indicate that while many firms focus on Scope 2 emissions (purchased energy), fewer address Scope 1 or Scope 3 emissions. The communication depends of the topic communicated, in particular general topics tend to lead greenwashing behaviours, rather than the more specifics which induce more greenhushing. From a statistical point of view, Mitigation and Sustainability levels are not generally related to the communication, but depend from the specific topic. Moreover, there seems not to be any dependence between the communication and how firms perceive to be sustainability leaders. This study contributes to the literature by revealing the significant disconnect between SMEs' environmental actions and their public communication efforts, emphasizing the need for better transparency and accountability in the manufacturing sector. Our findings suggest that stronger communication of mitigation strategies could enhance stakeholder trust and support Italy's broader climate goals.

*Keywords: communication, sustainability, mitigation, strategies, climate change*

## 1. Introduction

In today's business environment, companies face mounting pressure—from stakeholders demanding stronger ESG performance to regulators enforcing stricter reporting mandates—to reconcile economic growth with environmental stewardship and social equity (Brundtland Commission, 1987; Bansal & DesJardine, 2014). Sustainable development, defined by the Brundtland Commission (1987) as meeting present needs without compromising future generations, requires firms to integrate economic, environmental, and social goals into their core operations (Elkington, 1997). By embedding responsible resource management, fair labor practices, and long-term value creation into strategy, companies balance profitability with responsibility, ensuring resilience and relevance in a rapidly changing global landscape (Bansal & DesJardine, 2014).

Within manufacturing—responsible for about 20–30 % of global greenhouse-gas emissions due to energy-intensive, fossil-fuel-driven processes (IEA, 2021)— sustainable strategies split into two complementary approaches. Mitigation focuses on cutting emissions at the source through circular-economy practices like material recycling and reuse to minimise waste and enhance resource efficiency (IPCC, 2014; Geissdoerfer et al., 2017). Adaptation builds resilience to climate impacts—via supplier diversification, climate-risk assessments, and investment in resilient infrastructure—to safeguard continuity against extreme weather and resource scarcity (Smit & Wandel, 2006; Linnenluecke et al., 2013; Engert et al., 2016).

Small and medium-sized enterprises (SMEs), with their limited budgets and expertise, often struggle to implement these measures. However, partnerships with larger firms, participation in industry networks, and access to government incentives—such as green loans or clean-energy subsidies—can help overcome these barriers (Revell et al., 2010; Porter & van der Linde, 1995). Equally important is effective communication: transparent reporting and stakeholder engagement around mitigation and adaptation efforts build trust, enhance reputation, and attract eco-conscious customers and investors, while correlating with stronger environmental performance (Delmas & Burbano, 2011; IPCC, 2021).

By weaving sustainability, mitigation, and adaptation into their business models—from procurement through production to marketing—manufacturers of all sizes can not only reduce emissions and pollution but also improve operational efficiency, competitiveness, and resilience, thereby aligning with global climate targets such as those set out in the Paris Agreement (IPCC, 2018). In this context, we focused on the communication of sustainability and mitigation strategies of Italian SMEs, in particular we aims to identify if:

- There is a difference between the communication of the mitigation and the sustainability strategies.
- Exists a relationship between the development of sustainability and mitigation strategies adopted by SMEs and their communication.
- The communication done by SMEs and their perception of being sustainability leaders are related.

## 2. Literature Review

### 2.1 Mitigation In The Manufacturing Sector

The urgent need for mitigation strategies is underscored by the escalating climate crisis. As mentioned before, mitigation refers to efforts to reduce or prevent the emission of greenhouse gases, which can be achieved through various means including technological changes, improved energy efficiency, and shifts in management practices.

These efforts are critical in limiting the global temperature increase to well below 2°C above pre-industrial levels, as stipulated in the Paris Agreement (UNFCCC, 2015). For the manufacturing sector, this translates into a pressing need to transform production processes, energy sources, and supply chains.

A crucial aspect of understanding mitigation strategies is the categorization of greenhouse gas (GHG) emissions into three scopes, as defined by the Greenhouse Gas Protocol (GHGP) (Patchell, 2018). This framework, widely adopted by companies and organizations worldwide, provides a comprehensive approach to measuring and managing GHG emissions.

- Scope 1 emissions: refer to direct emissions from owned or controlled sources. For manufacturing companies, these typically include emissions from on-site fuel combustion, company vehicles, and any process emissions (Blanco, Caro & Corbett, 2016).

- Scope 2 emissions are indirect emissions from the generation of purchased energy. In the manufacturing context, this primarily relates to electricity consumption. The mitigation of Scope 2 emissions often involves improving energy efficiency and transitioning to renewable energy sources (Brander, Sood, Wylie, Haughton & Lovell, 2011).

- Scope 3 emissions include all other indirect emissions that occur in a company's value chain. For manufacturers, this can encompass a wide range of activities, from the extraction and production of purchased materials to the use and end-of-life treatment of sold products (Huang, Weber & Matthews, 2009). Scope 3 emissions often represent the largest share of a company's carbon footprint but are also the most challenging to measure and mitigate.

The link between climate change and mitigation in the manufacturing context is multifaceted. Firstly, the manufacturing sector must drastically reduce its direct emissions through improved energy efficiency, electrification, and innovative production processes (Bataille et al., 2018). Secondly, manufacturers must consider the entire lifecycle of their products, addressing emissions from raw material extraction to end-of-life disposal (Scope 3 emissions).

However, challenges remain in implementing such mitigation strategies. Several barriers to industrial energy efficiency and mitigation were identified, including high upfront costs, lack of information, and split incentives (Fischedick et al., 2014). Additionally, the impacts of climate change itself pose risks to manufacturing operations, necessitating adaptation strategies alongside mitigation efforts. Companies implementing robust mitigation strategies often find themselves better positioned to adapt to climate-related disruptions, demonstrating the synergies between mitigation and adaptation (Gasbarro, Rizzi & Frey, 2017).

As we move forward, the integration of innovation and digital technologies in mitigation efforts presents new opportunities. Both internal capabilities and external pressures play significant roles as drivers of eco-innovation in manufacturing firms (Mazzanti, Antonioli, Ghisetti & Nicolli, 2015), suggesting that effective mitigation strategies need to consider both firm-level factors and broader policy environments. Even Industry 4.0 concepts can contribute to sustainable manufacturing, potentially enabling more efficient and less carbon-intensive production processes; however, realizing

these benefits requires careful planning and implementation (Beier, Niehoff & Xue, 2018). In this context, the digitalization can play a role in the communication of mitigation efforts as effective communication of the strategies can enhance a company's legitimacy and stakeholder support (Hahn, Reimsbach, & Schiemann, 2015).

### 2.2 A Focus On Small-Medium Enterprises

Although there is extensive research on climate-change mitigation in manufacturing, we still lack a clear picture of how Small and Medium-sized Enterprises (SMEs) tackle this issue worldwide. SMEs form the backbone of industrial ecosystems, accounting for roughly 90% of businesses and over 50% of employment globally (World Bank, 2020). Learning how these firms mitigate climate impacts is therefore essential to understanding the sector's overall environmental footprint.

Most existing studies focus on large companies, which have very different resources and capabilities than SMEs—especially when it comes to managing Scope 1, 2, and 3 emissions. Examining SME-specific challenges could help shape more effective policies and support on a global scale (Hoogendoorn, Guerra & van der Zwan, 2015). SMEs face a set of common challenges—limited financial resources, insufficient in-house expertise, and poor access to best-practice guidance—that hinder their ability to tackle emissions across all three scopes (Cagno, Worrell, Trianni & Pugliese, 2013; Ormazabal, Prieto-Sandoval, Puga-Leal & Jaca, 2018). In particular, measuring and reporting direct (Scope 1) emissions is often inaccurate or incomplete, since SMEs typically lack the sophisticated monitoring systems of larger firms, leading to underestimation of their true footprint (Jansson, Nilsson, Modig & Hed Vall, 2017). When it comes to indirect emissions from purchased energy (Scope 2), SMEs usually have less bargaining power to secure renewable contracts or favorable utility rates, and they encounter higher barriers to adopting energy-efficient technologies (Trianni, Cagno & Farné, 2016). Moreover, the intricate nature of value-chain emissions (Scope 3) presents perhaps the steepest hurdle: constrained resources and complex supplier networks mean many SMEs can only provide partial or superficial disclosures of these indirect impacts (Johnson, 2015).

Despite these challenges, SMEs can improve their mitigation efforts by adopting environmental management systems (EMS), which help them track and reduce emissions across all scopes (Testa, Gusmerotti, Corsini, Passetti & Iraldo, 2017). Collaborative approaches—such as industrial symbiosis networks—also enable SMEs to share resources and knowledge, boosting environmental performance (Patricio, Axelsson, Blome & Rosado, 2018; Borghesi, Cainelli & Mazzanti, 2021).

### 2.3 The Communication Of Sustainability And Mitigation Efforts

Effective communication is a cornerstone of any successful sustainability strategy, acting as the bridge that ensures stakeholders—employees, customers, investors, regulators, and communities—understand, support, and help implement climate mitigation goals (Genc, 2009). Yet SMEs often lack the resources and expertise to produce quantitative emission data, instead relying on qualitative narratives to describe their environmental initiatives (Borga, Citterio, Noci & Pizzurno, 2009). While this approach may seem less rigorous, it nonetheless signals a genuine commitment to sustainability. At the same time, ambitious targets set by governments and agencies can backfire—if stakeholders perceive them as imposed or insincere, communication risks provoking skepticism rather than buy-in (Cox, 2008; Lee, Park & Klassen, 2015). Firms without sufficient expertise or funding may even resort to greenwashing— presenting misleading or exaggerated claims about environmental performance—which can severely damage credibility and erode trust (Ockwell, 2009; Delmas &

Burbano, 2011). Common greenwashing tactics include using vague claims ("eco-friendly"), highlighting minor green initiatives while ignoring larger impacts ("selective disclosure"), or employing misleading visuals and labels without third-party verification (Christensen & van Rensburg, 2020). Regulators and industry bodies are responding: the EU's Green Claims Directive now requires SMEs to substantiate green marketing with clear evidence, and voluntary certifications are gaining traction as a means to demonstrate legitimacy.

Worse still, some companies practice greenhushing by deliberately downplaying or concealing their sustainability efforts out of fear of backlash, regulatory scrutiny, or accusations of hypocrisy. This silent approach can leave stakeholders uninformed about genuine improvements and stifle peer learning across industries (Walker & Wan, 2012; Lyon & Montgomery, 2015). Recent case studies in the food-processing sector reveal that firms with strong emission-reduction records withheld data to avoid drawing attention to upstream suppliers with weaker performance, inadvertently slowing sector-wide progress (Scott & Wang, 2023).

Both greenwashing and greenhushing undermine transparent dialogue: the former by overstating progress and risking legal penalties or "green penalties" in stock markets, the latter by obscuring real gains and denying SMEs the reputational benefits of sustainability leadership (Crijns, Cauberghe & Hudders, 2018). To counter these risks, experts recommend adopting a "Gold Standard" approach to communication— combining verified quantitative metrics (e.g., emission intensity per unit output) with narrative context, and engaging third-party auditors to validate claims (Delmas & Burbano, 2011; Christensen & van Rensburg, 2020).

Internally, clear, ongoing dialogue—through training programs, regular updates, and participatory initiatives—engages employees and embeds environmental responsibility into day-to-day operations (Baumgartner & Rauter, 2017). Externally, transparent reporting helps avoid the reputational damage of greenwashing (Crijns, Cauberghe & Hudders, 2018) and can directly drive better environmental performance: researchers have found that companies that openly communicate their climate strategies tend to achieve greater emissions reductions (Dahlmann, Branicki & Brammer, 2019). Moreover, involving key stakeholders—employees, suppliers, local communities—in both mitigation efforts and their communication not only improves outcomes but also strengthens credibility and reach (Ferraro, Siano & Vollero, 2019; Penz & Polsa, 2018). The channels and formats of communication matter just as much as the message itself. Sustainable business model frameworks—such as the archetypes proposed by Bocken, Short, Rana & Evans (2014)—encourage firms to integrate mitigation strategies into their core models, rather than treat them as peripheral add-ons. This integration is reflected in the rising quality and depth of corporate sustainability reports, particularly among manufacturers, where disclosures on mitigation efforts have become more comprehensive (Reilly & Hynan, 2014; Michelon, Pilonato & Ricceri, 2019). Digital and social media now offer targeted, emotionally engaging platforms for sharing climate initiatives, fostering peer-to-peer advocacy and community action (Gill, Dickinson & Scharl, 2008; Testa, Cosic & Iraldo, 2020), though these tools must be wielded carefully to avoid misinformation, polarization, and short-term gimmicks (Chatterjee, Thongprasert & Some, 2024).

Policymakers are beginning to recognize and support SMEs' pivotal role in climate goals. The European Union's SME Strategy for a Sustainable and Digital Europe, for example, provides measures to help smaller firms transition to greener business models and boost energy efficiency (European Commission, 2020). Looking ahead, emerging technologies—blockchain for traceability, AI for data analysis, advanced ICT for real-time monitoring—promise to revolutionize how companies track, verify, and communicate their mitigation work (Hermundsdottir & Aspelund, 2021). Early studies

suggest that environmental innovators are more likely to collaborate with external partners, further highlighting the value of collective approaches to both implementing and narrating climate strategies (De Marchi, 2012; De Marchi & Di Maria, 2015; Kouhizadeh, Saberi & Sarkis, 2021). Yet despite these advances, the relationship between actual mitigation actions and their communication in SMEs remains underexplored—a crucial gap given the unique challenges and opportunities these firms face across different cultural and economic contexts (Baumann-Pauly, Wickert, Spence & Scherer, 2013; Johnson & Schaltegger, 2016).

## 3. Research Framework And Empirical Analysis

As mentioned above, the communication of sustainability and mitigation strategies is relevant for manufacturing companies, which often face scrutiny regarding their environmental impact, as the global community intensifies its efforts to address climate change and environmental sustainability. Italy's commitment to reducing greenhouse gas emissions by 33% by 2030, as part of the European Union's climate goals, has placed significant pressure on its manufacturing sector (European Commission, 2021). This commitment, coupled with growing stakeholder expectations and the transformative impact of the COVID-19 pandemic, has accelerated the trend towards adopting and communicating robust mitigation strategies among Italian manufacturers. Moreover, in Italy, SMEs represent a significant part of the economy and the manufacturing sector. According to ISTAT (2020), SMEs constitute over 99% of Italian businesses and contribute to about 67% of the added value in the manufacturing sector. Understanding how these companies address climate change mitigation is therefore crucial to assessing the sector's overall environmental impact. On this context, our work aims to answer these research questions:

- Is there a difference between the communication of the mitigation and the sustainability strategy?
- Is there a relationship between the development of sustainability and mitigation strategies adopted by SMEs and their communication?
- Is there a relationship between the communication done by SMEs and their perception of being sustainability leaders?

We employed a multi-faceted research approach by quantifying the declared levels of sustainability and mitigation efforts, analyzing the associated communication strategies, and cross-referencing self-reported data with publicly available information, in order to identify best practices, common challenges, and areas for improvement in how the analyzed firms articulate their environmental commitments and actions. Initially, we developed a detailed close-ended survey structured to gather information on various aspects of sustainability practices and mitigation strategies implemented by these companies. This allowed us to gain insights into the depth and breadth of environmental initiatives across the sector. The survey was provided to 1500 SMEs Italian manufacturing firms in 2024, containing 11 questions, 5 on the sustainability strategy and 6 about the mitigation strategies. Concerning the sustainability strategy we asked strategic question related to CSRs (Kassier, 2024), B-corps (Richardson & O'Higgins, 2019) and environmental reports (Christensen, Hail & Leuz, 2021). On the other hand, regarding the mitigation we asked something about direct/indirect emissions (Fawzy, Osman, Doran & Rooney, 2020) and Carbon credits (Probst et al., 2024). More details on the questionnaire are reported in Appendix A.

A sample of $N_{answers}$=1497 answers was finally collected. All the answers were coded as dummy variabes $Qs_i^n$, for the sustainability strategy related questions, and $Qm_i^n$, for the mitigation-related ones (where n=1, …, $N_{answers}$ and i the number of the question), assuming value 1 or 0. More details on the coding of each answer are reported in Appendix A. These variables have been combined for the generation of new dichotomic indicators; the sustainability level of a n-th firm has been evaluated as:

$$\text{SustLevel}_n = \begin{cases} \text{High} & if \sum_{i=1}^{4} Qs_i^n \geq 3 \\ \text{Low} & otherwise \end{cases}$$

indicating high level if a firm obtained 1 in at least three of the first four questions related to the sustainability strategy. Firms who answered "Don't know/prefer not to answer" in all four questions were removed from the sample. The last question regarding the sustainability strategy ($Qs_5^n$) was used to evaluate if a firm perceives to be a sustainable leader in the sector, thus the related variable has been defined as:

$$\text{SustLeader}_n = \begin{cases} \text{Yes} & if \quad Qs_5^n = 1 \\ \text{No} & otherwise \end{cases}$$

All the questions related to the mitigation were used to code the effort of each firm related to each Scope emissions. The indicators of such Scopes emissions were defined as:

$$\text{Scope1}_n = \begin{cases} 1 & if \quad OR(Qm_1^n, Qm_2^n) = 1 \\ 0 & otherwise \end{cases}$$

$$\text{Scope2}_n = \begin{cases} 1 & if \quad OR(Qm_3^n, Qm_4^n) = 1 \\ 0 & otherwise \end{cases}$$

$$\text{Scope3}_n = \begin{cases} 1 & if \quad OR(Qm_5^n, Qm_6^n) = 1 \\ 0 & otherwise \end{cases}$$

being $OR(\cdot,\cdot)$ the logical or operator that assumes value equal to one if at least one of the two analyzed variables is equal to one. Firms who answered "Don't know/prefer not to answer" in all six questions were removed from the sample.

Finally, exploiting the single Scopes indicators, an overall variable indicating the global Mitigation level assuming value "High" only if a firms employed efforts on at least two Scopes:

$$MitLevel_n = \begin{cases} \text{High} & if \sum_{i=1}^{3} \text{Scope } i^n \geq 2 \\ \text{Low} & otherwise \end{cases}$$

Subsequently, we retrieved from ORBIS database size, market, ATECO and profit of the firms. Due to some unavailable data, a refined final sample of $N_{refined}$=1033 firms was recorded with full characterization of sustainability level, mitigation level, financial and structural data.

Following the survey analysis, we employed web scraping techniques to analyze the public communication of sustainability and mitigation efforts on the $N_{refined}$ firms' websites. This step was crucial in complementing the information obtained through the questionnaire to compare the self-reported data from the survey with publicly available information.The web scraping process was performed by using a custom-made Phyton code allowing the retrieval of all words reported on each firm's website. Afterwards, a list of sustainability-related relevant words was selected and divided into eight buckets of keywords in order to categorize them into topics specifically related to sustainability and/or mitigation efforts. The complete list of the eight buckets is reported in Appendix. Then, to empirically evaluate the communication, we calculated the Term-Frequency Inverse Document Frequency (TF-IDF) of each *n*-th website for all eight buckets. The TF-IDF has been calculated following Paik (2013) as:

$$TF - IDF_k^n = \sum_{i=1}^{N-words_k} TF(t_i, k) * IDF(t_i, k)$$

where $k=1,\ldots,8$ is the number of the bucket, $t_i$ is the $i$-th term($i=1, \ldots, N\text{-}words_k$) belonging to the $k$-th bucket, $TF(t_i,k)$ represents the frequency of each term ($t_i$) of the bucket $k$, normalized over the document length and the intra-document Terms

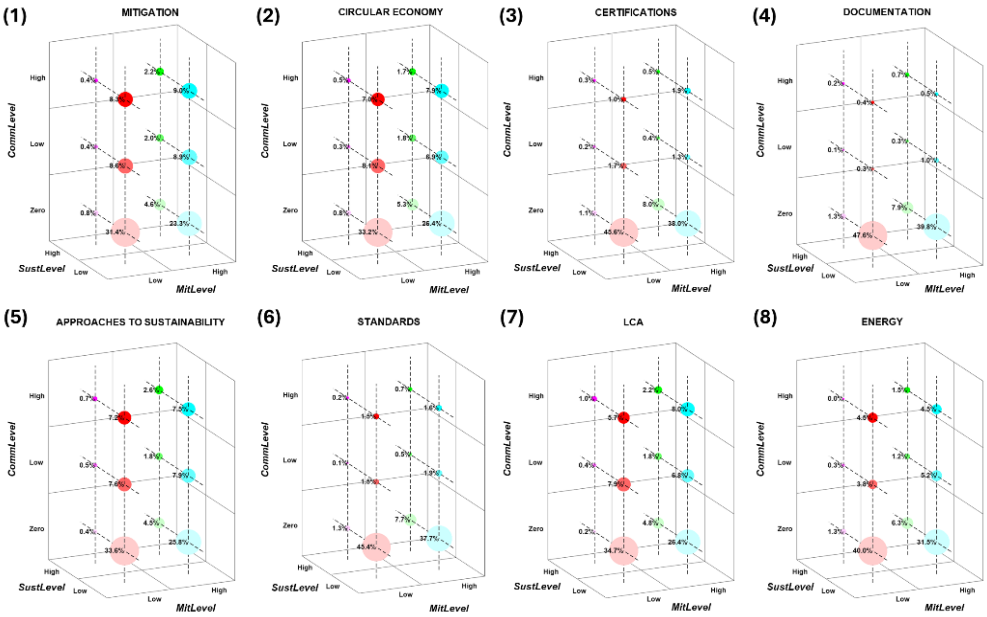
Frequencies, and $IDF(t_i,k)$ is the rarity of the term $(t_i)$ among all the $N_{refined}$ websites. Then, we create a new three-level cathegorical variable representing the communication level of each $n$-th firm per $k$-th bucket as:

$$CommLevel_k^n = \begin{cases} \text{Zero} & if \quad TF - IDF_k^n = 0 \\ \text{Low} & if \quad 0 < TF - IDF_k^n \leq Median_k \\ \text{High} & if \quad Median_k < TF - IDF_k^n \end{cases}$$

where $Median_k$ is the median among all $TF - IDF_k^n$ different from zero of the $k$-th bucket.

Regression models were implemented using STATA to statistically evaluate relationship among variables for answering research question 2 and 3.

The first model used employed exponential-mean where the regression equation was set as:



$$(TF - IDF|x) = exp(a_1 SustLevel + a_2 MitLevel + a_3 ln(Profit) + a_4 Size + a_5 Market + a_6 GeoArea + b)$$

The second model involved a probit regression as follows:

$$\Pr(SustLead = 1) = a_1 ln(TF - IDF) + a_2 SustLevel + a_3 MitLevel + a_4 ln(Profit) + a_5 Size + a_6 Market + a_7 GeoArea + b$$

Concerning the variables used, TF-IDF, SustLevel, MitLevel and SustLead are the same above-described, Profit represent the net profit of a firm, Size is a dummy variable assuming value 0 for small enterprises and 1 for medium ones, Market is a dummy variable assuming value 1 if the firm has B2B

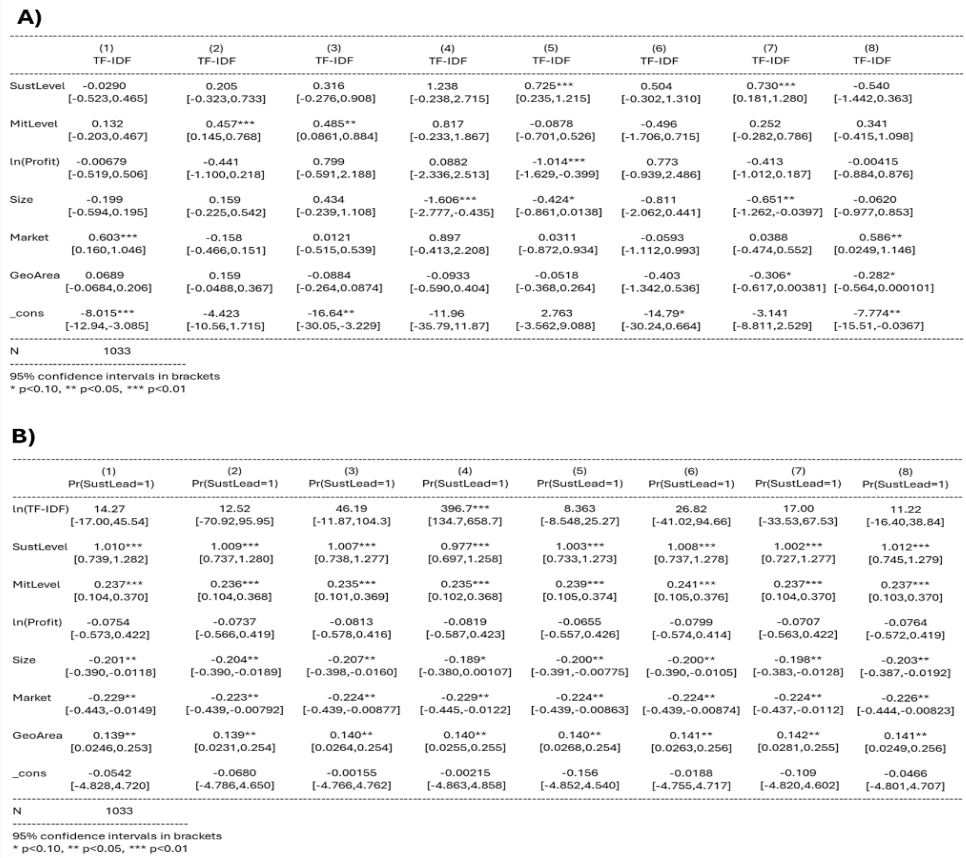
market and 0 for the B2C one, and GeoArea is a three level categorical value assuming value 2 for firms from North-East of Italy, 1 for the North-West ones and 0 otherwise.

Source: Our elaboration.

**Figure 1:** Communication of Sustainability and Mitigation (divided in eight topics) with respect to the Sustainability Strategy level and the Mitigation level.

## 4. Results And Discussions

We started analyzing the firms' mitigation efforts in relation with the three scopes. The major efforts are related to Scope 2 emissions; actually, 69.7% (720 firms) of the sample undertakes initiatives on the mitigation of purchased energy, in particular electricity. This can be motivated by the fact that in recent years Italy gives benefits on the purchasing or re-arrangement of energy production with renewable energy sources (Canelli, Fontana, Realfonzo & Passarella, 2024) especially to SMEs. Scope1 emissions related mitigation efforts were still relevant, as taken into account by about 1 out of every 2 firms (49.8%) but, on the other hand, the Scope 3 emissions efforts were not very high (35.9%) probably due to the known difficulties of SMEs to control the emission along the whole value chain (Olekanma, Rodrigo, Adu & Gahir, 2024). However, 19.1% of the sample declared mitigation efforts on all three Scopes emissions placing them as Mitigation leaders.



To answer the first research question, we qualitatively analyzed the dispersion of the different communication levels of the 8 topics (buckets) with respect to the Sustainability Level and Mitigation Level. From Figure 1, we can notice that firms tend to communicate general topics (Mitigation, Circular Economy, Approaches to Sustainability, LCA and Energy) more than specific ones (Certifications, Documentation and Standards). This communication of general topics also contains a significant number of firms (from 8% for the Energy topic to 16.9% of the Mitigation topic) which perform

greenwashing, as depicted by bright red circles in Figure 1. On the other hand, regarding the specific topics, we observe an increase in greenhushing behaviours (light green circles in Figure 1) from firms that don't communicate even if their Sustainability and Mitigation levels are high.

To assess a possible relationship between communication and the Sustainability/Mitigation levels, we evaluate the exponential-mean regression described in the above section; the results are reported in Figure 2A. It is worth noting that is no generalizable relationship between firm's levels and its communication, but it is strictly related to the communicated topic. In particular, an increase of mitigation level induces a statistically relevant increase in communication only for the Circular Economy and Certification buckets; on the other hand, an increase of Sustainability level leads a statistically relevant increase in communication only for the Approaches to sustainability and LCA buckets.Thereafter, we assessed whether the communication of sustainability strategies and mitigation affects firms' perceptions of being sustainability leaders. From Figure 2B, only for the Documentation Bucket, an increase of communication (TF-IDF) is associated with a statistically relevant increase of probability that the firm perceives to be a Sustainability Leader. Thus, communication is not a factor that influences the perception of being a sustainability leader; on the contrary, as expected, the levels of sustainability and mitigation positively affect this perception.

## 5. Conclusions

This study adds a fresh perspective to the ongoing conversation about sustainability in SMEs, especially within the manufacturing sector. One of its key contributions is shedding light on the gap between the sustainability actions that SMEs are taking and how they communicate these efforts. While many companies are making strides in reducing their environmental impact, their communication often falls short, leaving stakeholders unclear about the true extent of their commitment. This disconnect raises important questions about how SMEs can better align their actions with their messaging to build trust and transparency (Adams & Frost, 2008; Hahn et al., 2015).

**Figure 2:** Panel of Regressions described in the "Research framework and empirical analysis" section.

We also deepen the discussion around emission mitigation, particularly in the context of SMEs tackling Scope 1, 2, and 3 emissions. The findings highlight how Scope 3 emissions remain a significant challenge due to the complexity of managing environmental impacts across supply chains. This aspect is critical, as it underscores the need for more tailored solutions that help SMEs navigate these obstacles and strengthen their sustainability practices (Gadde & Dubois, 2010; Matthews et al., 2008).

Another valuable insight from this research is the nuanced view it offers on greenwashing and greenhushing. By exploring these two extremes—overstating or downplaying environmental efforts—we provide a better understanding of how these practices can influence public perception and stakeholder trust. This is especially relevant today, as transparency becomes an increasingly important driver of corporate reputation (Delmas & Burbano, 2011).

Looking ahead, there's a lot more to uncover in this field. Future research could explore how SMEs approach sustainability in different regions or industries, considering how cultural and regulatory differences might shape their strategies and communication. The challenges of Scope 3 emissions also deserve more attention—what innovative tools, like blockchain or collaborative networks, might help SMEs better manage their supply chains and reduce emissions? (Saberi et al., 2019).

It would also be valuable to understand how effective sustainability communication impacts key business outcomes, such as customer loyalty, investor interest, or brand reputation. This could help SMEs craft strategies that not only showcase their environmental efforts but also support their growth (Chkanikova & Mont, 2015). Public policies and incentives are another area worth exploring. Research here could guide governments and organizations in designing programs that genuinely empower SMEs to adopt greener practices (Brammer et al., 2012).

Finally, technology opens up exciting possibilities for the future of sustainability. How can tools like artificial intelligence or advanced analytics make it easier and more affordable for smaller companies to measure, report, and communicate their progress? Exploring these questions could unlock new opportunities for SMEs to lead the way in sustainability, despite their limited resources.

By diving into these areas, future studies can help bridge the gap between theory and practice, offering practical solutions that benefit SMEs, policymakers, and stakeholders alike in the journey toward a more sustainable future.

## Appendix A

Here we report in detail the questions and the available answers provided to the firms. The questions are divided depending on the contribution they have either on sustainability or mitigation. In addition we reported how we coded each question.

### Sustainability

Question 1: Is your company a Benefit Corporation and/or a certified BCorp?

Yes No Don't know/Prefer not to answer

$Qs_{1n} = \{1 \quad if \quad answer = Yes$

$0 \quad otherwise$

Question 2: Have you ever produced an environmental report? Examples: social report, environmental report, impact report, mission statement, sustainability report.

Yes No Don't know/Prefer not to answer

$Qs_{2n} = \{1 \quad if \quad answer = Yes$

$otherwise$

Question 3: What environmental certifications have you achieved? Select from the list.

CAM; CARBON FOOTPRINT; ECOLABEL; EMAS; ISCC; ISO13009; ISO14001; ISO14006; ISO 14040/14044; ISO 14064; 14067: 14090/14091; ISO 21401; ISO

50001; Made Green in Italy; Life Cycle Assessment; No One; Don't know

$Qs_{3n} = \{0 \quad if \quad OR(No\ One, Don't\ know) \quad 1 \quad otherwise$

being OR(•,•) the logical or operator.

Question 4: To what extent is environmental sustainability part of your mission or "corporate goal"?

(Very unlikely) 2 3 4 5 (Very Likely)

Don't know/Prefer not to answer

$Qs_{4n} = \{1 \quad if \quad answer \geq 4$

$otherwise$

Question 5: How much do you agree with the following statement, "Regarding environmental sustainability actions (example: reducing carbon emissions), our company acts ahead of competitors."

(Very unlikely) 2 3 4 5 (Very Likely)

Don't know/Prefer not to answer

$Qs_{5n}$ = {1 $if$ $answer \geq 4$ 0 $otherwise$

### Mitigation

Question 1: To reduce emissions, your company had to :

Introduce new products Modify existing products Change the production process Update employee skills Identify new ad hoc professionals Find new sources of funding Other (specify) No action Don't know/prefer not to answer

$Qm_{1n}$ = {0 $if$ $OR(No\ Action, Don't\ know \backslash prefer\ not\ to\ answer)$ 1 $otherwise$

Question 2: Does your company purchase carbon credits (carbon offsets) or participate in reforestation projects and other similar environmental initiatives to reduce its environmental impact?

Yes No Don't know/Prefer not to answer

$Qm_{2n}$ = {1 $if$ $answer = Yes$

$otherwise$

Question 3: Does your company produce its own electricity? If yes, through what facilities? [multiple answers possible].

Wind; Solar/Thermal; Photovoltaic; Thermoelectric; Hydroelectric; Geothermal; We do not produce our own energy; Don't know/prefer not to answer

$Qm_{3n}$ = {0 $if$ $OR(We\ do\ not\ produce\ \ldots, Don't\ know \backslash prefer\ not\ to\ \ldots)$

$otherwise$

Question 4: Do you buy energy from renewable sources (but not self-generated)?

[choose one]

Yes No Don't know/Prefer not to answer

$Qm_{4n}$ = {1 $if$ $answer = Yes$

0 $otherwise$

Question 5: Let us now consider "scope 3 emissions," i.e., emissions related to activities that occur outside your company boundaries but are linkable to your product and/or production process (e.g., emissions related to the raw materials you use). How often have you assessed these emissions in your business discussions? [choose one]

Never Rarely Occasionally Often Very often

Don't know/prefer not to answer

$Qm_{5n} = \{1 \quad if \quad OR(Often, Very\ often)$

$0 \quad otherwise$

Question 6: Which of these activities did you consider as sources of indirect emissions? Other: emissions related to production cycle and business travel; waste generated in operations; employee commuting

Emissions related to the purchase of materials, products or services for your business Emissions related to the transportation of the products, materials or services you purchase (inbound logistics, handled by you or companies you contract)

Emissions related to the transportation of the products, materials or services you sell

(outbound logistics, managed by you or companies contracted by you)

Emissions related to the end-of-life of products

Emissions related to the distribution network of your products

Emissions related to the use of your products by consumers

None of these

Don't know/prefer not to answer

$Qm_{1n} = \{0 \quad if \quad OR(None\ of\ these, Don't\ know\ \backslash prefer\ not\ to\ answer)$

$1 \quad otherwise$

## Abstract

As companies are increasingly called upon to play a role in addressing societal challenges, they are expected to adopt hybrid logic, integrating market and social logic. This shift has profound implications for brand management, as brands become powerful vehicles through which companies articulate their social commitments and values. In this evolving landscape, the integration of Diversity, Equity, and Inclusion (DEI) principles into branding has gained growing strategic relevance. Brands are being urged to not only represent diverse social identities (e.g., gender, disability, race, etc.), but also to foster equity and promote active inclusion, both in the marketplace and in broader society. Inclusive branding emerges as a Social Purpose Branding strategy based on this hybrid logic, aligning competitive positioning with a clear social purpose.

Despite the growing relevance of the topic, academic literature on inclusive branding remains fragmented. Most studies focus on specific marketing tools (e.g., product, advertising) or diversity dimensions (e.g., disability), often adopting a theoretical and consumer-centered approach. There is a lack of comprehensive frameworks that reflect managerial perspectives on understanding the complexity of implementing an inclusive branding strategy.

The study addresses these gaps by: (1) mapping inclusive branding initiatives through the triad "marketing tools/activities-intended audiences–diversity dimensions"; and (2) identifying key challenges and managerial solutions in implementing inclusive branding strategies. Based on document analysis of the Diversity Brand Index and eight in-depth interviews with DEI and branding professionals, the study offers both theoretical insights and practical implications for managers seeking to build credible, inclusive, and socially impactful brands.

*Key words: Diversity Equity and Inclusion (DEI), inclusive branding, Diversity Brand Index (DBI), in-depth interview, content analysis.*

## 1. Introduction

In recent years, both marketing scholars and practitioners have widely recognized the increasingly significant role of brands as catalysts for social change (Swaminathan et al., 2020). Brands are taking a stance on socially meaningful issues, particularly in light of consumers' growing distrust in institutions (Edelman, 2025). The issue of social recognition of inequality and the demand for reduced social discrimination have gained notable attention (Chandy et al., 2021). This growing relevance can be primarily attributed to the heightened awareness of the diversity of social identity categories (e.g., gender, race/ethnicity, body size and shape, etc.) present in contemporary society (Licsandru et al., 2020).

This phenomenon is shaped by macro-level factors such as demographic shifts — for instance, the aging population in countries like Italy (Eurostat, 2025) — and migratory flows, which are making societies increasingly multicultural (Demangeot et al., 2019). Moreover, the rising importance of this issue is also linked to factors that have intensified the negative effects of diversity, thereby exacerbating forms of discrimination and social exclusion. These include the Covid-19 pandemic (Kipnis et al., 2021; Ferraro et al., 2023), political and regulatory developments, and the digital revolution, which has introduced disparities in access to technology (Patric and Hollenbeck, 2021), algorithmic discrimination, and cyberbullying (Vernuccio et al., 2025).

As highlighted by Ferraro et al. (2023), corporate leaders are also assigning high strategic priority to DEI initiatives (Creary et al., 2021), especially in response to increasing pressures from younger generations - namely Generation Z and Generation Alpha- who are significantly more attuned to these issues than their predecessors. Against this backdrop, it is increasingly evident that companies must define and implement inclusive branding strategies grounded in the principles of diversity, equity, and inclusion (DEI). These strategies aim to welcome, represent, include, and empower all social identity categories, while actively working to eliminate all forms of social discrimination among market participants (Vernuccio et al., 2025; Burgess et al., 2021, 2022). To this end, firms must reconcile market logic with social logic by adopting a "hybrid logic" (Spry et al., 2021), which underpins the Social Purpose Branding approach (Gray et al., 2024). This approach is characterized by: (1) a social commitment that is integrated into the brand identity and articulated through a deliberate social mission, guiding corporate actions and behaviors toward addressing the root causes of discrimination linked to diversity; (2) a medium- to long-term strategic horizon; (3) the development of a meaningful connection with consumers who identify with the DEI values endorsed by the brand; (4) the consistent alignment between the firm's social commitment and its core business; and (5) the generation of tangible and measurable impact both in the market and within society (Gray et al., 2024). Accordingly, firms are expected to build an inclusive social brand identity (Ferraro et al., 2023) to articulate a clear positioning - both competitive, in the minds of consumers, and social, within the broader societal community - and to uphold the brand's social promise through the integrated use of all tools of the marketing mix (Henderson & Williams, 2013; Kipnis et al., 2021; Burgess et al., 2022; Vernuccio et al., 2025).

However, the academic literature on this topic remains notably fragmented. Specifically, when examining the tools of the marketing mix, the focus has primarily been placed on the product and advertising, typically adopting a consumer perspective to explore the effects of advertising communication on psychological responses among consumers (e.g., Eisend et al., 2023; Wilkie et al., 2023; Branca et al., 2024; Chauhan et al., 2025). Therefore, there is a lack of a comprehensive analysis that considers the full range of marketing tools that companies can deploy to implement an inclusive branding strategy. Furthermore, existing studies have primarily focused on specific dimensions of

diversity (e.g., Licsandru & Cui, 2018; Montecchi et al., 2024), without addressing how different elements of the marketing mix can be combined to tackle various facets of diversity through an intersectional lens. Moreover, following the logic of Social Purpose Branding, it becomes essential to consider the two main categories of intended audiences: (1) consumers, who must be engaged to promote inclusion within the marketplace; and (2) the societal community, which must be addressed to remove the underlying causes of discrimination in society.

In this regard, the academic marketing literature lacks empirical studies on this phenomenon from a managerial perspective - a viewpoint that is particularly relevant for supporting practitioners in understanding how social and market logics can be effectively integrated through the strategic use of the marketing mix.

To address these gaps, the present study adopts a managerial perspective with the aim of:

(1) mapping, through an integrated framework, the variety of marketing initiatives implemented by firms in the execution of inclusive branding strategies, based on the triad "marketing tools–intended audiences–dimensions of diversity";

(2) exploring the most critical managerial challenges perceived in the implementation of inclusive branding strategies, as well as the main managerial practices adopted by firms to address them.

From a theoretical standpoint, this study contributes to addressing the fragmentation of existing literature by proposing an integrative framework that captures the breadth of inclusive branding initiatives. Specifically, it accounts for the different dimensions of diversity tackled by such strategies, while also considering the distinct categories of intended audiences. Furthermore, by offering an original systematization of the multifaceted managerial challenges inherent in inclusive branding, the study puts forward - for the first time - a comprehensive set of actionable marketing and branding responses. In this regard, the paper offers a valuable managerial contribution as well, serving as a structured set of strategic guidelines for practitioners engaged in the definition and implementation of inclusive branding strategies.

The remainder of the paper is structured as follows: it begins with a literature review on diversity, discrimination, inclusion, and inclusive branding, followed by a presentation of the research methodology and the key findings. The paper concludes with a discussion of the results, limitations of the study, and avenues for future research.

## 2. Theoretical background: from diversity to inclusion

Diversity refers, in general terms, to physical or sociocultural differences- either real or perceived - that are attributed to individuals, as well as to the representation of such differences within academic research, market contexts, and organizations (Arsel et al., 2022). According to Park et al. (2023), diversity is a measure of heterogeneity in individuals' social identities, focusing on «traditionally underrepresented, underserved and marginalized populations» (p. 175). Heterogeneous starting conditions can lead to a disproportionate or inappropriate allocation of opportunities and resources among individuals within and across different social groups (Shultz et al., 2022; Ashik et al., 2025). An individual may be marginalized due to a specific structure or category of social identity. The structure of social identity refers to overarching criteria such as gender, body shape or body size, sexual orientation, and socioeconomic status, whereas the category of social identity refers to a specific class within that structure (for example, "obesity" as a category within the "body size" structure). In what follows, the terms "structure" and "category" will be collectively referred to as dimensions of diversity.

Given that individual identity is increasingly fluid and nuanced, and that people are less and less likely to fit neatly into clearly defined social identity categories (Ferraro et al., 2023), diversity should be understood as a multidimensional construct (Patrick & Hollenbeck, 2021; Branca et al., 2024), embracing an intersectional perspective (Gopaldas & DeRoy, 2015). In fact, focusing on a single dimension of diversity can sometimes lead to additional forms of discrimination (Burgess et al., 2022).

Therefore, heterogeneous starting conditions can result in the acquisition of either privilege or discrimination. In the presence of such "distortions," the concept of equity refers to fairness and impartiality toward individuals, both in terms of opportunities and outcomes, regardless of the initial conditions that may lead to unequal situations (Arsel et al., 2022; Campbell et al., 2023). Regardless of their initial social identity categories, individuals should be ensured fair treatment in accessing resources, opportunities, and markets, and should have the same potential to achieve comparable outcomes as members of other groups.

The concept of inclusion, in turn, pertains to the creation of a culture that fosters a sense of belonging and the integration of diverse groups (Arsel et al., 2022). It goes beyond mere tolerance to encompass the active embrace and valorization of diversity, ensuring full participation in decision-making processes and equal access to resources and opportunities for all individuals (Schultz et al., 2022). While diversity may be considered a given - a structural element embedded within the society in which economic actors operate - equity and inclusion policies result from a deliberate commitment to social responsibility voluntarily undertaken by companies. In this perspective, inclusive branding should be defined as a Social Purpose Branding strategy grounded in the principles of diversity, equity, and inclusion, aimed at welcoming, representing, including, and valuing all categories of social identity, while eliminating any form of social discrimination for all participants in market exchanges (Vernuccio et al., 2025).

The inclusive branding strategy is grounded in the adoption of a hybrid logic that combines both social and market-oriented perspectives. To build an inclusive brand, a company must first define its social brand identity (Ferraro et al., 2023; Vernuccio et al., 2025) as well as its competitive and social positioning and subsequently identify the marketing activities required to fulfill the brand's social promise addressed to both consumers and the broader societal community (Vernuccio et al., 2025).

Recent theoretical contributions (e.g., Grieco, 2024) highlight the importance of jointly considering the various tools of the marketing mix and the multiple dimensions of diversity, to provide a more comprehensive understanding of the path toward inclusion undertaken by firms and to identify different approaches to inclusive branding. In this regard, Vernuccio et al. (2024) show that brands adopt a strategic approach to inclusion when they: (i) embrace a hybrid logic characterized by deep integration of DEI principles into the brand identity, (ii) demonstrate a strong focus on intersectionality, and (iii) make extensive use of marketing mix tools. Similarly, Burgess et al. (2022) refer to a "transformative" approach to inclusion when companies act as first movers in assuming social commitments, achieve a high degree of DEI integration within the brand identity, and pay close attention to intersectional dynamics.

However, with specific regard to the tools of the marketing mix, academic literature has primarily focused on the product and advertising tools. Concerning the former, Hays (2008) highlighted how the product - considered together with packaging - has the potential to address all dimensions of diversity. Achieving this requires that product design be guided by the principles of inclusion, taking into account the needs and abilities of all individuals to reduce both actual and perceived difficulties related to product use (Keenan et al., 2021; Patrick & Hollenbeck, 2021). In line with this perspective,

Masiello et al. (2024), focusing on the specific case of toys designed for children with disabilities, emphasized that the design of such products should be inspired by the "universal" need shared by all children to play and to grow through play.

As for advertising, numerous studies underscore the powerful role this communication tool can play in fostering social change (e.g., Ruggs et al., 2018, cited in Wilkie et al., 2023). Nonetheless, several scholars draw attention to the critical issues associated with advertising, particularly the stereotypical portrayal of individuals (Viglia et al., 2023; Graw & Zotos, 2016), and of women in particular (Eisend, 2010; Tsichla, 2020). Similar concerns apply to body size representations - with beauty often depicted as synonymous with slim and sculpted physiques (Chauhan et al., 2025) – and disability (Masiello et al., 2024).

Adopting a predominantly consumer-centered perspective to investigate the psychological effects of advertising (e.g., Wilkie et al., 2023; Branca et al., 2024; Chauhan et al., 2025), previous research has shown that such stereotypes in advertising can lead to negative consequences - especially for female consumers - by diminishing their sense of inclusion and perceived fairness (Åkestam et al., 2017). These portrayals may also contribute to broader societal harms, including the reinforcement of discrimination and social exclusion (Ferraro et al., 2023). Even with respect to the dimensions of diversity, scholarly contributions tend to focus on specific issues in isolation, such as disability, sexual orientation, ethnicity, body size, and body shape.

While prior studies have focused on specific marketing tools and particular dimensions of diversity, they have largely overlooked the diversity of intended audiences—namely, consumers and societal communities—addressed by firms in the implementation of inclusive branding strategies. A joint consideration of the triad "marketing tools/activities–intended audiences–diversity dimensions" could offer a more comprehensive understanding of inclusive brand management. Moreover, the predominance of theoretical contributions and the consumer-oriented focus of the limited empirical research underscore the need to adopt a managerial perspective—particularly valuable when seeking to uncover the underlying logics that guide certain types of business decisions and activities (Bartoli et al., 2025).

## 3. Methodology

This study adopts a qualitative design articulated in two complementary phases: the methodological approach is based on the integration of document analysis and in-depth interviews, within a design that emphasizes the progressive construction of knowledge (Dubois & Gadde, 2002).

The first phase involved a systematic document analysis (Bowen, 2009) of official sources related to the Diversity Brand Index (DBI) from 2018 to 2025 (www.diversitybrandindex.org). The Diversity Brand Index is a study that, through a web survey conducted on a statistically representative sample of the Italian consumers, identifies the brands perceived as most inclusive by consumers. It then analyzes and evaluates the marketing initiatives/activities that the brands implement through a Scientific Committee and a Security Check Committee composed of experts in various areas of diversity (LGBTQ+, ethnicity, disability, gender and gender identity, religion, age). In 2021, the DBI became a European certification mark for brands that are genuinely committed to DEI and successfully bring this commitment to the market and society.

The information provided in the different editions of the DBI has been integrated with information obtained from corporate websites of the brands included in the index.

The systematic document analysis adopted an approach based on ex-ante coding that considered: (a) brand and initiative; (b) marketing tools/activities, (c) intended audiences (i.e., consumers and societal community); (d) dimensions of diversity supported (i.e., gender, body, disability, ethnicity/race, sexual orientation, age, and economic status).

The outcome of this phase is a qualitative map of the various initiatives that companies have implemented to promote their inclusive branding strategies. It also offers a holistic reading of the intended audiences and the diversity dimensions involved in these initiatives. The findings from the first phase of the research informed the design of the second phase, which aimed to explore professionals' perspectives on the key managerial challenges associated with implementing inclusive branding strategies, as well as the managerial solutions companies can use to address these challenges.

The second phase involved conducting eight in-depth qualitative interviews (Creswell, 1998) with seven managers responsible for defining and implementing inclusive branding strategies. The purpose was to gather their insights on the key managerial challenges they face in this area and to explore how these challenges can be addressed through marketing and branding initiatives. Additionally, one interview was conducted with the consultant responsible for the Diversity Branding Initiative (DBI) to gain a broader perspective on the same topics.

In selecting the professionals to be included in the survey, managers from the most active companies identified in the first phase of the study were contacted. The key informant approach (Robson and Foster, 1989) was adopted: given the subject matter, only expert profiles (e.g., Chief D&I Officer, Equality Diversity & Inclusion Leader) were included in the "theoretical sample", as they were able to provide a broad and in-depth view of the phenomenon, precisely because of their experience and responsibilities (Dexter, 1970). Respondents have an average of 17 years of work experience, with about 5 of those years dedicated to Diversity, Equity, and Inclusion (Table 1). The average tenure in DEI may seem low, but this is due to the fact that these positions were only recently established in the company in response to the increasing relevance of the issue.

| Interview ID | Industry | Participant job title | Years of professional experience | Years of experience in DEI |
|---|---|---|---|---|
| I1 | Entertainment | Senior Director Marketing Italia & Grecia | 23 | 7 |
| I2 | Grocery retail | Diversity, Equity, Inclusion Manager | 17 | 3 |
| I3 | Fashion | Brand Manager South East Hub | 18 | 4 |
| I4 | Food | Chief D&I Officer | 18 | 3 |
| I5 | Food | Creative Content and Brand Image manager | 18 | 4 |
| I6 | Furniture | Equality diversity & inclusion leader | 13 | 3 |
| I7 | Toy industry | Channel Director | 14 | 5 |
| I8 | Consultancy | Chief Operating Officer | 18 | 10 |

**Table 1:** Study informants

The interviews were guided by a semi-structured protocol developed based on insights emerging from the document analysis about the initiatives, the intended audiences and the diversity dimensions and some questions regarding the perspectives of the respondents on the most relevant challenges to address in implementing the inclusive branding strategy and the managerial solutions that could be proposed to overcome these challenges.

Each interview, with an average duration of approximately 40 minutes, was fully transcribed and analyzed using thematic content analysis (King & Horrocks, 2010), following an iterative approach that integrated descriptive coding, interpretive coding, and the identification of overarching themes. This process contributed to the development of a more articulated understanding of the phenomenon through a framework that summarizes the most relevant challenges concerning the various intended audiences considered (i.e., consumers and societal community) and the managerial solutions deemed most appropriate to address them.

## 4. Findings

### 4.1 Mapping inclusive marketing initiatives

Through systematic document analysis, three categories of inclusive marketing initiatives targeting different intended audiences have emerged:

1. Inclusive marketing initiatives for consumers. These initiatives focus primarily on consumers and utilize the product along with packaging, distribution, and physical or virtual points of sale. They also involve pricing strategies and communication through owned media (Edelman and Salsberg, 2010).
2. Inclusive marketing initiatives for societal community. This category targets primarly the broader societal community and includes activities such as sponsorship programs (e.g., sponsor for "Pride" events or for International Day for the Elimination of Violence Against Women), local engagement initiatives (e.g., support for local programs for breast cancer prevention), training and education projects (e.g, mentoring programs for unoccupied women), and welcoming projects (e.g., for the refugees). What sets these initiatives apart from those aimed at consumers is their focus on individuals as members of a specific societal community, particularly those who may be at risk of

exclusion or discrimination. As a result, companies may leverage their products for social purposes beyond mere sales.

3. Inclusive marketing initiatives for both consumers and societal community. These initiatives target both consumers and the societal community through advertising efforts.

This clear division enhances the understanding of how different marketing initiatives are employed depending on the audience they seek to engage. Adding the analysis of the dimensions of diversity considered in the various initiatives, a summary map emerges, as shown in Figure 1.

| Intended audiences | Consumers | | | | Consumers and societal community | Societal community | | |
|---|---|---|---|---|---|---|---|---|
| Tools/ activities / Diversity dimensions | Product and packaging | Distribution and point of sale | Price | Communication in brand owned media | Advertising | Sponsorship/ Local community engagement | Training projects | Welcoming projects |
| Gender | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | |
| Body | ✓ | | | ✓ | ✓ | | | |
| Disability | ✓ | ✓ | | ✓ | ✓ | ✓ | | |
| Ethnicity/race | ✓ | | | ✓ | ✓ | | | ✓ |
| Sexual orientation | ✓ | | | ✓ | ✓ | ✓ | ✓ | ✓ |
| Age | ✓ | ✓ | ✓ | ✓ | | | ✓ | |
| Economic status | ✓ | ✓ | ✓ | | | ✓ | | |

Source: Authors' own work.

**Figure 1:** Implementing the inclusive branding strategy:
marketing tools/activities, intended audiences, and diversity dimensions

The picture that emerges allows for further considerations. First, concerning marketing tools/activities (columns), it appears that product/packaging and advertising are the tools that companies can use to work on the greatest variety of diversity dimensions, together with communication at brand touchpoints on owned media - the so-called owned media - which allows companies to reach consumers primarily in their journey of interaction with the brand. The other marketing tools aimed at consumers (i.e., distribution and price) focus on a smaller variety of DEI issues, as do initiatives aimed primarily at the community, which focus predominantly on gender and sexual orientation.

Then, considering the diversity dimensions (rows), there appears to be a substantial balance these dimensions and the variety of tools used by companies to address them, although gender, disability, and sexual orientation seem to be the areas for which the greatest number of marketing tools and activities are used.

### 4.2 The most relevant perceived managerial challenges and solutions

Through interviews with professionals, we identified the challenges perceived by the respondents as most relevant in the implementation of an inclusive branding strategy with respect to different intended audiences (i.e., consumers and societal community).

Specifically, the analysis revealed four key perceived challenges:

1. Ensuring accessibility. According to the respondents, brands must first work to make products, pricing, and distribution accessible to consumers, not only to meet functional benefits (related, for example, to product and packaging usability), but also symbolic benefits (such as making consumers feel that the brand acknowledges and values their specific needs) and experiential benefits (e.g., enabling autonomy in accessing the point of sale or in using the product).

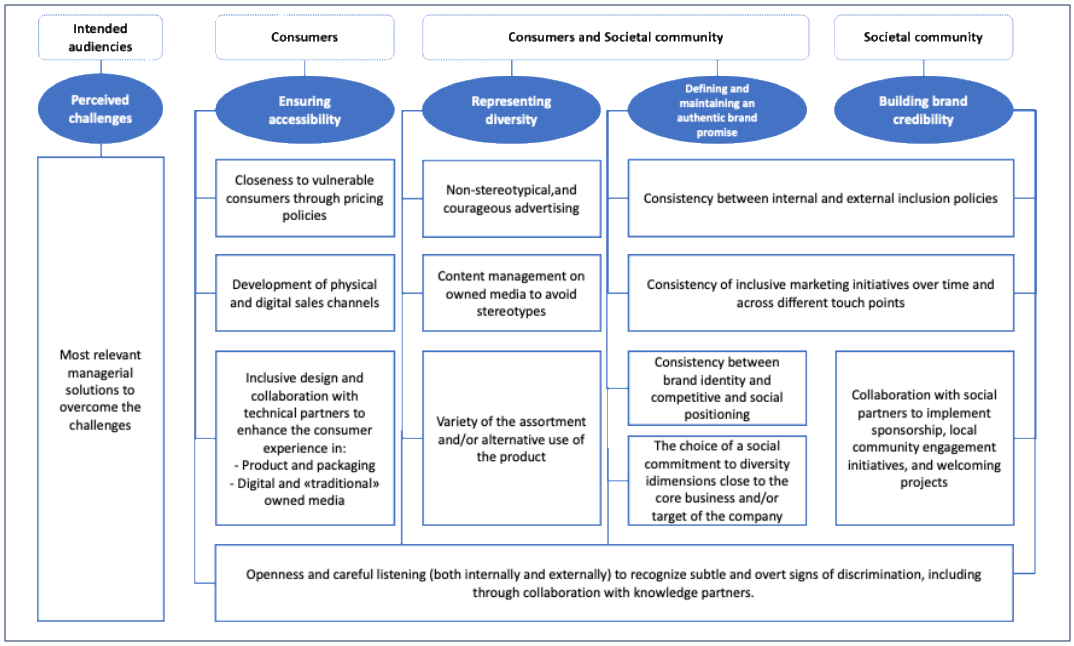
2. Representing diversity. Respondents highlighted that companies should convey their commitment to fostering a culture of inclusion, both internally and externally, through an appropriate representation of diversity that goes beyond stereotypical or even discriminatory portrayals. In this way, consumers and individuals belonging to the societal community will be able to recognize themselves in the values the company embraces and the diversity it supports.

3. Defining and maintaining an authentic brand promise. Companies must select the dimensions of diversity they intend to address in line with their brand identity values, to establish authentic brand promises both towards consumers and the societal community.

4. Building brand credibility. To allow the positive effects of inclusive branding to mature for the brand, consumers, and the societal community, the company must be perceived as credible. This challenge is closely linked to the previous one and, as we will see, some of the managerial solutions highlighted by respondents will overlap.

For each of these challenges, specific sub-themes were identified, corresponding to the main managerial solutions (in terms of marketing and branding) that, from the respondents' perspective, can be adopted to address them. The resulting framework is illustrated in Figure 2.

- **Managerial solution for "ensuring accessibility", "representing diversity", "defining and maintaining an authentic brand promise", and "building brand credibility".**



All respondents emphasized the importance of a managerial solution that cuts across the various challenges: continuously working on fostering openness and careful listening towards employees, consumers, and individuals belonging to the societal community, to recognize subtle or overt signs of discrimination, including through collaboration with knowledge partners.

With specific reference to the challenge of accessibility, by incorporating bottom-up suggestions from staff, target consumers, or individuals close to them (such as caregivers in the case of disability), the brand can develop more inclusive product offerings (for example, for different body sizes or races), or identify and support dimensions of diversity that are particularly relevant to the communities it serves.

In other cases, listening to consumers also proves useful for addressing the second challenge (i.e., representing diversity), by responding to demands for greater consideration of diverse social identities (e.g., race or ethnicity) within the brand's product assortment.

These practices are also particularly important for addressing the challenge of defining and maintaining an authentic brand promise. Often, the choice of the theme or themes to be embraced in promoting

DEI is informed by internal and external listening processes, including collaborations with knowledge partners who conduct more structured research on consumers and society more broadly. These partnerships are essential for gathering data and insights to assess the current state of exclusion or discrimination related to one or more dimensions of diversity, and to identify the most appropriate actions to address such issues.

Source: Authors' own elaboration.

**Figure 2:** Key challenges and managerial solutions in implementing the inclusive branding strategy

Finally, by monitoring social media conversations, the company can engage more closely with consumers and understand whether, and how, the brand's credibility in implementing inclusion strategy is being perceived.

- **Managerial solutions for "ensuring accessibility"**

According to respondents, companies can work toward accessibility through several key managerial practices:

a) The development of inclusive design for both products and packaging, as well as for owned digital assets - such as websites, branded immersive environments, and applications - and traditional touchpoints, including physical stores, customer service, and brand events. The underlying logic is that of "design for all", an approach that does not focus solely on the special needs of consumer groups at risk of marginalization, but rather aims to create products and brand touchpoints that are suitable for everyone:

"We pay close attention to size variety, offering both plus-size models and smaller sizes. We are very inclined to meet customer requests when they ask for a specific fit or size that is not currently available. Of course, there must be a minimum quantity threshold, but if a loyal customer tells us, 'I would be interested in buying this model in a 4XL,' we definitely try to accommodate their request" (I3).

To achieve this, it is often necessary to engage technical partners, particularly for the adoption of advanced technological solutions. In this regard, artificial intelligence (AI) holds significant potential for enhancing the accessibility and usability of certain products and services. For example, AI tools can support automatic translation of texts into less common languages, brand voice assistants can assist people with visual or motor impairments, and facial recognition technologies can facilitate product and service use for individuals with visual disabilities. Another noteworthy example is the use of voice assistants, which help blind individuals perform various activities (such as reading a book), while also supporting those with motor disabilities in managing tasks in the domestic environment, thanks to integration with home automation systems.

b) The development of physical and digital sales channels.

According to the interviewees, distribution is considered an important tool for the implementation of inclusive branding strategies. Industrial firms can promote more inclusive distribution by integrating their physical retail structure with the development of online sales channels. E-commerce, in this regard, presents significant potential, offering:

- Access to services across time and space. E-commerce platforms are always available, regardless of location, and can therefore be used by individuals who, for various reasons, may not be able to reach physical stores (for example, due to disabilities or geographical constraints) or comply with standard opening hours (because of work schedules or other commitments).

- Accessibility for people with disabilities. E-commerce websites should be designed to ensure easy navigation for users with visual impairments (for example, through high contrast between text and background or compatibility with screen readers), motor impairments (by enabling keyboard navigation or compatibility with adaptive joysticks), or hearing impairments (for example, by providing video subtitles, written transcripts, or animated visual alerts as alternatives to audio signals).

The need to make physical retail environments accessible also informs all decisions regarding store design, as stores represent a fundamental brand touchpoint for companies aiming to foster inclusion. While accessibility achieved through the removal of architectural barriers primarily provides functional benefits, the potential of physical stores to deliver symbolic and experiential value should not be underestimated. A store can be not only physically accessible, but also welcoming and perceived as a safe space for consumers at risk of social exclusion or discrimination. This can be achieved, for instance, through training staff on physical or mental disabilities, offering dedicated materials, and creating spaces tailored to vulnerable minority groups, such as neurodivergent individuals or women at risk of violence.

"Our stores play an important role in ensuring both accessibility and a welcoming environment for all consumers. In particular, we have focused on two initiatives. The first, developed in collaboration with the association Donnexstrada, involved converting some of our stores into 'purple points'. These locations have staff trained in supporting women facing street violence or insecurity. We have also introduced 'quiet hours', during which we reduce the level of sensory stimuli within stores to prevent overstimulation for neurodivergent individuals" (I2).

c) The use of pricing strategies to demonstrate closeness to vulnerable consumers.

Pricing can also serve as a means of demonstrating closeness and support toward consumer groups at risk of marginalization, such as those defined by age, socioeconomic status, or gender. For example, some retail chains offer specific promotions for older customers. These initiatives are intended not only to provide functional benefits, such as price reductions, but also to convey symbolic value, by making consumers feel acknowledged and valued. One interviewee cited the example of Nuvenia in this regard:

"An interesting pricing initiative is the one introduced by Nuvenia, which has taken a stand against period poverty. In Italy, they launched a cashback campaign called 'we absorb the VAT', aimed at counteracting the effects of the tampon tax - the ten percent VAT rate on sanitary products - and supporting women in accessing essential goods" (I8).

- **Managerial solutions for "representing diversity"**

From the respondents' perspective, companies can address this challenge through the following managerial practices:

a) Variety of assortment and/or alternative use of the product. Regarding the first point, brands are expected to provide adequate representation of diversity through the breadth of their product assortment, including items that reflect and give visibility to different diversity dimensions. As one interviewee highlighted:

"Think about Barbie a few years ago: she was the beautiful, slim, blonde doll who embodied a single concept of feminine beauty. Today, Barbie can have different skin tones, body types, and even some disabilities. Today's Barbie reflects the diversity of our society" (I7).

This illustrates the company's clear intention to offer symbolic benefits to consumers. The same logic applies when limited-edition products are launched in connection with specific events, commemorations, or diversity-related themes. For instance, fashion brands often release capsule collections during Pride Month, sometimes even adapting their visual brand identity for a limited period, such as incorporating the rainbow colors associated with the LGBTQ+ community.

Companies can also suggest different uses of a product in order to meet the needs of specific social identity groups:

"Over time, we introduced gluten-free pasta into our assortment because we believe food should bring people together, not separate them. For the same reason, we often reinterpret traditional recipes to accommodate special dietary needs or religious restrictions on the consumption of certain ingredients" (I4).

b) Content management on owned media to avoid stereotypes.

Gender diversity can be addressed with brand touchpoints such as product packaging. The example of Lego, cited by one of the interviewees, helps to illustrate this point:

"In 2021, Lego removed gender distinctions from its product packaging to avoid the frustration boys might feel when asking for a toy that was traditionally marketed to girls. Today, Lego packages include only an age recommendation, which is intended to guide consumers based on the cognitive development needed to fully enjoy the product. There are no longer sets specifically for boys or girls" (I7).

Still within the analogue realm, brand communication events also play an important role. These experiential contexts offer an opportunity for consumers to engage directly with a brand's commitment to diversity, equity, and inclusion. Several interviewees referred to fashion shows as a relevant example, where brands are now actively embracing a more inclusive representation of beauty by featuring models who do not conform to conventional aesthetic standards.

On digital owned media, brands can also represent a wide range of social identities through the appropriate use of digital technologies:

"Thanks to artificial intelligence, our online stores can now display virtual models with different body types, skin tones, sizes, and ages, overcoming the limitations of the past when the only available choice was between a male and a female model" (I3).

In branded immersive environments, such as the metaverse, companies can work on representing specific aspects of diversity such as disability, ethnicity, race, and sexual orientation. Within these virtual spaces, users can interact through avatars they create, and they can exchange unique digital goods, such as Non-Fungible Tokens (NFTs). In particular, some developers, such as Meta, have significantly expanded avatar customization options to include features like wheelchairs, hearing aids, a variety of body shapes, and a broad range of skin tones.

c) Non-stereotypical and courageous advertising. Advertising emerges as a key area of intervention, as emphasized by several respondents who highlighted the essential characteristics that inclusive advertisements should embody. First and foremost, brands must commit to eliminating stereotypes. However, promoting inclusive content may sometimes generate mixed reactions from the broader public. Despite this risk, brands are encouraged to act courageously and take responsibility for challenging dominant representations of diversity in order to foster social change.

With specific reference to disability, some interviewees pointed out that recent efforts by brands to embrace inclusion have shown that portraying physical disability is not incompatible with the desire to

inspire and captivate consumers. Such efforts can result in positive outcomes for consumers, the brand, and society. As in the case of product and packaging design, the approach to advertising should also aim for universal representation. Rather than emphasizing the special needs of a particular group, advertising should employ an empathetic tone consistent with the inclusive identity of the brand, avoiding any form of pity or glorification.

- **Managerial solutions for "defining and maintaining an authentic brand promise"**

According to respondents, companies can address this challenge through the following managerial solutions:

a) Social commitment to diversity dimensions close to the core business and/or target of the company. Respondents emphasized that, in order to build an authentic brand promise, companies should first engage with diversity issues that are closely related to their area of activity in the market.

"To be authentic, we must not stray too far from our core business, and it makes sense to build inclusion starting from what we do best. If we are Nike, we want to change the world through the power of sport, and no one will question our authenticity because working in the world of sport is what we are best at" (I6).

Another useful aspect to consider when defining the brand's promise, including its social dimension, is its alignment with the core target audience. Thanks to ongoing listening efforts, companies may appear more authentic when promoting inclusive initiatives that primarily address the consumers they already know and are close to:

"In our commitment to diversity and inclusion, we started with an issue that matters to women, who are our core target. Gender equality and the fight against violence towards women were therefore the first causes we felt compelled to support" (I2).

b) The consistency between brand identity and competitive and social positioning. Respondents highlighted that the implementation of an inclusive branding strategy can be perceived as authentic only if diversity, equity, and inclusion values are embedded in the brand's identity. When this is the case, it becomes possible to build an authentic positioning that is both market oriented and socially driven. As will be discussed further, this is even more valid when a culture of inclusion is embedded throughout the organization, starting with human resource management. Otherwise, there is a significant risk of diversity washing, which occurs when consumers and societal communities perceive the company's commitment to DEI as inauthentic.

- **Managerial solution for "building brand credibility"**

Credibility emerges as a particularly significant challenge from the perspective of the respondents. In their view, brands need to establish collaborations with social partners to develop initiatives such as sponsorships, local community engagement, and welcoming projects. As previously noted with regard to authenticity, when brands move beyond their core market domain to embrace a social commitment, they must rely on the expertise of those who have long operated within that specific context:

"Partnering with social organizations is, for us, a necessary condition both for identifying diversity issues that are distant from our business environment but still relevant, and for implementing initiatives. We cannot be credible if we act alone; we need the contribution of experts in the specific area" (I1).

- **Managerial solutions for "defining and maintaining an authentic brand promise" and "building brand credibility"**

Both to work on the authenticity of the brand promise and on brand credibility, the respondents emphasized the need to focus on:

a) The consistency of inclusive marketing initiatives over time and across different touchpoints. To make the social promise authentic and the brand credible, the company must be recognized as inclusive in every element of the marketing mix and at every stage of the customer journey. It is essential to ensure alignment across all marketing activities so that the necessary synergy is created to strengthen brand value both in the market and in society. For example, as one respondent pointed out:

"If there is not a truly inclusive offering, building communication on top of it quickly collapses, because consumers are quite savvy and will notice" (I1).

b) The consistency between internal and external inclusion policies. Several respondents highlighted that the approach to inclusion primarily develops within human resource management, aiming to ensure the representation of as many organizational structures and categories of social identity as possible, to value diversity, and to promote work that is dignified and rewarding for all individuals within the company. When an inclusive culture permeates the organization, employees can play a crucial role in promoting diversity, equity, and inclusion toward the market and in advancing concrete social commitments to the societal community. It is common for employees to collaborate in implementing socially oriented activities or projects such as mentoring or targeted training for groups at risk of discrimination to facilitate their integration into the workforce. Finally, the company's social commitment to inclusion can translate into initiatives that inspire and stimulate the growth of specific social identities.

## 5. Conclusion

This study contributes to the growing body of research on inclusive branding by advancing a more comprehensive understanding of how brands implement DEI principles through marketing strategies and operations.

Concerning the first phase of the research – realized through the systematic document analysis – the study provides a representation of the marketing initiatives' variety, jointly considering marketing tools/activities, intended audiences, and diversity dimensions. The proposed map (Figure 1) offers a more holistic view of inclusive branding practices. While existing literature has often focused on specific tools of the marketing mix - primarily product design and advertising (e.g., Hayes, 2008; Eisend et al., 2023) - our findings highlighted a broader approach. Moreover, the multidimensional lens (in

adopting the above mentioned "triad") allows for a clearer distinction between initiatives aimed at consumers and those directed toward the broader societal community, addressing a key gap in the current academic literature. Finally, the construction of the map also made it possible to understand which tools and activities are mainly used by brands to respond to the needs of different categories and social identity structures, confirming, on the one hand, the versatility of the product (highlighted by Hayes, 2008) and also highlighting that of communication on owned media.

Regarding the second phase of the study – realized through in-depth interviews with experts - preliminary findings of a broader, ongoing research project are presented. The results complement the predominantly theoretical and consumer-focused orientation of existing studies and bring to light the internal decision-making processes, challenges, and rationales behind inclusive branding strategies. Although exploratory, these early findings already offer valuable insights into the key managerial challenges and the most relevant managerial solutions in implementing inclusive branding strategies, as perceived by marketing professionals.

Four challenges have emerged as most relevant from the practitioners' perspective - ensuring accessibility, representing diversity, defining and maintaining an authentic brand promise, and building brand credibility – as well as the managerial solutions that companies can use to address them (Figure 2).

Although some previous studies (Burgess et al., 2021; 2022) have highlighted some of these challenges (i.e.., the credibility and authenticity issues), the research provided a comprehensive reading of the main criticalities that companies should address in their inclusive branding strategies, also deepening the main managerial practices that could be utilized to overcome these challenges. In the "ensuring accessibility" challenge, the study confirmed the need for the inclusive design emerged in previous study (Keenan et al., 2021; Patrick and Hollenbeck, 2021). Moreover, it showed the relevance of technological partnerships in developing inclusive product offering and branded touch points (both digital and "traditional" owned media). Furthermore, findings provide an original insight about the role of pricing policies that was not addressed in previous studies. Regarding the "representing diversity" challenge, the study overcomes the focalization of previous research on the advertising (e. g., Foster et al., 2022; Chauhan et al., 2024), highlighting the need for providing the representation of different social identity dimensions in all brand touch points. The study also encourages further inquiry into the role of marketing mix coherence and message consistency in shaping perceived authenticity and long-term brand equity.

On the managerial side, this study offers actionable insights for practitioners aiming to design and implement inclusive branding strategies. First, implementing an inclusive branding strategy requires more than isolated campaigns or symbolic gestures. It calls for a deep, strategic commitment that permeates the brand's culture, values, and operations. Moreover, credibility in inclusive branding depends on consistency over time. The findings suggest that when brands maintain a coherent DEI commitment across all touchpoints - and avoid opportunistic or seasonal engagement – they can build an authentic brand promise. Authenticity is not achieved through messaging alone but through alignment between brand promises and all the inclusive marketing initiatives carried out by brands.

Another key implication concerns the role of employees, who can act as influential ambassadors of DEI values when they feel genuinely involved in the brand's purpose. This internal alignment not only strengthens the organizational culture but also enhances the brand's external credibility.

Ultimately, DEI is not just a moral imperative but a strategic opportunity: it enables brands to innovate, reach underserved audiences, and build deeper, values-based relationships with both consumers and societal community.

This study presents some limitations that open avenues for further research. First, concerning the systematic document analysis, it considered only the initiatives in the Diversity Brand Index. Although these are the most relevant in the Italian context, the decision to use this database may have excluded some elements of variety and, consequently, limited the generalizability of the reading. Second, the empirical investigation relies on a limited number of in-depth interviews conducted within a specific national and cultural context. Although the selected informants possess high levels of expertise, the managerial perspectives gathered may reflect context-dependent dynamics shaped by institutional, market, or socio-cultural characteristics.

Future studies could expand the qualitative field by interviewing other professionals from companies engaged in different stages of implementing inclusive branding strategies (e.g., early adopters, followers, and those who are relatively reluctant) to increase the variety of viewpoints further. Furthermore, it would be interesting to conduct a cross-case analysis that provides a deeper understanding of the various approaches to inclusion employed by companies. Finally, by adopting a consumer perspective, further exploration is needed on the role of emerging technologies and data ethics in representing diversity.

# Designing for Clarity: Investigating the Effects of Packaging Complexity on Consumer Perception

Martina Columbano[1],*, Cristina Zerbini[1], Donata Tania Vergura[1], and Silvia Bellini[1]

## Abstract

Packaging design plays a crucial role in shaping consumer behavior. Excessive design complexity can disrupt visual attention and information processing, impairing information processing and influencing product perceptions. This research examines how packaging design complexity affects consumer perceptions of sustainability, healthiness, tastiness, and naturalness, as well as purchase intentions, through the lens of visual attention. Building on existing conceptualization of design complexity, we focus on the quantity of informative and non-informative elements present on the packaging. We investigated the effects of these design elements on consumer perception and decision-making using eye-tracking and behavioral measures. The research contributes to the literature on visual complexity in packaging by elucidating the role of visual attention patterns in shaping consumer attitudes and purchase intention towards packaged food products. Findings offer insights into optimizing packaging design for both clarity and appeal, balancing aesthetics with functional effectiveness to enhance consumer experience and promote sustainable consumption.

*Keywords: Design complexity, eye-tracking, packaging, sustainability, purchase intention*

### 1. Introduction

Packaging design serves as a powerful tool for influencing consumer decision-making (Rettie & Brewer, 2000; Silayoi & Speece, 2007). While visually appealing packaging can enhance product attractiveness, excessive design complexity may result in cognitive overload, thereby negatively impacting consumer perceptions and purchase intentions (Guo et al, 2025; Thomas & Capelli, 2015). High visual crowding can lead to attentional dispersion, where competing elements draw gaze away from key product cues. This study examines how packaging design complexity affects its perceived sustainability, as well as consumer perceptions of product healthiness, tastiness, naturalness, and purchase intention. Furthermore, it investigates whether visual attention patterns can explain these differences in packaging perception.

### 2. Literature review

Consumers' initial impressions of food packaging are shaped not only by core brand and product elements but also by the visual complexity of the elements displayed on the product packaging. Pieters et al. (2010) operationalize visual complexity by distinguishing between feature complexity and design complexity. Feature complexity pertains to variations in basic visual features such as color and luminance, whereas design complexity refers to the overall elaborateness of shapes, objects, and patterns. Our study focuses on design complexity, which can be assessed according to six key principles (Pieters et al. 2010): quantity of objects, irregularity of objects, dissimilarity of objects, detail of objects, asymmetry of objects, irregularity of object arrangement.

A complementary theoretical lens is provided by processing fluency theory, which holds that the ease or difficulty with which a stimulus is processed influences affective reactions and judgments (Reber et al., 2004). Simpler designs, due to higher perceptual fluency, tend to generate more positive emotional reactions, while highly complex or irregular layouts demand greater cognitive effort, reducing immediate fluency. Recent studies further link minimalist aesthetics with cues of purity and eco-friendliness. Ton et al. (2023) demonstrated that minimalist packaging not only increased consumers' willingness to pay but also enhanced perceptions of product purity and naturalness. Similarly, Wang et al. (2024) found that lower visual complexity improved perceived environmental friendliness by amplifying notions of naturalness and product authenticity.

However, emerging research nuances this traditional fluency account by introducing perceptual fluency. Xu (2024) demonstrates that the relationship between packaging design complexity and consumer response depends on the consumer's construal level, the way individuals mentally represent and interpret information. Consumers operating at a low-level construal focus on concrete details and, for them, visually crowded and information-rich packaging can increase purchase intention because greater design complexity aligns with their processing style. By contrast, consumers which a highlevel construal think more abstractly and, therefore, respond more favorably to packaging with a simple design, in line with the classic predictions of processing fluency theory. These findings suggest that perceptual fluency is conditional and arises when the packaging design style matches the consumer's construal level, rather than when simplicity is objectively high.

Despite these insights, prior studies have not systematically disentangled the effects of decorative (geometric) versus meaningful (product-related) complexity across different levels of complexity. To address this gap, the present study integrates visual attention theory, with processing and perceptual fluency perspectives to examine how varying levels of both geometric and product-related complexity influence gaze behavior and downstream consumer evaluations. Specifically, we investigate how design complexity shapes visual attention patterns and how these patterns translate into perceptions of sustainability, healthiness, tastiness, naturalness and purchase intentions. Building on this framework, our research applies these principles to food packaging, examining their impact on consumer perceptions and purchase intention, and addresses three central research questions:

**RQ1:** How does design complexity level (low/high) influence visual attention patterns on food packaging?

**RQ2:** Does design complexity influence perceived sustainability, healthiness, tastiness, naturalness, and purchase intention?

**RQ3:** Do different types of complexity (non-informative vs informative) interact with complexity level to influence attention and perception?

By integrating visual attention theory with processing and perceptual fluency and packaging design insights, these questions will elucidate how varying degrees and types of visual complexity shape both the early-stage perceptual engagement and the downstream evaluative judgments that drive consumer choice.

## 3. Methodology

This research comprises two between-subjects eye-tracking lab experiments in which participants are randomly assigned to view one of two complexity conditions (C1-low vs. C2-high) for a fixed duration of 10 seconds. Within their assigned condition, each participant views two distinct mock pasta packages. Immediately after stimulus exposure, participants complete a brief questionnaire assessing packaging perceived sustainability and product healthiness, tastiness, naturalness and purchase intention.

In Study 1, complexity is introduced via abstract, purely decorative geometric shapes. The low-complexity condition features a minimal layout containing only essential branding and product information while the high-complexity condition displays numerous shapes dispersed irregularly across the package surface.

Study 2 will adopt an identical structure but replace the abstract shapes with meaningful product-related ingredient imagery. More specifically, the low-complexity condition presents the same elements of Study 1 while the high-complexity one showcases multiple, densely arranged ingredient illustrations. In *Figure 1* the stimuli for both studies have been reported.

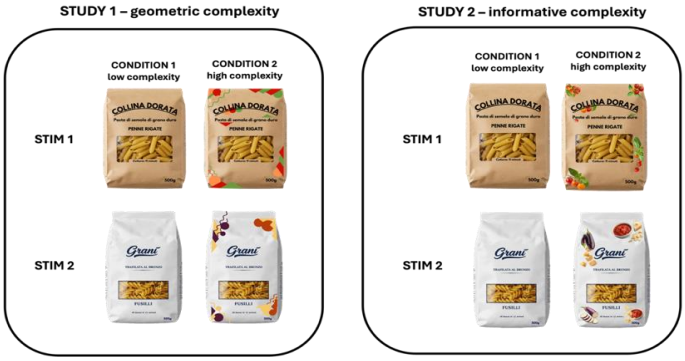

**Figure 1:** Stimuli

Visual attention is recorded using a Tobii Pro Fusion screen-based eye-tracker (sampling rate 120 Hz) during the ten-second exposure. Key metrics include:

**Visit Count:** Number of visits on predefined areas of interest (AOIs).

**Time to First Fixation:** The time it takes for the participant's gaze to fixate on a specific AOI.

**Dwell Time:** Total time spent within each AOI (ms).

AOIs encompass the brand logo, product description, product image, cooking instructions, and complexity-related elements. By correlating gaze patterns with survey responses, we aim to determine how each level and type of complexity guides attention and shapes consumer perceptions.

Furthermore, in the questionnaire portion of the experiment, the following behavioral measures were recorded: Perceived Environmental Friendliness (Sokolova et al., 2024), Perceived Healthiness (Hagen, 2021), Perceived Tastiness (Raghunathan et al., 2006), Perceived Naturalness (Hagen, 2021) and Purchase Intention (Putrevu, 2008)

## 4. Results

The final sample consisted of 65 participants (Mage = 22.53; SD=2.33; 55% female), who were evenly distributed across the low and high complexity conditions (n = 32 and n = 33 respectively).

### 4.1 Behavioral Results

Pairwise Mann–Whitney U-tests were conducted to investigate which of the variables investigated was significantly affected by design complexity. The findings, reported in *Table 1*, reveal that the more complex packaging outperformed the simpler one in both purchase intention and perceived sustainability. By contrast, no significant differences emerged across conditions with regards to tastiness, healthiness and naturalness, suggesting that design complexity did not exert a measurable influence on these product attributes.

| Mann–Whitney U test | STIMULUS 1 | | | STIMULUS2 | | |
|---|---|---|---|---|---|---|
| Metric | Mean_C1 (low complexity) | Mean_C2 (low complexity) | Wilcox_p | Mean_C1 (low complexity) | Mean_C2 (low complexity) | Wilcox_p |
| Purchase Intention | 3.30 | 4.04 | 0.04 | 3.31 | 3.87 | 0.05 |
| Perceived Sustainablity | 4.51 | 5.06 | 0.05 | 2.71 | 2.87 | 0.5 |
| Perceived Tastiness | 5.17 | 5.27 | 0.93 | 5.40 | 5.07 | 0.25 |
| Perceived Healthiness | 4.57 | 4.53 | 0.84 | 4.13 | 4.24 | 0.39 |
| Perceived Naturalness | 3.92 | 3.90 | 0.94 | 3.60 | 3.47 | 0.60 |

**Table 1:** Behavioral Results

### 4.2 Eye-tracking Results

The eye-tracking data was analyzed both qualitatively, through the generation of heatmaps, and quantitatively using pairwise Mann–Whitney U-tests. The heatmaps, shown in *Figure 2*, illustrate the degree of visual attention with color intensity, where red denotes the areas with the highest fixation density and green indicates minimal attention. In the low-complexity condition participants' fixations were highly concentrated on key informational elements such as brand, claims and product window, Whereas the high-complexity condition exhibited a more dispersed fixation pattern, consistent with the presence of the additional complexity elements.

**Figure 2:** Eye-tracking Heatmaps

Eight areas of interest (AOIs) were defined on the packaging stimuli with two categories aggregated for analytical purposes (sidetext and complexity). For the present analysis we will focus on four key AOIs:

Complexity: containing the complexity elements

Description: containing the product description (e.g. "Trafilata al Bronzo")

Sidetext: text placed on the side of the packaging

Window: opening where the product is visible

The results, reported in *Table 2* and *Table 3*, for stimulus1 and stimulus 2 respectively. Overall, the *Complexity* AOI consistently drew greater dwell time and revisits, demonstrating that the decorative elements were visually salient without distracting from core product cues such as brand, pasta type, or cooking time. The *Description*AOI showed higher revisit counts and shorter time to first fixation in the high-complexity condition, indicating enhanced salience in richer visual contexts. In contrast, *Sidetext* attracted more attention in the low-complexity condition, suggesting that simpler designs encourage exploration of peripheral information. Finally, the *Window* AOI was more attended to under low complexity, implying a stronger focus on product-related visuals when fewer competing elements are present.

**Table 3:** Eye-tracking Results for Stimulus 2

## 5. Conclusions

This research aimed to clarify how low versus high levels of packaging design complexity shape early visual attention and downstream judgments of sustainability, healthiness, tastiness, naturalness, and purchase intention. Results show that added complexity increased purchase intention and, for one stimulus, enhanced perceived sustainability, while tastiness, healthiness, and naturalness remained unaffected. Eyetracking indicates that complexity broadens the spread of visual attention without reducing focus on core brand or product cues and even improves detection of key descriptive information. These findings refine processing fluency theory by showing that visual richness can

create its own form of fluency when it matches consumers' detail-oriented processing, consistent with construal-level and visual crowding perspectives. From a managerial standpoint, carefully organized geometric complexity can spotlight priority information and strengthen quality or sustainability cues, whereas overly minimalist designs risk drawing attention to peripheral, nonessential elements. Building on these insights, in Study 2 informative complexity will be tested, directly addressing RQ3 by incorporating elements that are both visually rich and product relevant. The goal of this next phase is to clarify how meaningful complexity may amplify of constrain the effects observed in the present study.

## Abstract

Women's entrepreneurship, recognized as a source of economic growth and social innovation, remains underrepresented in traditional male-dominated industries, where several structural, cultural and institutional barriers persist. This study investigates strategic pathways and orientations that shape women participation in the low-tech industry, thus addressing the following research questions: *what are the distinctive entrepreneurial pathways through which women enter and dominate the low-tech industry? How do contextual factors influence these trajectories?*
This study employs a comparative multiple analysis approach focused on seven women-led wine startups. The findings show three different entrepreneurial pathways- the heritage-driven entrepreneur, the opportunity-based digital entrepreneur and the artisanal innovator- thus reflecting the heterogeneity of women leadership, with its own socio-demographic profiles, management characteristics and innovation trajectories. Theoretical and managerial implications are discussed.

*Keywords: Women entrepreneurship; Wine industry, Startups, Entrepreneurial pathways.*

## 1. Introduction

Women-led entrepreneurship is increasingly acknowledged as a driver of social innovation, fostering sustainable managerial business models (Audretsch *et al.*, 2022; Gul & Jan, 2025). Yet, limited attention has been dedicated to understanding the intersection between gender and entrepreneurship (Foss *et al.*, 2019), producing a severe delay in transferring scientific evidence into practical support (Martínez-Rodríguez *et al.,* 2022). This is more even true in some masculine-dominated industries, where the marginal position of women entrepreneurs (Livat & Jaffré, 2022) often clashes with the increasing success of the business they lead (Chadwick & Dawson, 2018). Against this backdrop, it is increasingly urgent to acknowledge that women may engage in distinct entrepreneurial process, meaning that there could be alternative gender-informed interpretation of how entrepreneurial ventures are initiated and managed (Harrison *et al.*, 2015). Recognizing such specificities could effectively contribute to advancing the understanding of entrepreneurship, better documenting the barriers women face and how to circumvent them (Serrano-Pascual & Carretero-Garcìa, 2022). One such industry where these gendered dynamics remain pronounced is the wine industry, that has been cultural masculine for many years and whose firms are currently experiencing a wave of female entrepreneurship (Livar & Jaffré, 2022). Such dynamics open up research trying to assess how the industry is impacted by this increasing feminization, with a specific focus on how women conceptualize, structure, take control and guide

their businesses (Paoloni *et al.*,2020). The Italian wine industry represents a fertile context for exploring gendered entrepreneurial dynamics. As the world's leading wine producer[27], Italy blends tradition with innovation across production, distribution, and marketing (Vrontis *et al.,* 2016; Duarte Alonso *et al.,* 2021). Yet, limited knowledge exists on the strategic orientations, entry logics, and contextual influences shaping women's entrepreneurial trajectories in this sector. To fill this gap, this study addresses the following research questions: *what are the distinctive entrepreneurial pathways through which women enter and dominate the low-tech industry? How do contextual factors influence these trajectories*?

In doing so, drawing from a comparative multiple-case analysis of seven Italian women-led wine startups, this paper uncovers the heterogeneity of women entrepreneurship pathways, shedding lights on contextual dimensions and gender norms embedded in local ecosystems. As such, this study advances a more nuanced understanding of entrepreneurial narratives in a tradition-bound sector.

## 2. Framing Women's entrepreneurship: beyond the gender gap

In the last decades, female entrepreneurship literature has moved beyond studies focusing on the "underperformance" of women compared to male entrepreneurs, toward a more nuanced understanding on how gender shapes entrepreneurial logics (Jennings & Brush, 2013; Foss *et al.,* 2019). Women are increasingly recognized for their transformative role in reshaping business narratives and archetypes (Bryne *et al.*, 2019). While existing literature has examined factors hindering women's entrepreneurial orientation (Santos *et al.*, 2018), recent research has emphasized the diversity of factors women mobilize when creating new ventures, and their ability to act upon heterogeneous value creation logics, shaped by biographical trajectories and social capital (Hechavarría *et al.*, 2017). This shift has fostered different entrepreneurial typologies according to different goal orientations and cultural, social, and economic motivations (Alam *et al.*, 2021) and they non-linear ways they could combine (Wu *et al.*, 2019). That is, the emergence of woman-led firms could not be understood as the adoption of the masculine norm of entrepreneurship, but as a process of contextual innovation (Lewis, 2006). Women entrepreneurs are driven by the pursuit of autonomy, work-life balance, social goals and personal identity expression (Santos *et al.*, 2018), instead of profit maximization logics. They usually adopt alternative strategic orientations for survival and growth (Audretsch *et al.,* 2022) - especially in the case of poor institutional support (Arun, 2023) - and show a strong preference for digital social innovation (Suseno & Abott, 2021) to transgressively respond to structural constraints and dominant norms they are subjected to (Lewis, 2006). Collectively, these insights call for a typological approach to women's entrepreneurship, redefining it through inclusive and pluralistic theoretical frameworks.

## 3. Research Setting and Design

The wine sector represents a compelling empirical context for studying gendered entrepreneurship dynamics (Duarte Alonso *et al.*, 2021; Livat & Jaffré*,* 2022), as it is currently experiencing a wave of

[27] https://www.efanews.eu/item/49565-italy-first-in-wine-production-second-for-export.html

feminization. Italy not only leads global wine production (41.0 mhl in 2024)[28] but it also the birthplace of a cohort of women-led early-stage firms that are redefining the supply chain through digital retail, direct-to-consumer logistic and experiential values. To capture such gendered entrepreneurship in resource-constrained and path-dependent settings (Jennings & Brush, 2013), this study employs a comparative multiple-case analysis of seven women-led wine startups, launched between 2016 and 2023. From 1147 Italian food and beverage startups listed on Crunchbase, 65 mentioned "wine", and only those with at least one-woman founder or CEO were retained: *Piccini 1882*, *Casa Botter*, *Vino.com*, *Digital Wines*, *Enologica Vason*, *Viniamo Eno Lab* and *Emporio Liquoreria Mainardi*. Secondary data for each firm was triangulated and manually coded along five dimensions: founder profile, entry logic, strategic orientation, resource mobilization and ecosystem ties.

## 4. Findings

Table 1 summarized the features of three different entrepreneurial pathways in wine women startups. Four startups (*Piccini 1882*, *Casa Botter*, *Enologica Vason* and *Emporio Liquoreria Mainardi*) are well-established firms with a long family tradition over decades. In all cases, women leading these firms have inherited a mature asset base (vineyards, cellars, a well-recognized brand) and focused on renewal processes to update firms' value proposition. *Piccini*'s Orange Label Chianti is an example of chromatic revitalization. *Casa Botter* followed a similar logic, with the glitter-packaged Brilla! Prosecco line, who expanded their exports to the USA. Differently, *Enologica Vason* chose a technological upgrading, by introducing mobile filtration and biotech ingredients, in such ways to reposition the family-service business to "precision winemaking" partner. In a similar way, *Emporio Liquoreria Mainardi* revived vermouth recipes for niche export markets, combining micro-scale production with experiential retail in their physical stores. All these firms are example of the "heritage-driven pathways": all firms in which the female successors inherit mature tangible and intangible assets, that finance innovation internally and privilege incremental innovations to strengthen the authenticity narrative while safeguarding inter-generational control. At the opposite extreme, *Vino.com* and *Digital Wines* represent the "opportunity-based digital pathways". In these cases, women founders entered downstream, bypassing vineyard ownership and building technology-centered business models. While *Vino.com* operates as a virtual sommelier with more than 8000 labels online, *Digital Wines* combines a B2C shop with a B2B data service. Both women founders transform their ICT and finance skills into strategic assets to overcome structural barriers in accessing credit and financing innovations. Interestingly, both firms leverage fixed investments, cross-border partnerships and proprietary recommendation engines to compensate for the absence of a family base. Finally, *Viniamo Eno Lab* emerged as an exceptional entrepreneurial artisanal innovator path. A firm born from the creative initiative of a single entrepreneur with marketing expertise, that combines a "wine-library" retail space with strong social-networking ties, thus leveraging the experiential value of wine tasting while deepening its embeddedness in the local community.

| Startups | Founder | Entry logic | Strategic orientation | Resource mobilization | Ecosystem ties | Paths |
|---|---|---|---|---|---|---|

**Table 1:** Women entrepreneurship pathways

## 5. Discussions and Conclusions

This study explores women's entrepreneurship in the Italian wine industry by identifying three distinct pathways—heritage-driven, opportunity-based digital, and artisanal innovator—each reflecting a unique configuration of founder profile, entry logic, strategy, resources, and ecosystem ties. While the

heritage-driven pathway confirms that longstanding tradition, terroir narrative and archival recipes can underwrite renewal processes reinforcing the strategic value of legacy resources, thus contributing to a more nuanced understanding of the resource-based view of family firms (Vrontis *et al.*, 2016). Consistently with the global trend, the opportunity-based digital pathway demonstrates the role of ICT and technical expertise that allow women entrepreneurs to offset gendered institutional barriers, by substituting code and analytics for vineyard and cellars (Gul & Jan, 2025). Finally, the single artisanal-innovator startup shows that leveraging community embeddedness can be a successful strategy ensuring economic viability through experiential approaches to wine entrepreneurship. Overall, our findings advance typological understanding in women entrepreneurship research, by categorizing alternative trajectories women can follow to revitalize firms' business models. More specifically, our study advances the literature about women entrepreneurship, showing that women do not merely replicate a masculine archetype, but instead mobilize heterogeneous strategic and organizational resources to suit their specific constraints and aspiration, often in a creative way. From a practical point of view, pathway heterogeneity has several implications for incubators and investors, suggesting the necessity of considering differentiated evaluation criteria in entrepreneurial projects. Finally, policymakers should tailor entrepreneurial support, to successfully drive family transitions, while contemporaneously incentivizing industry consortia to reinforce digital infrastructure.

## Abstract

In un contesto di crescente attenzione verso la sostenibilità ambientale, le imprese utilizzano con frequenza crescente dichiarazioni ambientali – o "green claims" – nella comunicazione della sostenibilità. Tuttavia, tali affermazioni risultano spesso vaghe, ingannevoli o non verificabili, favorendo pratiche di greenwashing. Il contributo applica la recente Direttiva 2024/825 Empowering Consumers for the Green Transition all'analisi del contenuto della comunicazione green di sette imprese italiane operanti nel settore alimentare. La Direttiva rappresenta il primo tentativo di disciplinare in modo diretto, specifico e vincolante la comunicazione ambientale, prevedendo obblighi e divieti puntuali. L'analisi dei casi ha permesso di osservare nel concreto quali claim risultano più ricorrenti nella comunicazione aziendale e consente di valutare il grado di conformità delle attuali strategie comunicative alle nuove disposizioni normative. I risultati evidenziano l'inadeguatezza dei messaggi promozionali rispetto agli standard richiesti, sottolineando la necessità per le imprese di rivedere il proprio approccio comunicativo. Lo studio propone infine indicazioni strategiche per una comunicazione green conforme, trasparente e responsabile e delinea dei possibili percorsi di disciplina di una comunicazione green indisciplinata.

*Keywords: environmental labelling; consumer trust; information transparency; sustainable consumer*

## 1. Introduzione

In un contesto globale segnato da una crescente crisi ambientale, la sostenibilità è emersa come una delle dimensioni centrali nelle scelte di consumo e nelle strategie aziendali (Capgemini, 2020). Negli ultimi decenni, numerosi studi hanno evidenziato una trasformazione profonda nelle preferenze dei consumatori, sempre più consapevoli e disposti a orientare i propri acquisti verso prodotti e servizi caratterizzati da un minore impatto ambientale (Iraldo & Melis, 2012; Camilleri, 2017; Testa et al., 2021). Secondo un recente sondaggio dell'Eurobarometro (2024), oltre due terzi dei cittadini europei dichiara di essere disposto a sostenere un costo maggiore per beni e servizi sostenibili, riconoscendo che le scelte individuali possono contribuire alla mitigazione del cambiamento climatico. Questa

crescente attenzione dei consumatori ha reso la comunicazione ambientale da parte delle imprese una leva competitiva cruciale, ma anche un terreno ad alto rischio. Da un lato, i green claims – ovvero le dichiarazioni di carattere ambientale che accompagnano prodotti e strategie aziendali – rappresentano uno strumento essenziale per informare e orientare i consumatori (Leonidou et al., 2014). Dall'altro, la diffusione di pratiche ambigue o non verificabili ha sollevato preoccupazioni crescenti di greenwashing, minando la fiducia dei consumatori e la legittimità delle imprese (Peattie & Crane, 2005; Delmas & Burbano, 2011).Per rispondere a queste criticità, l'Unione Europea ha adottato la Direttiva (UE) 2024/825 "*Empowering Consumers for the Green Transition*", che entrerà in vigore nel 2026. Si tratta del primo intervento normativo strutturato e vincolante volto a disciplinare l'uso dei green claims, introducendo divieti espliciti, criteri di verificabilità e requisiti di chiarezza. La nuova cornice regolatoria segna un cambio di paradigma, imponendo alle imprese di passare da dichiarazioni generiche e persuasive a comunicazioni trasparenti, documentate e proporzionate all'impatto reale dei propri prodotti. In questo quadro, il presente contributo analizza il caso di sette imprese italiane del settore alimentare, con l'obiettivo di: (i) identificare le tipologie di green claim oggi più diffuse; (ii) valutarne la conformità rispetto ai requisiti della Direttiva (UE) 2024/825; e (iii) delineare le implicazioni strategiche per le imprese chiamate ad adeguarsi alle nuove regole. L'analisi intende offrire un duplice contributo: teorico, arricchendo il dibattito sul marketing sostenibile e sulla regolamentazione della comunicazione ambientale; e pratico, fornendo indicazioni utili alle imprese che si preparano ad affrontare le sfide di trasparenza e accountability poste dalla nuova disciplina.

## 2. Green Claims e Greenwashing: evidenze dalla letteratura

Negli ultimi decenni, le imprese hanno progressivamente integrato i *green claims* nelle proprie strategie comunicative. Secondo la definizione della Commissione Europea (2016), un green claim è una dichiarazione commerciale che suggerisce, direttamente o indirettamente, che un prodotto, un servizio o un'impresa abbia un impatto ambientale ridotto o addirittura positivo, rispetto al passato o ai concorrenti. Tali affermazioni possono assumere diverse forme: testi descrittivi, nomi di prodotto o azienda, simboli, loghi, colori o immagini. Esse trovano diffusione su molteplici canali, dalla pubblicità tradizionale ai media digitali, fino all'etichettatura e al packaging dei prodotti (Leonidou et al., 2014). Diversi studi hanno evidenziato come i green claims rappresentino uno strumento centrale attraverso cui le imprese comunicano il proprio impegno ambientale (Ottman, 1993; Easterling et al., 1996; Hartmann & Apaolaza-Ibáñez, 2009; Reale, 2024), informano i consumatori sulle performance ecologiche dell'offerta (Peattie & Belz, 2010) e stimolano comportamenti d'acquisto più sostenibili (Carlson et al., 1996; Testa et al., 2011). Una parte consistente della letteratura si è concentrata sull'analisi della diffusione, dei contenuti e delle strategie narrative delle dichiarazioni ambientali, con l'obiettivo di identificare le caratteristiche principali e le modalità comunicative ricorrenti (Testa et al., 2011). Per favorire una sistematizzazione teorica, diversi autori hanno proposto classificazioni dei green claims in base alla loro forma, funzione e grado di specificità ambientale (Iyer & Banerjee, 1993; Chen & Chang, 2013; Stoica, 2021; Nes et al., 2024). All'interno di questo ambito si inserisce il fenomeno del *greenwashing*, ovvero la pratica di comunicare in modo fuorviante l'impegno ambientale dell'impresa. Secondo Delmas e Burbano (2011), si tratta di un disallineamento tra le dichiarazioni pubbliche e le effettive caratteristiche ambientali di prodotti, servizi o processi aziendali. Più

recentemente, Montgomery et al. (2024) hanno sottolineato la dimensione percettiva del fenomeno, descrivendolo come un meccanismo ingannevole in grado di indurre nei consumatori valutazioni eccessivamente positive sull'impatto ambientale dell'organizzazione. Il greenwashing può manifestarsi a livello aziendale, quando coinvolge l'intera identità comunicativa dell'impresa, o a livello di prodotto, quando riguarda specifici messaggi legati all'offerta. Da un punto di vista semiotico, si distinguono pratiche basate su elementi testuali (*claim-based greenwashing*) da quelle fondate su segnali visivi (*executional greenwashing*). La letteratura ha spesso evidenziato il ruolo delle affermazioni ambigue, non verificabili o esagerate, in particolare nei messaggi promozionali, come principale veicolo di comunicazione ingannevole (Delmas & Burbano, 2011; Matthes, 2014). Le diverse strategie di greenwashing – che includono omissioni informative, affermazioni generiche, simboli ambigui o riferimenti a benefici ambientali non dimostrati – concorrono a costruire una rappresentazione distorta della sostenibilità aziendale (Tabella 1). A fronte della diffusione crescente di queste pratiche, la letteratura internazionale ha posto in evidenza la necessità di definire criteri armonizzati e standard condivisi per garantire l'uso corretto delle affermazioni ambientali nei diversi settori e mercati.

| Forma di Greenwashing | Descrizione | Autori | Definizione |
|---|---|---|---|
| Falsità | Dichiarazioni ambientali completamente false o inesatte | Kangun et al. (1991); de Jong et al. (2020); Ziolo et al. (2024) | Ziolo et al. (2024, p. 5346) "(…) ingannare consapevolmente il destinatario con un messaggio che crea l'immagine di un'azienda/prodotto come amico dell'ambiente" |
| Ambiguità e vaghezza | Affermazioni generiche ed esagerate; claim poco accurati e specifici | Carlson et al (1993); Banarjee et al. (1995); Baum et al. (2012); Leonidou et al. (2014); Steenis et al. (2024); Polonsky et al. (2024); Marrucci et al. (2025) | Carlson et al. (1993, p. 31): "il claim è eccessivamente vago o ambiguo; contiene una frase o un'affermazione che è troppo ampia per avere un significato chiaro". |
| Divulgazione selettiva | Claims che mettono in evidenza solo alcuni aspetti positivi, più o meno marginali, o che trascurano quelli negativi | Lyon e Maxwell (2011); Marquis e Toffel (2016); Balzan (2023) | Lyon e Maxwell (2011, p. 9): "(…) informazioni positive sulle prestazioni ambientali o sociali di un'azienda senza la piena divulgazione di informazioni negative su queste dimensioni, in modo da creare un'immagine aziendale eccessivamente positiva" |
| Mancanza di prove attendibili | Affermazioni prive di prove accessibili o scientificamente fondate; Comunicazione fuorviante legata ad obiettivi e piani futuri | Delmas e Burbano (2011); Testa et al. (2015); Torelli et al. (2020) Spaniol et al. (2024) | Spaniol et al. 2024, "l'affermazione non è comprovata se chi la formula non è in grado di fornire la documentazione della validità della rivendicazione". |
| Greenwashing esecutivo | Uso ingannevole di colori, immagini, simboli che evocano la sostenibilità | Hartmann et al. (2013); Parguel et al. (2015), Bonincelli et al. ## 3. Regolamentazione europea e contrasto al greenwashing

Per tutelare i consumatori e garantire il corretto funzionamento del mercato interno, l'Unione Europea ha adottato fin dal 2005 la Direttiva 2005/29/CE sulle pratiche commerciali sleali tra imprese e consumatori. In mancanza di regole specifiche sulle dichiarazioni ambientali, molti Stati membri hanno fatto ricorso a strumenti volontari – come linee guida pubbliche e codici di autodisciplina – per interpretare e applicare le norme generali in materia di pubblicità ingannevole ai green claim. Negli ultimi anni, tuttavia, la crescente pressione dell'opinione pubblica e della società civile ha accelerato il dibattito normativo, stimolando un intervento più strutturato da parte delle istituzioni europee. In tale contesto si colloca la recente Direttiva (UE) 2024/825, entrata in vigore nel 2024 con applicazione prevista a partire dal 2026, e la proposta di Direttiva 2023/166, ancora in fase di approvazione, relativa all'attestazione e comunicazione delle asserzioni ambientali (*Green Claims Directive*). La Direttiva 2024/825 rappresenta un punto di svolta nel percorso di regolazione della comunicazione ambientale: per la prima volta l'Unione Europea introduce criteri vincolanti e tipizzazioni esplicite che superano l'incertezza interpretativa del passato. Essa sancisce il passaggio da un approccio generale e indiretto a una regolazione specifica delle pratiche di comunicazione ambientale, offrendo così maggiore certezza giuridica e strumenti concreti per il contrasto al greenwashing (Tabella 2). Tra gli elementi di maggiore rilievo, la direttiva:

- riconosce espressamente le caratteristiche ambientali e sociali come attributi essenziali del prodotto, rispetto ai quali possono configurarsi pratiche ingannevoli;
- regola le asserzioni riferite a prestazioni ambientali future, imponendo che siano fondate su impegni concreti, verificabili e monitorabili;
- impone trasparenza nei confronti comparativi, obbligando l'impresa a fornire informazioni chiare sul metodo e sul perimetro del confronto tra prodotti o operatori, pena l'ingannevolezza per omissione.

La novità più incisiva risiede nell'inserimento di cinque divieti specifici tra le pratiche commerciali considerate sleali in ogni caso, a prescindere dalla valutazione individuale. In particolare, la Direttiva 2024/825:

- vieta l'uso di marchi di sostenibilità non supportati da sistemi di certificazione indipendenti o istituiti da autorità pubbliche.
- proibisce l'impiego di asserzioni ambientali generiche – come "verde", "ecologico" o "amico della natura" – in assenza di una comprovata eccellenza delle performance ambientali del prodotto o servizio.
- interdice l'attribuzione di benefici ambientali all'intero prodotto o azienda quando il vantaggio riguarda solo un elemento parziale, contrastando una delle forme più comuni di greenwashing (Tabella 2), come ad esempio nel caso in cui si affermi che un prodotto è "realizzato con materiale riciclato" quando tale caratteristica riguarda esclusivamente l'imballaggio.
- vieta l'uso di dichiarazioni sulla neutralità climatica ("carbon neutral", "a impatto zero") basate su meccanismi di compensazione delle emissioni che non rientrano nella filiera diretta del prodotto.

- impedisce di presentare come vantaggi ambientali caratteristiche che rappresentano il semplice rispetto di obblighi normativi comuni a tutti i prodotti della stessa categoria, affrontando una forma di comunicazione fuorviante particolarmente insidiosa.

| **Forma di Greenwashing** | **Principi non rispettati** | **Direttiva 2005/29 come modificata dalla 2024/825** |
|---|---|---|
| Falsità | Veridicità | Ingannevolezza rispetto a caratteristiche ambientali e sociali di un prodotto/servizio (art.6, par.1) |
| Ambiguità e vaghezza | Chiarezza dell'oggetto | Ingannevolezza rispetto a caratteristiche ambientali e sociali di un prodotto/servizio (art.6, par.1) Violazione divieto genericità (All. 1, p.to 4 bis) |
| | Accuratezza e Specificità | Violazione divieto amplificazione (All. 1, p.to 4 ter)<br>Violazione divieto claim su carbon neutrality basato su compensazione (All. I, p.to 4 quater) |
| Divulgazione selettiva | Rilevanza | Ingannevolezza rispetto a caratteristiche ambientali e sociali di un prodotto/servizio (art.6, par.1) |
| | Coerenza con il prodotto<br>Comparazione non ingannevole | art. 6, par. 2, lett. d art.7, par.7 |
| Mancanza di prova attendibili | Esistenza della prova e metodologia scientifica | art. 12 |
| | Aggiornamento e claim futuri | art. 6, par. 2, lett. e |
| Greenwashing esecutivo | Veridicità | Ingannevolezza rispetto a caratteristiche ambientali e sociali di un prodotto/servizio (art.6, par.1) |
| | Accuratezza e specificità | Violazione divieto genericità |
| | Uso corretto marchi | Violazione divieto di amplificazione<br>Violazione divieto marchio di sostenibilità non basato su sistema di certificazione (Allegato 1, 2-bis) |

**Tabella 2**: Corrispondenze tra forme di greenwashing, principi di corretta comunicazione e disposizioni normative. Fonte: elaborazione propria.

Con questa codificazione, la direttiva pone fine alla frammentazione e all'ambiguità che hanno caratterizzato l'enforcement in materia di green claims. Per le imprese, ciò implica un cambiamento significativo: non è più sufficiente un adeguamento superficiale, ma diventa necessario rivedere in profondità le strategie comunicative, integrando trasparenza, verificabilità e coerenza normativa.

## 4. Metodologia

Lo studio adotta un approccio qualitativo di tipo esplorativo, fondato su un disegno a casi multipli (*multiple case study*). Tale scelta metodologica è ritenuta adeguata per indagare fenomeni complessi e contestuali come la comunicazione ambientale delle imprese, che si colloca all'intersezione tra pratiche di marketing, vincoli normativi ed evoluzione delle aspettative sociali (Eisenhardt, 1989; Yin, 2018). Il campione comprende sette imprese italiane appartenenti a diversi segmenti dell'industria alimentare – acque minerali, zucchero, caffè, lattiero-caseario, prodotti da forno, gelato e pasta – con l'obiettivo di garantire una copertura rappresentativa delle principali categorie merceologiche e delle relative pratiche comunicative in materia di sostenibilità. Le aziende analizzate sono San Benedetto, Eridania, Lavazza, La Molisana, Misura, Granarolo e Sammontana. La selezione dei casi è avvenuta a partire dall'osservazione delle imprese associate a Centromarca (Associazione Italiana dell'Industria di Marca), individuata come punto di partenza per mappare le aziende più rappresentative del comparto. Successivamente, l'analisi è stata estesa anche a imprese non associate, così da includere brand rilevanti del settore alimentare italiano che ricorrono con frequenza a dichiarazioni ambientali. La raccolta dei dati è avvenuta da Aprile a Giugno 2025 e si è basata principalmente su quanto visualizzabile direttamente sui packaging dei prodotti, reperibili online attraverso Google Immagini, sui siti ufficiali delle aziende e su piattaforme di acquisto online (come Amazon, Carrefour, Esselunga, Coop, ecc.), con l'obiettivo di analizzare le dichiarazioni di sostenibilità così come vengono realmente presentate al consumatore nei contesti di esposizione e acquisto. Questa scelta è motivata dall'esigenza di valutare la comunicazione visiva e testuale direttamente accessibile al pubblico, ovvero quella che incide in modo più immediato sulla percezione e sulle decisioni d'acquisto. L'analisi dei contenuti è stata condotta con un approccio qualitativo di tipo interpretativo (Krippendorff, 2018; Mayring, 2000). Il processo di codifica è stato iterativo e condiviso tra i ricercatori, così da incrementare l'affidabilità interpretativa.

## 5. Risultati

L'analisi condotta ha consentito di individuare alcune tendenze comuni, nonché di mettere in luce criticità ricorrenti rispetto ai criteri di chiarezza, verificabilità e proporzionalità introdotti dalla Direttiva (UE) 2024/825. Un primo elemento trasversale riguarda la diffusione di claim generici, spesso espressi tramite slogan sintetici e suggestivi, privi di riferimenti specifici all'impatto ambientale effettivo. È il caso, ad esempio, di espressioni come *"Ecogreen"* (San Benedetto), *"A misura d'ambiente"* (Misura), *"For Planet"* (Lavazza) o *"#bontàresponsabile"* (Granarolo), che, pur evocando un orientamento valoriale, risultano privi di elementi oggettivi a supporto e spesso veicolati attraverso elementi visivi amplificativi.

Tali dichiarazioni si pongono in contrasto con il divieto di affermazioni ambientali vaghe o non dimostrabili, previsto dall'Allegato I della Direttiva. In alcuni casi, come San Benedetto o Lavazza, tali claim sono accompagnati da più espressioni accattivanti e colori simbolici (verde, blu, immagini di natura) che accentuano l'effetto persuasivo, ma non sono sostenute da alcuna prova accessibile. Inoltre, nella maggior parte dei casi analizzati, tali affermazioni non sono accompagnate da documentazione o fonti consultabili dal consumatore. L'assenza di link, QR code o riferimenti a report di sostenibilità o standard metodologici limita fortemente la verificabilità dei messaggi, violando uno dei pilastri centrali della nuova normativa. Anche laddove sono riportati valori o etichette ambientali, non è quasi mai presente un'indicazione delle fonti, delle modalità di misurazione o di confronto utilizzato. Questo fenomeno suggerisce un approccio comunicativo ancora prevalentemente autoreferenziale, in cui la prova dell'affermazione ambientale viene data per implicita o scontata, piuttosto che dimostrata. Accanto ai claim identitari, si osservano anche numerose affermazioni riferite a singole caratteristiche del packaging o dei materiali utilizzati, come l'impiego di plastica riciclata, carta compostabile o materiali da fonti rinnovabili. Questi messaggi – riscontrabili in aziende come San Benedetto, La Molisana, Granarolo e Sammontana – risultano talvolta formulati in modo corretto, ma in altri casi enfatizzano aspetti marginali o obbligatori, presentandoli come vantaggi distintivi. Ad esempio, l'indicazione "87% materiali rinnovabili" di Granarolo o "pack completamente compostabile" di La Molisana è priva di dati metodologici o confronti comparativi, limitandone l'efficacia informativa e configurando potenziali casi di amplificazione indebita. Nel caso di Sammontana, ad esempio, l'indicazione "oltre 50% di plastica bio-circolare" è supportata da una certificazione (ISCC), ma non chiarisce né il tipo di plastica né il peso ambientale dell'intervento, rendendo difficile valutare il beneficio reale per il consumatore. Un ulteriore ambito ricorrente riguarda i claim relativi alla neutralità climatica o alla compensazione delle emissioni, come quelli utilizzati da San Benedetto, Lavazza, La Molisana, Misura e Sammontana. In molti di questi casi, la dichiarazione di "$CO_2$ impatto zero" o "carbon neutrality" si basa su meccanismi di compensazione non esplicitamente indicati, né accompagnati da dati quantitativi verificabili. L'assenza di trasparenza metodologica, unita all'uso di simboli evocativi (foglie, sfondi verdi, loghi "green"), compromette la chiarezza e può indurre il consumatore a sovrastimare l'effettivo impatto positivo del prodotto sul clima. Secondo la nuova normativa europea, tale forma comunicativa rientra tra le pratiche vietate in ogni caso (Allegato I, punto 4-quater), in quanto potenzialmente fuorviante. Lavazza, ad esempio, associa il claim "$CO_2$ impatto zero" a una compensazione generica indicata solo online, mentre Sammontana afferma di compensare le emissioni della linea "Barattolino" ma non specifica con quali standard o quantità. In molti casi, inoltre, la neutralità climatica viene associata visivamente a simboli naturali e loghi "green" che rafforzano l'effetto persuasivo del messaggio. Questo tipo di comunicazione combinata (claim + visual semiotico) può generare un effetto cumulativo, amplificando la percezione di sostenibilità anche in assenza di reali evidenze. Si tratta di un esempio di greenwashing visivo, particolarmente frequente nei settori ad alta esposizione reputazionale come quello alimentare (Changing Markets Foundation, 2023). In questo senso, la Direttiva invita non solo a verificare le affermazioni testuali, ma anche a vigilare sull'uso ingannevole di elementi iconografici e simboli grafici che possano indurre in errore. Diversi claim analizzati si riferiscono, invece, a modalità di produzione o approvvigionamento. Alcuni esempi includono l'uso di energia rinnovabile da parte di Eridania e Misura, oppure la tracciabilità delle

filiere dichiarata da Sammontana per le mandorle o da Granarolo per il benessere animale. Anche in questo caso, si riscontra una significativa variabilità nella qualità della comunicazione: se da un lato alcuni messaggi sono supportati da certificazioni di terza parte (es. Rainforest Alliance, ISCC), dall'altro la maggior parte dei claim appare generica o non verificabile, con fonti documentali non accessibili al consumatore. In alcuni casi, come quello di Eridania, il riferimento all'uso di "energia da fonti rinnovabili" è accompagnato da diciture tecniche (es. "certificato GO"), ma senza possibilità di verifica esterna, lasciando il consumatore senza strumenti per accertarne l'autenticità. Infine, si rileva la presenza di claim basati su dati quantitativi, soprattutto in riferimento alla riduzione delle emissioni di $CO_2$. Eridania, Granarolo e Sammontana riportano percentuali o valori assoluti riferiti alla diminuzione dell'impatto ambientale. Tuttavia, anche in presenza di informazioni numeriche, le imprese raramente forniscono dettagli su periodo di riferimento, metodologia di calcolo o confronto utilizzato (es. versione precedente del prodotto, media di mercato). Questo limita la possibilità di valutare l'affidabilità e la coerenza del messaggio comunicato. L'indicazione "–35% $CO_2$" di Eridania è un esempio emblematico: pur trattandosi di un dato misurabile, mancano dettagli fondamentali come l'anno base, il perimetro di analisi e la fonte di certificazione. Nel complesso, i risultati mostrano come, sebbene le imprese analizzate manifestino un chiaro intento di valorizzare le proprie pratiche sostenibili, la comunicazione che ne deriva presenti ancora forti criticità in termini di trasparenza, coerenza e conformità normativa. Tale comunicazione ambientale appare spesso orientata a finalità persuasive più che informative, generando affermazioni che, pur suggestive, risultano ambigue o non supportate da evidenze documentali. La lettura incrociata dei risultati ha inoltre messo in luce una forte eterogeneità tra i settori: le aziende del beverage e del caffè fanno maggiore uso di claim visivi e simbolici, mentre nel lattiero-caseario e nei prodotti da forno prevalgono claim identitari e riferimenti all'etica o alla tradizione, sebbene anch'essi spesso non verificabili. La sintesi comparativa riportata nella Tabella 3 consente di visualizzare tali vulnerabilità comunicative in modo strutturato, evidenziando sia le ricorrenze che le specificità settoriali. In prospettiva, ciò impone una riflessione strategica sulla necessità di riallineare i green claim ai criteri imposti dalla Direttiva (UE) 2024/825, valorizzando la rendicontazione ambientale come leva di trasparenza e accountability.

| **Azienda** | **Settore** | **Green claim** | **Criticità riscontrate** |
|---|---|---|---|
| San Benedetto | Beverage | *"Ecogreen", "$CO_2$ impatto ZERO", "100 ECO", "il nostro impegno concreto", "100% carbon neutral", "100% bottiglia plastica riciclata"*  | Claim generici e di forte impatto visivo; assenza di dati quantitativi, fonti o dettagli metodologici su calcolo delle emissioni e compensazione. Le affermazioni di neutralità climatica non sono accompagnate da prove verificabili. Utilizzo di simboli, colori e parole che rafforzano la percezione di sostenibilità senza garantirne la trasparenza. |

| Azienda | Settore | Green claim | Criticità riscontrate |
|---|---|---|---|
| Eridania | Zucchero | *"Il futuro chiede dolcezza", "100% energia da fonti rinnovabili", "-35% $CO_2$"*  | Claim quantitativi non accompagnati da dati di calcolo, fonti o riferimenti temporali. Mancanza di trasparenza metodologica e potenziale greenwashing visivo tramite simboli evocativi. |
| Lavazza | Caffè | *"For Planet", "Eco Caps", "ZERO $CO_2$ impact caps", "sostenibile con note fruttate"*  | Claim suggestivi (es. "For Planet") senza supporto informativo. Neutralità climatica ($CO_2$ zero) dichiarata ma senza trasparenza metodologica. Uso intensivo di visual greenwashing (colori, natura, foglie). |
| La Molisana | Pasta | *"Impronta ambientale ridotta", "pack compostabile", "Carbon Neutrality"*  | Claim coerenti e supportati da etichette di smaltimento e certificazioni; tuttavia, manca evidenza quantitativa sull'impatto ambientale reale. Uso di claim simbolici ("ritorna alla terra") non sempre verificabili. |
| Misura | Prodotti da forno | *"A misura d'ambiente", "energia da fonti rinnovabili", "zero impatto $CO_2$", "$CO_2$ compensata", "Confezione 100% raccolta carta certificata FSC®"*  | Claim parziali e non sempre verificabili; mancano dati quantitativi, fonti documentali e riferimenti a metodologie. Focus sul packaging, ma assenza di trasparenza sull'impatto complessivo del prodotto. |

| Azienda | Settore | Green claim | Criticità riscontrate |
|---|---|---|---|
| Granarolo | Lattiero-caseario | *"#bontàresponsabile", "100% riciclabile", "–20% $CO_2$", "bio", "benessere animale"*   | Claim variegati, non supportati da fonti verificabili. La riduzione di $CO_2$ non è contestualizzata; l'hashtag e il claim etico risultano simbolici più che informativi. |
| Sammontana | Gelato | *"Dal 2017 Sammontana compensa le emissioni di $CO_2$ generate nel ciclo di vita della linea Barattolino", "oltre 50% di plastica bio-crcolare"*   | Claim visivi e testuali su riduzione e compensazione $CO_2$, uso di materiali sostenibili (plastica bio-circolare, carta), supportati da certificazioni parziali (es. ISCC, FSC). Mancano dati quantitativi accessibili, riferimenti metodologici chiari e prove verificabili. Forte enfasi grafica e simbolica che può amplificare indebitamente la percezione di sostenibilità. |

**Tabella 3:** Sintesi dei green claim analizzati per ciascuna azienda.

## 6. Discussione

I risultati emersi dall'analisi evidenziano come, nella maggior parte dei casi, le imprese analizzate dimostrino un'effettiva attenzione alle tematiche ambientali e un impegno sostanziale nella riduzione del proprio impatto ecologico. Tuttavia, tale impegno non trova un corrispettivo adeguato nella comunicazione adottata: le criticità riscontrate non derivano tanto dalla falsità delle informazioni fornite, quanto piuttosto da una certa superficialità comunicativa che mina la trasparenza e la precisione dei messaggi veicolati. L'utilizzo ricorrente di dichiarazioni vaghe, generalizzazioni, semplificazioni visive ed espressioni enfatiche suggerisce una strategia comunicativa orientata prevalentemente alla persuasione piuttosto che alla rendicontazione. Tali modalità – sebbene efficaci nel catturare l'attenzione del consumatore sensibile ai temi ambientali – risultano oggi inadeguate rispetto agli standard di chiarezza, verificabilità e proporzionalità introdotti dalla Direttiva (UE) 2024/825. In questa prospettiva, la direttiva rappresenta non solo uno strumento sanzionatorio, ma anche una leva di trasformazione strutturale della comunicazione green: il ricorso a slogan evocativi o a formulazioni

generiche non sarà più sufficiente. Le imprese dovranno orientarsi verso un nuovo modello comunicativo, fondato su: l'impiego di affermazioni circostanziate, proporzionate e non ambigue; la documentazione rigorosa e verificabile dei benefici ambientali dichiarati; la contestualizzazione esplicita di dati, confronti e obiettivi futuri; la chiarezza informativa, anche in presenza di simboli, claim visivi o marchi ambientali. Le criticità attualmente più ricorrenti consistono proprio nella violazione dei nuovi divieti assoluti dell'Allegato I, con: claim generici (es. "eco", "sostenibile", "green") non supportati da prove di eccellenza complessiva e privi di specificazioni adeguate (violazione del punto 4-bis e 4-ter); dichiarazioni di neutralità climatica fondate, anche solo in parte, su compensazioni (violazione del punto 4-quater); marchi ambientali autodichiarati (violazione del punto 2-bis); amplificazioni indebite di benefici ambientali, espressi sia in termini testuali che visivi (violazione del punto 4-ter). Il quadro normativo emergente stimola una riflessione più ampia sulla necessità di armonizzare le strategie comunicative con l'effettiva performance ambientale, rafforzando il nesso tra pratiche aziendali e narrazione pubblica. In tal senso, diventa sempre più rilevante il confronto tra ciò che viene comunicato esternamente e le effettive pratiche ambientali interne, per evitare disallineamenti potenzialmente lesivi della fiducia dei consumatori. Dal punto di vista teorico, i risultati contribuiscono ad alimentare il dibattito sulla tensione tra marketing valoriale e regolazione pubblica, ponendo in luce le sfide che le imprese devono affrontare nel coniugare l'esigenza di differenziazione competitiva con i vincoli di trasparenza e responsabilità. Invece, dal punto di vista manageriale, lo studio evidenzia la necessità per le aziende di rafforzare i propri processi di rendicontazione, migliorare la governance della comunicazione ambientale, e promuovere una maggiore integrazione tra funzioni marketing, sostenibilità e compliance normativa. L'adozione di una comunicazione più rigorosa e verificabile può diventare non solo un obbligo normativo, ma anche un'opportunità strategica per costruire relazioni più solide con consumatori consapevoli e stakeholder esigenti. Tuttavia, l'analisi presenta alcuni limiti metodologici che è opportuno evidenziare. In primo luogo, la valutazione dei green claims è stata effettuata sulla base di criteri interpretativi, ancorati a un impianto normativo che – pur formalmente in vigore – non è ancora pienamente operativo nei singoli Stati membri e potrà essere oggetto di successivi chiarimenti applicativi. In secondo luogo, l'analisi si è limitata a fonti documentali pubblicamente accessibili, escludendo ogni possibilità di verifica interna o confronto diretto con le aziende coinvolte: ciò ha confinato l'osservazione all'universo comunicativo esterno, escludendo eventuali elementi di approfondimento o giustificazione. In particolare, lo studio ha focalizzato l'analisi su ciò che è effettivamente visibile al consumatore nel momento dell'acquisto – ovvero quanto esposto su packaging, siti ufficiali e piattaforme di e-commerce – senza poter accedere a documentazione tecnica interna o a ulteriori materiali aziendali. Questo approccio, pur coerente con l'obiettivo di valutare la trasparenza comunicativa verso l'esterno, limita la comprensione dell'intero processo di costruzione e validazione dei claim. Tra le prospettive per future ricerche, appare opportuno estendere l'analisi a un numero più ampio di imprese e settori, e soprattutto integrare l'approccio documentale con strumenti qualitativi come interviste in profondità a responsabili marketing, sustainability manager o altri esponenti aziendali. Ciò consentirebbe non solo di accedere a fonti aggiuntive e approfondire le motivazioni strategiche alla base dei green claim, ma anche di valutare la coerenza tra comunicazione e pratiche aziendali. Ulteriori sviluppi potrebbero inoltre prevedere una sistematizzazione dei formati comunicativi più efficaci e conformi, sulla base di casi virtuosi e benchmarking tra imprese. Alla luce di quanto emerso, è possibile affermare che la Direttiva (UE) 2024/825 può costituire un punto di

svolta normativo e culturale nella disciplina della comunicazione ambientale, contribuendo a definire uno spazio comunicativo più regolato, coerente e orientato alla responsabilità. Le evidenze raccolte suggeriscono, inoltre, che l'attuale comunicazione green, pur animata da intenti positivi, si trovi ancora in una fase "indisciplinata", che richiede un'evoluzione verso forme più trasparenti, verificabili e legalmente sostenibili.

## Abstract

As sustainability becomes a key concern for consumers, online delivery platforms face a dilemma: should they highlight their eco-friendly efforts or remain silent to avoid potential drawbacks? While greenwashing—the overstatement of sustainability claims—has been widely studied, greenhushing, the

intentional undercommunication of sustainability efforts, remains underexplored. This paper examines greenhushing on online delivery platforms from a consumer perspective, investigating why companies choose to withhold green cues and how this decision influences consumer perception and purchasing behavior. Empirical evidence suggests that managers engage in greenhushing due to concerns about consumer price sensitivity and skepticism. Our findings indicate that while consumers often perceive green products as more expensive, green labeling does not significantly impact their choices. Furthermore, greenhushing does not harm companies' moral perception or consumer attitudes, even when the rationale behind it is disclosed. However, revealing green efforts post-purchase enhances expectations, satisfaction, and review intentions. This study offers strategic recommendations for online platforms on effectively managing green disclosures to balance credibility, consumer expectations, and competitive advantage.

*Keywords: greenhushing, delivery platforms, sustainable communication*

## 1. Introduction

Toyota decided to remain quiet about achieving zero waste-to-landfill and zero waste-to-incineration in its manufacturing facilities in Europe for over a decade (Burrows, 2020). Similarly, Walmart has reduced its plastic bag waste by 38% since 2005 and cut CO2 emissions without explicitly publicizing it (Lindsey, 2016). At the same time, South Pole, a world-leading climate project developer and solutions provider, found that more climate-aware companies are setting science-based targets for their net-zero commitments, but 25% do not plan to disclose them. These are just a few examples of "greenhushing"—a deliberate strategy where companies conceal their environmental initiatives (Font et al., 2016; Ginder et al., 2021). Even as sustainability disclosure gains more attention, some businesses take the opposite approach, intentionally withholding information about their sustainability efforts to avoid scrutiny, backlash, or accusations of greenwashing (Acuti, Pizzetti, and Dolnicar 2022; Liadeli, Sotgiu & Verlegh, 2024; Malik, Ahmad & Guzmàn, 2025; Vallaster et al., 2012). This highlights a "Catch-22 communication" (Morsing, Schultz, & Nielsen, 2008), where the fear of criticism leads companies to stay silent about their sustainability actions. This strategic silence raises critical questions for marketing scholars and practitioners: Why do companies engage in greenhushing, and how does it impact consumer decision-making?

Therefore, in the spirit of an empirics-first approach (Golder et al., 2022), we identified the following research opportunity: literature on greenhushing and, in particular, consumers' reactions to greenhushing is still in its infancy, and the motivations related to greenhushing are not clearly defined (Tao, 2024). However, companies face a dilemma related to the choice of communicating their green efforts or not. Through discussions with managers, we discovered that, beyond the risks of reputational damage and greenwashing accusations, companies may also choose to withhold their sustainability efforts to avoid being perceived as overpriced due to their green claims, potentially leading to their exclusion from consumers' consideration sets. For instance, a manager said: "If I add an organic label to the product, consumers do not choose it because it is perceived as a more expensive product" (Interview made in December 2023). Literature has already pointed out that despite growing demand for sustainability, consumers often perceive organic products as costly and may hesitate to purchase them due to their higher price compared to traditional options (Haws, Winterich, and Naylor 2014). Moreover, research suggests that consumers attach lower performance to green products since they think that companies have diverted resources to make the product greener at the cost of its quality (Mai et al. 2019; Newman, Gorlin, and Dhar 2014; Usrey et al. 2020). However, we do not know how

consumers react to undisclosed sustainability efforts and the trade-offs companies face in choosing whether to communicate their green initiatives or not.

By adopting an experimental design approach, we aim to fill this gap by exploring the motivations behind greenhushing and its impact on consumer perception and decision-making. In particular, we investigate how consumers will perceive a company engaging in greenhushing, whether managers' fears about negative associations with green products are true, why consumers think companies engage in greenhushing, and what is a possible solution for this problem. By shedding light on this underexamined phenomenon, we contribute to the broader discussion on corporate sustainability communication and its implications for both businesses and consumers.

## 2. Background Literature: Greenwashing Versus Greenhushing

The growing emphasis on corporate sustainability has led companies to adopt different communication strategies regarding their environmental efforts. Greenwashing, a well-documented phenomenon, occurs when firms overstate or overclaim their environmental commitments to appear more sustainable than they actually are (Delmas & Burbano, 2011; Lyon & Montgomery, 2015). This practice has led to consumer skepticism, regulatory scrutiny, and reputational risks for brands found guilty of misleading claims (Nyilasy, Gangadharbatla, & Paladino, 2014).

In contrast, greenhushing refers to the deliberate decision by companies to under-communicate or entirely withhold information about their sustainability initiatives (Font et al., 2016; Ginder et al., 2021). Unlike greenwashing, which seeks to gain favor through exaggerated sustainability claims, the reason for such behavior could be as simple as cost-saving (Falchi et al., 2022) but could also be to avoid any risk associated with these green initiatives, such as from fears of backlash, accusations of greenwashing, or competitive disadvantage (Acuti, Pizzetti, & Dolnicar, 2022; Vallaster et al., 2012). Often, these companies are known as the "Silent Green firms" (Delmas & Burbano, 2011) or companies with discrete positioning towards corporate social responsibility (Ginder et al., 2021). While greenwashing has been widely studied in marketing literature, greenhushing remains relatively underexplored, particularly in terms of its impact on consumer perceptions and purchase behavior. Tao (2024), by exploring why companies engage in greenhushing, hypothesizes that companies facing reputational crises are more likely to adopt greenhushing, driven by increased conservatism. Ettinger et al. (2021) discovered that, contrary to managers' concerns, consumers in the hospitality sector actually appreciate hotels that communicate their CSR efforts. Such transparency not only enhances consumer attitudes but also helps reduce unsustainable behaviors. Other research refers to this phenomenon as green blushing (Falchi et al., 2022) suggesting interventions to mitigate negative outcomes of green communication and identifying various forms of greenhushing. Moreover, greenhushing, like greenwashing, undermines a company's environmental efforts and can harm its reputation by eroding trust and credibility (Tao 2024). It may also signal that sustainability is unimportant, particularly when adopted by market leaders, potentially influencing smaller companies to do the same.

## 3. Methodology

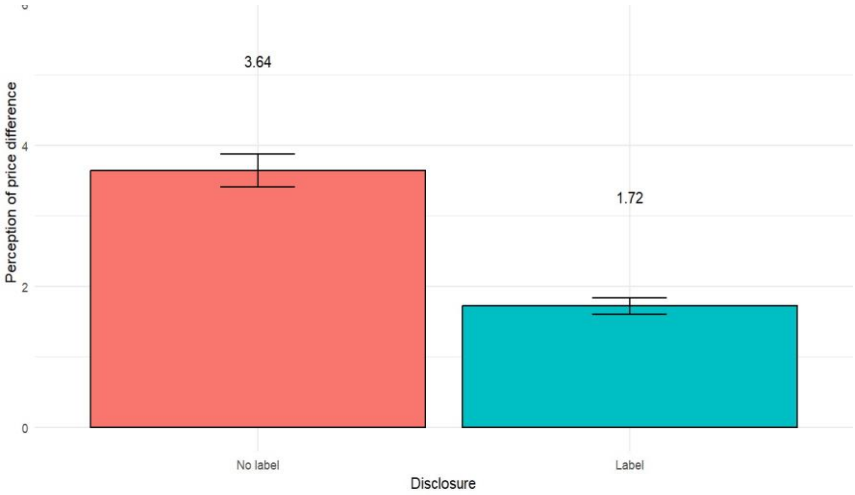
The context of this paper is the online food delivery market. We chose this context because this market is growing rapidly (about $1 trillion in 2023, according to Statista, 2024), and it has a big environmental impact. Second, we know little about consumers' sustainable choices when they order food online. Finally, the choice architecture of online food delivery platforms makes it an interesting context to study and test possible interventions.

The following four studies explore different aspects of greenhushing and its impact on consumer perceptions. Study 1 tests the manager's assumption that green products labeled as such will be perceived as more expensive, potentially deterring consumers. Study 2 investigates consumer reactions to greenhushing versus greenwashing. Study 3 examines consumer responses when they know the reasons behind a company's greenhushing, revealing no significant difference in perceptions of credibility, integrity, or brand attitude between greenhushing and green promotion. Finally, Study 4 tests an intervention where the green nature of a product is disclosed after purchase.

### *Study 1: Testing the assumption*

Following an empirical-first approach, Study 1 tested the original assumption held by business managers regarding the potential downsides of explicitly framing products as "green." The key prediction explored in this study was that when green products are clearly labeled as such, consumers would perceive them as more expensive, which would, in turn, negatively affect their purchasing decisions. To this aim, we recruited 400 American participants from Prolific (47.7% female, 49.7% male, 2.5% nonbinary, 0% preferred not to state, $M_{age}$= 36.6). Participants saw two apples (i.e., Apple 1 and Apple 2) that looked similar (same color, same size, etc.). We asked participants to imagine seeing these two apples while doing their online groceries. We randomly assigned participants to one of the two conditions (disclosure of the green nature of Apple 1: yes vs. no) between-subjects design, which varied whether Apple 1 had a label saying 100% organic. We chose a label that is commonly used on organic fruits in grocery stores. Our first dependent variable was the perception of the price difference between the two apples. We measured this with a single-item 7-point scale: "Which apple do you think is more expensive?" anchored (1 = Apple 1 is much more expensive, 4 = The two apples have about the same price, 7 = Apple 2 is much more expensive). Our second dependent variable was the choice between the two apples. We measured this with a single-item 7-point scale: "If you were to buy an apple, which apple would you prefer to buy?" anchored (1 = For sure, Apple 1, 4 = I have no preference, 7 = For sure, Apple 2). Finally, participants reported their age and gender. Results show that disclosing the green nature of Apple 1 has significantly increased its perceived price ($M$ = 1.72, $SD$ = .84) compared to another apple that appeared to have the same price in the control condition (i.e., no disclosure / no organic label) ($M$ = 3.64, $SD$ = 1.70, $t(398)$ = 14.25, $p$ < .001, $d$ = 1.43). However, the disclosure of the green nature of Apple 1 did not have any significant effect on the choice of participants ($M$ = 3.47, $SD$ = 1.96) compared to the control condition ($M$ = 3.63, $SD$ = 2.22, $t(398)$ = .75, $p$ = .45, $d$ = .08). This indicates that the intuition of managers is correct about how consumers might associate a higher price with a product which is explicitly labeled as organic. These preliminary results also indicate that managers, by engaging in greenhushing, might not be losing any potential demand for their products, as the choice between the two apples was not affected by whether Apple 1 was labeled as organic or not. If any, managers are avoiding losing the demand of price-

sensitive consumers who might associate green labels with more expensive products.



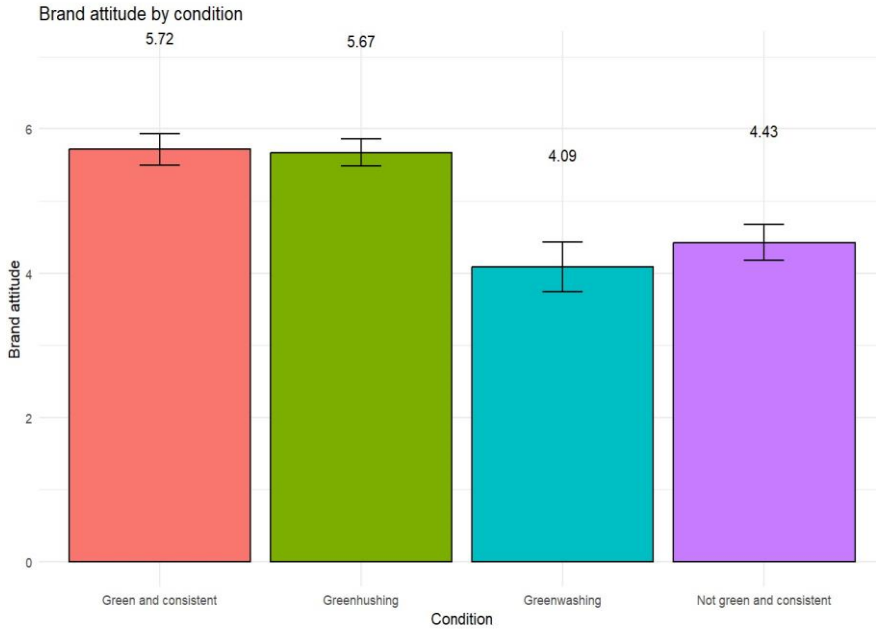
Notes: $N$ = 400. The graph displays the means and the 95% confidence interval as error bars.

**Figure 1:** Products are perceived as more expensive when labeled as organic

### *Study 2: Consumers' Reactions to Different Strategies*

Study 2 investigates how consumers might react when knowing that a company is engaging in greenhushing and how it compares to other strategies like greenwashing. We tested consumers' moral reactions and their attitudes toward the company.

We recruited 400 American participants from Prolific (48.7% female, 50.0% male, 1.0% nonbinary, 0.2% preferred not to state, $M_{age}$= 38.25). Participants were presented with a scenario about a mid-



sized company called *Food to You* working in the food delivery business. Participants were told that the company needed to make some operational decisions (new vehicles, packaging) and that the company had two options: sustainable options (electric vehicles, eco-friendly packaging) vs less sustainable but cost-effective options. We randomly assigned participants to one condition in a 2 (choice: sustainable vs not sustainable) x 2 (self-promotion as environmentally conscious: yes vs. no) between-subjects design, which varied which option the company had chosen and whether it promotes itself as environmentally conscious or not. So, each participant, depending on the condition they were assigned to, learned about the company's decision (sustainable vs cost-effective) and whether the company is promoting itself as environmentally conscious, i.e., walk-the-talk (Schoeneborn, Morsing, and Crane 2020).

As a consequence, we identify four strategies: green and consistent (i.e., when the company chooses sustainable options and promotes itself as environmentally friendly), not green and consistent (i.e., when the company does not choose sustainable options and does not promote itself as environmentally friendly), greenwashing (i.e., when the company does not choose sustainable options and promotes itself as environmentally friendly), and greenhushing (i.e., when the company chooses sustainable options but does not promote itself as environmentally friendly). Our first dependent

variable is the morality of the firm's choices. We measured this with a threeitem 7-point scale: "How fair/acceptable/ethical are the company's choices?" ($a$ = 0.94) anchored (1 = Extremely unfair/unacceptable/unethical, 7 = Extremely fair/acceptable/ethical). Our second dependent variable was brand attitude. We measured this with a four-item 7-point scale: "I think of Food to You as:" ($a$ = 0.95) anchored (1 = negative/bad/uninteresting/unattractive, 7 = positive/good/interesting /attractive). We averaged both our dependent variables. Finally, participants reported their age and gender.

For our first dependent variable (i.e., morality), a two-way ANOVA revealed a significant main effect of choosing green options ($F$(1, 396) = 143.77, $p$ < .001, $\eta_p^2$ = .27) and of self-promotion as environmentally conscious ($F$(1, 396) = 8.07, $p$ = .005, $\eta_p^2$ = .02), as well as the interaction of the two factors ($F$(1, 396) = 16.55, $p$ < .001, $\eta_p^2$ = .04). As shown in Figure 2, when the company chooses the green options there is no difference whether the firm promotes itself as green ($M$ = 5.91, $SD$ = 1.17) or not ($M$ = 5.73, $SD$ = 1.15, $t$(396) = .89, $p$ = .81). Meaning that greenhushing might not be seen as morally bad by consumers. On the other hand, when the company does not choose sustainable options, it makes a difference whether the firm promotes itself as environmentally conscious ($M$ = 3.65, $SD$ = 1.83) or not ($M$ = 4.61, $SD$ = 1.38, $t$(396) = 4.88, $p$ < .001). This means that greenwashing is the worst strategy a company could adopt.

For our second dependent variable (i.e., brand attitude), a two-way ANOVA revealed a significant main effect of choosing green options ($F$(1, 396) = 122.92, $p$ < .001, $\eta_p^2$ = .24) but not of self-promotion as environmentally conscious ($F$(1, 396) = 1.31, $p$ = .25, $\eta_p^2$ = .003), as well as the interaction of the two factors ($F$(1, 396) = 2.15, $p$ < .001, $\eta_p^2$ = .005). Similar to what we found before, when the company chooses the green options, there is no difference in brand attitude whether the firm promotes itself as green ($M$ = 5.72, $SD$ = 1.11) or not ($M$ = 5.67, $SD$ = .93, $t$(396) = .23, $p$ = .99). As a result, greenhushing might not negatively influence brand attitudes. Different from morality, when the company does not choose sustainable options, it makes no difference whether the firm promotes itself as environmentally conscious ($M$ = 4.09, $SD$ = 1.74) or not ($M$ = 4.43, $SD$ = 1.25, $t$(396) = 1.85, $p$ = .25). Directionally, greenwashing is worse than not choosing sustainable options and being consistent with communication.

Notes: $N$ = 400. The graph displays the means and the 95% confidence interval as error bars.

**Figure 2:** Brand attitude toward different strategies

These results suggest that companies practicing greenhushing don't face negative moral reactions or brand-related drawbacks. Consumers consistently respond positively to green practices, regardless of whether the company publicizes them. Conversely, companies engaging in greenwashing get the worst outcomes and reactions from consumers. Managers might opt for greenhushing to avoid any risk associated with green communications. Given that greenhushing is considered similar to being green and explicit, it might be an attractive option for managers. At the same time, communicating green efforts can enhance reputation as well as nudge sustainable behavior (Liu, Cao and Font, 2024). In the following study, we propose a possible intervention to solve this trade-off.

### *Study 3: Disclosing Greenhushing Reasons*

In Study 3, we used the scenarios from Study 2 to ask some participants about their opinions on why companies engage in greenhushing. Each participant was asked to indicate the motivation that influenced the company's choice.

Results from this preliminary investigation showed that consumers expect companies to engage in greenhushing either to avoid misinterpretation or to avoid being perceived as expensive. We used these motivations to test how participants would react to greenhushing if they knew the reason for the company's choice.

We recruited 301 American participants from Prolific (49.8% female, 48.1% male, 1.3% nonbinary, 0.6% preferred not to state, $M_{age}$= 38.9). Participants saw 3 different scenarios depending on the experimental group they were assigned to. In a three-condition between-subjects design, participants were assigned to one of the following conditions: green and consistent (same as in Study 2),

greenhushing to avoid misinterpretation, and greenhushing to avoid being perceived as expensive. Respondents then rated the credibility of the company on a three-item 7-point scale ($a$ = .94) (A brand that will not betray you/A brand that accomplishes its value promise/An honest brand) (1 = Totally disagree, 7 = Totally agree), the integrity of the on a fouritem 7-point scale ($a$ = .90) (A brand that gives back to its consumers/A brand with moral principles/A brand true to a set of moral values/A brand that cares about its consumers) (1 = Totally disagree, 7 = Totally agree), and their attitude toward the company on a three-item 7-point scale ($a$ = .95) (Negative – Positive/Dislike – Like/Unfavorable - Favorable). Finally, participants reported their age and gender.

Results show that participants do not show a significant difference between the three different conditions. For credibility, the difference between green and consistent ($M$ = 5.57, $SD$ = 1.00) and greenhushing to avoid misinterpretation ($M$ = 5.66, $SD$ = 1.13) or greenhushing to avoid being perceived as expensive ($M$ = 5.44, $SD$ = 1.27) was not significant ($p$ > 0.70). For integrity, the difference between green and consistent ($M$ = 5.11, $SD$ = 1.15) and greenhushing to avoid misinterpretation ($M$ = 5.39, $SD$ = 1.09) or greenhushing to avoid being perceived as expensive ($M$ = 4.99, $SD$ = 1.19) was not significant ($p$ > 0.21). Finally, for brand attitude, the difference between green and consistent ($M$ = 4.95, $SD$ = 1.07) and greenhushing to avoid misinterpretation ($M$ = 5.27, $SD$ = 1.23) or greenhushing to avoid being perceived as expensive ($M$ = 4.75, $SD$ = 1.23) was not significant ($p$ > 0.14). These results indicate that even when consumers might know the reason for a company's choice to engage in greenhushing, they might not perceive it as less credible or integral compared to a company that uses green practices and is vocal about it.

### *Study 4: A Possible Intervention*

Study 4 tests an intervention that allows companies to benefit from communicating their green efforts and avoid engaging in greenhushing. Our main prediction is that if the green nature of a product is disclosed only after the purchase is done, consumers will react positively to it, and the company will avoid all the risks of negative associations with green products, while also encouraging sustainable behavior among both consumers and competitors.

We recruited 100 American participants from Prolific (49% female, 50% male,

1% nonbinary, 0% preferred not to state, $M_{age}$= 38.45). Participants saw an assortment of four apples with different colors, types, and prices, emulating a real online delivery platform that sells groceries. We asked participants to choose the most preferred apple from the assortment (i.e., the apple that they would choose in a real purchase setting). After that, regardless of their choice, we randomly assigned participants to one of the two experimental conditions (disclosure of the green nature of apple 1: yes vs. no) between-subjects design, which varied the message they saw after completing their choice. Participants were either shown a standard thank you message by the platform – control condition - (i.e., Thank you for ordering from us! Your order is confirmed, and we're getting it ready to ship. We hope to see you again.) or a message that revealed the organic characteristic of the apple they have chosen – treatment condition (i.e., Thank you for ordering from us! Your order is confirmed, and we're getting it ready to ship. We're excited to let you know that the product you've chosen is an organic product. We hope to see you again). We controlled in our analysis for the choice of apple. Respondents rated the apple they have chosen in terms of expectations (please rate the apple you have chosen) on a 7-point scale (1 = much worse than expected, 7 = much better than expected), their satisfaction (my feelings toward the apple I have chosen can best be characterized as) on a 7-point scale (1 = very dissatisfied, 7 = satisfied), and their likelihood and motivation to leave a review (please indicate how likely / motivated you would be to post a star rating and a text review at the review forum?) on a two

item ($a$ = .94) 7-point scale (1 = Not very likely/motivated, 7 = very likely/motivated). Finally, participants reported their age and gender.

Results show that participants reported higher expectations (*M control* = 4.8, *SD* = .990; *M treatment* = 5.48, *SD* = .995; $t(98) = 3.43$, $p < .001$) and satisfaction (*M control* = 5.64, *SD* = 1.16; *M treatment* = 6.08, *SD* = .944; $t(98) = 2.08$, $p = .020$) in the treatment condition compared to the control condition. Next, we tested for mediation: disclosure (0 = No disclosure, 1 = Disclosure) was a significant predictor of expectations ($b$ =.68, *SE* = .19, $t(98) = 3.43$, $p < .001$), which, in turn, was a significant predictor of both satisfaction ($b$ =.60, *SE* = .09, $t(98) = 6.66$, $p < .001$) and intention to write a review ($b$ =.52, *SE* = .18, $t(98) = 2.99$, $p = .004$). Our estimation of the indirect effect using 10,000 bootstrap replications produced a significant indirect effect of postpurchase disclosure on satisfaction ($a \times b$ =.41, *SE* = .13, 95% *CI* .17 to .68) and intention to write a review ($a \times b$ =.36, *SE* = .17, 95% *CI* .07 to .71) via expectations. Importantly, this indirect effect remained significant when we controlled apple choice. In sum, this study highlights that disclosing a product's organic nature in the postpurchase phase significantly boosts consumer expectations, satisfaction, and review intentions. This strategy enhances perceptions without affecting initial purchase decisions, helping to mitigate potential negative associations with green product cues.

## 4. General Discussion

As sustainability continues to shape consumer expectations, online delivery platforms must navigate the complex landscape of green communication. Greenhushing, while often a strategic decision, carries potential risks and missed opportunities. By understanding consumer responses to green cues and developing clear communication strategies, businesses can enhance trust, loyalty, and long-term sustainability goals. In this work, we examined the phenomenon of greenhushing on online delivery platforms, adding to the scant literature on consumers' perceptions towards greenhushing. Results confirm that consumers perceive green-labeled products as pricier (Study 1), but their choice is not significantly affected, suggesting that greenhushing may not harm demand (Study 2), even when disclosing the motivation behind the choice (Study 3). Consumers do not seem to differentiate between brands that "walk the talk" (Schoeneborn, Morsing, and Crane 2020) or brands that neglect to communicate their green efforts. Interestingly, greenhushing can be a viable strategy if managed properly, and our intervention, i.e., disclosing the green nature of products after the purchase, can enhance consumer engagement (Study 4). Results show indeed that post-purchase disclosure boosts consumer expectations, satisfaction, and review intentions without affecting purchase decisions, offering companies a way to highlight sustainability efforts without the risk of negative perceptions. Together, the studies suggest that greenhushing can be a viable strategy if managed properly, and postpurchase disclosures can enhance consumer engagement without the drawbacks of upfront green labeling.

This work makes several contributions to the literature on sustainable marketing and corporate communication. First, it extends the concept of greenhushing—previously underexplored in empirical marketing research—by systematically examining how consumers perceive this strategy across different scenarios. Second, by contrasting greenhushing with both greenwashing and explicit green promotion, we enrich our understanding of consumer attributions, moral judgments, and brand attitudes in response to varied sustainability communication strategies. Third, the paper introduces post-purchase green disclosure as a novel communication intervention, showing its potential to enhance satisfaction and engagement without influencing initial purchase decisions, challenging assumptions about when and how green signals should be conveyed. Together, these contributions

broaden the scope of sustainability communication literature, suggesting that timing and transparency are key levers for effective green positioning.

Our findings provide some guidance to companies, suggesting a promising strategy to enhance consumer perceptions without influencing their initial purchasing decisions, thereby potentially mitigating negative pricing associations often linked with green product cues. Our research highlights the importance of timing in sustainability communication, showing that disclosing green attributes post-purchase avoids negative perceptions, mitigates price-related backlash, and fosters informed, unbiased consumer decisions.

Given the scant literature on greenhushing, we hope that our study will stimulate further research in the field. Table 1 provides some future research questions that can be explored to extend our understanding of greenhushing practices.

| **Future Research Direction** | **Description** | **Potential Research Questions** |
|---|---|---|
| **Consumer Segmentation in Greenhushing** | Investigate how different consumer segments (e.g., price-sensitive vs. sustainability-driven) react to greenhushing | How do consumer preferences and perceptions of greenhushing vary across demographic and psychographic segments? |
| **Long-Term Effects of Greenhushing** | Analyze how greenhushing influences brand trust, loyalty, and consumer behavior over time. | Does greenhushing impact long-term brand equity compared to transparent green marketing? |
| | | |
| **Cross-Cultural**<br><br>**Perspectives on Greenhushing** | Examine cultural differences in consumer responses to greenhushing strategies | Are there cultural variations in how consumers perceive greenhushing versus greenwashing? |
| **Effectiveness of PostPurchase Green**<br><br>**Disclosure** | Explore the psychological mechanisms behind the positive effects of postpurchase green disclosure. | Why does revealing a product's green nature after purchase enhance consumer satisfaction and brand perception? |
| **Competitive Effects of Greenhushing** | Investigate whether greenhushing influences competitors' sustainability<br><br>communication strategies | Does greenhushing by one company encourage or discourage competitors from openly marketing their green initiatives? |

| | | |
|---|---|---|
| **Ethical and Moral Considerations in Greenhushing** | Assess whether consumers view greenhushing as ethical or deceptive and how this perception evolves. | Under what conditions do consumers perceive greenhushing as an ethical business practice? |
| **Impact of Greenhushing on other stakeholders (e.g. investors)** | Explore how greenhushing affects investor confidence and corporate social responsibility (CSR) assessments | Do investors view greenhushing as a strategic move or a lack of commitment to sustainability? |
| **Impact on Sustainable Consumer Behavior** | Explore whether greenhushing has a negative effect on sustainable consumer behavior | Does greenhushing reduce consumer engagement with sustainability and ecofriendly behaviors? |

## Abstract

Over the last decades, the scope of sustainability-related communications – and consequently their misleading use – has expanded from lying about the environment (greenwashing) to deceptions regarding social issues (socialwashing). This research compares these two forms of corporate misleading communications, socialwashing and greenwashing, and investigates their effects on investors' intentions. Our experimental results suggest that socialwashing is more detrimental for investment intentions than greenwashing. Because individuals self-recognize more with human victims rather than the environment, investors perceive the crisis caused by socialwashing as more severe than greenwashing. Notably, when companies harm other human beings, the divergence between claims and behavior is less relevant compared to events impacting the environment. The article contributes to deepen the understanding of variation in investor reactions across different corporate washing contexts and raises awareness of corporate risks when communicating social issues.

*Keywords: corporate misleading communication, intention to invest, greenwashing, socialwashing, sustainable marketing.*

### 1. Introduction

In the last years, concern about the role of organizations regarding environmental and social issues has drastically increased. Sustainability management and marketing are generally regarded as global goals aimed at reducing the harm caused by corporate activities to society and the environment. However, companies have often instrumentally adopted sustainability as a mean to increase profits and create economic value (e.g. Russo & Harrison, 2005). Through decoupling and impression management tactics (Patriotta, Gond, & Schultz, 2011), businesses often act irresponsibly rather than responsibly, and manage sustainability-related communications that are intentionally false or misleading to project a responsible image and improve consumers' perception of ads and brands (Schmuck, Matthes, & Naderer, 2018). This questionable behavior is referred in literature as *greenwashing*, that is the attempt to disseminate disinformation so as to present a responsible public image.

Literature and cases happened in the marketplace (e.g. 2019 McDonald's paper straws case; 2021 Adidas green marketing campaign for its Stan Smith sneakers) suggest that, when detected,

greenwashing causes severe consequences for companies. Greenwashing deteriorates company's reputation and trust (Guo, Zhang, Wang, Li, & Tao, 2018), increases consumer skepticism (Delmas & Cuerel Burbano, 2011), and reduces purchase intentions (Swaen & Vanhamme, 2005). Besides consumers, greenwashing affects also other stakeholders. For instance, it erodes investor's confidence (Delmas & Cuerel Burbano, 2011). Indeed, investors are increasingly interested in sustainability and ESG issues and look for information about them (Cellier, Chollet, & Gajewski, 2016; Nath, Holder-Webb, & Cohen, 2013). In relation to private investors, Gatti et al. (2021) analyzed how different forms of greenwashing influence investment intentions. Their findings suggest that individuals are less likely to invest in companies that falsify environmental claims (falsification) or engage in manipulative business practices (deceptive manipulation), compared to those that selectively disclose information (information selection) or divert attention from poor environmental performance by promoting positive practices (attention diversion). Notably, investors are likely to distance themselves from the greenwashing company not only when it is directly involved in making false claims about its environmental performances, but also when the behavior of a supplier is in contrasts with their statements. Thus, greenwashing seems pervasive and contagious, vicariously affecting companies within the supply-chain (Pizzetti et al., 2021).

Recently, not only the frequency and the forms of greenwashing have multiplied, but also the scope of misleading communications has expanded, extending the scope of washing to multiple domains. For example, in late 2023, the term "charitywashing" was used to describe the case involving influencer Chiara Ferragni and confectioner Balocco over their "Pink Christmas" pandoro (Russo, 2023). Due to a misleading marketing campaign, consumers paid a premium believing their purchases would support pediatric oncology at Turin's Regina Margherita Hospital. However, the actual €350.000 donation came directly from Balocco and was not linked to sales of that specific product. Meanwhile, Ferragni earned over €1 million for her promotional involvement. Another example comes from Danone, which promoted its Actimel drink as offering significant health benefits, despite the product being ultra-processed and calorie-dense, and not actually providing the alleged benefits. This strategy, known as "healthwashing," aimed to create a false connotation of healthfulness (Delerm et al., 2023).

Recently, Gatti et al. (2025) have identified and described 39 distinct types of *washing through a review of academic, practitioner, and media articles, as well as blogs, forums, and personal websites. Their analysis has resulted in a dictionary of *washing phenomena, which includes concepts such as Biodiversitywashing, Bluewashing, Brownwashing, Carbonwashing, COP-washing, Peacewashing or Purplewashing, just to mentioned few of them. As the list of *washing suggests, the phenomenon is no more relegated to the environmental sphere, but it also encompasses social-related issues.

This is probably a consequence of the shift in companies' marketing commitment towards social issues. With the societal marketing orientation established since the beginning of the new millennium, companies have started to include social aspects in their reports and communications, addressing issues such as health and safety, employee relationships, philanthropy and charitable contributions (Gatti & Seele, 2014). Other drivers have contributed to the rise of corporate communication on social issues, including the shift toward increasingly stringent regulation on Corporate Social Responsibility (CSR) (Sheehy, 2015) and the global adoption of the United Nations' Sustainable Development Goals (SDGs), introduced in 2017, which address not only environmental concerns but also a broad range of social issues.

As in the environmental domain, this shift has led to practices that can be categorized under the umbrella of "socialwashing", raising concerns about the actual societal benefits companies claim to generate. The investigation of corporate questionable and misleading practices in the social domain is

far more limited compared to greenwashing, even though socialwashing, as greenwashing, might cause severe consequences for companies and the society. The aim of this exploratory research is to shed lights on whether and how socialwashing affects investor intentions. Although there is evidence that corporate misconducts in the social sphere negatively affect stock markets, less is known about investors' reactions to corporate socialwashing and its variations (Carberry, Engelen, & Van Essen, 2018). This study is thus a necessary step for expanding our knowledge on the consequences of corporate washing in various domains, and aims to raise corporate awareness of the risks they take when dealing with social issues. With this aim in mind, the study provides a direct comparison of socialwashing and greenwashing effects on investment intention by means of two experimental designs.

## 2. Socialwashing and greenwashing effects

Among the several benefits of sustainability marketing for companies, it has been documented its power in shaping investments. A positive sustainability corporate profile attracts investments (e.g. Waddok & Smith, 2000), as witnessed by the raise of Socially Responsible Investing (SRI), which refers to investors' interest in non-financial cues in corporate reporting. Notably, not only institutional investors (such as organizations) show an interest in company's non-financial performances, but also individual investors, who look for information about sustainability related activities relying on ESG and other aggregate indexes (Cellier et al., 2016) or sustainability reporting (Nath et al., 2013). Notably, the participation by individual investors in stock markets has grown in many countries starting from the 90s, thanks to technological developments and virtualized marketplaces (Aspara & Tikkanen, 2011). In March 2025, 88% of investors from a worldwide survey declared a moderate to strong interest for sustainable investing (Morgan Stanley, 2025). At the same time, globally, concerns about transparency, authenticity and greenwashing, are the top barriers to sustainable investment from individual investors (Morgan Stanley, 2023). So far, the literature has mostly investigated how sustainability related initiatives facilitate investments, and little is known about the consequences of corporate misleading communications on investment decisions.

Scandals, corporate crises and misconducts negatively affect stock exchange. This happens because investors make decisions regarding investments depending on forecasted cash flows. For instance, when a company faces a product harm crisis, the market responds by updating and adjusting the stock prices according to the expected future cash flow (Cleeren, Dekimpe, & van Heerde, 2017). Similarly, ethical misconducts and greenwashing have a negative effect on stock exchange returns (Carberry et al., 2018). However, not all the crises affect investments in the same way, since investment decisions are not only driven by rational motives, but emotions and heuristic thinking shape decisions too. Investors react more negatively to certain crises, misconducts or misleading communications. For example, compared to an environmental accident or misconduct, greenwashing is more detrimental for investments because it implies a deception to stakeholders, which violates the implicit contract between the company and its stakeholders, and worsen investor's confidence in the company (Gatti et al., 2021). In the short term, investors also react more negatively to expressive manipulation (i.e. when a company emphasizes green values, beliefs, and ideals, rather than conveying factual or performance-based information) than by selective disclosure (i.e. when the communication emphasizes only positive environmental information, neglecting other, more questionable information) (Li et al., 2024). However, over time, both forms of greenwashing lead to a decline in investors' willingness to invest.

The scope of the misleading communication may also influence stakeholders' reactions, e.g. being the environment or other human beings. Recent communications from brands emphasize the human-side of their company, inspired by recent advancements in marketing literature. Indeed, consumers tend to

connect with other individuals and prefer brands that make visible who are the persons behind the product (Fuchs et al., 2022). "Personizing" the artisan of a product allows the consumer to socially connect with them and recognizing the passion they put in their work (Fuchs et al., 2022; 2015). Recognizing that companies are not intangible entities, but groups of individuals who work to produce something has, therefore, social and emotional effects on stakeholders (Eichinger et al. 2022). However, this connection with other human beings may also determine negative effects. When the corporate behavior hurts human beings, such employees or other consumers, investors react more negatively (King & Soule, 2007). This effect can be explained by the self-categorization theory: individuals more easily identify with other humans, because they recognize more common attributes with other human beings compared to other life or non-life forms (e.g., Turner, Hogg, Oakes, Reicher, & Wetherell, 1987). This self-categorization as humans explains why individuals prefer products and corporate initiatives that help other individuals rather than animals or the environment (Lafferty & Edmonson, 2012; Auger, Devinney, Louviere, & Burke, 2008). Building on self-categorization theory, being individuals responsive to helping other human beings and sensitive regarding human conditions, we might expect a specular effect when corporate actions hurt or penalize other individuals. Therefore, we expect that misleading sustainability related communication involving human beings (socialwashing) affects more negatively intention to invest compared to misleading communication about the environment and animals (greenwashing). More formally:

$H_1$: *Socialwashing is more detrimental for investment intentions than greenwashing.*

Furthermore, we explain the more detrimental effect on investment of socialwashing compared to greenwashing because of the greater perceived severity of the misleading communication involving a social issue. As stated above, individuals tend to perceive commonalities with other human beings. Such perceived similarity increases the relevance of the social issue for the investor and triggers defensive behaviors. Indeed, individuals attribute more responsibility to a perpetrator of an abuse when the victim shares similarity with the observing subject (Shaver, 1970). Moreover, individuals tend to perceive such harm as more likely to occur in the future, consequently it is seen as more severe. Conversely, individuals tend to see the negative effects of a behavior as less relevant and severe if they do not recognize commonalities with the victim of the misbehavior. Therefore, investors by self-recognizing more with human victims of the socialwashing rather than the environmental damages related to greenwashing, would perceive the effect of socialwashing as more severe. Severity is particularly relevant in crisis management (Zhou & Ki, 2018), so that the higher the severity, the greater the negative effect of a crisis. Thus, we expect that the higher severity of socialwashing, explains the lower intention to invest after socialwashing. More formally:

$H_2$: *Socialwashing is perceived as more severe than greenwashing.*

In the context of private investors, previous studies also suggest that greenwashing has a more severe negative impact on investment intentions than corporate misbehavior not associated with misleading communication (i.e. a corporate misconduct) because greenwashing implies a lie to stakeholders (Gatti et al., 2021). In other words, misconducts are less detrimental to investment intentions than greenwashing. This is because green communications tend to raise stakeholders' expectations regarding a company's future behavior. Therefore, when a company is implicated in greenwashing, it is perceived as more blameworthy (Pizzetti et al., 2019). In such cases, stakeholders perceive a greater degree of psychological contract violation (Li-Hin and Blumberg, 2018), compared to a company that does not claim to be environmentally committed (Parguel et al., 2011). These dynamics partly explain the recent rise of the greenhushing phenomenon, whereby companies engage in environmentally sustainable actions and initiatives but choose not to communicate them, for fear of being accused of greenwashing

(Acuti et al., 2022). Given that greenwashing appears to have a more detrimental effect than an environmental misconduct not accompanied by green communication, opting not to disclose environmental efforts may be perceived as a more strategic decision. This is particularly true in light of the increasing risk of being accused of greenwashing—even unjustly.

While such dynamics appear to be supported by existing research on greenwashing (Gatti et al., 2021), this differential effect might disappear in the social context. Given the greater perceived severity of the harm caused by companies to other human beings, stakeholders may overlook the divergence between claims and actual behaviors (as it happens in socialwashing), and respond in a similar way to both socialwashing and social misconduct. The misleading communication (the "lie") may carry less weight in the social context: severity is so high that, even in the absence of deceptive communication, stakeholders' reactions remain strongly negative. We therefore hypothesize a differential effect of washing when it is related to the environment and social issues. More formally:

*$H_3$: Investors' intentions are more negatively affected by the misleading communication when the misconduct regards the environment (greenwashing vs environmental misconduct), compared to the social domain (socialwashing vs social misconduct).*

In the following sections we report two experimental studies that test our hypotheses.

## 3. Study 1

The aim of Study 1 was to test H1. Specifically, we compared socialwashing to greenwashing and test their effect on intention to invest. We expect to find lower intention to invest with socialwashing compared to greenwashing.

### 3.1 Participants and procedures

We employed a single factor (misleading communication: socialwashing vs. greenwashing) between-subjects design, involving 75 ($M_{age}$ = 33.4; 60% males) participants recruited from the U.S. sample of MTurk. Building on the literature on investment decisions (Oberecker & Diamantopolous, 2011; Delfino, Marengo, & Ploner, 2016; Fisher, 1993), we introduced the investment situation. First, we asked participants to imagine that a fictitious character who wants to invest a small amount of money on the stock exchange and asks suggestions to a friend who gained good profits from investing on a company that declares to be committed to sustainability. Second, we described the company and its sustainability profile; then we introduced the corporate misleading communication through an ad-hoc created newspaper article. The use of newspaper article to describe washing behaviors has been deemed suitable because of the relevance of media in shaping investment behaviors (Carberry et al., 2018). Socialwashing was manipulated by describing that the company was alleged of employing child labor and not verifying the age of its worker in its plantations. In the greenwashing condition, the company was accused of using of palm oil, which production caused deforestation, habitat degradation and animal threats. In both cases, the behavior was in open contradiction with the sustainability claims of the company.

After the scenarios, participants filled out questions regarding intention to invest (Elliott, Jackson, Peecher, & White, 2017, Cronbach α = .869); and, as control variables, investment situation credibility (Cronbach α = .694), and company description credibility (Cronbach α = .741) both from Dahlen and Lange (2006). Preliminary analyses showed that the investment situation (F= .007, p >.05; $M_{greenwashing}$ = 4.80(.97) vs. $M_{socialwashing}$ = 4.82(.98)) and the company (F= .276, p >.05; $M_{greenwashing}$ = 4.59(.87) vs. $M_{socialwashing}$ = 4.45(1.29)) were perceived equally credible between conditions. Attention and

manipulation checks were included in the questionnaire. Manipulation checks showed that participants correctly identified the involvement of the company in a social issue (for the socialwashing condition) and in environmental issues (for the greenwashing condition).

### 3.2 Findings

We found that the intention to invest varied depending on the scope of the corporate misleading communication. In line with our hypothesis 1, participants were less willing to invest in the socialwashing condition compared to greenwashing condition ($F= 7.632$, $p < .01$; $M_{socialwashing} = 2.31(1.12)$ vs. $M_{greenwashing} = 3.06(1.24)$).

The finding of study 1 support the idea that socialwashing is more detrimental for investment intentions compared to greenwashing. The next experiment aims at providing additional evidence to our finding and seeks to explain the effect of greenwashing through greater perceived crisis severity.

## 4. Study 2

The aim of Study 2 was to test H2 and H3. Employing an experimental design similar to Study 1, we examined the effect of socialwashing on perceived severity, and we compared it with a social misconduct. Greenwashing, compared to environmental misconduct, might be particularly detrimental for investments because of the lie that it implies (Gatti et al., 2021). However, we expect a lower effect of the corporate lie in the social domain. Indeed, in social domain the closeness with the victims augments the severity and decreases the intention to invest being the misleading communication present or not. We then expect that investors' intentions are more negatively affected by greenwashing compared to an environmental misconduct (not associated with an environmental misleading communication), but their intentions do not change in the social domain.

### 4.1 Participants and procedures

160 participants ($M_{age} = 33.7$; 52.2% male) took part in 2 (Misleading communication: present vs. not present) x 2 (scope: environmental vs. social) between-subjects design. Experimental conditions are illustrated in Figure 1.

| | | **Scope** | |
|---|---|---|---|
| | | ***Social issue*** | ***Environment*** |
| **Misleading communication** | *Present* | Socialwashing | Greenwashing |
| | *Absent* | Social Misconduct | Environmental misconduct |

**Figure 1:** Experimental conditions of Study 2

We used similar procedures and scenarios of previous experiment and the same measurements for intention to invest (Cronbach α = .841), and investment situation (Cronbach α = .782) and company credibility (Cronbach α = .799) as control variables. Moreover, we measured perceived crisis severity (Dahlen and Lange, 2006, Cronbach α = .904).

The manipulations of the environmental and social misconduct when the misleading communication was present (greenwashing and socialwashing conditions respectively) were the same of study 1. When the misleading communication was not present (environmental misconduct and social misconduct conditions), we provided a neutral description of the company (not related to sustainability) to kept constant the amount of text, describing the company as involved to improve technical skills. Then, we used the same harming events (use of palm oil vs. child labor) of the other two conditions.

Participants rated the investment situation (Interaction: F = 1.102, p =.295; $M_{greenwashing}$ = 4.94(1.13) vs. $M_{env\text{-}misconduct}$ = 5.18(1.15) vs. $M_{socialwashing}$ = 4.82(.98) vs. $M_{soc\text{-}misconduct}$ = 4.66(1.37)) and the company (Interaction: F = .002, p =.966; $M_{greenwashing}$ = 4.71(1.14) vs. $M_{env\text{-}misconduct}$ = 4.93(1.21) vs. $M_{socialwashing}$ = 4.45(1.29) vs $M_{soc\text{-}misconduct}$ =4.67(1.37)) as equally credible between conditions. Manipulation checks confirmed the effectiveness of the manipulations.

### 4.2 Findings

*Intention to invest.* We found a significant main effect of the misconduct (F = 28.122, p <.001): when it was about the social issue, the intention to invest was significantly lower compared to environmental issue ($M_{social}$ =2.08(1.06) vs. $M_{environmental}$ = 3.06(1.21)). We also found a significant interaction effect (F = 4.378, p <.05). Planned contrasts tests showed that socialwashing lowers intention to invest compared to greenwashing (t = 2.203, p <.05; $M_{socialwashing}$ = 2.21(.99) vs. $M_{greenwashing}$ = 2.79(1.18)). This result aligns with H1 and study 1. Between the two misconducts (absence of misleading communication), the social misconduct lowers intention to invest compared to the environmental misconduct (t = 5.399, p <.001; $M_{social\text{-}misc}$ =1.97(1.12) vs. $M_{env\text{-}misc}$ = 3.29(1.20)). The comparison between socialwashing and social misconduct (misleading communication not present) conditions was not significant. Conversely, we found that greenwashing was more detrimental on intention to invest than the environmental misconduct (t = 1.998, p <.05; $M_{greenwashing}$ = 2.79(1.18) vs. $M_{env\text{-}misconduct}$ = 3.29(1.20)).

*Perceived severity.* We found a significant effect of misconduct (F = 42.326, p <.001): the social misconduct was perceived as a more severe than the environmental misconduct ($M_{social}$ =2.75(1.31) vs. $M_{environmental}$ =4.24(1.52)). No other significant effects were found.

Results support H2 and H3. Socialwashing increases perceived severity, as well as decreases intentions to invest. Notably, a social misconduct is detrimental for intention to invest even when it does not imply a lie to stakeholders. Conversely, misconduct in the environmental domain affects more negatively investments when they are in opposition with green communication, i.e. when the company greenwashes.

## 5. Conclusion

Companies face severe damages when they cause harm to the environment or human beings. If the consequences on the customer base are witnessed by several studies, this paper adds evidence to the negative effects such events have on potential investors. Gaining a deeper understanding of variation

in private investors reactions across different contexts is essential given the increased involvement of individuals in stock markets (Aspara & Tikkanen, 2011) but also the greater relevance of unethical behavior for stock exchanges (Carberry et al., 2018).

Our study emphasizes how the involvement of other human beings has detrimental effects for companies. When companies misbehave regarding the good of other humans, investors are not eager to overlook and declare a lower intention to invest. Our findings suggest that this happens because investors perceived that socialwashing is a more severe event than greenwashing. In line with the extant literature, the more severe is the crisis, the lower the intention to invest since investors tend to forecast a more negative cash flow. A misconduct in the environment domain is detrimental for investments too, especially when it implies a betrayal of the environmental-related promises (i.e., greenwashing). When the company greenwashes, investors are less willing to invest compared to a situation when the company damages the environment, but its walk is not in opposition to its talk (i.e. environmental misconduct). When the harm is cause to individuals, investors react even more negatively, and do not differentiate between socialwashing and misconduct. While companies might be tempted of employing greenhusing to avoid greater scrutiny from stakeholders regarding their environmental performances, this practice to hide their intention might be less strategic and effective for what concerns social issues.

Future research might increase the external validity of our findings analyzing stock market exchanges after a real scandal, since a real misconduct might generate slightly different results compared to a fictitious one. Moreover, future studies should investigate the attribution of responsibility, since attributions are particularly relevant in this domain (Zhou and Ki, 2018)

# Inclusive Marketing on a Fine Line: Is There a Case for Hushing? A Delphi-Based Inquiry

Cecilia Grieco[1],*, and Valentina Cascio[1]

[1] Sapienza University of Rome, Italy

* Corresponding author: cecilia.grieco@uniroma1.it

## Abstract

Inclusive marketing is increasingly adopted by brands to align with diversity, equity, and inclusion values. However, growing criticism, ideological backlash, and accusations of wokewashing are prompting some firms to deliberately under-communicate their inclusive efforts—a phenomenon conceptualised as "hushing." Despite its practical relevance, hushing has received little scholarly attention. This study aims to address the gap by (1) defining hushing within the inclusive marketing domain, (2) integrating backlash theory to understand when and why brands remain silent, and (3) proposing methods to detect this phenomenon in marketplace communication. A Delphi methodology will be employed to engage a panel of experts—including consultants, brand managers, and scholars—with the aim of reaching consensus on the drivers, implications, and anticipated trajectories of hushing. The study is expected to advance theoretical understanding of strategic silence in brand activism and, once results are available, to offer practical guidance for organizations seeking to manage the risks of inclusive communication while remaining committed to social impact.

*Keywords: Inclusive marketing, hushing, wokewashing, consumer backlash, Delphi method, reputational risk.*

## 1. Research background

Inclusive marketing has evolved from a normative aspiration into a strategic imperative that reshapes how brands construct and communicate value in an increasingly plural society. Early conceptual work already framed diversity as a market resource (Urciuoli, 2003), and the last decade has seen an exponential growth of empirical studies that interrogate how the authentic representation of disability, body size, gender fluidity, ethnicity, and other intersecting identities can unlock new forms of brand equity and consumer engagement (Kim et al., 2024; Konings et al., 2024; Wang et al., 2025). Despite extant literature has grown in the last five years, the approach is mostly fragmented with only few attempts to provide a univocal and shared definition. Grieco (2024) focus on the composite nature of the concept, defining inclusive marketing as "*any marketing action undertaken by a company to address one or multiple audiences of underrepresented individuals with the purpose of providing access, empower or celebrate them through the elements of its product offerings or additional to it, that determines tangible and/or intangible output*" (Grieco, 2024, p.8). Tuli et al. (2025) stress its meaning stating that it "*transcends traditional boundaries by recognizing and valuing cultural, social, and individual differences, with marketing practices conveying perceptible points of differentiation that are responsive, meaningful, and accessible to all segments of society*" (Tuli et al., 2025, p.10-11).

A robust body of evidence shows that inclusive cues enhance brand warmth, credibility, and purchase intentions when consumers perceive the portrayal as genuine rather than tokenistic. Experimental work on disability-inclusive ads reports significant uplifts in both brand trust and willingness to pay (Wang et al., 2025; Qayyum et al., 2023). Parallel findings emerge in the plus-size and body-positivity domain, where size-inclusive visuals boost approach emotions and attitude toward the brand (Kim et al., 2024; Joo et al., 2021). These outcomes are not confined to a single format or sector, yet they span fashion, cosmetics, sport sponsorship, and digital retail environments. Beyond attitudinal shifts, inclusive marketing has demonstrable economic value (Chatzopoulou et al., 2024; Marceau et al., 2024).

Notwithstanding, the same literature cautions that mis-aligned or opportunistic executions can provoke backlash. Studies on tokenism in entertainment marketing (Podoshen et al., 2021) and on "rainbow-washing" in sport and social-media contexts (Diwanji et al., 2025) reveal negative spill-overs ranging from brand avoidance to activist consumer campaigns. These findings underscore the fine line between advocacy and appropriation. Inclusive marketing has become a prominent strategy for brands seeking to align themselves with values of diversity, equity, and social responsibility. While intended to appeal to a broader and more socially conscious consumer base, these initiatives often provoke ambivalent or negative reactions.

The risks associated to these initiatives might prevent companies from communicating their efforts towards inclusion. A similar phenomenon has started to happen concerning sustainability initiatives, leading scholars and managers to speak about green blushing or green hushing. Hilton (2025) defined this phenomenon as the deliberate under-reporting of environmental achievements to escape scrutiny or accusations of greenwashing. Guercini et al. (2025) explore green hushing in digital contexts, unveiling how it could be determined by the lack of a well-structured sustainability communication plan, criticalities in companies' internal coordination, hardship to find the proper KPIs to refer to, and issues to properly communicate with the target audiences. The application of this concept to the inclusive marketing domain is under question in this research. The starting point is twofold. On the academic side, extant contributions largely pinpoint to the challenges that open for companies who decide to embrace inclusion in their marketing strategies. Furthermore, the uncertainty about the actual output and the risk that the efforts made will not pay off, when even backlash. On the practitioner side, there have been signs of disengagement, with companies that have been traditionally committed with inclusive marketing, have suddenly reduced their efforts in this direction. For example, the Pride month 2025 has seen a decline in corporate sponsorships. Several major brands have scaled back or entirely withdrawn their support for Pride events, with approximately 25% of corporate donors either cancelled or reduced their contributions (Onclusion, 2025). It emerges that companies are increasingly choosing an internal-only approach, reducing rainbow-branded logos and overt advertising campaigns (Onclusion, 2025).

## 2. Research gap and purpose of the research

Given the outlined scenario, the purpose of the research is to understand whether there is a case for hushing in the field of inclusive marketing, that could be intended as the strategic under-communication or deliberate silence about a firm's initiatives to avoid stakeholder criticism, ideological backlash, or accusations of wokewashing.

This form of reputational risk management reflects a growing awareness among marketers that publicizing inclusive initiatives can, paradoxically, alienate segments of their consumer base who perceive such actions as politically motivated or inauthentic.

Despite its growing managerial relevance, hushing in the inclusive marketing domain has received virtually no scholarly attention. Understanding when, why and with what consequences brands choose silence rather than voice represents a critical gap at the intersection of inclusive marketing and risk management.

This research therefore aims to (1) formalise the construct of hushing in the inclusive marketing domain, (2) integrate backlash theory to predict when brands will remain silent, and (3) propose empirical approaches to detect and measure this phenomenon in marketplace communications.

## 3. Method

Given the nature of this objective, qualitative investigation has been considered the most appropriate method to delve into such a multidimensional and complex phenomenon. To this end the Delphi technique has been selected for its potential to develop understanding around emerging phenomena, and in particular when there is the need to forecast future trajectories of specific trends (Rowe and Wright, 2001).

The Delphi method is based on a systematic and iterative approach to theoretical generation. It consists of multiple rounds of interaction among individuals who possess in-depth knowledge of the topic under investigation, with the goal of reaching consensus on descriptive statements regarding the phenomenon studied (Gebhardt et al., 2022). In this way it leverages collective human intelligence to identify effective ways of addressing complex problems. The main characteristics of the Delphi method include the anonymity of experts, which can express their opinions freely; the iterative nature of the process, enabling experts to revise their views on the evaluated items throughout the rounds; external facilitation, which involves sharing the results of previous rounds with participants; the integration of quantitative analysis methods within the process, including the use of predefined thresholds for achieving consensus (Profillidis and Botzoris, 2019).

The first step is the identification of the panel. A key informant approach will be followed to select participants who can be considered as well-positioned to provide a comprehensive perspective on the topic of inclusive-hushing. In this sense a purposeful sampling technique will be applied to search for participants. Inclusion criteria will consider different background, characteristics and experience with the topic (Munir et al., 2025). Consistently the panel will include: (i) managers from consulting firms and creative agencies for their direct contact with brands and their role of market monitoring; (ii) managers from firms that have so far been considered as virtuous in their activities of inclusive marketing, for their expertise and direct involvement with the topic; (iii) scholars and academics who performed conceptual and empirical research on this topic who already have the opportunity to study inclusive marketing and its evolution in the scientific debate. Consistently with extant research, the panel size will be around 20/30 individuals, yet thematic saturation will be adopted as the criterion for performing the interviews (Munir et al., 2025).

Once the expert panel will be defined a set of iteration rounds will be conducted. The first one will be carried out through in-depth interviews, for which a semi-structured guide and a protocol will be developed and shared among the researchers. The interviews will be recorded and transcribed to be content analyzed with ad hoc software for data analysis. Furthermore, questionnaire formatted for Lickert scale responses will be developed basing on the output of the first round and sent out to the panelist for the subsequent rounds. According to Skulmoski et al. (2007), two or three iteration rounds are sufficient for most research to get data saturation.

## 4. Expected findings

The involvement of key informants through the Delphi analysis is seen as an effective choice to delve into a topic that, despite raising great interest, is controversial in the way it could actually bring value to the brands. Starting from the pitfalls and the risk of backlashing which emerge from extant literature, the goal is to shed light on panelist perspectives about the risk of hushing in the inclusion domain. The goal of this research is to understand the drivers that could lead companies to under-communicate their efforts towards inclusive marketing as well as proposing effective strategies to overcome this risk. The research is exploratory in nature, given the innovative lens through which the topic is analyzed, and it could open interesting avenues for future research. From a managerial perspective it has great potential to support those brands that are committed to the integration of inclusive instances into their marketing and communication strategies, as it could outline the best practices to strengthen the reliability and the effectiveness of their initiatives.

# The Influence of Mindfulness on the Attitude–Behaviour Gap in Sustainable Fashion Consumption in the Fast Fashion Industry

Manjitha Mathew[1],*, Riccardo Spinelli[1], and Poornima Vijaykumar[2]

[1] Department of Economics, University of Genoa, Italy
[2] Department of Commerce & Management, St. Joseph's College of Commerce (Autonomous), Bangalore University, India

## Abstract

This work-in-progress study explores the influence of mindfulness on the Attitude-Behaviour (A-B) gap in sustainable fashion consumption within the fast fashion industry, focusing on Indian consumers. While consumers increasingly express concern for sustainability, their behaviour often remains inconsistent with these values, a phenomenon known as the A-B gap. Drawing on the concept of mindfulness – defined as the awareness that arises from paying attention, on purpose, in the present moment, and non-judgmentally – this study investigates whether higher levels of mindfulness are associated with a smaller A-B gap. It further explores the internal and external barriers that even mindful consumers face in aligning their sustainability attitudes with actual behaviour. A qualitative research approach using semi-structured interviews will be employed for data collection and thematic analysis will be used to identify patterns related to mindfulness, consumer decision-making, and value-behaviour alignment. This study aims to contribute to literature by integrating mindfulness theory with sustainable consumption research and to offer practical insights for sustainability marketers and policymakers seeking to promote mindful, responsible consumer behaviour in the fast fashion sector.

*Keywords: Mindfulness, Attitude-Behaviour gap, Sustainable fashion consumption, Fast Fashion*

## 1. Introduction

The fast fashion industry (FFI) is characterised by rapid production cycles, low-cost labour, and high levels of consumption and disposal, leading to significant environmental and social consequences (Niinimäki et al., 2020). Despite increased consumer awareness of sustainability issues, many individuals continue to purchase fast fashion despite their ethical concerns, demonstrating an Attitude-Behaviour (A-B) gap (Joy et al., 2012). Existing research suggests that impulsivity, social and cultural influences, consumer scepticism, marketing influence, and habitual consumption patterns contribute to the A-B gap in sustainable fashion choices (Joy et al., 2012; Gadhavi & Sahni, 2020; Lu et al., 2022; Wei & Jung, 2022). However, mindfulness, a state of heightened present-moment awareness and

intentional decision-making (Kabat-Zinn, 2013), has been linked to reduced impulsivity and greater alignment between attitudes and behaviour (Bahl et al., 2016; Fischer et al., 2017). While mindfulness has been widely studied in the context of health and well-being, its role in bridging the A-B gap in sustainable fashion consumption remains underexplored.

This work-in-progress study seeks to address this gap by investigating whether mindfulness influences the A-B gap in the fast fashion context. Specifically, it explores whether consumers with higher mindfulness levels exhibit greater alignment between their sustainability attitudes and actual purchasing behaviour. The study also examines barriers that may prevent even mindful consumers from acting in accordance with their values. Adopting a qualitative research design, it uses semi-structured interviews with young adult consumers in India to uncover how mindfulness operates within real-world fashion consumption contexts. The Indian market offers a unique lens for this inquiry: it is a rapidly evolving consumer economy where affordability often drives purchasing decisions, yet it also disproportionately bears the environmental and social costs of fast fashion production. By situating the research in this context, the study not only contributes to sustainability and consumer behaviour literature but also provides culturally and economically relevant insights into the psychological mechanisms that may help bridge the gap between ethical intention and action.

## 2. Literature Review

### 2.1 The Attitude-Behaviour (A-B) Gap in Sustainable Fashion Consumption

The A-B gap refers to the inconsistency between what consumers believe or express as their values (attitudes) and what they actually do in practice (behaviour) (Vermeir & Verbeke, 2006). In the context of sustainable consumption, this gap occurs when consumers acknowledge the importance of sustainability but continue engaging in unsustainable behaviours (Johnstone & Tan, 2015). The A-B gap is particularly prevalent in the FFI, where consumers express concern for environmental and ethical issues but often fail to act on them (Joy et al., 2012; Joergens, 2006). Joergens also highlights that this gap is narrower in sectors like food, where health and sustainability align, but more pronounced in fashion and automobiles, where aesthetics and brand loyalty tend to override ethical considerations (Egbue & Long, 2012).

Several interrelated factors contribute to this persistent gap. Price sensitivity, convenience, and limited availability are key barriers to sustainable fashion consumption; while ethical alternatives are often perceived as costly and harder to access, fast fashion offers affordable, readily available options that appeal to budget-conscious consumers (Joergens, 2006; Joy et al., 2012; Wiederhold & Martinez, 2018). Cultural and social influence, and trend responsiveness, fuelled by peer pressure and digital media, drive rapid consumption cycles that deprioritise sustainability (Gadhavi & Sahni, 2020). Consumer scepticism around corporate sustainability claims and greenwashing contributes to a lack of trust and reduced motivation to engage in sustainable consumption (Lu et al., 2022; Wei & Jung, 2022). Impulsivity and marketing influence, through limited-time promotions, discounts, and influencer marketing, encourage spontaneous purchasing behaviour, often at odds with ethical intentions (Jacobs et al., 2018). A more recent study by Mathew and Spinelli (2025) further confirms the persistence of this gap in fast fashion, emphasising that despite strong sustainability attitudes, habitual buying, low emotional engagement, and cognitive dissonance frequently hinder sustainable action.

These challenges highlight the complexity of the A-B gap in sustainable fashion consumption and underscore the need to examine not only structural barriers but also internal psychological mechanisms

that influence consumer behaviour. Understanding these dynamics is crucial for developing interventions and strategies that can better align consumer attitudes with sustainable actions.

### 2.2 Mindfulness and Consumer Decision-Making

Mindfulness, defined by Kabat-Zinn (2013) as "the awareness that arises from paying attention, on purpose, in the present moment, and non-judgmentally", has emerged as a promising construct in understanding ethical and sustainable consumer behaviour. Its potential to enhance self-awareness, regulate impulsive tendencies, and align actions with personal values makes it particularly relevant to bridging the A-B gap in fast fashion consumption.

Bahl et al. (2016) conceptualise mindfulness as a counter to mindless consumption, proposing that it fosters ethical decision-making by disrupting automatic behaviours and promoting alignment between internal values and external actions. Fischer et al. (2017) support this by identifying pathways through which mindfulness enhances sustainable consumption: increased awareness of consequences, reduced impulsivity, and greater intrinsic motivation. Both studies position mindfulness as a self-regulatory tool that can help consumers resist social and marketing pressures that encourage unsustainable fashion consumption. Rosenberg (2004) and Armstrong (2021) offer philosophical and cultural insights. Rosenberg frames mindfulness as a critique of consumerism itself, arguing that it helps individuals detach from desire-driven, ego-based behaviours. Armstrong applies this critique to fashion, contrasting the impermanence and ego-focus of fast fashion with Buddhist principles of non-attachment and ethical living. They suggest that integrating mindfulness into fashion practices could foster more conscious and sustainable consumption behaviours. Mantzios et al. (2018) provide indirect support through their study on mindful eating, which found a negative relationship between mindfulness and fat and sugar consumption. Although focused on dietary behaviour, the findings suggest mindfulness can reduce impulsive consumption more broadly, including in the fashion domain. Stanszus et al. (2017) provide direct empirical evidence linking mindfulness training to sustainable consumption behaviour. Their BiNKA intervention, an adapted mindfulness-based course focused on consumption, demonstrated that mindfulness can disrupt automatic buying patterns, clarify values, and foster compassion.

Collectively, these studies offer a multidimensional understanding of how mindfulness can help align consumer attitudes with sustainable behaviour. By enhancing self-regulation, promoting ethical reflection, and challenging the cultural norms of consumption, mindfulness holds transformative potential for addressing the FFI's sustainability challenges.

## 3. Research Objectives

This study aims to examine the influence of mindfulness on the A-B gap in sustainable fashion consumption within the FFI. Specifically, it seeks to analyse whether higher levels of mindfulness are associated with greater alignment between sustainability attitudes and actual purchasing behaviour. Additionally, the research explores the internal and external factors that may prevent consumers from consistently acting in accordance with their pro-sustainability attitudes.

## 4. Methodology

This study will adopt a qualitative research approach, using semi-structured interviews to explore the role of mindfulness in reducing A-B gap.

Participants will be purposively selected from individuals in India who engage with fast fashion at varying frequencies, enabling comparison across different consumption levels. Data will be collected through open-ended interviews exploring consumers' level of mindfulness, sustainability attitudes, actual purchasing behaviour, and related barriers. Responses will be analysed thematically to identify patterns and connections between mindfulness, the A-B gap, and barriers to sustainable consumption.

## 5. Expected Outcomes

This study is expected to provide a clearer understanding of how mindfulness influences the A-B gap in sustainable fashion consumption within the FFI. It anticipates that participants with higher levels of mindfulness will generally exhibit a smaller A-B gap, demonstrating greater alignment between pro-sustainability attitudes and actual purchasing behaviour. However, it also considers the possibility that some participants may display minimal A-B gaps despite lower mindfulness levels, due to factors such as ingrained sustainable habits, minimal fashion engagement, or external constraints. Additionally, the study aims to identify key barriers that even mindful consumers face in translating their attitudes into consistent behaviour.

## 6. Research Limitations

As a qualitative study focused on Indian consumers, the findings will be context-specific and not intended for statistical generalisation. The relatively small sample size and use of self-reported data may introduce biases, including social desirability and recall bias.

## 7. Theoretical and Managerial Implications

This research contributes to sustainability and consumer behaviour literature by exploring mindfulness as a psychological mechanism that may bridge the A-B gap. It introduces a cognitive-behavioural lens to understanding ethical consumption, extending mindfulness research into a new domain - fast fashion. For sustainability marketers and fashion brands, the study offers actionable insights into how mindfulness traits can be activated or supported through communication strategies and product offerings. It can guide the development of marketing campaigns that appeal to consumer values, promote reflection, and reduce impulsive consumption.

## Abstract

As consumer expectations grow for brands to take meaningful stances on social and political issues, this study explores how the top nine luxury fashion brands are genuinely "walking the talk" in their advocacy for gender fluidity and inclusivity. Via the analysis of the top nine most valuable luxury fashion brands worldwide, we assess the authenticity of their corporate and brand activism through public messaging, internal policies, and sustainability initiatives. The research integrates a comprehensive review of literature on gender in the fashion industry with an in-depth analysis of each brand's organizational structure and people-centered strategies. It seeks to uncover whether these companies genuinely align their values with their advocacy or if their actions are primarily driven by branding and market positioning. The findings highlight the nuanced challenges luxury brands face in reconciling commercial objectives with authentic social responsibility. Ultimately, the study offers valuable insights into the shifting landscape of brand activism in the luxury sector and its potential to shape broader societal attitudes toward gender identity and inclusion.

*Keywords: People-oriented sustainability; Corporate Social Advocacy; Brand Activism; Luxury Fashion Brands; Gender inclusivity*

## 1. Research Aim and Background

Fashion companies are increasingly prioritizing environmental and social sustainability, though their efforts range from genuine initiatives to instances of greenwashing and woke-washing (Sobande 2019; Palakshappa, Bulmer, & Dodds 2024; Sterbenk et al. 2022). While luxury and sustainability have traditionally been viewed as opposing concepts (Muniz & Guzmán 2021), a growing number of luxury brands are now formalizing their commitments to ethical and social causes (Karaosman, Brun, & Morales-Alonso 2017). Within this evolving landscape, contemporary understandings of gender have become central to global cultural and societal discourse (Wilson et al. 2024). The growing involvement of luxury fashion brands in addressing—or deliberately avoiding—social issues reflects a broader, emerging trend in the industry (Bhagwat et al. 2020). Today's consumers increasingly expect brands to take meaningful positions on societal matters, a demand that is consistently highlighted in consumer research, industry practice, and academic literature, and defined as brand activism (Austin et al. 2019; Ahmadi & Ataei 2022; Palakshappa, Bulmer, & Dodds 2024).

Brand Activism actions typically represent a stronger stance than Corporate Social Responsibility (CSR) and Diversity, Equity, and Inclusion (DEI) initiatives, being more provocative and critical (Wettstein & Baur, 2016; Lee, Alwi, & Gambetti, 2024).

Authenticity is crucial to avoid inadequacy, accusations of whitewashing or scandals, as well as brands' decisions on which side of the social issue they choose to support, or cause cherry picking (Parguel et al. 2015; Sobande 2019, O'Donnell et al. 2023). Recent studies suggest that engaging in socio-political discourse is no longer optional—especially for brands that significantly influence global culture and public dialogue (Waymer & Logan, 2021).

In light of this shift, our study focuses on luxury fashion brands, examining their strategic approaches to corporate and brand activism. Specifically, we investigate whether these brands are genuinely embodying their stated values in response to evolving conversations around gender fluidity and inclusivity. The study attempts to respond to the following research question: *To what extent are these brands authentically engaging in gender-related activism, and how are they contributing to the broader discourse on gender identity and inclusion?*

## 2. Methodology

We conducted an analysis of the nine most valuable luxury fashion brands, as identified in Interbrand's 2024 annual ranking (Burberry, Cartier, Chanel, Dior, Gucci, Hermès, Louis Vuitton, Prada, Tiffany). Using the framework developed by Vrendenburg et al. (2020), which evaluates the depth and authenticity of corporate and brand engagement with social issues, we categorized each brand accordingly. These brands were chosen for their significant communicative power and their dual role in an industry characterized by both diversity and uniformity—an industry widely acknowledged for its influence on social discourse.

Our desk research examined their public communications, strategic messaging, and internal corporate structures to assess the sincerity of their involvement in gender inclusivity efforts. We examined the top nine global luxury fashion brands listed in Interbrand's 2024 ranking, analyzing their websites, annual and CSR reports, and press materials using gender-related keywords. This desk research targeted controlled, internal communication channels to evaluate the authenticity of their engagement with gender inclusivity. Adopting a micro-process-oriented approach, our research aligns with calls for activity-based branding analysis (Johnson, Melin & Whittington, 2003; Salvato, 2003), focusing on the everyday practices that shape organizational behavior (Helfat & Peteraf, 2015).

The analysis followed a two-stage process. First, we applied a "walking the talk" framework, partially based on Lerpold et al. (2015, 2019), to assess how brands translate gender inclusivity into governance, leadership, and workforce practices. Second, we used Vredenburg et al.'s (2020) brand activism taxonomy to categorize each brand's socio-political engagement—ranging from avoidance to authentic activism.

Furthermore, we created a comprehensive index based on 27 variables: 13 "talk" indicators (e.g., gender-related messaging, executive statements, policies) and 14 "walk" indicators (e.g., female representation, diversity roles). Variables were scored binary (0/1), with additional points for exceeding benchmarks (e.g., gender quotas over 50%). Each brand was independently assessed by two researchers, with cross-checks for accuracy. The dataset, covering over 5,000 pages from 2023–2024, offers a robust and current evaluation of luxury fashion's role in gender inclusivity.

## 3. Results

The content analysis of the collected material led to the definition of the 'ways of walking' for the nine luxury companies under analysis, meaning the concrete actions they have implemented in favour of gender issues, if any. Our investigation highlighted the most significant and frequently repeated actions undertaken by luxury brands regarding gender-related sustainability efforts. These actions are categorized under the following labels: internal policies, international agreements and pledges; mentoring; partnerships, charities, and foundations; rankings and certifications.

Luxury fashion brands are increasingly implementing internal and external initiatives to promote gender equality. Internally, companies like Chanel, Hermès, Gucci, Prada, and Tiffany & Co. have introduced policies such as appointing women to leadership roles, ensuring equal pay, expanding parental leave, and forming diversity councils and equity boards. Many brands also pursue certifications and participate in global indices like the Bloomberg Gender-Equality Index to measure progress.

Externally, brands support gender equality through mentoring programs (e.g., Dior's Women@Dior, Tiffany's African Brilliance Collective), international initiatives (e.g., Cartier's WJI 2030), and campaigns promoting female entrepreneurship (e.g., Cartier Women's Initiative). Charitable efforts, such as Gucci's Chime for Change and the Chanel Foundation, further demonstrate their commitment to empowering women and girls globally.

These actions reflect a broad and growing commitment by luxury brands to address gender issues through leadership, policy, advocacy, and philanthropy.

The study evaluates the gender-related brand activism of nine top luxury brands by combining communication efforts ("talk") and actual initiatives ("walk"), using a framework based on Vredenburg et al. (2020). Brands are categorized into four types: avoidance, silent activism, inauthentic activism, and authentic activism.

In continuing the analysis of gender-related brand activism among nine leading luxury brands, the study integrates both desk research and empirical data collection through a "walk-the-talk" methodology. This approach evaluates not only what brands communicate publicly about gender equality ("talk") but also the concrete actions they undertake ("walk"). The results are interpreted using the framework proposed by Vredenburg et al. (2020), which categorizes brand behavior into four types: brand activism avoidance, silent brand activism, inauthentic brand activism (often referred to as "woke-washing"), and authentic brand activism, where communication and action are meaningfully aligned.

Overall, the findings suggest that most of the brands under review demonstrate a relatively balanced approach, with comparable levels of communication and action. Among the standout performers are Burberry, Gucci, and Tiffany, which exhibit high scores in both communication and implementation. These brands can be described as "talking walkers"—companies that not only speak out on gender issues but also back their words with substantial initiatives. Their leadership in this space positions them as key actors in the evolving landscape of brand activism. In contrast, Prada and Hermès appear to adopt a more reserved stance. While they have taken some steps toward gender inclusivity, their public communication tends to focus on other themes, suggesting either avoidance or a form of silent activism. This indicates a potential gap between internal efforts and external messaging. Chanel, Dior, and Louis Vuitton are identified as being in a transitional phase. These brands have launched promising initiatives—such as partnerships and foundations aimed at supporting women—but their overall engagement still appears to be in the early stages. Interestingly, the presence of female CEOs at Chanel and Dior does not seem to significantly influence the depth or visibility of gender-related initiatives,

challenging assumptions about leadership and advocacy. Finally, Cartier presents a unique case, as it places strong emphasis on communication, often highlighting its commitment to gender issues. However, the corresponding actions do not yet fully match this narrative. While Cartier's efforts are not superficial enough to be labelled as "woke-washing," there is a clear need for better alignment between its messaging and its tangible contributions. Achieving this balance would enhance the brand's credibility and position it more firmly among its peers in the luxury sector.

From a broader perspective, the analysis reveals that most brands are more advanced in addressing gender diversity from a traditional, binary standpoint. This is reflected in the relatively narrow range of "walk" scores (between 5 and 8) in this area. However, when the focus shifts to genderless or non-binary inclusion, the differences become more pronounced, with scores ranging from 6 to 13. This suggests that while some brands are beginning to embrace more inclusive understandings of gender, others are still catching up.

## 4. Implications and conclusions

The analysis reveals that most fashion brands exhibit a "walk" dimension—prioritizing actual practices over mere communication—indicating a mature and cautious approach to brand management and social sustainability. While environmental sustainability is more established, social aspects like gender inclusivity are still developing. This "walk over talk" trend may reflect authentic brand activism and inclusive marketing strategies that require significant business model changes and impact the entire supply chain.

Theoretically, the study aligns with evolving research on gender in fashion, moving beyond product design to examine companies' strategic commitments to DEI and CSR. It emphasizes analysing formal declarations and implemented actions rather than promotional content, helping assess the authenticity of brand activism.
As a managerial contribution, this methodology offers insights for brands aiming to engage in social issues authentically. It highlights the importance of learning from best practices to avoid accusations of greenwashing and to build genuine connections with diverse audiences, especially through inclusive marketing.

A key limitation of the study is its small sample size, which, while representative, limits the generalizability of the findings across different industries and cultural contexts. Future research should broaden the scope to include less prominent brands, diverse sectors, and varied cultural settings to better understand how brand advocacy is practiced and perceived. Additionally, further studies could investigate the relationship between brand activism, consumer responses, and the actual social impact of such activism. This would help assess the true influence brands have in driving social change.

## Abstract

This research explores Instagram's role in promoting healthy food options. By capitalizing on the most scalable food hashtags (#food, #foodporn, #foodstagram, #instafood, #foodie, #healthyfood) this study identifies the centrality of visual product aesthetics and epicurean eating as determinants of experiential food pleasure for health-conscious consumers.

*Keywords: healthy food, Instagram, visual product aesthetics, epicurean eating, health consciousness, pleasure.*

### 1. Introduction

Instagram is considered among the most influential photo and video sharing social networks. A widely popular activity on Instagram is foodtography (Coary and Poor, 2016), in which users take photographs of their meals and share them with others, whether they are followers, friends, or family (Andersen et al., 2021). In current years there is a strong debate on healthiness and an increasing number of Gen Z consumers are becoming health conscious, also thanks to social media. Instagram has been identified by many as a vehicle to promote and support healthy behaviors (Chung et al., 2017) but the results have been mixed with positives (e.g. sport-related communities) and negatives (e.g. eating disorders) results. In general, research suggests that healthy eating can be promoted by focusing on the aesthetic of food images and by capitalizing on epicurean eating (Landry et al., 2018; Cornil and Chandon, 2016; Block et al., 2011), defined as "the enduring pleasure derived from the aesthetic appreciation of the sensory and symbolic value of the food" (Cornil and Chandon, 2016, p. 52). Epicurean eating promotes food pleasure derived from savoring in moderation, without excess, with a focus on not just taste but visuals (aesthetics) and identity as well (we are what we eat). This contributes to health consciousness, which has been defined as an "individual difference variable that measures how active the individual is in maintaining one's health" (Naylor, Droms, and Haws, 2009, p. 223).

Instagram posts operate according to algorithms which tend to show content to individuals based on their previous engagement patterns. If an individual looks for and engages more frequently with healthy lifestyle posts (e.g., healthy food), s/he is more likely to be shown similar or related content, which in

turn might reinforce positive health behaviors (Friedman, 2022). Our study tries to understand the key drivers of this effect. By focusing on Instagram and its visual and aesthetically pleasing oriented culture, this research explores centrality of visual product aesthetics (Bloch et al., 2003) as related to epicurean eating (Cornil and Chandon, 2016) and how it might predict experiential food pleasure for health-conscious consumers (Provencher et al., 2009). Figure 1 illustrates the hypothesized relationship among the variables of interest.

## 2. Methodology

After IRB approval, 200 GenZ consumers were invited to participate in an extra-credit opportunity for a large introductory marketing course. First, they were asked to access their Instagram account and were randomly assigned to one of the six most prominent hashtags (over 1 million posts) related to food: #food, #foodporn, #foodstagram, #instafood, #foodie, #healthyfood. Overall, the Instagram algorithm is designed to give users a personalized experience that reflects their interests and behaviors on the platform. By randomly assigning subjects to a particular hashtag, we rely on Instagram as a social media platform providing the most salient food images for the GenZ consumer participating in our study. Second, subjects participating in the study were asked to evaluate their Instagram food images in terms of experiential food pleasure (10 items scale adapted from PANAS). Questions related to health consciousness (7 item scale; Provencher et al., 2009), centrality of visual product aesthetics (11 items scale; Bloch et al., 2003), and epicurean eating (7 item scale; Cornil and Chandon, 2016) followed.

## 3. Findings

With a final sample of 170 GenZ consumers, we conducted a mediation analysis (PROCESS model 4, Hayes, 2017) with 5,000 bootstrap samples at 95 % confidence intervals to test our hypothesized framework according to the variables of interest (Figure 1). All the variables were continuous and mean-centered. According to the total effect model, health consciousness (Cronbach's alpha =.855) has a significant and positive relationship with experiential food pleasure (Cronbach's alpha =.936; $b = 0.5799$, $p < 0.001$). Moreover, when centrality of visual product aesthetics (Cronbach's alpha =.919) and epicurean eating (Cronbach's alpha =.874) are included in the model, this effect is still significant ($b=0.471$, $p < 0.001$). The effect of health consciousness on experiential food pleasure through centrality of visual product aesthetics was not significant [$b = 0.031$; BC CI (-0.031, 0.105)]. However, the indirect effect of epicurean eating was significant [$b=0.047$; BC CI (0.001, 0.106)]. In addition, the sequential effect of centrality of visual product aesthetics and epicurean eating was significant [$b=0.031$; BC CI (0.001, 0.068)].

Our findings suggest that consumers who are more health conscious are more likely to associate positive feelings with the food images they see on Instagram. The psychological variables that seem to explain the effect are centrality of visual product aesthetics and epicurean eating.

## 4. Conclusions

Our study suggests that centrality of visual product aesthetics affects perceptions of food pleasure driven by epicurean eating for health-conscious consumers. This provides further understanding on the effectiveness of food images on Instagram. Interventions aimed at promoting healthy options on Instagram need to take into consideration the existing beliefs, attitudes, and behaviors (e.g. health consciousness) of the specific target audience due to the fact that Instagram and hashtags provide targeted messages based on past preferences and engagement patterns on the platform. Instagram

offers great opportunities to reinforce existing behaviors (good and bad) but might not deliver as expected when change is sought. Our future studies aim to further investigate these findings by: considering a bigger sample, controlling for food images, considering the design features of the food images (differences in colors, shape etc), and comparing an epicurean vs. visceral eating approach. The hope is to present the results of these new potential studies and analyses by the time of the conference.

# Fashion Activism Among Movements and Businesses: Insights from Italian Activist Entrepreneurs

Giulia Monteverde[1], * Andrea Runfola[2], and Simone Guercini[1]

[1] University of Florence
[2] University of Perugia

*Corresponding author: giulia.monteverde@unifi.it

## Abstract

This paper explores the sustainability challenges in fashion and examines how activist entrepreneurship influences fashion activism. Using a qualitative approach, the research analyzes case studies involving activist entrepreneurs. The findings indicate three distinct pathways to achieving fashion activism.

*Keywords: sustainability; fashion activism; activist entrepreneurship; social movements*

## 1. Introduction and Theoretical Setting

The current global landscape is marked by instability and critical issues surrounding sustainability. The fashion industry is notably highlighted for its adverse effects, positioning it as a central player in the sustainability dilemma (Akrout and Guercini, 2022). This sector is deeply intertwined with various environmental, social, and economic concerns, such as the exhaustion of natural resources, the application of toxic chemicals, and the accumulation of textile waste (Islam *et al.*, 2021). Moreover, it is connected to social issues such as child labor, poor working conditions, unfair wages (Henninger *et al.*, 2016), and economic difficulties related to the relocation of production to low-wage areas (de Brito *et al.*, 2008). The rapid turnover of fashion trends, characteristic of the fast fashion model, significantly worsens the sustainability crisis in the fashion industry. Specifically, fast fashion companies are increasingly adopting a two-pronged strategy: shortening lead times and providing trendy merchandise as soon as trends emerge. This tactic fundamentally changes traditional production cycles. These businesses significantly reduce selling cycles and implement more frequent buying cycles by making smaller, more frequent purchases. Hence, consumers purchase more fashion products at lower prices (Pookulangara and Shephard, 2013).

In this framework, sustainable fashion—also known as green fashion, ethical fashion, or slow fashion—emerges as an alternative approach to fast fashion (de Oliveira Campos e*t al.*, 2023). Sustainability in the fashion industry manifests in various ways, such as the use of reused and recycled materials, the promotion of vintage and second-hand clothing, the adoption of vegan alternatives, the implementation of made-to-order production models, and the prioritization of fair, ethical, and environmentally responsible practices (Henninger *et al.*, 2017). Therefore, companies and consumers are becoming increasingly aware of sustainability issues in the fashion industry and the urgent need to address them. Many firms aim to make incremental changes to their business models, while new

ventures are being established with sustainable business models from the start (Runfola and Monteverde, 2023). Additionally, topics related to sustainable fashion consumption have gained significant traction in recent years (Dabas and Whang, 2022).

In the proposed scenario, another crucial topic arises with profound implications in the empirical world: fashion activism to approach sustainability. Specifically, "*fashion activism can imply individual or collective action and be embraced by social movements; in fact, activists generally do not take action just for their own benefit but are mostly driven by values of solidarity and by an ambition to bring about social change*"; fashion activism fights for "*social justice, environmental stewardship, economic prosperity and cultural regeneration*" (Mazzarella and Black, 2023, p. 234). In this paper, we connect fashion activism to activist entrepreneurship, focusing on individuals who are simultaneously activists and entrepreneurs in the fashion system for the sake of sustainability. Indeed, while this conceptualization might initially appear dissonant, research suggests possible intersections between activism and entrepreneurship (e.g., van den Broek *et al.*, 2012; Abebe *et al.*, 2020). Activist entrepreneurs engage in business activities while successfully fulfilling their role as activists, embracing a cause to advocate through efforts that extend beyond local boundaries; they connect with, or even create, communities of like-minded supporters (Monteverde *et al.*, 2024). Activist entrepreneurship can be linked to the concept of unconventional entrepreneurship (Guercini and Cova, 2018).

This research seeks to investigate how fashion activism is expressed through the lens of activist entrepreneurship. While existing literature has explored sustainability in fashion, it has largely overlooked the role of fashion activism in addressing sustainability challenges. Similarly, the study of activist entrepreneurship remains under-researched, necessitating more empirical work. This paper presents a novel perspective by examining how fashion activism and activist entrepreneurship can be integrated to promote sustainability. The exploratory goal of our research is paired with a qualitative methodological approach that focuses on case studies of three Italian activist entrepreneurs in the fashion industry.

## 2. Research Methodology And Case Studies Profile

Considering the exploratory nature of the research, this paper follows an inductive reasoning approach and adopts a qualitative methodology through multiple case studies (Eisenhardt, 1989). A thorough review of secondary data sources, including published interviews, news articles, corporate websites, social media content, and relevant online materials, informed the selection of activist entrepreneurs within the fashion industry. Specific criteria—primarily derived from existing literature—guided the selection of these activist entrepreneurs: i) they embrace and advocate for a cause related to sustainability in fashion; ii) they are surrounded by a community of followers supporting the same cause; and iii) they are founder-entrepreneurs of a sustainable fashion company, where profit is primarily viewed as a means to a greater purpose. We identified three activist entrepreneurs in Italy; for confidentiality, we refer to them as Alpha, Beta, and Gamma. The case studies draw from three sources of information for data gathering: in-depth, face-to-face, and semi-structured interviews with the activist entrepreneurs; desk research and secondary data; and online observation of primary social media platforms used by activist entrepreneurs, mainly Instagram and LinkedIn. We have successfully gathered data at all three levels for each of the three case studies.

*Alpha.* During his previous employment in the fashion industry, Alpha began to question the environmental and social impacts of the sector, a concern largely overlooked at the time. This critical reflection and subsequent involvement in non-profit organizations after leaving the industry led him to view his prior participation as an ethical lapse within a system he considered unsustainable. In 2015,

Alpha co-founded a sustainable fashion company with two colleagues in Italy. Initially conceived as a non-profit educational initiative, it has become a fashion brand. A key product is a t-shirt made from graphite, a non-toxic industrial waste. The company has consistently integrated educational programs into its operations, partnering with schools since its inception. Between 2018 and 2019, the company expanded its offerings to include design consultancy. In 2020, it further diversified by providing educational programs and courses for students while offering guidance and support to other fashion brands aiming to adopt sustainability. At the same time, during these years, Alpha intensified his activism efforts; he co-founded the Italian branch of the world's largest fashion activist movement and currently serves as Vice-President. He has also taken on key and influential roles in the European Commission, participating in extensive outreach activities. Alpha has led various online mobilizations to promote sustainable fashion, and since 2023, a television series has documented his travels to countries affected by Western fashion overconsumption. In 2024, Alpha published a book about responsible fashion.

*Beta.* After a career as an Export Manager in the German fashion industry, Beta founded a sustainable fashion company in Italy in 2012 after being exposed to the industry's darker side. Driven to create ethically produced, aesthetically pleasing products while respecting all living beings, she established a brand focused on animal welfare, a relatively novel concept at the time. This Italian handbag brand utilizes innovative plant-based materials like oranges, apples, cacti, corn, and other plant derivatives. Beta's commitment to animal welfare, evident in her self-identification as an agent for change and an animal activist, is reflected in the firm's production practices, prioritizing cruelty-free alternatives to animal leather. Beta fosters collaborations with animal rights movements worldwide as a spokesperson for animal rights. She volunteers and promotes awareness campaigns, including dedicated product lines within her fashion brand, focusing on sustainable fashion and prioritizing animal welfare. With a highly active online community, her fashion company presents itself as a social movement that welcomes all who share its aspirations and values. Beta is often invited to speak at various forums and events.

*Gamma.* Beginning in 2016, Gamma started to engage with sustainability as a consumer by critically examining her daily habits and purchasing decisions. Initially, Gamma focused on sustainability within the fashion industry, utilizing Instagram and YouTube to share information about slow fashion, the circular economy, and zero-waste concepts with her Italian audience. She is regarded as a true activist and a pioneer in various areas of sustainability in Italy. Gamma has built a strong online community that supports her activism for sustainability. Additionally, she is a driving force behind numerous online campaigns, using hashtags to mobilize her followers. She co-founded a social movement for responsible fashion in Italy, uniting a diverse coalition of brands, businesses, and industry experts. In 2021, Gamma published a book outlining virtuous behaviors for integrating sustainability into everyday life. From an entrepreneurial perspective, in 2018, Gamma founded a sustainable fashion brand for women, emphasizing eco-friendly fabrics, natural dyes, fair labor practices, and support for local artisans. In 2023, she also launched a zero-waste beauty brand. Gamma is frequently invited to lead online and in-person workshops on sustainable fashion. Moreover, in 2024, she became involved in a global network facilitated by an NGO to foster a deeper understanding of the climate crisis.

## 3. Findings and Concluding Remarks

According to this study's findings, the realization of fashion activism through the lens of activist entrepreneurship for sustainability occurs via three main pathways. Specifically, they involve activist entrepreneurs who advocate for sustainable fashion by strategically leveraging activist movements (either founded by them or connected with them) and their own companies. The first pathway involves the activist entrepreneur, the company, and the social movement. The sustainable fashion cause is

promoted through mutual reinforcement, where the activist community supports and integrates the company's practical efforts in sustainability. The second pathway emphasizes the relation between the business world, represented by the company, and the activist domain, represented by the social movement. Both elements are essential for promoting sustainable fashion and engaging diverse stakeholders in this discussion. The third pathway regards the activist entrepreneur and the activist company. As the sustainable fashion initiative becomes more integrated within the company, it increases calls to action, mobilization efforts, and dissemination activities. In this scenario, the company adopts a clear position via its brand, echoing the idea of brand activism (Vredenburg *et al.*, 2020). Conversely, entrepreneurs can position themselves as brands separate from companies to promote the sustainable fashion movement.

While providing interesting theoretical contributions, the paper also offers valuable managerial implications. With its high engagement, ability to create trends, capacity to shape marketing practices, and focus on sustainability, the fashion industry is a particularly relevant case study for understanding the interplay between activism and entrepreneurship. The advancement of fashion activism through activist entrepreneurship can inform practices in other sectors. Fashion can act as a catalyst for new sustainability trends driven by activism initiatives.

## Abstract

This research explores the awareness and perceptions of youth present at climate negotiations regarding the Loss and Damage fund, with particular attention to the role of the communication of organisations involved in its governance. Based on a qualitative approach, the study includes 168 interviews to youth participants to Youth4Climate (Rome) and COP28 (Dubai), four days of ethnographic observations, and a web listening analysis of more than 150.000 online contents. Results show a significant increase of youth's awareness after the announcement of the fund's operationalization at COP28 (+31%). However, youth's level of knowledge remains mainly general, suggesting the need for more transparent, clear, inclusive and accessible communication. Online platforms results being the main information source, despite they often lack reliability, exposing youth to the risk of disinformation like greenwashing. Transparency, inclusivity and coherence among communication and actions emerge as primary criteria to evaluate the legitimacy of the organisations involved in the fund's governance. The study contributes to enhance the debate regarding sustainability communication, highlighting the central role of youth as change makers, and proposing concrete recommendations for a more effective, transparent and inclusive communication from organisations involved in the Loss and Damage fund governance.

*Keywords: Loss and Damage, Transparency, Inclusivity, Sustainability Communication, Youth*

## 1. Introduction

This research is situated within the sustainability communication field, with a focus on transparency and inclusivity in the communication of organizations involved in Loss and Damage (L&D) fund governance, from the perspectives of youth attending climate negotiations. COP27 marked an essential moment in efforts to establish the L&D fund, with its operationalization milestone reached during the first day of COP28 (Shumba, 2024). As a result, after the negotiations, multiple critical elements

regarding L&D and the associated funding arrangements emerged, sparking public discussion. Within the climate change context, the voices of young activists have emerged as a powerful force advocating (UN, 2018). Therefore, this study aims to analyze the level of awareness of youth specifically regarding the L&D fund, exploring the strategic role of online platforms in creating and shaping their knowledge, as well as their perspectives. Furthermore, based on these perspectives, the research examines which elements youth prioritize when evaluating the organizations involved in the fund's governance, with attention to their communication practices and activities. The research hypothesizes that:

H1: The majority of youth at climate negotiations are expected to have become aware of the L&D fund, especially after its operationalization, due to the wide dissemination of information online. An increase in the depth of knowledge is expected when comparing the periods before and after this event, although the overall level of knowledge is anticipated to remain mostly general, with only a few youths demonstrating a low level, and an increase among those with deep knowledge.

H2: Youth are expected to prioritize elements such as transparency and inclusivity in the communication and activities of organizations involved in the L&D fund governance. These factors influence their perception of the organizations, shaping trust or suspicion of disinformation as greenwashing, and determining whether they support the involvement of the organization in the fund's governance.

## 2. Literature Review

The term L&D refers to the adverse consequences of climate change that persist despite efforts in mitigation and adaptation, impacting communities at both an economic and non-economic level (Burkett, 2014; UNEP, 2024). Despite this, ambiguity regarding the term still remains, which brings scholars to be concerned about problems regarding clarity, liability, and inclusivity within the fund governance, which consequently brings difficulties in international communication and collaboration (Shumba, 2024). Therefore, it is relevant that the actors involved in its governance communicate effectively to guarantee accessibility to information and inclusion. L&D can be categorized within the area of climate justice (Rao, 2022), which more and more is linked to human rights, human development, and climate change (Porter et al., 2020), as well as to climate finance (Zakour, 2024). Among the different stakeholders, youth have particularly shown to prioritize human rights in the climate change agenda (Gasparri et al., 2022), and to bring climate justice at the core of their public debate (Buhre, 2025; Trott, 2024). After the youth organization of Fridays For Future, which quickly gained international attention (Sanson & Bellemo, 2021) after conducting the largest climate mobilization in history (Sanson et al., 2019), youth became officially recognized as agents of change (UN, 2018). Studies have shown how their role in negotiations delegation can bring positive outcomes, (United Nations Joint Framework Initiative on Children, Youth, and Climate Change, 2010; Campisi et al., 2023) highlighting the importance in understanding their perspectives and opinions comncerning topics included in the negotiations agenda setting. Currently, in the literature, research regarding youth involvement and perceptions related to L&D is still very limited. Therefore, this study aims to enrich this field by analyzing youth awareness and knowledge of L&D, as well as by understanding if their priorities in terms of communication of the L&D fund by organizations involved in its governance are aligned with the most critical problems of the fund.

## 3. Methodology

The research relies on a qualitative analysis with in-depth interviews with 168 total participating young activists from all countries at Youth4Climate (Y4C) in Rome (56 interviews) and COP28 (112

interviews), representative of both genders and under 34 years old. Furthermore, four-day ethnographic observations were conducted, including immersive interaction and mystery observations, of four working groups into which youth were divided during the Y4C events, and four side- events with youth participating as delegates to discuss and negotiate at COP28. Finally, web listening was conducted across online conversations on different channels, including social media, news channels, blogs, and specific online forums on climate change, covering 150,000 contents from October 2021 to February 2024 delivered in all languages. The software adopted was 'The Signal 2' by Buzztech2. The system of queries and tagging covered a wide selection of topics related to climate change.

## 4. Results

61% of participants at Y4C declared that they were aware of L&D, while at COP28 92% declared it. More specifically, the amount of youth with a low level of knowledge regarding the L&D has increased from 13% (Y4C) to 23% (COP28); the one with general knowledge from 13% (Y4C) to 34% (COP28); while those with a deep knowledge remained stable at 35%. In parallel, the online analyses shows a spike in the volume of posts shared mentioning the L&D fund during COP28, with more than 10.000 posts per day, compared to those during COP27 (more than 7.000) and COP26 (more than 2.000). The annual average among COP27 and COP28 was about 500 posts per day. This trend reflects what has been reported by youth declaring to hear and discuss L&D especially or sometimes only during COPs, highlighting the relevance of enhancing continuative communication during the entire year. Furthermore, the online sentiment analysis shows a prevalence of negative sentiment in the daily posts (more than 6.000 posts per day), followed by those with positive sentiment (more than 5.000 posts per day) and in conclusion by those with a neutral tone (more than 1.000 posts per day). Moreover, during the interviews, youth underlined communication transparency, accountability, and inclusivity as the main criteria through which they evaluate the actors involved in the L&D fund governance. These elements have been accounted as crucial for all the actors involved: from the fund host to financial contributors as philanthropists or public sectors, and intergovernmental organizations. For what concerns the host of the fund, the World Bank, 63% of youth expressed were not satisfied with the choice of giving it the role; 13% remained neutral to this choice; while 24% supported it. Critics are mainly focused on the low perception of communication transparency, inequalities, and accountability, mainly due to past actions, such as deals with oil companies, and communication strategies, which made them skeptical of greenwashing. Among the organizations suggested as an alternative to host the fund, the Warsaw International Mechanisms, the Green Climate Fund, and the Caribbean Development Bank have been mentioned. Among the actors involved as financial contributors, philanthropy is seen as very positive, but not very involved in the context of financial investments. Differently, the private sector is perceived in a more controversial way: six youth out of ten oppose its participation within the fund's governance, denouncing phenomena like greenwashing and youthwashing. Youth supporting its involvement acknowledge that, despite these issues, the private sector has the financial capacity and high expertise to support the fund. In particular, insurance companies have been described as entities that earn profit from losses and damages. Indeed, despite 68% of youth considering them useful tools to build resilience, eight youth out of ten do not support their involvement in the fund. This would be accepted only in case of financial contribution through donations without a direct economic earn, guided by transparency, inclusion, and accountability. Finally, intergovernmental organizations, such as UN agencies, are considered by the interviewers as reliable actors, able to guarantee transparent communication and real commitment in emergency situations, making their communication and actions aligned and authentic. The collaboration among these entities and governments is received positively, and their involvement in the L&D fund governance is recommended.

## 5. Conclusions

This study has deepened the level of awareness and knowledge of youth present at climate negotiations regarding the L&D mechanisms and fund, and the criteria through which they evaluate the actors involved in its governance, with particular attention to the role of their communication. Based on the data gathered, an increment in the youth awareness of the L&D after the announcement of its operationalization at COP28 has been noted (+31%). Nevertheless, as hypothesized, the level of general knowledge has increased, but in-depth knowledge had no change, which partially confirms the first hypothesis (H1). Data suggests that the awareness and knowledge gathered by youth was primarily through online sources like news and social media, rather than from more reliable and informative sources. This might be the result of what was reported by Shumba (2024), meaning that the ambiguity and unclear understanding of the L&D fund governance communication contribute to obstacles in the full comprehension from the public, especially among youth who are less engaged in traditional communication and technical language, while they are more engaged in digital communication based on accessible language (Hoover & Clark, 2013). This lack of accessibility, inclusion, and transparency is an element of youth disengagement. Additionally, as observed by Gasparri et al. (2022), youth show a strong interest in climate justice themes like L&D, and the online sentiment is generally negative or positive shows strong emotional engagement. Despite this, interest is not necessarily accompanied by the correct and effective tools that enable youth to distinguish between reliable content and disinformation causing a threat. To address this challenge, it is essential that organizations involved within the L&D fund adopt sustainable and inclusive communication strategies that are more transparent and all-encompassing. Making information and content more accessible, clear, and engaging enhances the understanding of the fund, and reinforces the trust of youth with those organizations. Results show that transparency, inclusivity, and coherence among communication and actions are prioritized by youth as elements taken into consideration to assess actors involved in the L&D fund governance, confirming the second hypothesis (H2). Their communication effectiveness is perceived as directly linked to their legitimacy. In the case of the World Bank, even among the youth who supported its nominee as fund host, the necessity for communication improvement in terms of alignment among communication and activities emerged. On the contrary, organizations with minor resources but considered more authentic and transparent resulted as significantly more appreciated, showing that communication reputation matters as much as, or even more, than the technical capabilities from the eyes of youth. The same criteria has been applied to the private sector. Despite recognizing the financial capacity as well as the expertise that could provide a benefit, youth evaluate positively only the organizations that demonstrate real commitment, with coherent and inclusive communication, and avoid greenwashing. This research contributes to enriching the area still to be better developed regarding youth perception of L&D and the communication of organizations involved. Moreover, it is relevant to note the limitations of this study. The research relies on a limited sample that is not representative, making analysis in a very specific temporal context, and taking into account only online media. The research also relies on perceptions, giving the risk of possible personal biases. Therefore, future studies could expand the sample to include a more diverse group of youth, in addition to a longitudinal approach to explore how youth awareness and perceptions evolve over time in response to communication efforts. Finally, studies can integrate qualitative or mixed approaches to improve representation. In conclusion, the research contributes to enriching the sustainability communication area, proposing a new critical lecture on the role of transparency and inclusivity as key factors in building trust among youth. Additionally, it enforces the academic debate related to the role of youth as change makers and to be more included in climate discussions. Finally, the study gives concrete indications to organizations involved in the L&D fund governance, suggesting strategies of

communication more effectively to engage with youth in a significant way, contrasting disinformation and improving their own legitimacy and reputation.

## Abstract

Lo studio esplora come le organizzazioni culturali e creative gestiscono la dipendenza da risorse critiche per rafforzare la propria sostenibilità e legittimazione, attraverso un'analisi qualitativa di 22 buone pratiche estratte dal progetto ECO ART – Digital REvolution for Sustainability. Utilizzando la Resource Dependence Theory (RDT) come quadro teorico di riferimento, l'indagine evidenzia come le risorse critiche si estendano oltre l'economico, includendo dimensioni reputazionali, digitali, territoriali e civiche. In particolare, emerge il ruolo strategico della dipendenza territoriale-reputazionale e della partecipazione comunitaria, nonché l'importanza delle alleanze con università e partner tecnologici per ridurre l'incertezza e rafforzare l'autonomia progettuale. I risultati contribuiscono a un arricchimento teorico della RDT, integrando paradigmi di governance collaborativa e sostenibilità multisfaccettata, e offrono indicazioni operative per le imprese culturali impegnate nella doppia transizione digitale e ambientale. È nel presente che il passato trova voce e il futuro prende forma: un ponte fatto di azioni quotidiane, alleanze e sperimentazioni, che trasformano ogni consiglio in un cambiamento tangibile e duraturo, orientato a un domani più sostenibile.

## 1. Introduzione

Nel cuore della transizione ecologica e digitale, le Industrie Culturali e Creative (ICC) stanno ridefinendo il proprio ruolo non solo come motori di creatività, ma come laboratori di innovazione sostenibile. Le organizzazioni culturali si trovano oggi a operare in ambienti fortemente interdipendenti, caratterizzati da scarsità di risorse pubbliche, pressione reputazionale e vincoli normativi sempre più stringenti. In tale contesto, emerge con chiarezza la necessità di comprendere come queste organizzazioni gestiscano le proprie dipendenze da risorse critiche esterne, in particolare nei settori della cultura, del digitale e della sostenibilità. Tale riflessione si inserisce pienamente nel dibattito proposto dalla presente conferenza, che invita a rileggere le esperienze passate per affrontare

le sfide future, valorizzando il ruolo strategico dell'innovazione e del marketing nella costruzione di modelli culturali più resilienti e sostenibili.

La *Resource Dependence Theory* (Pfeffer & Salancik, 1978) offre un quadro interpretativo utile per analizzare il comportamento strategico delle organizzazioni in condizioni di vincolo ambientale. Tuttavia, gran parte della letteratura RDT si è concentrata su imprese profit, trascurando l'applicazione sistematica del modello ai settori non profit e culturali, dove le risorse sono spesso intangibili, relazionali o istituzionali. Inoltre, non è ancora del tutto esplorato come le pratiche organizzative contemporanee traducano le strategie di riduzione della dipendenza in progetti operativi capaci di generare valore sociale, reputazionale o territoriale.

Alla luce di tali considerazioni, il presente contributo si propone di analizzare un insieme di buone pratiche culturali, digitali e ambientali, al fine di comprendere quali siano le principali risorse critiche da cui le organizzazioni dipendono, e in che modo esse attivino strategie di mitigazione coerenti con la RDT.

La domanda di ricerca che guida il lavoro è la seguente:

*In che modo le organizzazioni culturali, digitali e ambientali gestiscono le proprie dipendenze da risorse critiche, e quali strategie adottano per ridurre la vulnerabilità strutturale, alla luce della Resource Dependence Theory?*

Attraverso l'analisi di 22 buone pratiche specificamente selezionate, si intende contribuire alla discussione teorica sulla RDT ampliandone l'applicabilità al settore culturale e non profit, con particolare attenzione alla rilevanza delle risorse immateriali, alla funzione delle reti collaborative e all'adozione di strumenti digitali e partecipativi come leve di autonomia e proponendo la rilevanza di una dimensione territoriale – reputazionale quale risorsa strategica e condivisa per la creazione di valore.

## 2. Background teorico

La definizione fondativa delle ICC proposta dal Department for Culture, Media and Sport (DCMS, 1998; 2001) le identifica come industrie basate su creatività, abilità e talento, con potenziale economico attraverso la valorizzazione della proprietà intellettuale. Tuttavia, questa visione si è evoluta: secondo l'UNESCO, le ICC sono oggi considerate attori chiave per lo sviluppo sostenibile, grazie alla loro capacità di innovare, rigenerare territori e promuovere coesione sociale (Parekh, 2024) La ricerca sulle peculiarità delle Industrie Culturali e Creative ha evidenziato caratteristiche strutturali distintive che rendono tutt'altro che scontato lo studio di tale settore. Come sottolineato da Imperiale et al. (2021), basandosi su un'ampia revisione della letteratura consolidata (Borisova 2018; Lazzaro 2018; Madgerova e Kyurova 2019), emergono quattro caratteristiche fondamentali che configurano sfide manageriali e organizzative di ordine differente rispetto ad altri settori economici: la natura del prodotto, la dimensione organizzativa, la struttura organizzativa e il carattere imprenditoriale. La natura del prodotto culturale e creativo presenta una complessità ontologica unica nel panorama economico. A differenza di altri tipi di beni, i prodotti culturali e creativi incorporano valori non utilitaristici, quali qualità estetiche, spirituali, sociali, storiche e simboliche (Throsby 2001, pp. 28-29). Questa natura multivaloriale implica che l'utilità del prodotto dipende dalla capacità del consumatore di codificare e decodificare il valore, generando incertezza sia nei processi produttivi che nelle dinamiche di mercato (Townley et al. 2009). Un secondo elemento distintivo è rappresentato dal cosiddetto "missing middle" nella struttura dimensionale del settore. Le imprese operanti nelle ICC si polarizzano tra "big players" (multinazionali di grandi dimensioni) e organizzazioni micro e piccole, con queste ultime che

costituiscono la maggioranza del tessuto imprenditoriale. Queste entità spesso operano in forme notfor-profit o come imprese sociali, frequentemente sotto forma di freelancer (Imperiale et al. 2021). Questa caratteristica strutturale genera attività che possono operare in un range di modalità formali e informali, for-profit e not-for-profit, statali e commerciali, posizionandosi tra produzione e consumo e risultando spesso in interdipendenze lavorative complesse (Pratt 2009). Il "missing middle" ha implicazioni significative per l'adozione di innovazioni tecnologiche, poiché le piccole organizzazioni spesso mancano delle risorse necessarie per investimenti tecnologici significativi, mentre le grandi multinazionali potrebbero non riflettere le dinamiche innovative tipiche del settore creativo locale. Le ICC sono caratterizzate da un workflow temporaneo e non permanente (Benhamou 2003), integrato con una struttura prototipale basata su progetti. Il processo creativo è plasmato da ispirazione, talento, vitalità e impegno dei lavoratori culturali e creativi, emergendo da flussi di conoscenza e operativi complessi che rendono il lavoro in queste imprese altamente volatile. Jeffcutt e Pratt (2002) hanno definito le ICC come "chart businesses", evidenziando come assumano "forme organizzative diverse in tempi diversi e per tecnologie e industrie diverse", dimostrandosi "molto efficaci nel produrre prodotti e mercati per la novità" (Jeffcutt e Pratt 2002, p. 8). Questa fluidità organizzativa presenta sia opportunità che sfide per il settore e la sua filiera. Infine, il quarto elemento critico è rappresentato dalla generale carenza di competenze imprenditoriali trasversalmente a tutti i settori delle ICC. I creativi spesso mancano delle risorse necessarie per trasformare le loro idee innovative in proposte di business sostenibili. Essi trovano difficoltà nell'instaurare relazioni di fiducia reciproche e con istituzioni di Higher Education and Research (HE&R). Inoltre, mostrano frequentemente inadeguatezza nelle competenze di networking, elemento invece fondamentale per incrementare l'expertise cross-settoriale e promuovere opportunità trasversali. Conseguentemente, le ICC risultano spesso isolate o eccessivamente dipendenti dalle risorse pubbliche, affrontando difficoltà nello sviluppare strutture sostenibili e nel guadagnare visibilità di mercato, il che conduce alla sfida ultima di ottenere investimenti (Imperiale et al. 2021). La letteratura evidenzia una controversia fondamentale riguardo all'estensione con cui queste caratteristiche ostacolino o promuovano la sostenibilità delle ICC. Da un lato, la piccola dimensione e la precarietà dei lavoratori culturali pongono evidentemente importanti sfide di sostenibilità. Dall'altro lato, questi stessi fattori sono determinanti nel forgiare l'innovatività delle ICC, grazie all'apprendimento interattivo indotto dalla mobilità dei lavoratori creativi in vari progetti e team, così come alla capacità delle ICC di resistere ai cambiamenti indotti dalle crisi economiche rispetto alle performance di altri settori. A causa delle loro caratteristiche intrinseche, le ICC tendono normalmente a localizzare le loro attività in grandi agglomerati urbani, a detrimento di aree periferiche dove non riescono a trovare le condizioni ideali per start-up e crescita. Tuttavia, secondo una posizione divergente, la localizzazione al di fuori degli "hub creativi" potrebbe talvolta apportare altri vantaggi in termini di attaccamento personale e radicamento sociale degli individui creativi, costi generali e operativi più bassi, networking locale e supporto (Comunian et al. 2010). Questa tensione territoriale ha implicazioni dirette per l'implementazione di innovazioni tecnologiche, che potrebbero fungere da equalizzatori geografici, permettendo alle ICC localizzate in aree periferiche di accedere a mercati globali e reti collaborative internazionali.

La Resource Dependence Theory (Pfeffer & Salancik, 1978) rappresenta un paradigma fondamentale per comprendere come le organizzazioni gestiscano la propria sopravvivenza e autonomia in ambienti caratterizzati da incertezza e scarsità di risorse. Secondo la RDT, le organizzazioni non sono entità isolate, ma sistemi aperti che dipendono da risorse critiche esterne – materiali, finanziarie, simboliche o relazionali – il cui controllo è spesso concentrato in mani altrui. Questa dipendenza genera asimmetrie di potere e vulnerabilità strutturale, che le organizzazioni cercano di mitigare attraverso strategie di adattamento, negoziazione e cooptazione.

Negli ultimi anni, la RDT ha conosciuto una fase di rinnovato interesse e applicazione empirica, anche in settori non tradizionali come le industrie culturali e creative (ICC), le organizzazioni digitali e le iniziative ambientali. In questi contesti, le risorse critiche non sono solo materiali o finanziarie, ma includono legittimità istituzionale, capitale simbolico, accesso a reti collaborative, visibilità pubblica e competenze digitali (Biermann & Harsch, 2016; Ozturk, 2021). Una recente revisione bibliometrica della letteratura RDT ha evidenziato come la teoria sia stata frequentemente utilizzata per analizzare le strategie di sopravvivenza e adattamento in ambienti complessi, ma anche come vi sia una carenza di studi empirici che ne testino esplicitamente i concetti fondamentali, soprattutto in ambiti culturali e creativi (Ozturk, 2021) Tuttavia, la sua applicabilità a organizzazioni che operano in ecosistemi ad alta incertezza e interdipendenza – come quelle culturali, digitali e ambientali – è oggi sempre più riconosciuta.

In particolare, la RDT si rivela utile per analizzare come queste organizzazioni gestiscano la dipendenza da attori dominanti (es. enti pubblici, piattaforme digitali, fondazioni, policy makers) e attivino strategie di adattamento, innovazione e resilienza, riconfigurando le proprie relazioni di potere e rafforzando la propria autonomia in un ecosistema in continua evoluzione.

## 3. Metodologia

Per rispondere alla domanda di ricerca, è stata adottata una metodologia qualitativa fondata sull'approccio del case study esplorativo (Yin, 2018). Tale approccio si è rivelato particolarmente adeguato per indagare fenomeni complessi, ad alta variabilità contestuale e non ancora pienamente formalizzati sul piano teorico, come quelli relativi alla gestione delle dipendenze organizzative in ambito culturale e creativo. Il case study consente infatti un'analisi profonda e contestualizzata, soprattutto in presenza di confini labili tra fenomeno e contesto, e quando l'oggetto dell'analisi è inserito in un ecosistema relazionale ricco di interdipendenze.

Il contesto empirico di riferimento è costituito dal programma ECO ART – Digital REvolution for Sustainability, iniziativa finanziata nell'ambito del Piano Nazionale di Ripresa e Resilienza (PNRR), Missione 1 – Digitalizzazione, innovazione, competitività, cultura e turismo, Investimento 3.3 "Capacity building per gli operatori della cultura per gestire la transizione digitale e verde", Sub-investimento 3.3.3, Azione B1 (cd. *TOCC B1*). Il programma è promosso da un partenariato composto dall'Università degli Studi di Urbino Carlo Bo, dall'Università Politecnica delle Marche, da SID S.r.l., dalla Fondazione Arte della Seta Lisio e da Marchingegno S.r.l.___7. L'obiettivo generale dell'intervento è quello di rafforzare le competenze degli operatori culturali nella gestione della transizione digitale e ambientale, promuovendo l'integrazione di criteri sociali, ecologici e inclusivi nella progettazione e produzione culturale.

La selezione dei casi studio si è basata sull'elenco delle buone pratiche raccolte e sistematizzate nell'ambito del programma ECO ART. A partire da una popolazione iniziale di oltre 40 pratiche mappate, è stato selezionato un campione ragionato di 22 casi, secondo criteri teorico-metodologici di coerenza con la RDT, disponibilità informativa e varietà tipologica. In particolare, sono stati privilegiati i casi in cui le dinamiche di dipendenza da risorse critiche – materiali, simboliche, reputazionali e

territoriali – risultassero chiaramente articolate, e in cui fossero osservabili strategie di mitigazione attiva delle suddette dipendenze.

La raccolta dei dati è avvenuta attraverso un processo di triangolazione tra fonti documentali interne al progetto (schede descrittive, materiali di mappatura disponibili su piattaforma su richiesta), analisi di

contenuti digitali accessibili pubblicamente (siti web ufficiali, presentazioni, articoli, interviste e video), e codifica qualitativa secondo un approccio abductive-oriented. Tale triangolazione ha permesso di costruire una matrice interpretativa comparata in grado di identificare pattern ricorrenti nelle forme di gestione delle dipendenze, offrendo così una base solida per la discussione teorica e la riflessione sulle implicazioni manageriali.

## 4. Risultati e commento

L'analisi ha interessato un campione selezionato di 22 buone pratiche, estratte da un insieme più ampio di oltre 40 progetti, con l'obiettivo di garantire un'adeguata rappresentatività in termini di contenuti, tipologie organizzative, territori e target sociali. La selezione è stata guidata da criteri di varietà tematica (cultura, digitale, sostenibilità), rilevanza strategica (impatto reputazionale e innovativo) e coerenza rispetto ai presupposti teorici della Resource Dependence Theory (RDT). Le pratiche individuate si collocano lungo tre assi principali: iniziative culturali e territoriali (22 casi), pratiche digitali e di innovazione (10 casi), e infine pratiche ad orientamento ambientale o civico (8 casi). Per ciascun caso, sono state identificate la risorsa critica su cui si fonda la sopravvivenza o la crescita dell'iniziativa, il grado di scarsità o di concentrazione del controllo su tale risorsa, la forma di dipendenza che ne deriva e la strategia adottata per mitigarne gli effetti. Il quadro teorico di riferimento è quello elaborato da Pfeffer e Salancik (1978), secondo cui le organizzazioni sono entità sociali interdipendenti, inserite in un contesto ambientale da cui traggono risorse materiali, simboliche e istituzionali necessarie alla loro continuità. In tale contesto, le pratiche esaminate forniscono un osservatorio privilegiato per comprendere le modalità concrete con cui le organizzazioni culturali, sociali e civiche affrontano la vulnerabilità derivante da risorse esogene, assumendo strategie di adattamento e cooptazione. L'esame dei casi selezionati, tabella 1 in calce al manoscritto, mostra come le risorse oggi considerate critiche non siano più limitate alle dimensioni economiche o materiali, ma includano risorse reputazionali, sociali, digitali e ambientali. In particolare, numerose organizzazioni operanti nel settore museale e culturale hanno ridefinito il proprio campo d'azione attorno alla valorizzazione di pubblici vulnerabili, come giovani, donne e persone con disabilità. Tali segmenti, storicamente marginali nei modelli museali tradizionali, costituiscono oggi un asset strategico in quanto veicolano accesso a fondi pubblici dedicati, riconoscimento istituzionale e crescente legittimazione sociale. In termini di dipendenza, ciò si traduce in una pressione verso la trasformazione delle pratiche di governance, attraverso meccanismi di cooptazione di rappresentanti nei board, co-disegno di percorsi esperienziali e attivazione di dispositivi di accountability inclusiva.

Un secondo asse interpretativo riguarda la crescente rilevanza delle tecnologie digitali, che diventano risorsa cruciale non solo per la comunicazione e l'accesso al pubblico, ma anche per la produzione culturale stessa. Le pratiche che incorporano intelligenza artificiale, realtà aumentata, app e ambienti virtuali dimostrano una chiara consapevolezza della propria dipendenza da competenze e infrastrutture esterne. In risposta, tali organizzazioni implementano strategie di alleanza con enti universitari, partenariati tecnologici o outsourcing selettivo, con l'obiettivo di ridurre l'incertezza operativa, aumentare l'autonomia progettuale e garantirsi un vantaggio reputazionale rispetto alla concorrenza. Rispetto alla formulazione originaria della RDT, queste dinamiche suggeriscono una estensione teorica volta a includere le competenze digitali come asset intangibile ma strutturalmente centrale nei contesti contemporanei. La terza direttrice emersa dall'analisi riguarda le pratiche che valorizzano risorse territoriali, culturali e ambientali. Ecomusei, festival rurali e reti artigianali evidenziano forme di dipendenza legate alla scarsità di flussi turistici autonomi, alla debolezza strutturale della governance locale o alla difficoltà di mantenere il controllo sulla narrazione culturale. In questi contesti, le strategie di risposta si fondano su logiche di rete, collaborazione istituzionale e valorizzazione partecipativa dei

saperi locali. Tali pratiche evidenziano una forma di adattamento strategico che privilegia la densità relazionale e la coesione territoriale come strumenti per aumentare la resilienza organizzativa, rafforzare il capitale simbolico e accedere a circuiti di finanziamento multilivello.

L'analisi condotta conferma come la Resource Dependence Theory (RDT) costituisca un quadro utile per comprendere le strategie adottate dalle organizzazioni culturali e creative nel gestire risorse critiche, ma al contempo evidenzia la necessità di un ampliamento teorico per includere dinamiche specifiche del settore delle industrie culturali e creative (ICC) (Benghozi & Salvador, 2016a; Throsby, 2001; Lazzaro, 2018). In questo ambito, le risorse chiave non sono solo materiali o finanziarie, ma anche sociali, simboliche e ambientali, con particolare rilievo per la dipendenza territoriale-reputazionale, che si manifesta come una forma complessa di relazione con il contesto locale (Imperiale, Fasiello & Adamo, 2021; Salvador & Benghozi, 2023). Inoltre, musei e iniziative (Uffizi, Explora, Museo Ferragamo, Wien Museum) attivano programmi per giovani, donne, disabilità: queste categorie diventano risorse strategiche. L'organizzazione dipende dalla loro partecipazione per legittimità, fondi, audience e nel gestire la dipendenza tali istituzioni culturali sviluppano practice inclusive e governance partecipativa. Questa dipendenza territoriale è caratterizzata da una scarcity non tanto economica quanto culturale e simbolica, poiché il valore si fonda sull'embeddedness in un ecosistema sociale e sulla costruzione condivisa dell'identità locale, un aspetto che la RDT classica non considera completamente (Granovetter, 1985; Casciaro & Piskorski, 2005). Le organizzazioni culturali, come gli ecomusei o i consorzi artigianali, costruiscono alleanze e reti partecipative che fungono da meccanismi di governance collaborativa e legittimazione, riflettendo anche i principi della triple bottom line (Elkington, 1997), che integra sostenibilità economica, sociale e ambientale. Inoltre, le ICC devono gestire la crescente rilevanza delle tecnologie digitali, che rappresentano risorse intangibili e altamente specializzate, la cui scarsità richiede alle organizzazioni di sviluppare partnership strategiche con università, centri di ricerca e attori tecnologici (Benghozi & Salvador, 2016b; Jeffcutt & Pratt, 2002). Questa dipendenza dalle competenze digitali e dall'innovazione tecnologica amplia il campo di applicazione della RDT, suggerendo la necessità di includere asset immateriali e dinamiche di innovazione continua come fattori critici per la resilienza e il vantaggio competitivo delle imprese culturali (Madgerova & Vyara, 2019).

Infine, l'importanza del capitale sociale e civico, attraverso la partecipazione comunitaria e la co-gestione delle risorse ambientali e culturali, sottolinea il ruolo cruciale della fiducia sociale e della responsabilità collettiva nel rafforzare la legittimità organizzativa e ridurre la vulnerabilità derivante da risorse esterne limitate (Benhamou, 2003; DCMS, 1998; Townley, Beech & McKinlay, 2009). In questo contesto, le università emergono come nodi chiave nella rete di risorse, fornendo conoscenza specialistica, legittimazione istituzionale e mediazione tra attori diversi, confermando la rilevanza delle alleanze interdisciplinari e multi-stakeholder nel panorama contemporaneo delle ICC (Salvador & Benghozi, 2023). Queste configurazioni richiedono una rilettura della RDT in chiave relazionale (Casciaro & Piskorski, 2005), in cui l'interdipendenza si gioca non solo sul controllo diretto delle risorse, ma sulla gestione del significato condiviso e sulla costruzione simbolica dell'identità territoriale. L'autonomia organizzativa, in questo senso, si misura nella capacità di "mediare" il territorio come discorso culturale, piuttosto che semplicemente utilizzarlo come contesto fisico o amministrativo. In termini di implicazioni manageriali, è cruciale per le ICC posizionarsi come organizzazioni autentiche, profondamente radicate nel contesto locale e percepite come socialmente rilevanti.

La valorizzazione delle risorse informali e simboliche, quali memorie collettive, identità culturali e narrazioni (storytelling), si configura come un fattore competitivo strategico. Tali risorse non solo contribuiscono a differenziare l'offerta culturale, ma rappresentano anche leve fondamentali per la

mobilitazione di comunità, la costruzione di reti collaborative e l'accesso a finanziamenti pubblici e privati, che premiano l'innovazione sociale e culturale.

Inoltre, le ICC devono consolidare il proprio ruolo come agenti di innovazione culturale e sociale all'interno dei territori in cui operano, sfruttando il capitale territoriale non come mero spazio geografico, ma come un ambiente relazionale e simbolico dove si negozia la reputazione, la legittimità e, più in generale, le condizioni di sopravvivenza e sviluppo. Questo implica una gestione attenta delle relazioni con stakeholder locali, istituzioni e comunità, in una logica di governance collaborativa e partecipativa.

La reputazione, pertanto, deve essere considerata non un mero riflesso della performance economica, ma un driver strategico centrale, capace di influenzare in modo determinante la sostenibilità a lungo termine dell'organizzazione. Per le ICC, dunque, la gestione della reputazione territoriale e della dimensione simbolica rappresenta una priorità manageriale imprescindibile, che richiede competenze trasversali, visione strategica e capacità di innovare i modelli organizzativi e di governance tradizionali.

## 6. Conclusioni

Le evidenze emerse dall'analisi delle 22 buone pratiche culturali, digitali e ambientali selezionate consentono di rispondere in modo articolato alla domanda di ricerca iniziale, ovvero: in che modo le organizzazioni culturali, digitali e ambientali gestiscono le proprie dipendenze da risorse critiche, e quali strategie adottano per ridurre la vulnerabilità strutturale, alla luce della Resource Dependence Theory? I risultati mostrano che tali organizzazioni, operanti spesso in condizioni di alta incertezza e scarsità di risorse, attivano strategie multilivello di adattamento e influenza, tra cui l'alleanza con università e reti civiche, la valorizzazione reputazionale del territorio e la cooptazione di attori tecnici per compensare dipendenze digitali. La RDT si dimostra un quadro interpretativo ancora utile, ma necessita di essere estesa per includere forme di dipendenza da risorse immateriali e simboliche, quali la legittimazione culturale, il capitale relazionale e la visibilità pubblica. L'analisi suggerisce l'esistenza di una *Resource Dependence Theory territoriale-reputazionale*, dove il controllo delle risorse non si esprime solo in termini strutturali, ma anche attraverso la capacità di incidere su processi di significazione, inclusione e narrazione identitaria.

Tuttavia, lo studio presenta alcuni limiti. La natura qualitativa ed esplorativa dell'analisi, unita a una selezione non esaustiva delle buone pratiche, non consente generalizzazioni né l'identificazione di nessi causali forti tra configurazioni strategiche e performance organizzativa. Inoltre, l'adozione di fonti secondarie e descrittive può aver condotto a una sovra rappresentazione delle dimensioni più visibili o istituzionalizzate delle pratiche. In termini teorici, resta da esplorare in modo più sistematico l'interazione tra RDT e altre prospettive, come la teoria dell'embeddedness o le logiche istituzionali ibride, in particolare nei contesti a vocazione culturale e civile. Per future ricerche, si propone di approfondire, attraverso metodi misti o studi di caso longitudinali, il ruolo delle dipendenze reputazionali e territoriali nelle imprese culturali e creative, analizzando come queste si evolvano nel tempo e si traducano in strutture di governance, forme di resilienza e modelli di sostenibilità. Sul piano teorico, l'estensione della RDT verso una prospettiva più dinamica e relazionale può offrire contributi significativi per comprendere le strategie di sopravvivenza e innovazione nelle organizzazioni orientate al valore culturale e sociale, in ambienti ad alta complessità e interdipendenza.

Considerazione finale e in parte svincolata dal focus del progetto, le ICC – soprattutto quelle più piccole e radicate nei territori – dimostrano che è possibile innovare senza perdere l'anima, coniugando tradizione, tecnologia e sostenibilità.

## Abstract

Diversity, equity and inclusion (DEI) have become important topics for corporate reputation and employee engagement. However, DEI communication can expose organizations to reputational risks when customers perceive a misalignment between words and actions. This study investigates how the 20 most virtuous companies operating in Italy — recognized as Best Workplaces for DEI by Great Place to Work in 2024 — communicate their DEI commitments across different external channels that include LinkedIn, their corporate websites and CSR reports. Employee perceptions were analyzed using Glassdoor reviews. The study aimed to evaluate the consistency, authenticity and strategic integration of diversity, equity and inclusion (DEI) messaging, and to examine its relationship with employees' perceptions. The analysis emphasizes the importance of consistency across channels, inclusive language and credible storytelling, while highlighting the limitations of performative communication. The combination of qualitative analysis and content comparison made it possible to assess the effectiveness and internal consistency of DEI communication. The results only partially confirm the five hypotheses drawn from the existing literature. In fact, multichannel integration and storytelling can improve the credibility of communication, but this is not always reflected in organizational practice. The analysis also identified a pool of companies that adopt a low-profile strategy, i.e., they decide to communicate little on these issues despite DEI values being an integral part of their organizational culture. This suggests a strategy that embodies the tension between protecting reputation and meeting the demand for transparency from target audiences.

This study contributes to DEI communication research by integrating discursive, strategic and perceptual dimensions.

*Keywords: DEI, DEI communication, Italian companies, Great Place to Work, authenticity, organizational identity, employee perception, employee satisfaction*

## 1. Introduction

In the first few months of Donald Trump's second US administration, there was much talk of Diversity, Equity, and Inclusion (DEI). The concept was accompanied by fierce criticism, which led to significant cuts in DEI programs (Ng et al. 2025, White House, 2025).

However, the promotion of diversity, equity, and non-discrimination is a fundamental principle of human rights (United Nations General Assembly, 2015) and is recognized as one of the guiding values of the European Union (EU, 2024). The approach adopted by European and international legislators therefore differs greatly from the divisive rhetoric described in recent months by the US government; rather, it moves towards an inclusive conception of organizations, as proposed by Shore et al. (2011), who describe inclusion as a process in which "individuals are treated as insiders in the work group when they conform to organizational/dominant culture norms and downplay uniqueness." What the authors and legislators describe, therefore, is a way to promote talent in a supportive organizational environment in which everyone can fully express themselves. This polarized landscape raises a key question for contemporary organizations: how to communicate DEI authentically and effectively, without risking reputational backlash or being accused of 'diversity washing.'

From a business perspective, DEI represents a real competitive advantage (Bourke, 2018; Gallup, 2022). A study by McKinsey & Company (2023) found that companies with greater gender and ethnic diversity in their management teams are more likely to achieve better financial results than their less diverse counterparts, showing that diverse and inclusive organizations tend to be more innovative and perform better. Diversity of perspectives and experiences stimulates creativity and problem-solving, resulting in improved decision-making and stronger results (Hundschell et al., 2021). Companies with a strong DEI culture are able to attract and retain the best talent, thereby increasing their competitiveness in the market (Deloitte, 2024; Seijts and Milani, 2022). DEI, therefore, is not only an ethical principle but also a crucial strategic factor that contributes to the success and sustainability of the organization. Adopting this kind of DEI practices can improve business performance, employee satisfaction, reputation, and innovation, thereby creating a more equitable and productive work environment (Ferraro et al., 2023).

Thanks to the literature review and the empirical analysis of collected data, a framework to guide companies in DEI communication was developed with a specific focus on the authenticity and effectiveness of communication strategies.

This study focuses on the top 20 Italian companies included in the 2024 Best Workplaces for Diversity, Equity & Inclusion ranking (Great Place to Work Italy, 2024). Organizations were selected based on the following criteria: a minimum of 50 employees and past collaboration with Great Place to Work between 1 May 2023 and 15 April 2024. The ranking is constructed using 25 items from the Trust Index questionnaire to evaluate the experiences of individuals belonging to four key demographic categories: organizational level, gender, age, and contractual status (full-time/part-time). These items were used to calculate the Diversity, Equity & Inclusion Index, which determines each company's position in the ranking.

This study begins with a review of the literature aimed at identifying the key variables for constructing an effective DEI message. Then, the Great Place to Work Diversity, Equity and Inclusion ranking (2024) made it possible to identify the twenty companies to focus on for analysis. External communication, company websites, LinkedIn profiles and the content of sustainability reports (CSR) were taken into consideration to enrich the analysis and provide a more complete overview. Finally,

an assessment of the consistency between the stated message and internal perception was conducted by analyzing employee opinions published on the Glassdoor platform. The present study has some contextual and methodological limitations such as the companies' location (Italy), the period examined (1 year) and the lack of impact measurements such as retention or internal demographics.

## 2. Review of the literature

The growing importance of DEI issues within corporate strategies has stimulated considerable scientific research aimed at investigating how organizations communicate their DEI commitment to external stakeholders. On the one hand, DEI communication is a key strategic tool for building a company's reputation, brand identity, and stakeholder trust. On the other hand, it raises significant concerns for companies and may lead them to refrain from communicating their initiatives in order to avoid backfire phenomena (Illia et al., 2013; Baker et al., 2022; Martin et al., 2024).

### 2.1 Channels

Companies that decide to communicate their DEI commitment do so through various channels. The most common include:

Institutional websites, where DEI policies, employee testimonials, and measurable results are often found in the 'about us' or 'social responsibility' section (Mundy, 2019; Ravazzani et al., 2023);

ESG or CSR reports, which are formal tools for communicating DEI practices and metrics (Gray et al., 1995; Adams, 2002);

Social media platforms, which enable participatory and narrative communication through visual campaigns and storytelling (Verk, 2021) and promote dialogue and inclusion (Boulouta & Pitelis, 2014);

Public events and partnerships, such as participation in Pride or adherence to the Diversity Charter (Noh et al., 2024).

Integrating different types of channels helps to make communication more effective and credible (Judd & McKinnon, 2021).

One of the essential prerequisites for effective DEI communication is segmenting the target audience in order to tailor messages to the needs and expectations of different stakeholders by focusing on a specific audience (Dobbin & Kalev, 2016; Ozdemir et al. 2023). In particular, some studies show that each group experiences exclusion and inclusion in different ways and, therefore, a highly personalized message is needed on these issues (Nishii & Leroy 2022; Holvino et al., 2004). In any case, the content of the DEI message must be clear, consistent, and transparent (Alhouti et al., 2016) because this increases the value of authentic storytelling (Pless & Maak, 2004).

### 2.2 Content

Regarding content, personal stories and testimonials are powerful tools that reinforce the credibility of a company's perceived commitment to DEI (Byrne, 2022), while consumer-facing brands that integrate DEI narratives into their strategic messaging, especially when they highlight employee voices, tend to be perceived more positively (Mills Cox, 2025).

In fact, in the contemporary context of corporate communication, employees are no longer simply an internal audience of Diversity, Equity and Inclusion (DEI) policies, but are emerging as key players in

the co-construction of the company's reputation and public identity. In this sense, the literature is increasingly emphasizing the active role of workers in shaping the organization's external perception, particularly through individual and collective narratives, articulated across various formal and informal communication channels (Bisel, 2010; Frandsen & Johansen, 2011). On these occasions, their testimonies are perceived as more authentic by other users and therefore not only enrich the narrative but also legitimize it. However, when the aspirational image does not correspond to the internal reality, the risk of backlash increases (Walwema & Bay, 2023). Other studies show that the dissonance between institutional narratives and the daily experiences of employees can trigger skepticism, even accusations of diversity washing (Nishii, 2013; Baker et al., 2022).

The content of the message, which must be clear, transparent, and consistent with corporate values and other initiatives, is another important element. In particular, it is fundamental to pay attention to this aspect to avoid reputational damage caused by accusations of 'greenwashing' or 'diversity-washing', eroding the organization's credibility and reducing stakeholder engagement (Baker et al., 2022). In addition, messages must be emotionally engaging, capable of evoking positive emotions and building a strong bond with stakeholders. The importance of telling authentic and personal stories to enhance the perception of these initiatives and strengthen the emotional connection with the public has been emphasized in recent research (Pless & Maak, 2004, 2019). Moreover, transparency and consistency in DEI messaging are considered essential to avoid accusations of hypocrisy and to maintain stakeholder trust (Byrne, 2022).

To summarise, the authenticity and credibility of the organization are fundamental to the success of these strategic initiatives. To this end, companies can use testimonials and real stories (Ferdman & Deane 2014) or obtain certifications from recognized bodies (McCandless et al., 2022).

Precisely because of the reputational problems that miscommunication in the DEI field can cause, it is advisable for organizations to continuously monitor their communications. This ensures that the organization's public image remains aligned with its values and actions (Avery & McKay, 2010).

### 2.3 Language

Another important point to consider in DEI communication is language, whose terms must be chosen carefully and represent elements of justice in themselves (Williams, 2023; Nguyen et al., 2020). In the corporate sphere, language can build or inhibit the participation of represented groups; therefore, adopting inclusive pronouns, non-binary identity references, and giving space to marginal narratives avoids tokenism and supports equity. The need to adapt messages to the local cultural context, paying attention not only to language but also to visual choices, has been highlighted in recent literature (Wolfgruber et al., 2022; Walwema & Bay, 2023).

### 2.4 Feedback

Feedback from the public also plays an essential role in analyzing the effectiveness of communication strategies, as collecting and analyzing feedback provides a better understanding of public perceptions and reactions. This input helps to adapt strategies based on the results obtained, thus ensuring the success of DEI initiatives (Nishii & Leroy, 2022; Nishii, 2013). Furthermore, creating structured feedback mechanisms enables open and constructive dialogue between the organization and its stakeholders (Podsiadlowski et al., 2013). Scholars (Bernstein et al., 2020; Kaplan and Donovan, 2016) support the idea that responding quickly to feedback and adapting strategies accordingly can increase stakeholder trust and engagement, improving the perception of DEI initiatives.

## 2.5 Communication in Diversity, Equity, and Inclusion

In summary, the literature review identified the following variables as most important for the implementation of effective DEI communication strategies:

Clarity and consistency of messages to reinforce the perception of authenticity and facilitate understanding of DEI values while avoiding ambiguities that can lead to mistrust or accusations of 'diversity washing' (Alhouti et al., 2016; Baker et al., 2022).

Perceived authenticity as an increasingly important aspect (Illia et al., 2025) in the construction of social messages, which can be aided by the contribution of personal narratives from different stakeholders (Pless & Maak, 2004; Byrne, 2022).

The appropriateness of communication channels, which should integrate different platforms to improve coverage and engagement (Judd & McKinnon, 2021).

Adaptation to the target audience is also important, as DEI communication is most effective when it is targeted and sensitive to the specificities of the audience (Dobbin & Kalev, 2016; Nishii & Leroy, 2022). In particular, different represented groups need personalised, inclusive, and sensitive language (Nguyen et al. 2020; Williams, 2023) in order to strengthen identification and avoid tokenism.

The presence of metrics and verifiable quantitative data reinforce the credibility of the DEI message and demonstrate a concrete commitment (Gray et al., 1995; Adams, 2002).

Stakeholder engagement and feedback allow strategic adjustments and strengthen engagement (Nishii, 2013; Podsiadlowski et al., 2013).

Reputation and media coverage are important because public perception of DEI commitment influences the legitimacy and effectiveness of communication (Avery & McKay, 2010).

## 2.6 The strategy of silence

Alongside explicit and proactive forms of communication, a strategic silence is emerging in corporate communication processes, particularly on reputationally sensitive issues such as diversity, equity, and inclusion. In certain political and cultural contexts, companies may deliberately choose not to expose themselves publicly, or to adopt a muted communication strategy, in order to avoid the risk of backlash, media controversy, or polarizing reactions from stakeholders (Crane & Glozer, 2016; Illia et al., 2013). Silence, in this sense, is not an absence of communication, but rather a deliberate form of organizational identity and reputation management. This strategy is particularly evident in socio-political contexts perceived as hostile or polarized, where the adoption of an explicit DEI narrative can generate accusations of ideologization or unsolicited activism. Some organizations, while pursuing concrete inclusion and diversity initiatives, prefer not to emphasize them in public channels, opting for a low-profile communication strategy or focusing on technical, neutral, or low-visibility language (Walwema & Bay, 2024). In these cases, the choice of silence is a form of risk-averse DEI communication (Berkelaar et al., 2022), aimed at preserving reputational capital by avoiding exposure on divisive value issues. However, this strategy can have ambivalent consequences: while it reduces the immediate risk of negative reactions, it can compromise the perception of authenticity and transparency, making the involvement of internal and external stakeholders less effective (Pless & Maak, 2004; Nishii, 2013). For this reason, balancing visibility and caution is one of the main challenges in contemporary DEI communication today.

It is important to emphasize that the early months of 2025 have been particularly significant for diversity, equity and inclusion matters. Following the US elections in 2025 and the inauguration of the Trump administration, DEI began to polarize public debate, even in Europe. To understand the influence of these events, an exploratory analysis was conducted using Media Cloud, focusing on content published from January 2025 onwards. It was found that newspapers published a significantly higher number of articles than in previous years: the word 'DEI' was mentioned 1,750 times in January 2025, which is a 90% increase compared to all previous years (average 912). However, this greater visibility is not matched by more articulated content because most of the articles are generic and lack focus on specific initiatives (e.g. gender gap, disability, generational inclusion, etc.). The aim of this study is to understand whether Italian companies have reacted to this new context by aligning with American positions on DEI.

According to the literature review presented, and considering this scenario the following research question is raised:

How do these companies communicate their commitment to Diversity, Equity & Inclusion (DEI) through external channels, and how consistent is this communication with employees' internal perceptions?

To answer this question, the study analyzed whether:

**H1.** Employees perceive companies that communicate DEI issues clearly, consistently, and authentically more positively.

**H2.** Personal testimonials, storytelling and concrete data posted on LinkedIn and corporate websites are associated with highly credible DEI communication.

**H3.** Companies with greater variety and integration of channels (e.g., LinkedIn, website, CSR) communicate their DEI commitment more effectively.

**H4.** There is a significant discrepancy between external DEI narratives (e.g. LinkedIn and websites) and internal employee perceptions, particularly in cases of 'diversity washing.'

**H5.** Companies that use inclusive language adapted to the Italian cultural context in their social media posts achieve higher digital engagement (e.g. more likes and shares on LinkedIn).

## 3. Methodology

In terms of methodology, the research takes a qualitative, multi-case approach, based on a sample of twenty Italian companies that were classified as 'Best Workplaces for Diversity, Equity & Inclusion' in Italy by Great Place to Work in 2024. Specifically, the ranking includes companies operating in Italy with at least 50 employees that collaborated with Great Place to Work between 1 May 2023 and 15 April 2024.

The websites, LinkedIn pages, CSR reports, internal policy documents, and Glassdoor reviews of these companies were examined. The inclusion of multiple types of documents strengthens the methodological foundation of this study, as using a diverse set of sources allows for a more nuanced and layered analysis of how organizations construct, communicate, and perform their DEI strategies. Document analysis is particularly effective when used in combination with other qualitative methods or sources, allowing researchers to corroborate evidence and capture different facets of the same phenomenon (Bowen, 2009). Each type of document brings a unique discursive layer that contributes

to a more comprehensive understanding of how Diversity, Equity and Inclusion (DEI) is framed within organizations.

In order to evaluate whether the communication meets the criteria of clarity, consistency, inclusiveness, presence of metrics, and personal narratives, a grid of indicators was developed based on a DEI Glossary (H1 and H2).

In addition, a "channel fit" set was created by calculating the degree of channel integration and the presence or absence of communication between platforms. This made it possible to assess the variety and strategic use of the different channels (H3). Thanks to the review and feedback from Glassdoor, it was possible to detect alignment or dissonance between the external DEI narrative and internal employee experiences (H1 and H4). The data were examined in a quantitative (e.g. sentiment, ratings) and qualitative (e.g. recurring themes of inclusion or exclusion) way. Furthermore, LinkedIn engagement metrics (likes, comments, shares) were analyzed to assess audience response to DEI-oriented posts using inclusive language and culturally adapted narratives (H5).

Reviews were examined both quantitatively (e.g., sentiment, ratings) and qualitatively (e.g., recurring themes of inclusion or exclusion). Moreover, LinkedIn engagement metrics (likes, comments, shares) were collected to assess audience response to posts using inclusive language and culturally adapted narratives. This provided empirical evidence for H5.

A qualitative approach was chosen to capture the depth and complexity of DEI communication practices, which often involve implicit meanings, symbolic choices, and culturally embedded narratives that are not easily quantifiable (Eisenberg, 2007).

Triangulation, as a methodological strategy, involves taking different perspectives on an issue under study, substantiating these views by combining linked methods and theoretical approaches, ultimately extending the validity of findings by integrating diverse data sources (Flick, 2018). This approach enables a more comprehensive understanding of complex phenomena by compensating for the weaknesses of single methods because results gained from one type of source can be validated or contradicted by another, leading to new insights.

### 3.1 Methods

The comparative case study method is adopted as it allows for the systematic identification of similarities and differences across multiple organizational contexts (George & Bennett, 2005). This approach helps to understand how different companies approach diversity, equity and inclusion (DEI) matters. By comparing multiple cases, contradictions and potential discrepancies between stated intentions and actual perceptions or outcomes can be detected. The approach also enables theoretical generalisation, helping us to understand how DEI is communicated, enacted and perceived within organizational settings.

To gather the data, scraping techniques were employed to extract publicly available information from three main sources: company websites, LinkedIn pages, and employee-generated reviews on Glassdoor. These platforms were selected for their relevance in shaping both the external image, and the perceived internal climate of organizations. Specifically:

LinkedIn was analyzed to assess corporate communication of DEI-related content, including posts, hashtags, campaigns, and leadership discourse.

Websites were examined for mission statements, policy documents, and dedicated DEI sections.

Glassdoor offered valuable qualitative data from employees' perspectives. This triangulation of sources enhances the validity of the findings by allowing for cross-verification and the identification of gaps or alignments between institutional narratives and individual experiences. Web scraping allows for consistent and replicable collection of large volumes of textual, and visual data, capturing how companies describe their DEI commitments across different digital environments. LinkedIn was used to analyze the language and visibility of DEI-related content within corporate posts and profiles, while Glassdoor reviews provided access to the employee perspectives on workplace inclusiveness.

Data were collected over the past 12 months, cleaned, organized into case files, and then systematically compared through thematic analysis.

Using scraping as a technique within a comparative case framework enables patterns to be traced across organizations while retaining sensitivity to context. This pairing of method and technique enables a grounded, data-rich exploration of how diversity, equity and inclusion (DEI) is performed, narrated and contested in the digital sphere by the twenty most virtuous Italian companies.

### 3.2 Analysis

A DEI dictionary has been created, collecting 89 Italian and English words taken from the analyzed literature and the Media Cloud website[29].

Posts from LinkedIn published in June 2024 and June 2025 have been scraped for all 20 companies in the last year (June 2024 to June 2025). The words used in these posts have been compared to the dictionary, and DEI-related posts have been counted. All metrics relating to engagement (shares, comments and likes) have been counted to assess audience interest in DEI-related posts. The researchers conducted a search for DEI-related posts to assess whether there were references to specific audiences related to diversity, equity and inclusion.

The companies' websites were analyzed to monitor content related to diversity, equity and inclusion (DEI), identifying the sections in which these topics were mentioned. The analysis also covered the types of images used.

The number of clicks required to access this information was counted. A thorough website analysis was conducted to ascertain whether they held a 'Best Place to Work for DEI' certification or a comparable designation. A comprehensive search was conducted for references to specific DEI-related target audiences.

The CSR reports, where available (12 out of 20 companies), were analyzed, and DEI-related terms and audience references were examined.

The Glassdoor platform was manually scraped to create a dataset containing all the available reviews for the companies (18 out of 20). The same time period used for LinkedIn (June 2024 to June 2025) was applied here. Due to the focus of this research on the Italian market and the absence of location specifications in the reviews, the Italian language filter has been selected. For each review of every company, the following information has been reported: the date; the overall rating given; the title; whether the review was flagged or excluded for three items (Recommend, CEO approval rating and

[29] https://www.mediacloud.org/

Commercial forecast); the list of advantages and disadvantages pointed out by employees; advice for TLs; and the score for the six dimensions investigated by Glassdoor (Culture and Values, Diversity, Equity and Inclusion, Work/Life Balance, Senior Executives, Salary and Benefits, and Career Opportunities). For each company's Glassdoor page, the overall rating of the reviews during the specified time period is reported, as well as the percentage of reviews giving 1, 2, 3, 4 or 5 stars, the percentage of reviews explicitly recommending the company, and the average score for each of the six dimensions. These values were then compared to the general score given by all Italian reviews without a date filter. Furthermore, it has been highlighted, as reported by Glassdoor, whether the overall value was below or above the average score for the company compared to other companies of the same size and in the same industry.

As employees are the primary stakeholders in DEI (Ravazzani et al., 2023), companies were consulted directly, albeit in an exploratory manner[30]. The following areas were investigated: which figures in companies are responsible for DEI; the focus areas; the initiatives implemented or planned; the objectives; how long they have been working on these issues; whether there has been a turnaround following the new American positions; the concrete, quantifiable results attributable to their commitment; the obstacles eventually encountered; the commitment of top management to every initiative; the main challenges; and the quantifiable results achieved.

## 4. Findings

The top 20 Italian companies recognized for their commitment to Diversity, Equity & Inclusion by Great Place to Work (GPTW 2024) were selected to conduct a qualitative analysis that explored how these organizations communicate DEI. In particular, the following channels were analyzed: LinkedIn, institutional websites, sustainability reports (CSR), and the Glassdoor platform.

This analysis made it possible to construct a communication quality index based mainly on two dimensions - narrative consistency across channels and perceived authenticity - which were then compared and analyzed. In particular, narrative elements such as storytelling, personal testimonials, and inclusive language were identified for the LinkedIn channel. Texts, specific indicators (e.g., turnover, minority percentages in the company, gender gap) and policies were extracted and analyzed from company websites and CSR reports. The comparison between narrative and objective data made it possible to generate an indirect indicator of perceived authenticity.

A comparative analysis was conducted for each company, starting with the content published on LinkedIn, where narrative elements such as storytelling, personal testimonials, and inclusive language were identified. At the same time, concrete data, indicators, and policies related to DEI were extracted from company websites and CSR reports. The alignment between narrative and objective data represented an indirect indicator of perceived authenticity.

Three key parameters were then considered to evaluate DEI communication:

**Multichannel presence**, i.e., the existence of DEI-themed content on all channels examined (LinkedIn, website, CSR report, and Glassdoor). This attitude was taken as an indicator of transparency and structured commitment.

**Communicative consistency**, calculated as a summary of the narrative Corresponding author between the different channels. Based on topic convergence, consistency of values and the presence

[30] Only five of the twenty companies that were invited to take part in the research have replied.

of any contradictions or misalignments between channels, a qualitative score (High, Medium, and Low) was assigned.

**Perceived authenticity**, calculated using indicators such as the language used, personalization, and the concreteness of the content across different channels.

Based on the results across these three variables, the effectiveness of DEI communication was calculated and classified as High, Medium, and Low. The comparison of these variables allowed us to validate the research hypotheses.

**Consistency and internal perception (H1 and H4):** Companies with higher Glassdoor ratings, both in terms of perceived inclusive climate and authentic representation, are those that adopt a clear, consistent, and integrated strategy (e.g., Cisco, American Express, DHL). Companies that show low consistency in their reports or highlight negative employee feedback show signs of narrative dissonance that could damage their reputation in the long term.

**Authenticity and storytelling (H2):** The inclusion of personal testimonials and the use of storytelling enhance the credibility of communication. On LinkedIn, posts that combine narrative elements with concrete metrics (e.g., ServiceNow, Webranking) achieve greater engagement and are consistent with an authentic perception of DEI commitment.

**Channel variety and integration (H3):** Companies that use at least three channels in an integrated way (e.g., Cisco, DHL, Mondelez) demonstrate more effective communication, reinforcing their DEI message and reaching different audiences.

**Inclusive language and digital engagement (H5):** Companies that use inclusive or gender-neutral language, inclusive graphics, and first-person content score higher on LinkedIn (e.g., AbbVie, Hilton).

**Low-profile strategies:** The analysis also reveals a trend that has been labeled low-profile strategies. In these cases, companies (e.g., Agile Lab, Unfix, Skylabs) communicate little or, in some cases, nothing at all about DEI issues. This choice seems to be motivated by a desire to avoid backlash in politicized contexts. While this strategy may well avoid reputational damage, it also means that the commitment is less recognizable to external stakeholders.

## 5. Discussion

The results partially confirm the hypotheses and have significant managerial implications.

In line with the literature review, narrative consistency and authenticity are two key dimensions of corporate communication in the field of DEI. Indeed, the data confirm that, in order to be effective, communications must be confirmed by internal perceptions and validated by real experiences. Without this alignment, companies risk compromising their credibility (Baker et al., 2022). In addition, storytelling and the ability to humanize communication through real-life stories promote user engagement. Finally, the presence of concrete data increases the credibility of the message (Adams, 2002; Gray et al., 1995). The value of multichannel communication and strategic integration is also confirmed (Judd & McKinnon, 2021). Furthermore, the analysis shows that effectiveness does not depend solely on the number of channels activated, but on their consistency and coordination. Finally, there are also cases of companies that decide not to communicate their DEI initiatives in order to avoid reputational damage (low-profile strategy). This option, while legitimate, can weaken the perception of commitment and leave room for suspicions of 'diversity avoidance.'

The most novel aspect of the analysis is provided by Glassdoor, which was used as a test for authenticity. In this sense, when comparing perceived external and internal communication, this study shows how Glassdoor can serve as a proxy for detecting misalignments and as an indirect measure of authenticity.

## 6. Conclusion

This study provides a comprehensive overview of how the 20 companies on the 'Best Workplaces for DEI Italy' list (Great Place to Work, 2024) communicate their commitment to diversity, equity and inclusion (DEI) across multiple channels.

The research aimed to assess the coherence, authenticity, and strategic integration of

DEI messaging, and examined its relationship with employees' internal perceptions. To this end, a qualitative content analysis was conducted, comparing material from

LinkedIn, the corporate website, the CSR report, and employee feedback on Glassdoor. The analysis revealed a fragmented communication landscape, with some companies demonstrating authentic DEI content and others showing significant variability. These findings emphasize the importance of aligning corporate DEI messaging with employee experiences and ensuring communication strategies are multichannel, consistent, transparent, and culturally contextualized.

Reviewing the literature and conducting an empirical analysis of the collected data provided valuable insights for companies on how to communicate DEI matters effectively.

The study also highlights three core dimensions that are important for companies to consider: narrative coherence across platforms, perceived authenticity by internal stakeholders, and the strategic integration of communication channels. It emphasizes the importance of coherence for companies that maintain consistency across multiple channels, aligning internal experiences with external narratives about diversity, equity and inclusion (DEI). Using inclusive language is often associated with greater engagement on platforms such as LinkedIn, although the relationship is not straightforward. Consequently, companies are generally viewed more positively by employees. The results confirm that using multiple communication channels is ineffective unless supported by coherence and content that aligns with actions and initiatives.

DEI initiatives are therefore essential for building trust and engagement with different audiences. However, communication alone is insufficient; it must be embedded in authentic practices and supported by the feedback. In terms of theoretical and managerial contributions, the findings suggest the need for a more integrated and reflexive approach to communication. This could help to bridge the gap between external representation and internal reality, as well as anticipating reputational risks.

In terms of managerial implications, the findings offer actionable insights. Firstly, multichannel communication is essential, as is ensuring that the various messages on LinkedIn, websites and CSR reports are aligned, in order to be perceived as authentic and coherent by stakeholders. However, variety of channels alone is not sufficient; it must be supported by clear and consistent language in order to build trust. Secondly, organizations should be aware of the reputational risks associated with both overexposure and under-communication. Thirdly, authentic employee narratives across channels can enhance perceived legitimacy, making the employee voice a relevant asset for corporate reputation. Communication strategies should be structurally aligned with organizational identity and leadership behavior.

Finally, the five interviews conducted to explore the issue revealed a range of perspectives that can be categorised into eight main areas relating to DEI. These areas and the specific initiatives relating to them are outlined below. Given the shared commitment of all five companies, the most innovative and unusual initiatives are reported.

Parenting and maternity support: company nursery (currently being implemented by Galileo), flexible working hours, extended paternity leave of one month (utilised by 100% of new fathers), and a return-to-work programme with a support intern (Mondelez). Pink parking spaces reserved for pregnant women or parents with children (Teleperformance).

Caregiving: flexible working hours (Mondelez).

Charity and social responsibility: collaboration with Project Next for refugee/migrant mentoring activities and selection processes that have led to the direct recruitment of 14 people (Mondelez); the TP for Inclusion initiative, an annual project now in its fourth edition, addressing issues such as empowerment, racism and disability (Teleperformance). Cultural events with a strong social focus, such as theatre in prison with the Pugliese Association, or awareness-raising activities, such as cooking with children with cancer (Teleperformance). Free training initiatives for young people in the area, such as the Server Security course, to bridge the gender gap in technical fields, and to encourage women to pursue non-traditional technical careers (Vianova). Support for 'Ragazze Digitali' (Digital Girls), with summer camps for female students (Webranking).

Gender equality: Women in Management programme (Mondelez), Gender pay gap eliminated or in the process of being eliminated (Mondelez, Teleperformance), Establishment of a Gender Equality Committee (Teleperformance), Increase in the percentage of women in senior roles (Teleperformance), support for women: breast cancer screening is currently being implemented at Galileo; a protocol has been established with an anti-violence centre to support women leaving abusive situations and fleeing violence, including through job placement at Teleperformance.

LGBTQ+ community: participation in Pride (Mondelēz), collaboration with

Arcigay (Mondelēz), inclusive recruitment guidance with supporting policies

(Mondelēz), establishment of an LGBTQ+ rights committee (Teleperformance), and collaboration with LGBTQ+ rights associations (Teleperformance).

Mental health: free psychological support for employees (Teleperformance), which is also open to their families (Mondelez). Training on mental health and well-being for managers (Mondelez).

Welfare in the broad sense: smart working was already in place before the pandemic in 2018 (Mondelez and Webranking); flexibility with a short working week (Mondelez); flexible holidays (Mondelez); and the elimination of clocking in (Mondelez since 1998); short working week with Friday afternoons off (Mondelez); 100% agile working contract with no obligation to be present (Vianova); flexible hours for most departments (Vianova); internal growth supported by coaching and development-oriented assessments (Webranking); internal growth of managers, many of whom are under 30 years old; cultivation of a culture of listening with an internal feedback and peer evaluation programme, implementation of an internal social media platform for communication and engagement; structuring of teams with small groups to encourage listening; welfare platform with flexible budget that can be used for personal and family needs.

For all these companies, the commitment of senior management was essential to implementing their initiatives, given that they were operating within a shared corporate culture. The reason there has not been a turning point since the USA took its new position is that there is a deep belief in DEI.

In addition to greater satisfaction, some companies achieved concrete results, such as: ● A birth rate higher than the national average (Mondelez, Vianova);

Employee responses to internal surveys reaching 98% satisfaction (Teleperformance);

Absenteeism reduced from around 10–12% to 3% (Teleperformance);

Retention and talent acquisition with a turnover rate of less than a third of the industry average (Webranking);

High retention, even in a context of strong market demand for personnel.

As the most virtuous companies in Italy in this area, it is clear that these dimensions are crucial for developing a people-centred plan to achieve concrete results.

## 7. Limitations and future research

The present study is not without its limitations. Firstly, the research focuses exclusively on a small group of companies in Italy, which limits the generalizability of the results and renders them potentially specific to the country's culture. Secondly, the sources utilized to explore the discursive and narrative dimensions of DEI do not permit the direct measurement of organizational impacts such as performance, retention or internal demographics. Consequently, companies do not utilize all channels equally, nor do they all have access to them. For instance, only 12 out of 20 companies have a CSR report, and two companies do not have a Glassdoor review page. Furthermore, companies on Glassdoor do not have the same number of reviews on the platform. Thirdly, the sample primarily consists of organizations that are already engaged in DEI activities, which may introduce a selection bias favoring the most exemplary or committed companies. In conclusion, the study is based on a limited one-year period, which restricts the findings to company practices and communication strategies within that period.

Future research could include a more heterogeneous sample of organizations to capture a wider range of communicative strategies and potential misalignments, not only Italian cases. Moreover, the utilization of internal organizational data has the potential to yield more profound insights into the nexus between external communication and actual practices. Additionally, longitudinal studies would provide invaluable insights into the evolution of DEI narratives in response to political shifts over time.

## Acknowledgments

We would like to acknowledge that no external funding was received for this research. We would also like to express our gratitude to the companies that graciously accepted our invitation to be interviewed.

# Choose and Reject: Emotional Framing in Sustainable Consumption — A Qualitative Perspective

Giovanna Pegan[1], *, and Silvia Ranfagni[2]

## Abstract

This study investigates how consumers emotionally frame sustainable consumption decisions through two decision strategies: choosing (actively selecting sustainable options) and rejecting (deliberately avoiding unsustainable ones). The research asks how these strategies shape consumers' emotional experiences and sense of identity.

Using a qualitative research design, we conducted in-depth interviews with thirty Italian consumers from Generations Z, Y, and X. Each selected one image symbolizing sustainability, which triggered narrative reflections on identity, emotion, and how they framed their sustainable behavior as either choosing or rejecting. The first findings reveal that choosing strategies to evoke pride, aspiration, and hedonic well-being while rejecting strategies that foster moral coherence, empowerment, and eudaimonic well-being. However, even sustainable choices may generate frustration or dissonance when actions feel externally imposed or economically constrained. Both strategies, when perceived as authentic, support self-congruity and well-being. The study contributes to consumer research by highlighting symbolic and emotional dimensions of sustainability-related decisions. Practical implications suggest supporting inclusion (choose) and exclusion (reject) paths through autonomy-enhancing interventions and identity-relevant communication.

*Keywords: consumer well-being; frustration; authentic decision strategies*

## 1. Theoretical Background

### 1.1 Framing Sustainable Consumption: Choose vs. Reject

In the context of sustainable consumption, the structure of decision-making has gained growing relevance. Specifically, the distinction between "choosing" and "rejecting" options (Shafir, 1993) affects consumer behavior and its symbolic and emotional implications. Goodman and Reczek (2021) show that choose strategies (actively selecting a sustainable option) and reject strategies (actively excluding an unsustainable one) activate different psychological mechanisms. Choosing is associated with approach motivations, positive affect, and aspirational self-expression; rejecting, instead, is tied to avoidance motivations, moral positioning, and more explicit social signaling (Sokolova & Krishna, 2016; Nan et al., 2023). The reject frame often leads to stronger perceived integrity and may reduce

cognitive dissonance when consumers aim to stay loyal to their ethical beliefs (Besharat et al., 2021). Thus, scholars (Chandrashekar et al., 2021) argue that these two modalities are not neutral but contribute differently to constructing moral identity. Rejecting dominant unsustainable products—especially in front of others—can act as a powerful reputational cue, reinforcing social identity and moral self-worth (Nan et al., 2023). Moreover, the psychological cost of rejecting may be higher, but so is its reward in terms of coherence and perceived authenticity. Understanding how the choose/reject framing shapes consumers' inner experience is essential to designing interventions that increase sustainable behavior frequency, emotional engagement, and value congruence with sustainable choices (Pegan et al., 2025).

### 1.2 Consumer Well-being in Sustainable and Anti-consumption Practices

Consumer well-being (CWB) has moved beyond material satisfaction to include psychological, existential, and identity-related dimensions (Sirgy & Lee, 2008; Resnik, 2022). Psychological research distinguishes between hedonic well-being—defined by pleasure, life satisfaction, and the absence of negative emotions (Diener et al., 2010)—and eudaimonic well-being, grounded in authenticity, personal growth, and purposeful living (Ryff, 1989; Ryan & Deci, 2001). Within this second tradition, well-being arises from feeling good and acting in alignment with one's true self. In this view, sustainable consumption can be enriching when perceived as autonomous, morally coherent, and socially meaningful (Aydin, 2010; Bhardwaj et al., 2024). One of the most influential constructs in this domain is self-congruity: the perceived match between consumer actions and their actual or ideal self-image (Sirgy, 1985; Kumagai, 2024). When sustainable choices are congruent with the ideal self, they activate positive emotions such as pride and self-worth, contributing to a sense of meaningful agency and subjective well-being (Han et al., 2018). This has been confirmed empirically in the Brand-Sustainability-Self Congruence (BSSC) model, which links sustainability-oriented brand identification to well being via emotional resonance and self-validation (Kumagai, 2024).

Furthermore, intrinsic motivation plays a crucial role. According to the Self Determination Theory (Deci & Ryan, 1985), only when sustainable actions are internally motivated—rather than driven by guilt or social pressure—do they lead to authentic and enduring well-being (Liu et al., 2022). In contrast, externally imposed sustainability norms may produce frustration or emotional ambivalence, particularly when access to information or viable alternatives is limited (Gelbrich, 2010; Azemi et al., 2020). Sustainable consumption becomes a source of well-being when it is not merely instrumental but expressive of moral agency, self-determination, and coherent identity. This understanding is further expanded by integrating perspectives from spirituality and cultural psychology (Pegan et al., 2023). Minton et al. (2022) emphasize how deeply internalized spiritual or cultural values act as interpretive frameworks that give ethical consumption a transcendent dimension. When sustainability is perceived as a spiritual or communal act—not just an individual preference—it contributes more robustly to long-term psychological well-being and social connection. Finally, anti-consumption practices—such as voluntary simplicity, ethical boycotting, or collaborative consumption—can enhance well-being by enhancing control, coherence, and purpose (Balderjahn et al., 2023; Lee & Ahn, 2016). These practices reflect not deprivation but deliberate alignment with higher values. In this context, rejecting becomes a symbolic and transformative act, reinforcing moral identity, reducing stress, and fostering personal empowerment.

## 2. Methodology

This study explores how consumers emotionally frame sustainable consumption choices by examining how the decision structure—choosing versus rejecting—is perceived to impact personal well-being. Its original contribution lies in linking these decision strategies to emotional states through a qualitative, participant-driven approach that foregrounds symbolic and identity-relevant aspects of sustainable behavior.

To address this goal, the study relies on 30 semi-structured in-depth interviews with Italian consumers from Generations X, Y, and Z. Participants were purposively selected to ensure diversity in gender, socio-economic background, and levels of engagement with sustainability. To explore the emotional and symbolic dimensions of sustainable consumption, the qualitative interviews began with a visual elicitation task used as the entry point of each interview. Each participant was asked to search online for one image that, in their view, best represented sustainable consumption. Participants were asked to explain why they chose the image, what it represented, and how it connected to their experiences and values (Table 1). The image thus acted as a symbolic anchor for their broader narrative, enabling insight into the emotional and moral dimensions of their behavior. All interviews were transcribed and thematically coded using an abductive, iterative approach. Coding reliability was ensured through team triangulation and stepwise refinement. The analysis focused on choosing vs. rejecting strategies, as the participants framed, related to emotional tone, coherence, and subjective well-being.

## 3. Key Findings and Discussion

Table 1 presents some illustrative examples from the thirty interviews, linking each selected image with the meaning ascribed by the participant, the decision strategy (choose or reject), the associated emotional state, and a representative quote. Choose strategies were associated with approach motivations and aspirational self-expression. Participants who selected images depicting reusable, durable, or locally sourced items (e.g., glass jars, Levi's jeans) often described their choices as coherent with their ideal selves. These decisions were not merely functional or ecological but served as tools for self-construction and pride. One respondent said, "It makes me feel good to choose those products like I am becoming the person I want to be" (R11). In this sense, choosing strategies evoked hedonic well-being— satisfaction, positive affect, and identity affirmation—particularly when choices aligned with one's aspirational image, echoing Kumagai's (2024) Brand Sustainability–Self Congruence framework.

| ***Image selected*** | ***Meaning Ascribed by Respondents*** | ***Strategy*** | ***Emotional State*** | ***Original Quote*** |
|---|---|---|---|---|
| Bulk products in glass jars | Symbol of conscious, consumption; "minimal waste" as an expression of lifestyle alignment | Choose | Pride, coherence | *"It is not just that there is no plastic—you can tell there is a different, more careful way of doing things." (R11)* |
| Fast fashion with red X | A depiction of what to reject, expressing a stance against unethical behavior and distancing from mainstream norms | Reject | Integrity, empowerment | *"I stopped buying from that brand. I liked their stuff, but it does not align with what I believe in." (R03)* |

| | | | | |
|---|---|---|---|---|
| Levi's jeans | Associated with longevity and conscious durability, they are sustainable because "they last forever." | Choose | Satisfaction, authenticity | *"I immediately thought of Levi's… I have had mine for years. Better to pay more and make it last." (R07)* |
| Amazon cart canceled | Small but powerful gesture of restraint used to express agency and refusal in a digital context | Reject | Control, meaningful selfregulation | *"I felt empowered not clicking 'Buy now.' It is small, but it felt meaningful." (R18)* |
| Organic product with a high price | Elicit frustration symbolizes the conflict between ethical intention and economic limitation. | Choose under constraint | Moral discomfort, frustration | *"I would love to choose better, but often I just cannot afford it. It makes me feel stuck." (R25)* |
| Instagram post with second-hand fashion | Emblem of social signaling linked to recognition and social validation in peer groups | Reject (public) | Validation, image-building | *"When I tell my sister I went vintage instead of fast fashion, she looks at me differently." (R14)* |
| Farmer's market with reusable bags | Evokes communal belonging and slow consumption; often described as a sensory and relational experience | Choose/Reject hybrid | Peace, meaning, connectedness | *"Shopping there feels like I am part of something—like I am not alone in caring." (R21)* |

**Table 1:** Illustrative Consumer Narratives Linking Sustainable Choices to Emotional Meaning (Selected Examples from a 30-Interview Dataset)

In contrast, reject strategies were linked to avoidance motivations, moral evaluation, and identity protection. Respondents often selected images such as crossed-out fast fashion logos or screenshots of canceled online purchases to express their refusal of unsustainable options. Rejecting such products conveyed moral clarity, empowerment, and self consistency—especially when the rejected option was dominant or socially accepted. As one respondent noted: "I stopped buying from that brand. I liked their stuff, but it does not align with what I believe in" (R03). These narratives are consistent with framing theory

(Goodman & Reczek, 2021; Sokolova & Krishna, 2016), where rejection intensifies moral self-signaling and strengthens reputational positioning. Notably, when reject decisions were made in visible or social contexts, such as those involving second-hand fashion shared on Instagram, participants described a further layer of social signaling and identity reinforcement. In these cases, rejection operated not only as a moral stance but also as a reputational asset.

The findings also reveal ambivalent or emotionally taxing experiences, particularly when participants selected images that reflected ethical intention constrained by external barriers—such as the high cost of organic products. In these cases, even choosing sustainable options generated frustration, guilt, or dissonance, especially when choices felt imposed rather than autonomous. This supports the Self-Determination Theory (Deci & Ryan, 1985), which posits that well-being arises when behaviors are internally motivated and aligned with one's values (Pegan et al., 2025). Conversely, externally pressured or guilt-driven choices were linked to negative affect and diminished agency (Gelbrich, 2010; Azemi et al., 2020).

While less frequent, some participants framed their sustainable practices in spiritual or communal terms, evoking belonging and transcendence (Pegan et al., 2023). The image of a farmer's market with reusable bags, for instance, was described as evoking "a sense of being part of something bigger" (R21), aligning with recent studies on spiritual motivations in ethical consumption (Minton et al., 2022).

## 4. Conclusion, implications and future research

Our first qualitative evidence shows that sustainable consumption is a dynamic process in which choosing and rejecting are symbolic acts that co-produce identity and emotion over time. Choosing affirms the self and an ideal identity (a primarily hedonic form of well being), whereas rejecting enacts ethical integrity and moral commitment (eudaimonic fulfillment). Yet emotions are not uniformly positive: alongside pride and authenticity, participants report ambivalence—frustration, guilt, and sacrifice—suggesting that sustainable action is best read as an ongoing, reflective negotiation of values. Conceptually, we propose a prospective, process-oriented perspective that traces how choose/reject strategies interact and how "dynamic coherence" unfolds longitudinally across contexts. Managerially, this implies designing choice architectures that enable inclusion (making sustainable options easy to choose) and strategic exclusion (empowering consumers to refuse unsustainable ones), reinforcing autonomy and identity. Policy should likewise favor autonomy-supportive messaging over mandates or guilt appeals so that actions feel self determined. Future research should extend these insights across settings and time, and examine how AI systems—chatbots, recommenders, algorithmic filters—shape the emotional and moral framing of sustainable choices. Given participants' ambivalent references to TikTok, Instagram, ethical apps, and ChatGPT, a key question is whether AI can be designed to support consumer autonomy, moral coherence, and sustainable well being.

# Scrolling for Truth: Generation Z's Perception of CSR Credibility

Anna Piergallino

University of Sannio, Italy

a.piergallino@studenti.unisannio.it

## Abstract

This exploratory study analyses how Generation Z evaluates corporate social responsibility communication, emphasizing authenticity, credibility, and media engagement. Based on two focus group of Italian university students aged 19 to 25, the study looks at the influence of digital media, testimonial trustworthiness, and the consistency between corporate messaging and actual behaviour. The findings show that, despite Gen Z is ethically aware and expects companies to engage in activism, they also prioritize practical factors like price and convenience. Participants distinguish between genuine and superficial CSR efforts, rewarding companies that demonstrate long-term commitment while criticizing opportunistic actions. Social media platforms, particularly Instagram and TikTok, emerge as the key sources of CSR content for this generational cohort. However, participants consider that the effectiveness of communication hinges on the alignment of the message and its perceived intent rather than the platform used. This study adds to existing literature on digital natives and CSR, offering insights for companies seeking to create effective CSR communication strategies that appeal to this socially conscious and media-literate generation.

*Keywords: GenZ · Perceived credibility · Corporate social efforts · Focus Group · CSR Communication*

## 1. Introduction

Companies' social role has evolved to encompass broader Corporate Social Responsibility (CSR) frameworks (Pelikánová & MacGregor, 2019), designed to encourage prosocial behaviours including altruism, characterized as individuals' willingness to sacrifice personal resources for others' benefit without anticipating external compensation (Bar-Tal, 1986), while advancing collective collaboration and societal progress (Fehr & Fischbacher, 2005).

This proliferation of CSR initiatives, however, has led to increasing scrutiny from stakeholders who question the credibility of such claims. Nevertheless, the expansion of CSR reporting and communication strategies has coincided with growing consumer doubt about the genuineness and reliability of corporate assertions (Skard & Thorbjørnsen, 2014; Lock & Seele, 2016). This doubt, commonly named as "greenwashing" or "woke-washing," poses considerable obstacles for organizations seeking to successfully convey their CSR activities to their audiences.

In digital communication contexts, the perceived credibility of CSR messaging becomes even more central, as consumers navigate a landscape saturated with promotional content and growing distrust (Rim & Dong, 2018; Wathen and Burkell, 2002).

Scholars have conducted comprehensive investigations into the complex nature of digital message trustworthiness (Dabholkar, 2006; Dou et al., 2012). Consumers continuously assess the trustworthiness of corporate communication, with research indicating that perceived credibility plays a pivotal role in shaping consumer decision-making processes, particularly in electronic commerce contexts, where CSR messages are frequently conveyed (Awad & Ragowsky, 2008).

These discoveries carry substantial implications for organizations involved in CSR communication activities. Companies that fail to convey credible CSR messages may struggle to engage with ethically aware consumers, particularly those from younger demographics who demand congruence between brand claims and behaviour (Alizadehrad & Maglakelidz, 2020; LaBarbera, 1982).

At the heart of this challenge lies the concept of trustworthiness, which represents a comprehensive set of perceptions that audiences form about a message source (Bettinghaus, 1969). As such, trustworthiness emerges as a multifaceted and vital component of organizational communication, particularly when addressing sensitive social and environmental responsibilities.

Key elements, such as message tone, choice of spokesperson, platform used, and visual style, have been found to influence CSR credibility, particularly among Gen Z audiences highly attuned to inconsistency and performative activism (Cammarota & Branca, 2025). It appears that, for optimal CSR communication effectiveness, organizations must thoughtfully examine the relationship between communication style and the channel used to engage diverse stakeholder groups.

Despite a growing body of research on CSR communication and consumer trust, existing literature tends to focus either on general consumer attitudes or on isolated communication variables (e.g., platform or message type). There is a lack of empirical insight into how the interplay between communication tone, source credibility, content framing, and channel selection affects perceived authenticity and trustworthiness among Gen Z audiences.

This study addresses this gap by starting to explore how young consumers evaluate CSR message credibility and which communicative elements enhance or hinder trust, using a qualitative focus group approach.

The purpose of this work seeks to explore whether Generation Z, a demographic particularly noted for its elevated awareness of social and environmental concerns (Jain et al., 2014; Dabija et al., 2019), values corporate social communication and incorporates it into their buying behaviors and brand selections. The research specifically aims to identify the information channels Generation Z utilizes to learn about companies' social involvement, along with determining which communication approaches they view as most trustworthy and prefer to interact with. To address this objective, we propose these research questions.

RQ 1 *When does CSR communication appear credible to Gen Z?*

RQ 2 Specifically, *which elements (platform, testimonial, tone, content) may enhance or undermine credibility?*

The first research question is rooted in Source Credibility Theory (Hovland, et al., 1953), which posits that the persuasiveness of a message is strongly influenced by the perceived trustworthiness and

expertise of the source. In the context of CSR communication, this theory is particularly salient, as stakeholders, especially younger consumers, evaluate not only the content of the message but also the authenticity and reliability of the sender. According to Ohanian (1990), credibility encompasses trustworthiness, expertise, and attractiveness, all of which contribute to the reception and impact of corporate communication. Generation Z, with its sophisticated media literacy and critical stance toward brand-generated content (Djafarova & Bowes, 2021), represents a uniquely challenging audience whose perception of CSR credibility hinges on both the moral integrity and perceived competence of the organization.

The second question draws upon persuasion theory and particularly the Elaboration Likelihood Model (ELM) proposed by Petty and Cacioppo (1986). ELM explains how message recipients process persuasive communication via either a central or peripheral route, depending on their involvement and motivation. For Generation Z, the medium (e.g., TikTok vs. LinkedIn), the tone (formal vs. conversational), and the type of messenger (peer vs. celebrity) function as peripheral cues that heavily influence the processing of CSR messages. Studies have shown that user-generated content (UGC) and testimonial authenticity act as amplifiers of message credibility, especially in environments saturated with marketing content (Djafarova & Bowes, 2021). Additionally, message framing and stylistic choices affect emotional engagement and ethical resonance, which are key dimensions for Gen Z audiences (Francis & Hoefel, 2018).

## 2. Literature review

### 2.1 CSR Communication

CSR communication refers to the strategic dissemination of information concerning a company's social and environmental initiatives, aimed at informing, engaging, and influencing stakeholders (Morsing & Schultz, 2006).

The success of CSR communication now hinges largely on its perceived credibility among target audiences. CSR credibility represents how believable, authentic, and consistent stakeholders find a company's social and environmental claims when compared to its actual values and behaviors (Kim & Ferguson, 2019). This complex concept incorporates multiple dimensions including trustworthiness, expertise, and goodwill, shaping how stakeholders view and respond to brands.

According to some recent literature, contemporary consumers approach corporate sustainability claims with considerable skepticism, a phenomenon extensively documented (Lock & Seele, 2016; Skard & Thorbjørnsen, 2014). This skepticism has elevated CSR credibility to a position of critical importance. As society becomes more attuned to social inequality, environmental destruction, and corporate ethical failures, consumers apply increasingly rigorous standards when evaluating organizational communications. The emergence of terms like "greenwashing" and "woke-washing" reflects widespread recognition that companies often manipulate ethical messaging for reputation management while avoiding substantive reforms (Delmas & Burbano, 2011; Cammarota & Branca, 2025). Modern stakeholders evaluate CSR communication not merely on what companies say, but on whether those messages reflect genuine behavioral change and sustained commitment.

Research demonstrates that credible CSR communication serves as a bridge for closing information gaps between organizations and their stakeholders (Du et al., 2010), building both trust and reputation over time.

The authenticity and consistency of CSR messaging have become fundamental requirements for meaningful stakeholder engagement, particularly among younger, digitally native consumers who possess sophisticated tools for fact-checking corporate claims. Understanding how specific demographic groups, particularly Generation Z, assess CSR credibility therefore represents both a timely research opportunity and a practical necessity for developing more effective communication strategies.

### 2.2 CSR Message Credibility

CSR message credibility extends beyond content to encompass the perceived trustworthiness of both the source and the communication channel. Drawing on Source Credibility Theory (Hovland & Weiss, 1951; Ohanian, 1990), credibility is understood as a function of three key dimensions: expertise, trustworthiness, and goodwill. In the context of CSR communication, this theory provides a valuable framework for understanding how stakeholders evaluate not just the message itself, but the messenger and medium through which it is conveyed.

Digital trust research reveals that online users evaluate information by examining both the messenger's identity and the platform where they encounter it (Wathen & Burkell, 2002; Dabholkar, 2006). This principle directly applies to CSR communication, where the messenger and medium significantly influence how audiences perceive message authenticity.

Generation Z demonstrates particularly sophisticated media literacy skills and exhibits notable skepticism toward traditional brand-generated content (BGC). Therefore, Djafarova and Bowes (2021) demonstrate that this demographic assign greater credibility to user-generated content (UGC), including peer reviews, influencer endorsements, and authentic behind-the-scenes material, which they perceive as more genuine, unfiltered, and emotionally compelling. In contrast, formal brand communications such as polished CSR reports or carefully crafted marketing campaigns often trigger suspicion, particularly when they appear overly manufactured or contradict the company's broader track record.

Platform selection plays an equally crucial role in determining message credibility. Visual platforms like Instagram and TikTok, characterized by their immediacy and interactive features, have become primary channels for reaching younger audiences with CSR content. However, success on these platforms depends on achieving alignment between message tone, messenger authenticity, and perceived organizational sincerity rather than simply adapting content format (Lim, 2020). Traditional corporate channels such as company websites or LinkedIn, while potentially informative, often fail to resonate with Gen Z audiences seeking genuine social and ethical dialogue, as these platforms are perceived as formal and disconnected from authentic conversation.

These communication dynamics highlight the strategic imperative for organizations to carefully select credible messengers and authentic contexts when sharing CSR initiatives. Organizations that fail to consider these factors risk not only diminished message impact but also active audience rejection and potential damage to their reputation.

### 2.3 GenZ and CSR perception

Generation Z (individuals born between 1995 and 2010) represents the first true cohort of digital natives, having grown up in an environment shaped by constant exposure to the internet, social media and mobile technologies (Francis & Hoefel, 2018). This generation displays a distinctive set of values and behaviours that fundamentally influence their relationship with brands and their expectations

towards corporate communication (Francis & Hoefel, 2018). A key element in their approach to consumption is the pursuit of authenticity and ethical consistency: Gen Z consumers expect brands to "practice what they preach", valuing transparency, inclusiveness, and alignment between corporate actions and communicated values (Francis & Hoefel, 2018).

In terms of media habits, Gen Z exhibits an intensive use of social platforms as primary channels for information and engagement. Studies show that Instagram and TikTok have become particularly influential environments where younger consumers encounter corporate content, form opinions, and engage with brand narratives (Djafarova & Bowes, 2021). However, this generation also shows a critical stance towards traditional BGC, often perceiving it as lacking in authenticity. Conversely, UGC and peer recommendations are considered more trustworthy and influential in shaping attitudes and behaviours (Djafarova & Bowes, 2021).

Regarding CSR, Gen Z demonstrates a high level of awareness and sensitivity. Compared to previous generations, Gen Z consumers more frequently evaluate companies based on their CSR initiatives and are more likely to reward or punish brands accordingly (Kim & Austin, 2019).

Notably, they tend to attribute higher credibility to CSR initiatives that are integrated into core business practices, such as socially responsible production processes, rather than to philanthropic activities perceived as peripheral or reactive (Kim & Austin, 2019). Furthermore, the mode of communication plays a crucial role: proactive, transparent, and multi-channel CSR communication resonates more positively with Gen Z, whereas reactive or inconsistent messaging may elicit scepticism (Kim & Austin, 2019).

These characteristics underline the importance of investigating not only the level of CSR awareness among Generation Z consumers, but also *through which channels* they access CSR-related information and how they assess the credibility of different communication sources. The exploratory focus group study presented in this article is designed precisely to address these questions, aiming to contribute to the understanding of how brands can effectively engage Gen Z audiences in the domain of CSR communication.

While previous studies have outlined Gen Z's general expectations toward CSR communication, little empirical work has explored the conditions under which CSR messages are perceived as credible by this cohort, especially in terms of platform choice, tone, and testimonial coherence. This research seeks to address this gap through an exploratory focus group study.

## 3. Methodology

Considering the exploratory nature of the study we adopted a qualitative research approach, employing two focus groups to start exploring Gen Z consumers' perceptions, attitudes, and reactions towards different forms of CSR communication and their perception of the CSR activities.

Focus groups are a qualitative research technique that involves gathering small, diverse groups of participants to engage in guided discussions about specific topics under the facilitation of a trained moderator (Krueger & Casey, 2015; Morgan & Spanish, 1984; Powell & Single, 1996).

This method was deemed particularly appropriate as it allows for the observation of interactive dynamics among participants and enables the capture of subtle nuances, shared meanings, and social influences that might not emerge in individual interview settings (Morgan, 1997; Kitzinger, 1995). The strength of focus groups lies in their ability to capture group dynamics and social interactions, where

participants can build upon each other's responses, challenge different viewpoints, and collectively explore complex issues in depth (Stewart & Shamdasani, 1990).

Data collection occurs through audio recordings of the sessions, which were subsequently transcribed and analyzed using thematic analysis (Powell & Single, 1996).

The empirical study was conducted through two focus group sessions on May and June 2025, composed of twelve participants. The sessions were held in a virtual environment via online video call, a modality that ensured participation from a geographically diverse pool while maintaining interactive engagement among participants. The target sample consisted of Generation Z consumers, selected because this demographic segment is particularly sensitive to social and environmental issues, highly engaged with digital media, and exhibits distinctive patterns of attitude and behaviour towards corporate responsibility communication compared to older cohorts. Moreover, Gen Z represents a critical audience for companies aiming to build long-term stakeholder relationships and to foster brand advocacy in the evolving socio-digital landscape.

Following Braun & Clarke's reflexive thematic analysis (2006), coding was conducted by the first author as the sole analyst. In this approach, inter-coder reliability is not considered a measure of quality; instead, transparency, reflexivity, and the coherence of the interpretive narrative are emphasized.

This exploratory phase is intended to provide valuable insights and to serve as a foundation for subsequent studies and for the development of a future research agenda.

### 3.1 Analysis Method

The analysis process followed a systematic approach to ensure rigor and validity. The focus group sessions were recorded and transcribed to capture participants' exact words and expressions. The transcribed data then underwent thematic content analysis to identify recurring patterns, themes, and insights related to consumers' perceptions of CSR communication (Braun & Clarke, 2006).

The analysis is guided by two complementary theoretical frameworks. Attribution theory (Heider, 1958) helps interpret how consumers attribute intentions and motivations to companies based on their CSR communications, particularly examining whether CSR efforts are perceived as genuine or opportunistic. Signalling theory (Spence, 1973) provides insights into how different communication tones and channels serve as signals that influence consumer perceptions of corporate authenticity and commitment to social responsibility. These theoretical lenses enable a deeper understanding of the underlying psychological processes that shape consumer responses to CSR messaging.

The empirical material was generated through two focus group sessions, involving a total of 12 participants aged between 19 and 25 years. The groups were composed of 6 females and 6 males. This sample allowed the study to capture a degree of homogeneity in terms of generational background, while also ensuring diversity of perspectives within the groups.

## 4. Findings

As an exploratory investigation into how Generation Z perceives and interprets CSR communication, the focus group yielded six interrelated themes that might shed light on the evaluative processes activated by this audience.

These preliminary findings contribute to bridging theoretical insights with emerging empirical patterns, especially within the framework of source credibility and signalling theory.

First, participants displayed a strong emphasis on the perceived congruence between corporate values and communicative behaviours, indicating that authenticity is evaluated based on the alignment with core business practices and the coherence between corporate actions and the social issues addressed, rather than on isolated or declarative statements.

The second preliminary theme that emerged during our focus group is testimonial credibility. Generation Z views influencers as a key filter in evaluating CSR messages, showing a distinct preference for spokespersons who are genuinely connected and linked to the cause, rather than those perceived as driven by commercial interests.

A third theme concerns the role of emotional engagement, as participants prefer CSR messages that combined visual immediacy with affective resonance, particularly on platforms such as TikTok and Instagram.

Fourth, skepticism towards institutionalized formats, such as CSR reports or official LinkedIn posts, was widespread, pointing to a generational expectation for accessibility and conversational tone.

In parallel, the fifth theme highlights the importance of perceived effort and continuity: one-off initiatives were often dismissed, while long-term, embedded CSR practices gained trust.

Lastly, the groups show an ability to detect perceived opportunism or "signalling incongruence," especially when companies appeared to adopt activist stances disconnected from their operational realities.

***Responsible Business: A Multidimensional Concept***

Participants across both focus groups understood responsible business as a multifaceted concept encompassing two distinct yet complementary dimensions. The first dimension centers on value-driven activism, where responsibility extends beyond traditional CSR to include awareness of environmental, social, and territorial impacts, as well as active engagement in broader societal issues such as LGBTQAI+ rights or positions on global conflicts.

*"A responsible company asks itself how it treats its employees, how it produces, and what kind of message it transmits to its clients." (P2)*

*"To me, it's also responsible if it voluntarily engages in social causes, takes a stance, for example, on Palestine and Israel, or racism." (P5)*

This might indicates a shift from a compliance-based view of CSR to one that includes value-driven activism and alignment with societal debates.

On the other hand, participants emphasized a more process-oriented perspective: a responsible company was expected to ensure coherence across the entire value chain, from working conditions to product quality, packaging, and post-sale practices.

*"For me, a responsible company is one that takes care of 100% of the process, from employees to sales to the final customer, and even after-sales." (P12)*
*"If a firm has been polluting for years but I see that it is genuinely working to reduce emissions, then I start perceiving it as more responsible." (P11)*

This evidence suggests that the notion of responsibility oscillates between two complementary dimensions for our GenZ sample: value-driven activism, where companies are expected to take positions on salient societal debates, and managerial-process responsibility, which focuses on the transparency, quality, and fairness of production and distribution systems. Together, these perspectives reflect a generational understanding of CSR that is simultaneously normative and operational, extending significantly beyond traditional regulatory compliance frameworks.

### *Identity Alignment as a Key Driver of Brand Preference*

Personal identification with a cause strongly influenced participant attitudes toward brands, with emotional resonance and shared values proving decisive in generating brand affinity. This effect was particularly pronounced when CSR initiatives reflected participants' lived experiences and personal identities.

*"If I belong to a certain community and I see a company that supports it, it's natural that I'm more drawn to it." (P6)*

*"If the company fights for a cause that touches me, I feel like part of a family." (P8)*

These responses highlight the significant potential of identity-based marketing strategies that authentically connect corporate values with consumer experiences.

However, insights from the second focus group revealed important nuances to this dynamic, emphasizing trust and authenticity as essential preconditions for successful identity alignment. Participants expressed widespread skepticism toward corporate claims they perceived as inflated, unverifiable, or purely promotional, suggesting that value alignment cannot be achieved without underlying credibility.

*"When I read 'we reduced emissions by 90%,' I don't believe it anymore. For me it's just marketing, there should be an external committee to verify those numbers." (P10)*

*"I trust more the reviews on YouTube by people who are not sponsored, rather than the official post of the company." (P9)*

These findings demonstrate that identity-based marketing proves effective only when coupled with perceived authenticity and independent validation. Shared values must be matched by credible communication practices; otherwise, alignment risks being undermined by consumer suspicions of opportunism or greenwashing. The data suggests that while emotional connection through shared identity remains a powerful driver of brand affinity, it requires a foundation of verified, transparent corporate behavior to achieve lasting impact.

### *Value-Behaviour Inconsistency and Consumer Guilt*

Despite demonstrating high awareness of ethical issues, participants across both groups openly admitted to a significant value-action gap in their purchasing behaviour. Practical considerations such as convenience, price, and product availability frequently overrode ethical considerations, even when consumers possessed clear knowledge of problematic corporate practices.

*"We say we care, but then we keep ordering from Amazon after reading about the workers' conditions." (P3)*

*"Even I, who am very sensitive to social issues, still buy from companies that aren't that committed." (P5)*

*"Let's be honest: we're selfish consumers. We buy what we need without thinking too much." (P8)*

This pattern of inconsistency was further reinforced: participants acknowledged continuing to purchase from brands associated with scandals or questionable practices when convenience or affordability took precedence. The inconsistency appeared particularly pronounced in different product categories, with participants applying varying ethical standards depending on the purchase context.

*"For agro-food products I check the labels, but for clothing I keep buying even if I know the company isn't very ethical." (P11)*

*"I avoid fast fashion when I can, but honestly sometimes it's the only affordable option." (P13)*

This cognitive dissonance reveals that ethical awareness does not automatically translate into ethical consumption patterns. Instead, the findings underscore the significant impact of structural and situational constraints, including price barriers, limited accessibility, and the absence of credible alternatives, that fundamentally limit the effectiveness of CSR as a standalone behavioural driver. The data suggests that while consumer guilt is present and acknowledged, it proves insufficient to alter entrenched consumption routines without complementary institutional support or the presence of visible, trustworthy ethical cues at the point of purchase.

### *Social Media as Primary Source of CSR Information*

Participants across both focus groups overwhelmingly identified social media,particularly Instagram and TikTok, as the most effective channels for CSR communication. Traditional sources such as sustainability reports or LinkedIn posts were perceived as inaccessible and passive, failing to engage younger consumers effectively.

*"If a company only publishes a CSR report, I assume they're not targeting young people like me." (P5)*

*"On Instagram, the content comes to me. I don't need to look for it. That makes a huge difference." (P2)*

This preference was primarily driven by content visibility and ease of access, with participants emphasizing that pop-ups, packaging cues, and short-form posts had significantly more impact than formal documents or detailed reports.

However, insights from the second focus group revealed important nuances regarding platform credibility. While visibility and accessibility remained valued, participants demonstrated sophisticated awareness that not all channels carry equal credibility. Some viewed LinkedIn and traditional media as more authoritative sources, whereas TikTok was frequently associated with superficial messaging and greenwashing tactics.

*"If a company communicates on TikTok, I assume it's just greenwashing. On LinkedIn or in the press, I take it more seriously." (P2)*

Conversely, other participants argued that credibility depends less on the medium itself and more on the underlying reputation of the company, noting that authentic messages can be effectively adapted across different platforms to reach distinct audience segments.

*"The social channel doesn't matter,the key is whether the company itself is credible." (P4)*

YouTube emerged as a particularly significant channel, especially through long-form reviews by smaller, independent creators. These were perceived as significantly more trustworthy than polished corporate posts or sponsored influencer endorsements, reflecting participants' preference for authentic, unbiased perspectives.

*"I trust more the YouTube reviews from people with few subscribers, because they're less influenced by deals with companies." (P5)*

These findings demonstrate that while social media platforms remain the primary source of CSR information for younger consumers, their effectiveness is critically mediated by perceptions of credibility, strategic platform selection, and the alignment of content format with consumer expectations for authenticity and accessibility.

### *Credibility, Coherence, and the Role of Influencers*

Generation Z participants demonstrated a sophisticated understanding of social responsibility that extends beyond environmental concerns to encompass accountability across entire production chains. However, this awareness was coupled with widespread skepticism toward corporate claims, which were frequently perceived as inflated or misleading.

This skepticism shaped participants' information-seeking behaviors, with trust appearing significantly higher when information originated from independent sources rather than corporate channels. Micro-influencers and non-sponsored reviews were particularly valued for their perceived authenticity and freedom from commercial influence.

*"I trust more the YouTube reviews from people with few subscribers, because they're less influenced by company deals." (P5)*

*"I rely more on what people I know personally say than on influencers." (P3)*

Central to participants' evaluation of brand authenticity was the requirement for coherence between corporate values and chosen brand ambassadors. Misalignment between a company's stated principles and its influencer partnerships was viewed as particularly damaging to credibility, with overexposure or contradictory messaging quickly undermining trust.

*"You can't say you're sustainable and then have your products promoted by influencers who shop at Shein." (P1)*

*"If an influencer promotes sustainability but also does Zara haul videos, they lose credibility." (P4)*

To address authenticity concerns, some participants proposed innovative solutions that would increase transparency in corporate communications. They suggested that companies could strengthen credibility by providing influencers and content creators with direct access to production processes, thereby reducing suspicions of scripted or superficial messaging.

*"Big creators should be invited to the company to see how materials are chosen and how people work. Showing the behind-the-scenes makes it more credible." (P4)*

Participants also drew important distinctions between different types of public figures, demonstrating nuanced understanding of messenger credibility. Artists and established public figures were perceived as more trustworthy than commercial influencers, owing to their long-term reputation and typically non-promotional stance.

*"Art lasts. Influencers don't. An artist can deliver a social message more authentically." (P2)*

These findings reveal that for Generation Z consumers, credibility stems from consistency across three key dimensions: the message, the messenger, and the medium. Any misalignments or perceived opportunism rapidly undermine trust, while transparency, independence, and authentic voice significantly enhance it. This suggests that effective CSR communication requires careful attention to both content and messenger selection, with authenticity serving as the fundamental prerequisite for meaningful engagement.

***Preferred CSR Content: Visual, Authentic, and Evidence-Based***

Participants across both focus groups demonstrated clear preferences for visual and concrete CSR content, particularly favouring behind-the-scenes videos, employee interviews, and infographics featuring verifiable data. Authenticity, transparency, and simplicity emerged as essential attributes of effective CSR communication, with participants consistently rejecting abstract claims in favour of tangible evidence.

*"I'd like to see videos showing what the company actually does, not just statements like 'we're sustainable'." (P2)*

*"Show me an image with strong impact and verifiable data,then I pay attention." (P6)*

*"Let the employees speak, show the production processes,that's what builds trust." (P3)*

The second focus group provided additional insights that emphasized the importance of process-based storytelling. Participants expressed strong preferences for content that traces the entire value chain, from material selection through packaging to distribution, as a means of demonstrating responsibility through concrete practices rather than abstract promises.

*"Show the production process, the packaging, even how shipments are made, if they use green transport or not." (P5)*

Beyond visual storytelling, participants consistently highlighted the critical role of external validation in building credibility. Certified data and third-party verification were regarded as necessary safeguards against greenwashing, with some participants explicitly calling for independent oversight of corporate CSR claims.

*"When I read "we reduced emissions by 90%," I don't believe it. There should be an independent committee checking those numbers." (P2)*

*"… so first, I check whether there are any labels, that is, whether there are brands, certifications, and so on." (P4)*

Credibility was further enhanced through first-hand testimonies, whether from employees directly sharing their workplace experiences or independent content creators documenting company practices. This personal dimension was seen as crucial for humanizing corporate communications and establishing authentic connections.

*"I like when a CEO or an employee explains things on YouTube, putting a face on the company makes it more credible." (P4)*

These findings collectively indicate that Generation Z consumers privilege CSR content that is visual, verifiable, and rooted in lived practices. Their preferences reflect a sophisticated demand for evidence-based communication where authenticity and transparency converge to counteract widespread

skepticism toward corporate sustainability claims. Effective CSR communication for this demographic requires moving beyond declarative statements to provide concrete, independently verified evidence of responsible practices throughout the entire value chain.

## 5. Discussion

The preliminary results of the focus group provide compelling insights into how Generation Z perceives and engages with CSR, offering both confirmation and expansion of existing academic literature. Participants articulated a multifaceted understanding of CSR, not confined to philanthropic gestures or reputational tactics, but grounded in ethical coherence, identity resonance, and social engagement. This supports Francis and Hoefel's (2018) characterization of Gen Z as a "truth-seeking" cohort that expects brands to demonstrate clear, consistent alignment between values and actions, especially on divisive societal issues such as climate justice, diversity, and equity.

A salient finding concerns the demand for relational authenticity, a desire to see one's values and identity reflected in the brand's CSR positioning. Participants consistently expressed appreciation for companies that engage in causes they personally relate to, suggesting that CSR is not merely assessed on normative or utilitarian grounds, but through the lens of identity-based evaluation. This complements Kim and Austin's (2019) assertion that Gen Z grants credibility to CSR when it is integrated into core business functions, such as ethical supply chain practices or inclusive workplace policies, rather than through detached or reactive philanthropy.

At the same time, the focus group revealed a persistent value-action gap. Despite high levels of ethical awareness and normative expectations, participants often admitted to making consumption choices driven by price, convenience, or habit. This contradiction, already documented by Carrington et al. (2010), appears not as a result of apathy, but of critical ambivalence, a reflexive negotiation between moral ideals and structural constraints. Interestingly, participants did not trivialize this dissonance; instead, they acknowledged it with irony or guilt, displaying a nuanced consumer consciousness that oscillates between aspiration and realism.

The role of digital media emerged as central to how Gen Z encounters, evaluates, and disseminates CSR-related information. Consistent with Djafarova and Bowes (2021), participants identified Instagram and TikTok as their primary platforms for discovering corporate initiatives. However, rather than responding to formal CSR campaigns, their attention is shaped by algorithmic curation and peer endorsement mechanisms. Traditional communication formats, such as CSR reports or LinkedIn posts, were dismissed as inaccessible or misaligned with their media consumption habits, underscoring the importance of tailoring message tone and format to the platform's social dynamics.

This behaviour aligns with the Source Credibility Theory (Hovland et al., 1953; Ohanian, 1990), which posits that the effectiveness of a message is significantly influenced by the perceived trustworthiness and expertise of the source. Participants expressed skepticism toward influencers perceived as overly commercial or misaligned with the values they claimed to support. In contrast, they attributed greater credibility to 'authentic voices', such as artists or public intellectuals. who were perceived as intrinsically motivated and value-consistent. This preference reflects growing influencer fatigue and heightened awareness of performative activism and greenwashing (Lim, 2020). Ultimately, for Gen Z, authenticity cannot be fabricated through marketing tactics; it must emerge from a congruent alignment between the messenger's identity, the message content, and the brand's actual behavior.

These preliminary findings portray Generation Z as ethically attuned, media-literate, and highly discerning in their reception of CSR communication. While CSR is not the primary driver of purchasing behaviour, it constitutes a powerful secondary filter through which brand legitimacy is evaluated. For CSR strategies to be effective with this cohort, they must be credible, transparent, identity-relevant, and narratively engaging. Companies should move beyond promotional rhetoric and embrace a dialogical, evidence-based approach that acknowledges the moral and cognitive sophistication of Gen Z consumers.

## 6. Conclusion and Limitation

This exploratory study offers a view of how a little sample of young consumers engage with corporate social responsibility communication, revealing both high ethical expectations and critical evaluative capabilities. Participants demand authenticity, transparency, and alignment between a company's stated values and its operational behavior. Rather than accepting CSR claims at face value, they assess the intentionality behind corporate messaging and differentiate between genuine activism and performative gestures.

At the same time, findings highlight a persistent value-action gap: despite endorsing ethical consumption, participants often prioritize affordability and convenience, illustrating the tension between normative ideals and market realities. This contradiction, however, does not indicate apathy, it reflects the structural constraints within which Gen Z constructs its consumer identity.

Digital platforms, particularly TikTok and Instagram, emerge as dominant arenas for CSR engagement. Yet, effectiveness is not defined by platform alone, but by the credibility of the messenger and the perceived congruence between message and action.

This study is based on a single focus group composed of a small and homogeneous sample of Generation Z participants, which may limit the generalizability of the findings. While the qualitative approach enabled in-depth exploration of perceptions and discourses, it does not capture the full diversity of views across different geographic, socioeconomic, or cultural segments within the Gen Z cohort. Additionally, the presence of researchers during the discussion may have influenced participants' responses due to social desirability bias. Future research should incorporate larger and more diverse samples, as well as mixed-method approaches, to validate and expand on these preliminary insights expanding this analysis through comparative or longitudinal methods, deepening our understanding of CSR perception in evolving digital and cultural contexts.

## Abstract

In recent decades, the roles of companies have undergone profound changes, evolving from a vision focused solely on profit, based on shareholder interest, to a vision that takes into account the interests of all stakeholders of the company. In line with this approach, the non-profit organization B Lab aims to recognize the positive impact of companies on multiple stakeholders through the B Corp certification. Within B Corps, a fundamental role is played by the leader, who with their vision guides the company to adopt sustainability strategies and inspires employees to share these values. Through a qualitative study based on semi-structured interviews, this exploratory research aims to investigate how B Corp leaders effectively communicate sustainability strategies to employees, to align internal stakeholders and ensure successful strategy implementation. In line with transformational leadership theory, our analysis shows that leaders adopt a role model within the company, transmitting their vision and actively involving employees in sustainability strategies by using direct communication based on face-to-face meetings and moments of dialogue. Interesting, our results also suggest that longer employee tenure may discourage employees' adoption of B Corps strategy due to a higher resistance to change. In addition, the higher the employees' position within the company, the greater their understanding and acceptance of the strategy, also due to their closer relationship with the leader.

*Keywords: B Corp, stakeholder theory, transformational leadership theory, innovation resistance, stakeholder engagement, sustainable management and marketing*

## 1. Introduction

In recent decades, the perception of the role of the company in society has undergone profound changes, generating a wide debate in literature (Gazzola and Mella, 2016; Sjåfjell and Taylor, 2019). The shareholder-centricity dominated economic and managerial thought for years, proposing a business model that aimed exclusively at maximizing profit for shareholders (Friedman, 1970; Hiller, 2013). However, over the years, management and business literature has highlighted the limitations of the profit-maximization model (e.g. Smith and Rönnegard, 2016). As a result, business theories have evolved towards alternatives perspectives, as the stakeholder theory (ST) which extends the responsibility of the company beyond shareholders to all those who have an interest in the company,

namely stakeholders (Freeman and Reed, 1983). This change led companies to rethink their strategies, considering the interests of multiple subjects and the environmental and social impact as well as the economic one (Haigh and Hoffman, 2012). The development of new business models based on the concepts of Corporate Social Responsibility (CSR) and sustainable development, has favored the integration of ESG (environmental, social, governance) practices into business strategies (Marcon et al., 2023; Baron, 2007). One of the results of this paradigm shift has been the emergence of purpose-driven companies: companies that aim to integrate social and sustainable practices into their strategies, initially through CSR and later through ESG criteria (Ventura, 2022, 2023; Lyon et al., 2024). In this context, B Corps, for-profit companies certified by the non-profit organization B Lab, emerge as organizations committed to meeting rigorous standards of performance, transparency and accountability, and placing social and environmental sustainability at the center of their business model (Villela et al., 2021; Gazzola et al., 2023). By adopting the legal form of benefit corporation, B Corps are required by law to consider the impact of their actions and decisions on five key areas: Governance, workers, community, environment, and customers (Diez-Busto et al., 2022; Richardson and O'Higgins, 2019).

In the context of B Corp, a crucial role is played by their leaders, who are responsible for designing and implementing sustainable strategies that consider the interests of all stakeholders (Kirst et al., 2021; Yaslioglu and Erden, 2018). It is essential that these leaders promote values consistent with the corporate mission and align employees and other internal stakeholders to these values to ensure effective implementation of sustainable strategies (Boeske, 2023; Ibn-Mohammed et al., 2024). The characteristics required of B Corp leaders reflect those typical of transformational leaders, who inspire employees to transcend self-interest and commit to achieving shared goals (Averina et al., 2023; Jiatong et al., 2022).

Previous literature on B Corp leadership has primarily focused on the motivations behind the decision to pursue B Corp certification, shedding light on the underlying principles that drive the adoption of sustainable strategies (e.g. Harjoto et al., 2018; Pollmeier et al., 2024; Stubbs, 2017). However, limited attention has been paid to how these strategies are communicated internally (Mion and Loza Adaui, 2020). Given the critical role of leaders in inspiring employees to align their personal values with those of the organization (Bommer et al., 2005), it becomes essential to investigate how corporate sustainability strategies are communicated to internal stakeholders and what may favor internal strategy acceptance and implementation. Accordingly, this exploratory study addresses two main objectives. First (objective a), it examines how B Corp leaders, acting as transformational leaders, use communication and personal behavior to promote a shared vision of sustainability and to inspire employees to align their individual values with those of the company. Second (objective b), the study investigates potential barriers and factors that may hinder or facilitate employees' acceptance and adoption of B Corp strategies. Indeed, the existing literature suggests that, despite leaders' efforts to communicate sustainability strategies effectively, employees may encounter various obstacles, such as changes in work routines, increased workload, or misalignment between personal and corporate values, that challenge their engagement with and implementation of B Corp principles (Lee et al., 2023).

## 2. Theoretical background

According to the transformational leadership theory, organizations' leaders should inspire followers to transcend their own self-interest in pursuit of a greater common good (Burns, 1978; Bass, 1985). In the corporate context, leaders align their values with those of the company and through their behavior inspire employees to do the same (Bommer et al., 2005). Burns (1978) and Bass (1985), who first introduced and thereafter refined the transformational leadership theory, identified four areas through which leaders motivate followers: intellectual stimulation, idealized influence, individualized consideration, and inspiring motivation (Bass and Riggio, 2006; Avolio and Bass, 2004). It contrasts with the transactional leadership theory, which supports a model of leadership based on rewards and punishments, with limited scope for inspiration and motivation for employees (Yaslioglu and Erden, 2018). Transformational leaders serve as role models within the company, communicating directly with employees to convey their values and ideas to create and share their vision and common goals (Yaslioglu and Erden, 2018). This behavior has several positive aspects within the company. It creates a sense of trust in employees, increasing their motivation and leading them to perform beyond expectations. It also contributes to the creation of an inclusive and positive work environment, which promotes employee growth and well-being, increasing commitment and reducing burnout (Nguon, 2022; Braun et al., 2013). This environment also promotes the development of innovative ideas and behaviors and increases job satisfaction (Podsakoff et al., 1996; Afsar and Masood, 2018). The actions of transformational leaders also help to reduce resistance to change by employees, as open and direct communication helps to resolve many doubts and fears employees have about change and facilitates organizational transitions (Chukwuma and Zondo, 2024). This leadership style appears particularly well-suited for the introduction and communication of sustainable strategies within B Corps, especially given the holistic and multi-goal nature of B Corp strategies. Indeed, the complexity of sustainability strategies requires employees to be intrinsically aligned with the company's long-term and diverse objectives. Leaders of purpose-driven companies often share the qualities of transformational leaders and in this regard are sometimes called disruptive, since they challenge the status quo by introducing revolutionary innovations (Ibn-Mohammed et al., 2024; Manu, 2022). This leadership style allows companies to align all internal stakeholders with the pursuit of social and environmental goals alongside profit and create a supportive and motivating environment to face the challenges that may arise.

One criticism of this theory concerns the lack of clarity about the processes by which leaders influence followers (Yukl, 1999). In addition, innovation resistance theory (Ram, 1987) suggests that different types of barriers make people resist the adoption of innovations. Those barriers are also relevant in the context of sustainable strategies, which are often perceived as disruptive due to their challenge to the status quo (Ram and Sheth, 1989). Employees may oppose change for various reasons: they may fear the consequences of introducing an innovation, such as losing their job or changing their work practices; they may perceive a misalignment between their values and those of the company; or they may feel distant from change itself because they perceive it as little relevant to their daily tasks (Lee et al., 2023).

In this context, by focusing on the internal communication dynamics between B Corp leaders and employees, this study aims to identify the key challenges, barriers, and enablers influencing the internal understanding and adoption of sustainability strategies within certified B Corp.

## 3. Methodology

This exploratory study adopts a qualitative research design to investigate the two primary objectives previously mentioned: (a) understanding how B Corp leaders communicate sustainability strategies to

employees, and (b) exploring factors that could support or hinder the employees' understanding and adoption of B Corp strategies.

Given the dual-perspective approach—focusing on both leaders and employees—two distinct respondent groups were considered. The first group comprised B Corp leaders, specifically CEOs or managers responsible for the design and implementation of sustainability strategies in B Corps headquartered in Italy. Interviews with this group aimed to explore the methods and effectiveness of internal communication of sustainability goals, as well as how leaders influence employee alignment and engagement through their behavior and vision.

The second group consisted of employees working within the same organizations as the interviewed leaders. Interviews with employees were designed to capture their perceptions of how sustainability strategies are communicated and implemented, to identify potential resistance to change, and to assess whether discrepancies exist between leader and employee perspectives—particularly regarding the perceived timing and urgency of implementation.

A total of 15 semi-structured interviews were conducted with B Corp leaders via Google Meet and Microsoft Teams during November and December 2024. Each interview lasted approximately 60 minutes, was audio-recorded with participants' consent, transcribed, and anonymized to ensure confidentiality.

In addition to the 15 B Corp leaders' interviews, 24 interviews with employees were conducted asynchronously via email. Due to scheduling constraints and personal preferences, not all employees were available for real-time interviews. To maintain consistency and comparability across responses, all employee participants were provided with the same set of questions and asked to return their written answers. These email interviews were conducted in December 2024.

Data were analyzed using the Gioia Methodology (Gioia et al., 2013), a structured approach to qualitative thematic analysis that emphasizes the systematic development of first-order concepts, second-order themes, and overarching aggregate dimensions. This method supported the generation of grounded theoretical insights while ensuring analytical transparency and rigor throughout the coding and interpretation process.

## 4. Conclusions and Implications for Theory and Practice

By addressing how B Corp leaders communicate sustainability strategies to employees, and the potential barriers to B Corp implementation as perceived by employees, this study contributes to the application of transformational leadership and innovation resistance theories to the B Corp context.

The results obtained show that leaders adopt a role model within the company, transmitting their vision and actively involving employees in sustainability strategies. They prefer direct communication, through personal meetings and moments of dialogue, in line with what is supported by Yaslioglu and Erden (2018). The behaviors described by B Corp leaders are aligned with what is expressed by the transformational leadership theory, confirming the intuition that B Corp leaders usually adopt a transformational leadership style.

The size of the small-medium enterprise, owned by most of the interviewed companies, allows leaders to work closely with employees, co-creating sustainability strategies and reducing misalignments.

The analysis also suggests that some leaders experience resistance to change from employees. In particular, older employees with longer organizational tenure may sometimes express resistance to B Corp strategy. In line with innovation resistance theory, functional and psychological barriers were identified to explain this behavior. The interviewed leaders indicated that cultural barriers are the most relevant obstacles for contemporary organizations. This issue seems worsened by age and education: older employees were not trained to consider sustainability in their work tasks and decisions. Therefore, leaders sometimes find it difficult to demonstrate the value of sustainability projects, which often have long-term outcomes that are not directly measurable in economic terms. As a result, sustainability related projects may not appear to be a priority, especially when they do not have an immediate impact. Accepting and implementing a sustainable business perspective requires involvement and commitment, demanding a substantial shift in mindset for some team members. The situation tends to be easier with younger employees and new hires, who are often more sensitive to sustainability related issues and do not need to change well-established work practices. Differences in the perception of sustainability strategies are also linked to employees' roles within the company. Those in decision-making positions typically have a clearer understanding of these strategies, due to greater access to information and more frequent and personal contact with the leader. In contrast, employees in more operational roles often require more time to fully assimilate them. Nevertheless, the leader's inspirational approach contributes to fostering a positive work environment and a shared sense of purpose within the organization. This was confirmed by employees, as in all six companies where the perceptions of leaders and employees were compared, a strong alignment of vision emerged.

This study has implications for practitioners, as it provides valuable insights to B Corp leaders and managers who want to effectively communicate the corporate strategy and vision to employees.

The main limitation of the study is probably related to the restricted focus on B Corps headquartered in Italy, which could give rise to cultural bias. Moreover, although anonymity was guaranteed, our data collection could have been affected by social desirability bias, particularly relevant in sustainability marketing and management studies.

While this explorative research provided valuable insights, there is the need for further studies, both qualitative and quantitative, with a larger sample and with B Corps in other countries, in order to confirm the validity of our results and to further investigate dynamics related to internal communication and employees' acceptance of B Corp strategy. Future research could also analyze the alignment between internal and external communication of sustainability strategies and the role of B Corp leaders in shaping external stakeholders' dialogue. Additionally, the impact of this communication on relationship dynamics and the perceived relationship quality in the whole supply chains is a promising venue for future research.

# Sustainability Communication or Missed Opportunity? Evidence from Italian SMEs in the Wood-Furniture Industry

Rosa Romano[1], * Veronica Capone[1], and Alberto Mattiacci[1]

[1] Sapienza University of Rome

*Corresponding author: r.romano@uniroma1.it

## Abstract

Digital sustainability communication is an increasingly strategic priority for businesses. This study examines how Italian SMEs in the wood-furniture sector address this challenge through their websites. Using the OSEC model on a sample of 54 firms, the research assesses the effectiveness of their sustainability communication. Preliminary findings reveal a strong focus on technical aspects of the website, with major gaps in content quality, transparency, and stakeholder engagement. Theoretically, the study extends the use of the OSEC model to a previously unexplored sector, confirming its relevance for SMEs. Managerially, it stresses the need for integrated digital strategies that enhance transparency and stakeholder dialogue.

*Keywords: sustainability communication; SMEs; OSEC model; wood-furniture sector.*

## 1. Introduction and Background

The Italian wood-furniture sector, a pillar of Made in Italy, is characterised by a strong artisanal tradition and an industrial district-based production model (Becattini, 1987). Comprising highly specialised small and medium-sized enterprises (SMEs) (Becattini, 1987), the sector confirmed its resilience in 2024, with a production turnover of €51.6 billion and exports totalling €19.4 billion (FederlegnoArredo, 2025).

The sector consists of two main segments: the wood macro-system, focused on raw materials and semi-finished products, and the furniture macro-system, which includes furniture and home accessories (FederlegnoArredo, 2020). The latter is particularly emblematic of Italian craftsmanship, blending aesthetics, functionality, and cultural identity (FederlegnoArredo, 2020). Within this segment, several specialised sub-sectors address diverse market needs: home furnishings, office furniture, lighting, and bathroom furnishings.

In the 21st century, regulatory and social changes have made environmental sustainability and the circular economy strategic priorities for businesses (Baratta et al., 2023), driven by growing consumer awareness, particularly among Millennials and Generation Z (Kapferer & Michaut-Denizeau, 2020). The wood-furniture sector, which is heavily dependent on material resources, is particularly involved in this transition (Jaeger & Upadhyay, 2020). However, SMEs still face significant organizational, cultural, and financial obstacles (Tura et al., 2019), accentuated by a perception of sustainability as a cost (Barbaritano & Savelli, 2020) and a fragmented European regulatory framework (Kazancoglu et

al., 2021). In this context, corporate websites play a key role in communicating sustainable commitment, thanks to their ability to offer transparency, updatability, and engagement (Wanderley et al., 2008), which are essential elements for strengthening reputation in the sector (Barbaritano, 2019). Against this background, the present study examines how Italian wood-furniture companies communicate sustainability and circular economy practices through their websites. The study pursues the following research objectives: (RQ1) to explore how websites convey sustainability-related information and values; (RQ2) to identify the features of effective and authentic online communication; (RQ3) to assess the transparency, consistency, and quality of sustainability reporting in relation to circular economy principles.

A qualitative approach is employed to analyse the digital communication strategies of Italian wood-furniture firms, evaluating their effectiveness, authenticity, and consistency, while also identifying potential signs of greenwashing.

## 2. Methodology

The sample was selected through purposive sampling (Campbell et al., 2020) from the FederlegnoArredo portal, focusing on the *Furniture* macro-system. Sector filters identified 538 companies in relevant segments for this study: bathroom furniture, office furniture, home accessories, kitchens, wooden components, furniture, movable partitions, seating, and bedding systems. The sample was further refined by selecting SMEs (annual turnover < €50 million; < 250 employees) (European Union, 2003) with export shares over 25%, reducing it to 81 firms. This export threshold was included given that the sector is expected to represent Made in Italy internationally, making export capacity a relevant indicator of market positioning. Final screening, based on website and product catalogue analysis, applied three inclusion criteria: (i) production of wood-based products; (ii) active corporate website. The final sample comprises 54 companies.

Website analysis followed the OSEC model (Orientation, Structure, Ergonomics, Content) (Siano et al., 2016), which assesses sustainability communication across 18 sub-dimensions and 64 indicators, using dichotomous coding (1 = present; 0 = absent). Final scores aggregate values across dimensions. The model evaluates: *Orientation* (mission/vision on sustainability); *Structure* (organisational features and stakeholder engagement tools); *Ergonomics* (usability, accessibility, interactivity); and *Content* (scope and quality of sustainability information, communication principles). It also detects potential greenwashing by assessing consistency with verifiable content (TerraChoice, 2010).

## 3. Preliminary results

The preliminary results concern eight SMEs in the sample, the first two with the highest turnover in each system in the wood-furniture sector. **Table 1** shows descriptive information about the sample.

| **Company** | **System** | **Turnover (million)** | **Company employees** | **Export share (%)** |
|---|---|---|---|---|
| *So.Ve.T. Societa Vetraria Trevigiana srl* | Lighting system; Furniture system | €2.5- €5 | 33 | 75-100 |

| | | | | |
|---|---|---|---|---|
| *Sigma L2 Paolo Granchi SRL* | Lighting system; Furniture system | €1-€2.5 | 8 | 75-100 |
| *Scarabeo Ceramiche SRL* | Bathroom furniture system | €5- €10 | 68 | 75-100 |
| *Pedini SPA* | Bathroom furniture system; Furniture system | €13-€25 | 63 | 75-100 |
| *Moroso SPA* | Office furniture system; Furniture system | up to €500.000 | 123 | 75-100 |
| *I 4 mariani SPA* | Office furniture system; Furniture system | €5-€10 | 49 | 75-100 |
| *Status srl* | Furniture system | €2.5-€5 | 20 | 100 |
| *Tonon e C. spa* | Furniture system | €5-€10 | 36 | 100 |

**Table 1**: Main characteristics of companies

Analysis of the websites of the eight SMEs using the OSEC model reveals an overall lack of performance in sustainability communication. Total OSEC scores ranged from 17.19% to 45.31%, confirming that the wood-furniture sector is still in the early stages of adopting structured and effective digital communication on sustainability (**Table 2**).

| **Company** | **Dimensions** | | | | **Total OSEC score** |
|---|---|---|---|---|---|
| | **Orientation** | **Structure** | **Ergonomics** | **Content** | |
| *So.Ve.T. Societa Vetraria Trevigiana srl* | 16.67% | 5.88% | 63.16% | 0% | 21.88% |
| *Sigma L2 Paolo Granchi SRL* | 0% | 0% | 63.16% | 0% | 18.75% |
| *Scarabeo Ceramiche SRL* | 33.33% | 11.76% | 73.68% | 4.55% | 29.69% |
| *Pedini SPA* | 33.33% | 5.88% | 63.16% | 4.55% | 25% |

| | | | | | |
|---|---|---|---|---|---|
| *Moroso SPA* | 100% | 23.52% | 68.42% | 27.27% | 45.31% |
| *I 4 mariani SPA* | 0% | 5.88% | 52.63% | 0% | 17.19% |
| *Status srl* | 0% | 13.64% | 63.16% | 18.18% | 26.69% |
| *Tonon e C. spa* | 50% | 0% | 68.42% | 31.82% | 35.94% |

**Table 2**: OSEC scores of sample companies

The dimension scores reveal significant disparities. *Ergonomics* is the strongest dimension (52.63%–73.68%), reflecting good usability and navigation. In contrast, *Content* and *Structure* are weak: many companies score below 20% for Content, with critical gaps in visibility, authenticity, and completeness, while Structure lacks adequate stakeholder engagement tools and communication practices. *Orientation* shows mixed results, with only some companies including explicit sustainability references in their mission and vision. All companies analysed report total OSEC scores below 50%, indicating an overall lack of compliance with sustainability communication standards (Siano et al., 2016). Moroso SPA leads (45.31%) with strong Orientation, followed by Tonon e C. spa (35.94%) and Scarabeo Ceramiche SRL (29.69%), which perform well in Ergonomics. Other companies show modest, consistent results, with fair Ergonomics but very low Orientation and Content scores, reflecting fragmented communication. The poorest performers, I 4 Mariani SPA (17.19%) and Sigma L2 Paolo Granchi SRL (18.75%), display major deficiencies across all dimensions, particularly in Orientation and Structure.

## 4. Discussion and Conclusion

Digital communication on sustainability in the wood-furniture sector is still underdeveloped and fragmented. Companies tend to focus on technical aspects such as ergonomics and website navigability, neglecting more strategic dimensions such as sustainable storytelling (Orientation), organizational transparency (Structure), and content quality (Content). This shortcoming compromises the credibility and authenticity of communication, as already noted in other sectors by Siano et al. (2016) and San Miguel et al. (2021). The analysis confirms the absence of integrated communication strategies, with little attention paid to governance, stakeholder engagement, and the use of the web as a tool for dialogic sustainability. Furthermore, sustainability content is often generic, unverifiable, and disconnected from the core business, exposing companies to the risk of greenwashing (Siano et al., 2016).

From a theoretical perspective, the study addresses the still largely unexplored topic of digital communication on sustainability, which is crucial today in order to respond to demands for transparency and regulatory pressures. The focus on SMEs is particularly relevant, given their greater difficulty in adopting and communicating sustainable practices due to structural and resource constraints (Upadhyay et al., 2021). The work also extends the application of the OSEC model, previously used in the energy and fashion sectors (Siano et al., 2016; San Miguel et al., 2021), to the wood-furniture sector, a pillar of Made in Italy (Becattini, 1987). On the managerial side, there is a need for an integrated approach to sustainable communication, based on authentic narratives and participatory governance tools, guided by principles of clarity, consistency, and transparency, to strengthen stakeholder trust and improve corporate positioning.

While providing an initial overview, this study is limited by the relatively small sample size and the use of a model adapted primarily to corporate websites. Future research could extend the analysis to include e-commerce channels, social media platforms, and multi-stakeholder reporting frameworks, in line with the methodological evolution proposed by San Miguel et al. (2021).

# Regenerating Salento: How to Turn an Agri-Environment Crisis Into a Place Branding Opportunity

Vittoria Tunno[1], *, Maria Irene Prete[2], Mauro Amoruso[1] and Antonio Mileti[3]

[1] Department of Architecture and Industrial Design, University of Campania "Luigi Vanvitelli", Aversa (CE), Italy

## Abstract

The Salento landscape has been reshaped by the outbreak of Xylella fastidiosa, which has caused the eradication of a centuries-old crop and caused environmental, social, and cultural effects that go beyond the loss of agricultural output. While current technical and policy discussions emphasise replanting resistant olive cultivars, literature on resilience warns that monocultures remain inherently susceptible to future shocks. This calls for a diversification strategy, both agronomic and narrative, that can replace or complement the olive tree's long-standing iconography with new symbols linked to emerging value chains and place attributes. This study investigates how consumers evaluate a hypothetical collective brand associated with new products from Salento and the extent to which they are willing to purchase them. An online survey administered to residents, former residents, and tourists measures place attachment, environmental values, perceived authenticity, regenerative value, purchase intention, and willingness to pay. A structural model tests whether authenticity and regenerative value mediate the relationship between these antecedents and consumer propensity to buy. The expected results will contribute to the literature on place branding in contexts of agro-environmental crisis and the definition of marketing guidelines for cooperatives and policy makers engaged in the regeneration of Salento.

*Keywords: Xylella, Place Branding, Agricultural Resilience, Regenerative Value, Purchase Intention*

## 1. Introduction

The first outbreak of *Xylella fastidiosa* subsp. *pauca* in Salento was recorded in 2013, and the bacterium has continued to advance along the peninsula ever since (Saponari et al., 2019). In a landscape dominated almost exclusively by centenarian old olive groves, the rapid extinction of trees has caused a double loss: the economic foundation of many farms and a key component of the region's natural capital - a pillar of both environmental quality and tourist appeal. The abrupt interruption of the

enduring "olive tree landscape" narrative (Sardaro et al., 2022) underscores the deep interdependence among agriculture, landscape, culture, and place branding.

Most of literature in the field has focused on the bacterium's epidemiology, vector distribution, diagnostic protocols, therapeutic approaches, and the identification of tolerant cultivars (Serio et al., 2024). Only recently, attention has turned to the crisis's structural underpinnings: excessive crop specialisation has eroded ecological resilience, leaving the production system exposed to biotic and climatic shocks (Lin, 2011). Agroecological research shows that crop diversification enhances long term stability, land use efficiency, and the protection of ecosystem services (Altieri & Nicholls, 2017). Landscape-ecology studies further demonstrate that *Xylella* invasion reshapes cultural and tourism services, highlighting the urgency of integrated regeneration strategies (Valente, 2024).

The results of recent landscape-economics studies indicate that local residents place a high value on multifunctional restoration of olive areas and recognise the benefits of a more varied agricultural mosaic that combines production, biodiversity, and recreational use (Frem et al., 2021). At the same time, place-branding literature investigates how territories strongly associated with a single product can redefine their value proposition when that product becomes a symbol of crisis (Zenker & Braun, 2014).

An unanswered marketing research question is posed by this paradigm shift: Can a region whose international reputation was built on olives and olive oil reinvent itself through new products born of diversified, regenerative farming systems? Put differently, is the intangible value generated by joint efforts of agronomists, entrepreneurs, and local communities transferable to markets and perceived by consumers as a credible promise of quality and sustainability? Can the engagement sparked by new products and a refreshed territorial image translate into sufficient willingness to buy and willingness to pay to support this transition? The present study addresses these questions by analyzing the relationships among users' place attachment, environmental values, perceived authenticity, and regenerative value, and by assessing whether and to what extent consumers are willing to purchase and pay a premium for products that embody the rebirth of the Salento landscape.

## 2. Methodological Framework

### 2.1 Identification Of The Study Area

The Salento peninsula in the Apulia Region (southern Italy) is the study area, which extends to 220,790 ha (Figure 1). *Xylella fastidiosa* has caused the most impact on the provinces of Brindisi, Taranto, and Lecce since 2013. This phitosanitary emergencies turn out to be letal for the iconic olives groves of Salento, many of them centenary and millennial trees protected by a special Regional law established in 2007, the n.14/2007 devoted to "The protection and valorization of the landscape of the monumental olive trees of Puglia". Although the whole of Salento remains the epicenter of the epidemic, the most recent surveillance documents a clear advance towards the north of the infected zone (Osservatorio Fitosanitario della Regione Puglia, 2024).

**Figure 1:** Study area represented by the Salento Peninsula in southern Italy

## 2.2 Questionnaire and measures

The questionnaire was administered online to an initial sample of 100 adult respondents, divided into residents in Salento, former residents and tourists. The first part investigates familiarity with Salento and the *Xylella* epidemic. After a careful analysis of the literature, the most useful scales to investigate the subject matter of the study were selected. The first section analyzes consumers' *green values* (Haws et al., 2014) (6 items, Likert scale 1-7) - the stable orientation to make environmentally friendly consumption choices, the environmental propensity conditions, the opening towards products born from regenerative practices. The second section analyzes the two dimensions of place attachment by Boley et al. (2021): *place identity* (3 items, Likert scale 1-7) - to what extent the Salento is part of the consumer's sense of self; *place dependence* (3 items, Likert scale 1-7) - how much Salento meets better than other places its objectives. The symbolic value of regeneration is rooted in users' place identity, and the scale describes how much the brand can rely on emotions and functionality attributed to the place.

The stimulus includes the following scenario: a cooperative of farmers from the Salento that has started to regenerate the lands affected by Xylella by introducing diversified crops (arboreal and herbaceous crops in general) together with resistant olive varieties.

Diversified crops ensure biodiversity, sustainable land use and resilience to shocks. The products have the territorial mark "Salento Rigenera", which certifies their local origin and, in particular, the provenance of former olive groves destroyed by *Xylella*. Third section analyzes how the social and environmental initiatives at the basis of "Salento Rigenera" are genuine and not opportunistic, considering the *perceived authenticity* scale (CSR-A) by Alhouti, Johnson & Holloway (2016) (6 items, Likert scale 1-7). Section 4 combines standard green value indicators with specific *post-Xylella* statements (biodiversity, landscape rebirth) an ad hoc scale was created for the evaluation of perceived regenerative value (4 items, Likert scale 1-7) and the Woo & Kim (2019) *green perceived value* scale (4

items, Likert scale 1-7) which analyzes the environmental, cultural and economic benefits attributed to regenerative products. In Section 5, attitudes (3 semantic differentials scale from 1 to 7 points) i.e. the affective-cognitive evaluation of the product concept, and the buying intention (WTB) (3 items, Likert scale 1-7) that investigates the pre-phase behaviour crucial for estimating market potential. Section 6 analyses the willingness to pay (WTP), giving a discreet choice between 7 levels of surcharge (0 >50 %) for "Salento Rigenera" oil compared to 500 ml of standard EVO oil at €7.00. Finally, the last section consists of background variables such as purchasing habits, political orientation and sociodemographic data, allowing control over heterogeneity.

## 3. Preliminary Results

The purpose of this study is to analyze a balanced sample of 200 respondents; at present, a balanced sample of 100 respondents is available, and preliminary results from basic descriptive statistics have been obtained. A strong correlation emerges between those who are firmly convinced that climate change is occurring and their purchasing propensity. The WTP sustainable premium price is approximately 20–30%. No significant differences are observed in purchasing propensity across age groups, while gender differences are evident, with female respondents showing higher propensity. Former residents display the strongest inclination to purchase. Place attachment does not significantly affect willingness to buy (WTB) or willingness to pay (WTP). The findings may contribute to the theory of postcrisis place branding, offering practical guidance for local cooperatives, consortia, and policymakers engaged in the transition toward more resilient agricultural systems.

# Track 10
# Services Marketing

Coordinators: Alessia Anzivino & Cristina Mele

In un lungo processo di evoluzione, gli studi di marketing dei servizi hanno per primi esplorato campi fondamentali del management contemporaneo, dall'importanza delle relazioni con i clienti al ruolo del personale e dell'ambiente (servicescape), alla centralità delle esperienze nella proposizione di valore, ai processi di co-creation. Il progresso delle tecnologie ha fortemente trasformato la trama eterogenea che costituisce la service industry, ma non ha fatto venire meno il carattere identitario di imprese il cui "prodotto" è in larga misura un atto, un'azione, una prestazione, una combinazione di conoscenze e competenze "incorporate" nelle persone, ovvero vendere un'esperienza con la promessa di un risultato.

È l'elemento condiviso da imprese molto differenti, dalle imprese globali della consulenza o della revisione alle aziende a raggio locale che forniscono servizi pubblici, dalle agenzie di pubblicità alle software house, dai piccoli studi di design alle grandi catene alberghiere, dalla sanità alla finanza, ai trasporti. Una varietà di settori che condividono però un approccio al marketing fondato sulla creazione di valore attraverso l'interazione personale fra l'impresa e il cliente e che non hanno mai smesso di fornire agli studiosi elementi di innovazione da esplorare e indagare.

L'obiettivo di questa sezione è quello di incoraggiare studi e ricerche in grado di applicare il marketing approach alla progettazione e alla gestione dei servizi con una prospettiva teorico-pratica in grado di coinvolgere manager e studiosi. Ci si propone di accogliere contributi che, nella prospettiva di marketing, propongano lavori di ricerca su: service design, service management, value co-creation, serviscape/context, service innovation, experiential marketing, Transformative Service Research (TSR), social innovation.Si suggerisce di contestualizzare i lavori di ricerca anche tramite casi pratici applicati ai comparti in cui sono coinvolte le imprese e le organizzazioni comprese nello Steering Committee della SIM.

Service marketing has long explored key areas of modern management—customer relationships, employee roles, servicescape, value co-creation, and experiential marketing. Technological progress has transformed the service industry, yet its core remains centered on delivering actions, expertise, and experiences that promise outcomes.

This section welcomes research applying a marketing approach to service design and management, aiming to engage both scholars and practitioners. Topics of interest include value co-creation, service innovation, experiential marketing, service design, servicescape, and Transformative Service Research (TSR). Contributions are encouraged to include practical cases from sectors represented in the SIM Steering Committee.

# Realigning value misalignments in digital public services trough servant leadership

Angela Caridà[1], *, Maria Cristina Dardano[1], Beatrice Bellassi[2] and Monia Melia[1]

[1] Department of Law, Economics and Sociology, University "Magna Græcia" of Catanzaro, Italy
[2] Independent Researcher, Italy

## Abstract

This paper develops a conceptual model to address value co-destruction in digital public services, focusing on misalignments between institutional service templates and the situated performances of users and frontline professionals. These misalignments, particularly salient in standardized, mandatory digital interfaces, can hinder engagement, reduce perceived relevance, and compromise public value outcomes.

The study is conceptual in nature and proposes an interdisciplinary model that integrates insights from public value theory, value co-destruction, and servant leadership. It introduces servant leadership not merely as a leadership style, but as a normative and operational logic that fosters institutional responsiveness, emotional attunement, and participatory alignment within service ecosystems.

The model advances a purpose-driven orientation for public service organizations and illustrates its application through two scenario-based cases involving older adults navigating digital public services. These examples demonstrate how leadership principles—such as humility, empowerment, interpersonal acceptance, and stewardship—can recalibrate service design to better reflect diverse user capabilities, preferences, and values.

This study contributes to service research by repositioning leadership as a relational infrastructure for co-creation, rather than a solely managerial function. It offers actionable insights for public managers seeking to restore public value under conditions of digital complexity and fragmentation.

The paper's originality lies in advancing a purpose-driven, leadership-enabled framework for addressing value co-destruction in public services—aligned with contemporary governance logics and the OECD Good Practice Principles for Public Service Design and Delivery in the Digital Age.

*Keywords: value co-destruction; public value; servant leadership; digital public services; value co-creation; well being.*

## 1. Introduction

The design and delivery of public services are undergoing a profound transformation, driven by digital innovation and a redefinition of the relationship between the state and its citizens. While the adoption of digital technologies has improved efficiency, personalization, and responsiveness, it has also revealed the limitations of traditional governance models—most notably New Public Management (NPM), which has been critiqued for prioritizing outputs over outcomes, fostering bureaucratic detachment, and contributing to service fragmentation (Dunleavy et al., 2006).

In response, the paradigm of New Public Governance (NPG) reframes public service provision as a collaborative, network-based process involving multiple stakeholders, including public institutions, civil society, and citizens (Osborne, 2006; Rhodes, 1997). Central to NPG is the emphasis on interdependence, participation, and the co-creation of public value (Osborne, 2010; Benington, 2011), with citizens increasingly seen as co-designers and co-producers of services (Voorberg et al., 2015; Torfing et al., 2019).

Although public services aim to generate collective value, they frequently produce unintended effects that contribute to value co-destruction (Engen et al., 2021). Recent research has highlighted that co-creation and co-destruction are not binary opposites, but rather interdependent outcomes of complex multi-actor interactions—particularly salient in digitally mediated services (Skålén & Trischler, 2024). Within this perspective, misalignments between design intentions ("templates") and lived service experiences ("performances") emerge as a critical source of public value erosion (Echeverri & Skålén, 2011). Poorly contextualized or overly standardized digital service interfaces often exacerbate these misalignments, disproportionately affecting vulnerable groups (Craig et al., 2025; Vinarski Peretz & Kidron, 2023). While numerous empirical studies have investigated these dynamics in context-specific settings, most focus on micro-level interactions and lack a broader strategic and conceptual framing. With few exceptions (e.g., Skålén & Trischler, 2024), higher-order theoretical perspectives on how to realign service design and performance in complex public ecosystems remain underdeveloped.

To address this gap, the present paper proposes a purpose-driven approach to mitigating value misalignments in digital public services—placing collective well-being and citizen inclusion at the center of service design. The conceptual model embodies this purpose-driven orientation as both a normative and operational stance (Gartenberg., 2022; Carballo., 2023; Ribeiro et al., 2024; Lyon et al., 2025; Von Ahsen & Gauch., 2022), enacted through servant leadership (Greenleaf, 1977), which we conceptualize as the key enabling mechanism for aligning service templates with users' lived experiences.

Grounded in values such as empowerment, humility, authenticity, and stewardship, servant leadership fosters participatory conditions and relational trust—essential to bridging the gap between institutional templates and the lived experiences of users (Van Dierendonck, 2011; Liden et al., 2008).

By linking the systemic sources of value co-destruction (Skålén & Trischler, 2024) with the operational logic of servant leadership, this paper offers a conceptual contribution that helps translate normative purpose into adaptive service strategies. It identifies mechanisms through which public service providers can reduce the misalignment between design and performance, ultimately supporting the reconfiguration of digital service ecosystems around public value co-creation, understood as multidimensional well-being (ISTAT, 2024; Hartley et al., 2017), and enabled by inclusive, ethical, and citizen-centered governance logics. To illustrate these dynamics, the paper presents two scenario-based examples that highlight typical misalignments and how servant leadership principles may help realign service experiences in practice.

## 2. Literature Background

This section reviews the literature, on value co-destruction in public services, public value and servant leadership, which collectively inform the conceptual foundation of the proposed model.

### 2.1 Value Co-destruction in public service

Service scholars increasingly examine the concept of value co-destruction in public services to develop a more rigorous understanding of its relational and systemic dimensions (Shah et al., 2021). While earlier contributions tend to conceptualize co-destruction as analytically distinct from value co-creation (Echeverri & Skålén, 2011; Luo et al., 2019), more recent accounts emphasize their mutual constitution within complex service interactions (Skålén & Trischler, 2024). Value co-destruction may emerge from resource misuse, whether intentional or resulting from a poor contextual fit between technologies, procedures, or tools and the service environment (Plé & Chumpitaz Cáceres, 2010; Vafeas et al., 2016), as well as from expectation misalignment, where service actors interpret roles, goals, or relational obligations divergently, leading to misunderstanding and dissatisfaction (Smith, 2013).

This perspective suggests that value co-destruction is not solely due to structural deficiencies or procedural inefficiencies; rather, it originates more fundamentally in the erosion of relational infrastructure that is, the collapse of shared interpretations, aligned expectations, and mutual sense-making among actors engaged in the service process. As argued by Rossi & Tuurnas (2021) and Van de Walle (2016), such breakdowns are not confined to isolated moments but may surface at any stage of public service delivery, thereby challenging conventional linear or dyadic models of interaction.

While not a constitutive element per se, materials, such as digital systems, forms, interfaces, or broader technological infrastructures, serve as carriers of procedures and shape how understandings and engagements are enacted. Their role becomes particularly critical in e-service contexts, where interactions are increasingly mediated and structured by technological artefacts (Voorberg et al., 2015; Lusch & Nambisan, 2015). When these material configurations are overly rigid, poorly designed, or insufficiently responsive to contextual variability, they are often associated with low perceived usefulness or limited ease of use, which may diminish users' willingness or ability to engage meaningfully with the service (Davis, 1989). This, in turn, can intensify misalignments among the core elements of practice. In such cases, materials become not merely enablers but active contributors to relational breakdowns, undermining the internal coherence of practice and giving rise to value co-destruction (Skålén and Trischler, 2024).

A central mechanism through which these misalignments materialize is the template–performance mismatch. According to Skålén and Trischler (2024), value co-destruction occurs when institutional templates, standardized, top-down service designs embedded in routines, protocols, and formal procedures, fail to resonate with the situated performances of users and frontline professionals, who enact services contextually based on local knowledge, lived experience, and normative commitments.

These mismatches are often intensified by rigid, technocratic models of service delivery that overlook situational complexity, and by tensions between competing value dimensions such as individual versus collective benefit, or procedural compliance versus adaptive responsiveness.

Crucially, the PVCPs framework emphasizes that templates and performances are mutually constitutive. Templates structure expectations and provide a basis for action, but they do not deterministically prescribe practice. Performances, in turn, are not passive executions but active interpretations that can reproduce, challenge, or reshape existing templates over time. This dynamic is

particularly salient in complex inter-organizational governance networks, where fragmented coordination, overlapping mandates, and ambiguous accountability structures increase the likelihood of misalignment (Klijn & Koppenjan, 2014; Naveed & Salman, 2020). Understanding value co-destruction in these contexts requires a perspective that accounts not only for the functional dimensions of service delivery, such as quality, accessibility, and efficiencybu, t also for broader concerns related to public trust, institutional legitimacy, and societal well-being (Naveed, 2025). These dimensions are fundamentally linked to the normative concept of public value, which offers a framework for evaluating the legitimacy and impact of public service systems (Rutgers & Overeem, 2014).

### 2.2 Public Value

Despite its growing prominence in public management and service research, the concept of public value remains theoretically contested and empirically elusive. As Rutgers and Overeem (2014, p. 808) observe, "*there is neither a simple, fixed, or exact meaning of public value, nor a conclusive way to recognize it*." Originally formulated by Moore (1995) as a normative framework to guide public managers in aligning public action with socially valued outcomes, public value emerged as a response to the instrumental rationality of New Public Management. This early formulation emphasized managerial discretion and authorizing environments as key levers in determining public benefit. However, more recent perspectives have expanded this view by foregrounding the collective, negotiated, and participatory nature of value creation, involving citizens, communities, institutions, and elected officials in deliberative and co-productive processes that transcend hierarchical models (Benington, 2011; Von Heimburg et al., 2021; Skålén & Trischler, 2024). This paradigmatic shift has also redefined the scope and function of public value. No longer confined to performance metrics or political legitimacy, it is increasingly understood as multidimensional societal well-being—economic, social, environmental, and institutional—co-created through both the internal functioning of public administrations and their external impact on society (ISTAT, 2024). This dual perspective distinguishes between internal public value, generated through organizational, infrastructural, and digital capacities, and external public value, referring to tangible benefits experienced by citizens, businesses, and stakeholders.

In public services, the value experienced by an actor is not necessarily a direct consequence of their personal contribution, but may emerge indirectly through interactions that also benefit those unable to contribute actively (Skålén & Trischler, 2024). This relational and inclusive understanding of value creation has important implications for how leadership is conceived in the public sphere—pointing toward models, such as servant leadership, that emphasize care, reciprocity, and the empowerment of others.

### 2.3 Servant leadership

Servant leadership, originally introduced by Greenleaf (1970), has garnered increasing attention in public management research as an ethically grounded and relational model of leadership centered on the commitment to serve others and promote the common good (Coetzer et al., 2017; Van Dierendonck, 2011). Although rooted in private sector thinking, the model has been progressively adapted to the public domain, where growing complexity, citizen-centered governance, and legitimacy pressures require leadership approaches that move beyond command-and-control logics (Spears, 1996; Pillay & Kikasu, 2024). In contrast to conventional leadership frameworks, servant leadership emphasizes the ethical empowerment, development, and inclusion of others, placing humility, active

listening, and accountability at the heart of institutional action (Liden et al., 2008, 2014). This orientation is particularly relevant in digital public services, where responsiveness, contextual sensitivity, and trust are essential to aligning service design with user experience (Voorberg et al., 2015). Van Dierendonck (2011) articulates six interrelated dimensions that shape this leadership style: empowerment involves fostering trust and autonomy by enabling others to grow; humility reflects the leader's ability to value others' contributions while accepting personal responsibility; authenticity is expressed through integrity, transparency, and self-awareness; interpersonal acceptance entails empathy and the capacity to forgive, creating a psychologically safe environment; providing direction ensures a coherent vision that aligns institutional goals with individual capabilities; and stewardship affirms the leader's responsibility not only to the organization but to the wider community. Together, these dimensions form a leadership model oriented toward long-term value creation and shared responsibility. Within this configuration, the principle of community building becomes particularly salient. As initially conceptualized by Spears (1996) and later reaffirmed by Van Dierendonck (2011), community building refers to the cultivation of inclusive, trust-based, and cooperative environments. It reflects the broader societal orientation of servant leadership, which extends beyond the immediate organization to embrace collective well-being as an institutional priority. Servant leadership therefore aligns closely with the normative foundations of public service. Both are grounded in the ethos of care, inclusion, and service to others. From this perspective, servant leadership does not merely complement public service values; it actively reinforces them by offering a practical and moral compass that guides public administrators in managing complex demands and in shaping institutional action toward the prioritization of enduring public value and societal well-being (Pillay & Kikasu, 2024).

## 3. Methodology

This study is conceptual in nature and employs a 'break-out' literature review approach, designed to transcend disciplinary silos and stimulate theoretical advancement through cross-domain integration (Gruner & Minunno, 2024). In line with this methodology, flexibility in article selection is maintained to support dynamic engagement with diverse conceptual traditions and enable deeper theoretical synthesis.

The research process was articulated in three phases.

First, a selection of influential and widely cited contributions was identified across three key research streams: value co-destruction in public service (Skålén & Trischler, 2024; Echeverri & Skålén, 2011), public value (Moore, 1995; Benington, 2011) and servant leadership (Van Dierendonck, 2011; Liden et al., 2008, 2014; Coetzer et al., 2017). In the second phase, these bodies of literature were examined to distill their core conceptual insights and theoretical trajectories. The third phase involved a cross-stream reading aimed at identifying underexplored connections and potential complementarities. While each of these streams is well-developed in its own right, their integration,pa rticularly in relation to digital public service, remains limited and conceptually fragmented.

To this end, the paper puts forward a conceptual model that brings together insights from the three domains and suggests that leadership, especially in its servant-oriented form, may provide a valuable lens for understanding and addressing the misalignments that contribute to value co-destruction in digital public service context.

### 3.1 Conceptual model

The conceptual model proposed (Figure 1) conceives value formation within the public service context, focusing on how misalignments between service templates (design intentions) and performances (situated enactments) can be strategically realigned. The model draws upon recent literature on value co-destruction in public services (Skålén & Trischler, 2024; Echeverri & Skålén, 2011), public value (Moore, 1995; Benington, 2011), and servant leadership (Van Dierendonck, 2011; Liden et al., 2008, 2014; Coetzer et al., 2017).

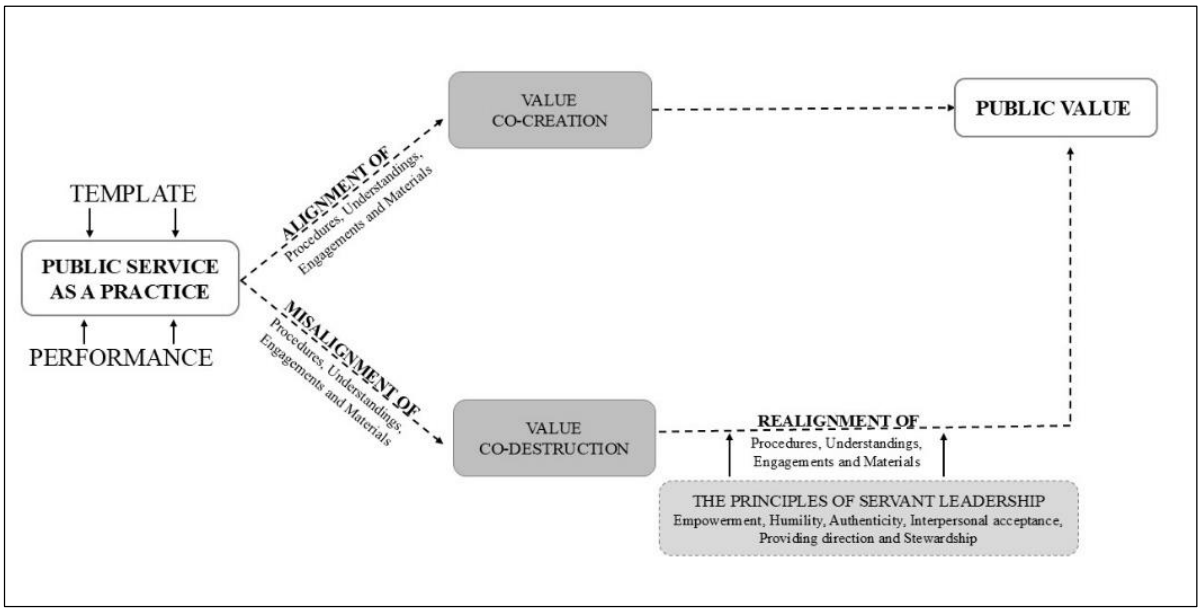

**Figure 1:** The conceptual model (Source: authors'elaboration)

At its foundation, the model builds on the framework of public value co-creation practices (PVCPs), as developed by Skålén and Trischler (2024), which conceptualizes public services as structured around the dynamic relationship between templates and performances. Templates refer to institutionalized service designs embedded in procedures and systems, while performances reflect the contextual enactment of these designs by users and professionals.

Within this interactional space, value co-creation and co-destruction emerge as contingent and dynamic outcomes. Co-creation occurs when alignment between service templates and user performances enables effective resource integration and mutual benefit. In contrast, persistent misalignments can disrupt service experiences and progressively undermine usability, trust, and perceived legitimacy, leading to value co-destruction (Echeverri & Skålén, 2011; Skålén & Trischler, 2024). Such breakdowns often arise when institutional templates, such as standardized digital interfaces, procedural routines, or normative assumptions, fail to reflect the contextual realities of users and professionals. Misalignments may involve conflicting understandings, emotionally disengaging interactions, inaccessible materials, or rigid procedures that disregard users' diverse capabilities and situational needs.

The proposed model advances this view by introducing servant leadership as a key enabler of purpose-driven realignment. By operationalizing principles such as empowerment, humility, authenticity, interpersonal acceptance, providing direction, and stewardship (Van Dierendonck, 2011), servant leadership enhances the system's responsiveness to misalignments and its capacity to recalibrate practices in line with user needs and lived experiences. This approach supports the restoration of coherence across service elements and fosters renewed conditions for public value co-creation.

Following this logic, two illustrative examples drawn from the literature on digital public services—particularly concerning older users—are presented to demonstrate how value misalignments can arise and be strategically addressed. Older adults remain among the demographic groups most vulnerable to the unintended consequences of digitalization (Caridà et al., 2025). They frequently encounter barriers that are cognitive, physical, or related to low digital self-efficacy (Chan & Chen, 2014; Wu et al., 2025). A core issue lies in the common design assumption that all users are digitally fluent and rational adopters of technology (Mustainah & Haryono, 2025). This perspective neglects critical psychological, motivational, and usability-related constraints (Lee & Coughlin, 2015). These challenges are particularly acute in mandatory digital interactions where technology anxiety, unintuitive interface design, and insufficient user support can significantly undermine engagement and lead to withdrawal from digital services (Caridà et al., 2025; Charmarkeh, 2017).

### 3.2 Conceptual model: illustrative scenarios

*Template–performance misalignment*

*Scenario 1: procedural and linguistic barriers.*

A senior citizen seeks to book a medical appointment online through a regional healthcare platform. Although the individual owns a smartphone and uses digital tools regularly for personal purposes, the portal requires complex identification steps, including a digital ID and CAPTCHA verification. Moreover, the interface uses highly formal and bureaucratic language. Despite initial attempts, the senior is unable to complete the process due to a lack of clarity and escalating frustration, ultimately opting for a telephone-based workaround.

This brief examples illustrate a procedural and material misalignment, where the design fails to accommodate cognitive load, linguistic accessibility, and user tolerance thresholds contributing to disengagement and reinforcing a sense of exclusion.

*Scenario 2. relational and motivational barriers.*

A senior citizen is technically proficient and fully capable of managing digital platforms but chooses to avoid using them for public services. When asked to complete an online renewal of a welfare benefit, they express concerns over privacy, distrust in institutional systems, and a strong preference for in-person interaction. In this case, the digital template is functionally accessible, yet a misalignment of understandings and engagements occurs; the service assumes uniform willingness to adopt digital tools, overlooking emotional and relational dimensions such as trust, perceived value, and user identity. The result is not service failure in a technical sense, but a relational disconnection that equally contributes to value co-destruction.

Both examples illustrate how even minor misalignments, whether material, procedural, cognitive, or emotional, can compound over time, undermining service engagement and diminishing perceived value. In these contexts, materials and procedures are not merely neutral carriers of institutional logic;

they become active mediators of user experience and, when poorly contextualized, can function as mechanisms of exclusion (Skålén & Trischler, 2024), particularly when they fail to reflect the diverse needs, expectations, and capacities of the public.

*Template–performance realignment trough servant leadership*

*Scenario 1: realignment trough humility, empowerment, providing direction, and emotional recognition.*

In the first case, where procedural complexity and inaccessible language prevent a senior from booking a medical appointment, realignment is enabled by several core principles of servant leadership: humility, empowerment, providing direction, and emotional recognition. Importantly, these are not limited to the actions of individual leaders but reflect an organizational orientation that prioritizes listening, inclusion, and responsiveness across all levels of the service system.

In this scenario, a public service organization shaped by servant leadership might initiate participatory sessions with older users to surface concrete barriers in the digital interaction process. By doing so, it enacts humility and empowerment, recognizing the experiential knowledge of users as a legitimate foundation for redesign. These co-creative settings mirror what Vargo et al. (2008) describe as socially embedded environments where value is produced through shared meaning-making and mutual learning, rather than one-directional delivery.

As insights from these engagements are translated into action, procedural revision, such as simplifying authentication protocols and adapting interface language, ensures that user needs inform service delivery. The principle of providing direction plays a crucial role here, maintaining coherence with institutional goals while adapting practices to lived realities.

Simultaneously, the organization's commitment to active listening and emotional recognition reframes user frustration not as resistance, but as an expression of cognitive overload and exclusion. These affective states can be directly addressed through co-creation processes. In turn, participatory redesign processes allow older adults to contribute to the development of more intuitive and inclusive materials. This collaborative engagement fosters shared accountability and relational learning (Acar et al., 2023; Mergel et al., 2025), reactivating user trust and involvement.

These interactions also activate social support (Park et al., 2019), reinforcing belonging, esteem, and emotional safety—dimensions especially relevant for those facing digital uncertainty (Liu et al., 2020; Farr, 2019). As Cutrona and Russell (1990) emphasize, such support emerges not from system design alone, but from the relational infrastructure built through co-creative practice.

*Scenario 2: realignment through interpersonal acceptance, authenticity, and stewardship.*

In the second scenario, where a digitally competent older adult disengages due to distrust, privacy concerns, and a preference for human interaction, realignment is enabled by servant leadership principles such as interpersonal acceptance, authenticity, and stewardship. These principles shift the logic of engagement from mandating digital compliance to fostering relational inclusion, allowing for the re-engagement of users through psychological safety and inclusive communication. This approach recognizes that public value is not solely technical or functional, but also deeply experiential and emotional, shaped by trust, recognition, and perceived control. (Meynhardt., 2009)

Servant leadership, in this context, opens space for co-creation by legitimizing user hesitations and enabling individuals to voice their concerns, negotiate meaning, and participate in redesign processes that reflect their lived realities (Suyeon & Nabatchi, 2018).

By leveraging authenticity, institutional actors respond not with scripted or standardized solutions, but with genuine openness to relational complexity. In doing so, they demonstrate interpersonal acceptance by affirming the emotional legitimacy of user disengagement and reframing it not as resistance, but as a valuable expression of lived experience.

Through the design of hybrid service pathways, such as maintaining in-person alternatives or integrating human-mediated digital support, servant leadership reflects stewardship, prioritizing long-term inclusion over short-term efficiency. This approach helps reduce technology anxiety and lowers barriers to digital participation by ensuring emotionally safe, low-pressure environments where users can ask questions, receive feedback, and co-develop improvements (Verschuere et al., 2018; Robert et al., 2020).

These socially embedded contexts foster perceived social support, a key enabler of meaningful engagement. As Park et al. (2019) conceptualize, social support functions as an operant resource activated through co-creative interactions. Emotional, informational, esteem-based, and network-related forms of support (Cutrona & Russell, 1990) are not intrinsic to the service design, but instead emerge through interpersonal dynamics particularly those enabled by servant-oriented leadership.

In addition, such interactions build self-efficacy and stimulate individual capacity-building (Acar et al., 2023), leading not only to improved service encounters but also to a broader transformation in how older users relate to digital public services. This is especially critical for maintaining sustained engagement and ensuring that services remain inclusive, participatory, and aligned with contextual realities.

Across both scenarios, servant leadership functions not merely as an interpersonal orientation but as a strategic and ethical infrastructure for institutional responsiveness. Through co-creative mechanisms, it facilitates adaptive recalibration by enabling emotional connection, building trust, and supporting user competence (Vargo et al., 2008; Liu et al., 2020; Skålén & Trischler, 2024). These outcomes form the building blocks of public value co-creation, particularly in contexts of rapid digital transformation.

## 4. Discussion and conclusion

This paper presents a conceptual framework that applies servant leadership principles to address misalignments between design expectations and actual performance in digital public services, with the ultimate goal of restoring public value. By integrating insights from the literature on public value (Moore, 1995; Benington, 2011), value co-destruction (Skålén & Trischler, 2024; Echeverri & Skålén, 2011), and servant leadership (van Dierendonck, 2011; Liden et al., 2008, 2014; Coetzer et al., 2017), this paper advances a purpose-driven orientation for public service organizations.

This orientation moves beyond the traditional focus on outputs to support a reconceptualization of service delivery as part of a digital ecosystem grounded in inclusion, emotional attunement, and multidimensional well-being (ISTAT, 2024; van Dierendonck, 2011; Skålén & Trischler, 2024).

At the core of the framework lies the idea that value co-destruction often stems from persistent misalignments between institutional templates and the lived experiences of both service users and frontline professionals (Echeverri & Skålén, 2011; Skålén & Trischler, 2024). These misalignments

manifest in inaccessible technologies, rigid procedures, and emotionally detached interactions, especially evident in mandatory digital interfaces, where users are compelled to engage regardless of trust, digital literacy, or personal preferences (Craig et al., 2025). Fragmented communication flows, divergent value orientations, and unclear role expectations further amplify co-destructive dynamics (Smith, 2013; Klijn & Koppenjan, 2014).

Addressing these issues requires more than technical adjustments. It calls for an institutional shift inspired by servant leadership, whose principles, empowerment, interpersonal acceptance, and clear direction (Van Dierendonck, 2011), combined with core public service values such as accountability, transparency, and ethical commitment (Pillay & Kikasu, 2024), provide both normative guidance and operational tools for better aligning service models with lived performances. By fostering trust, mutual understanding, and shared responsibility, servant leadership helps create a cultural environment conducive to value co-creation (Voorberg et al., 2015), in line with the OECD Good Practice Principles for Public Service Design and Delivery in the Digital Age (OECD, 2022).

For example, interpersonal acceptance, linked to autonomy and personal growth, enables empathetic responses to user disengagement (Pillay & Kikasu, 2024), while accountability and transparency clarify expectations and strengthen the coherence between service design and implementation. Empowerment and stewardship encourage meaningful participation and support the sustainability of service innovations (Echeverri & Skålén, 2011; Acar et al., 2023).

These dynamics can activate social support (Park et al., 2019), a mechanism that, as widely documented in the literature on digital public services for older adults (caridà et al., 2025), fosters emotional safety, user competence, and digital self-efficacy (Liu et al., 2020; Cutrona & Russell, 1990).

Beyond the individual level, servant leadership has the potential to mitigate systemic sources of co-destruction. By fostering value-driven direction and cultivating a climate of trust and shared responsibility, it may support adaptive sense-making and constructive dialogue among institutional actors—particularly in contexts characterized by fragmented coordination or opaque communication channels (Klijn & Koppenjan, 2014; Naveed & Salman, 2020). In such settings, the combination of empowerment, interpersonal acceptance, and ethical responsibility could contribute to streamlining communication, reinforcing accountability, and enhancing responsiveness to context. Furthermore, principles such as empathy, stewardship, and service orientation may play a crucial role in restoring public trust in times of digital acceleration. Rather than merely improving individual interactions, servant leadership could support institutional legitimacy and adaptability, potentially enhancing well-being not only for current users but also for future generations (Van Dierendonck, 2011; Peterlin et al., 2015; Beehner, 2020). Leadership, in this view, entails the orchestration of diverse actors and the engagement of stakeholders (Caridà et al., 2022) within the public sphere to manage tensions, align coalitions, and orient competing interests toward shared goals such as the creation of public value, shaped by ongoing struggles between ideas and interests (Hartley et al., 2019). In this sense, servant leadership is not merely a tool for restoring internal motivation or collaboration, as traditionally portrayed; rather, it redefines governance as purpose-driven and citizen-centered.

As underscored by Pillay and Kikasu (2024), it reinforces the citizen's central role in public value creation and reaffirms the ethical responsibility of public institutions to listen, adapt, and act with integrity. Leadership, therefore, is not solely an organizational function; it is a societal mandate aligned with the broader aims of democratic public service.

## 5. Main implications

At the theoretical level, the model offers an integrative contribution by bridging three strands of literature, servant leadership, value co-destruction, and public value, which have often been examined in isolation despite their underlying conceptual affinities. In doing so, it advances current understandings of co-creation by introducing servant leadership orientation as a critical factor shaping service performance and responsiveness. Importantly, servant leadership principles are not merely managerial traits, but are conceptualized here as institutional and cultural arrangements (Caridà et al., 2022; Edvardsson et al., 2014) that enable public value co-creation and support the recovery of misalignments between service templates and user performances. These principles, such as empowerment, humility, authenticity, and stewardship, act as institutional arrangements that inform the normative foundations of action within public service ecosystems (Ojasalo and Kauppinen, 2024). Rather than relying on hierarchical command structures, they cultivate the cultural conditions that enable adaptive practices to emerge spontaneously through co-creation, emotional recognition, and collaborative learning. In this way, servant leadership reconfigures public service ecosystem, enabling a shift from compliance-driven procedures toward trust-based, inclusive, and context-sensitive public service delivery.

For public managers and policy makers, the study underscores the importance of fostering ethical, participatory, and purpose-driven leadership in public administration. This includes promoting healthy organizational climates (Northouse, 2018), strengthening internal and external communication, and ensuring relational accountability across levels of governance. The model suggests that embedding servant leadership principles into decision-making processes can help build citizen trust, encourage co-creation, and support evaluation approaches that move beyond standard performance metrics to assess relational quality, well-being, and inclusion. In doing so, it may contribute to addressing the persistent misalignment between service design and actual performance, enabling more sustainable and equitable digital public services. Furthermore, by promoting emotionally attuned and user-centered interactions, this leadership approach can also enhance the public image of digital services and, by extension, public sector branding (Leijerholt et al., 2019). It may help counteract widespread perceptions of public administration as inefficient or unresponsive, instead positioning it as a trustworthy and value-generating presence in citizens' everyday lives (Wæraas & Byrkjeflot, 2012; Christensen & Lægreid, 2005; Osborne et al., 2013).

## Abstract

Le relazioni tra clienti e dipendenti di prima linea (FLE) sono una parte fondamentale degli incontri di servizio. Questo lavoro mira a consolidare le tipologie di relazioni esistenti tra cliente e FLE. Questo lavoro introduce il concetto di Gradiente Relazionale, un continuum di livelli di relazione con intensità diverse, modellate dal tipo di connessione emotiva, dalla reciprocità e dal contenuto dello scambio. È stato condotto uno studio Delphi per valutare il consenso degli esperti sul gradiente e confermare il nostro quadro teorico. Introduciamo un modello scalabile per descrivere diversi tipi di relazioni e offriamo una nuova interpretazione dei pilastri della teoria dello scambio sociale, aggiungendo diversi livelli di connessione emotiva. Questo modello ci aiuta a comprendere la granularità delle relazioni tra FLE e clienti, con implicazioni per il miglioramento delle interazioni di servizio, della soddisfazione dei clienti e del benessere dei dipendenti.

*Keywords: gradiente relazionale; relazioni cliente-dipendente; teoria dello scambio sociale; reciprocità; connessione emotive*

## 1. Introduzione

Le relazioni tra cliente e dipendenti di prima linea (FLE) sono al centro delle interazioni di servizio e gli studiosi di marketing se ne interessano da tempo. Tradizionalmente, la ricerca ha esaminato il modo in cui le relazioni influenzano il comportamento dei consumatori e i risultati organizzativi (Gwinner et al., 1998), dimostrando che le relazioni sono più efficaci quando sono costruite con una persona piuttosto che con un'organizzazione o la tecnologia (Giebelhausen et al., 2014). Queste relazioni hanno anche un impatto sul benessere, sulla motivazione e sulla creatività dei FLE (PerrySmith & Shalley, 2003). È ormai assodato che tra clienti e FLE esistono relazioni qualitativamente distinte (Price & Arnould, 1999). Sebbene siano state identificate varie tipologie di relazioni, la letteratura rimane frammentaria e la ricerca manca di un quadro completo che catturi la natura progressiva di queste interazioni. Pertanto, nonostante le intuizioni emerse dalla ricerca, rimane una domanda cruciale: Quali tipi di relazioni instaurano i FLE con i clienti e come variano queste relazioni? L'obiettivo di questo lavoro è di consolidare le diverse relazioni cliente-FLE in un quadro unificato. Basandoci sulla teoria dello scambio sociale (SET; Blau, 1964) presentiamo un nuovo costrutto concettuale, il Gradiente Relazionale, che cerca di ridefinire e approfondire la nostra comprensione di queste relazioni. La SET

è una teoria multidisciplinare diffusa in diversi campi, come la psicologia sociale, l'antropologia e il management. Essa spiega le dinamiche relazionali tra dipendenti e colleghi, leader, organizzazioni e clienti. Il principio fondamentale della SET afferma che tutte le interazioni dipendono dalle azioni di entrambi gli attori e che gli scambi sociali possono evolvere in relazioni di alta qualità solo se entrambi gli attori rispettano le regole dello scambio. La SET distingue gli scambi economici da quelli sociali e introduce la norma della reciprocità come regola fondamentale per costruire relazioni durature e di qualità. Allo stesso modo, il Gradiente Relazionale descrive un continuum di livelli di relazione con intensità diverse. Il movimento lungo il continuum è funzione di tre dimensioni: il tipo di connessione emotiva nella relazione sperimentato dalle due parti, il tipo di reciprocità e il contenuto dello scambio.

La connessione emotiva è definita come un senso di immediata compatibilità o incompatibilità nella relazione, in cui l'interazione può sembrare giusta o sbagliata. Riflette la misura in cui il FLE o il cliente si sente emotivamente attaccato o distaccato e la misura in cui l'individuo prova specifici sentimenti positivi o negativi verso l'altro (Batra et al., 2012). Molte relazioni – commerciali e non – sono caratterizzate da diversi gradi di connessione emotiva. Quest'ultima può, ad esempio, definire la forza dei legami in un network (Perry-Smith & Shalley, 2003) e delle amicizie commerciali (Price & Arnould, 1999). Tuttavia, in letteratura manca una chiara definizione dei vari gradi di connessione emotiva e di come queste definiscano ciascun tipo di relazione. La reciprocità si riferisce alla norma sociale che regola gli scambi: quando si dà qualcosa, si deve ricevere qualcosa in cambio (Cropanzano & Mitchell, 2005). Essa può essere rappresentata lungo un continuum che va dalla reciprocità negativa a quella generalizzata. La reciprocità negativa, nota anche come norma della ritorsione, implica una risposta immediata e di valore equivalente al danno ricevuto. Al centro del continuum troviamo la reciprocità bilanciata, in cui i benefici sono immediatamente ed equivalentemente restituiti (Guo et al., 2017). Infine, la reciprocità generalizzata prevede che le risposte non siano dirette ed equivalenti ma si basino su una preoccupazione generale per i bisogni degli altri. Sebbene la reciprocità sia considerata un elemento fondamentale degli scambi sociali, essa è legata ai comportamenti e alle norme che regolano le relazioni, trascurando le componenti emotive. In questi casi, possiamo trovare anche la reciprocità attrattiva, considerata un principio fondamentale delle relazioni sociali (Malloy & Albright, 1990). La forma più semplice di attrazione corrisponde alla simpatia. Tuttavia, comprende anche l'attrazione fisica e l'attrazione sociale. Nelle interazioni cliente-FLE, l'attrazione non implica necessariamente romanticismo o amicizia, ma piuttosto simpatia o considerazione positiva. Ciò include la reciprocità presunta - la convinzione che l'attrazione di una persona sia ricambiata - e la reciprocità effettiva - il comportamento osservabile che indica che l'attrazione che si prova per un'altra persona è ricambiata (Kenny et al., 2006). Durante le prime fasi, le relazioni si possono basare su una reciprocità presunta, ma i legami più profondi richiedono una reciprocità effettiva, cioè una concreta dimostrazione che convalidi il sentimento.

La SET distingue tra scambi economici e sociali. Tutti gli incontri di servizio implicano una componente economica, ma ciò che varia lungo il gradiente proposto è il peso della componente sociale. In particolare, distinguiamo tra scambi sociali e antisociali. Gli scambi sociali si basano su contributi volontari e non contrattuali, come affetto, rispetto o informazioni personali. Questi scambi generano benefici simbolici e si basano su obblighi non contrattuali e si fondano su un'aspettativa di reciprocità futura. Gli scambi antisociali, invece, si manifestano quando una delle due parti arreca danno all'altra, ad esempio attraverso aggressioni verbali, ingiustizie o mancanza di rispetto (Groth & Grandey, 2012). Nel contesto dei servizi, una relazione può contenere simultaneamente elementi economici, sociali e antisociali. Nella zona intermedia del gradiente prevalgono motivazioni economiche; con l'emergere di connessioni emotive, si aggiungono contenuti sociali. Agli estremi, la relazione può assumere una natura prevalentemente sociale o antisociale.

## 2. Metodologia

### 2.1 Studio 1: Studio Delphi

Data la natura concettuale del lavoro, è stato condotto uno studio Delphi per validare la struttura del Gradiente Relazionale. Il metodo Delphi, finalizzato a ottenere consenso tra esperti (Keeney et al., 2011), è stato condotto con nove accademici esperti in relazioni cliente-FLE e gestione dei servizi. Lo studio si è articolato in tre round di sondaggi anonimi. Nei primi due, gli esperti hanno valutato il loro accordo rispetto alle dimensioni e alle tipologie relazionali; nel terzo, hanno giudicato la coerenza tra ogni tipologia e la dimensione associata. In ogni fase, gli esperti hanno motivato le loro risposte tramite domande aperte. Tutte le dimensioni e tipologie relazionali che hanno superato la soglia di consenso del 75% sono spiegate nel prossimo paragrafo.

#### *Il Gradiente Relazionale*

Definiamo il gradiente relazionale un continuum di relazioni cliente-FLE, che va dalle relazioni avverse alle amicizie commerciali. All'estremità inferiore del continuum si trovano le relazioni avverse, cioè quelle caratterizzate da interazioni antagonistiche ripetute o episodiche. Sentimenti di ostilità caratterizzano la connessione emotiva tra le due parti, che può portare alla cosiddetta "spirale dell'inciviltà", in cui il comportamento negativo di una parte si scontra con una reciprocità negativa (Groth & Graandey, 2012). L'interazione si limita alle attività transazionali, ma spesso viola le norme sociali e può includere comportamenti controproducenti (Groth & Grandey, 2012). Seguono, sul continuum, gli scambi commerciali, relazioni puramente commerciali e incentrate sugli aspetti funzionali della transazione. Non comportano alcuna connessione emotiva: il FLE svolge i suoi compiti, il cliente paga e la reciprocità è immediata ed economicamente motivata. Gli scambi commerciali possono evolvere in rapporti. Il rapporto può nascere da una singola interazione positiva (Gremler & Gwinner, 2000). Si basa su una valutazione affettiva positiva dell'interazione e sulla percezione di una connessione tra le due parti. Le interazioni multiple, invece, possono portare a diventare conoscenti, poiché la familiarità e il riconoscimento reciproco si sviluppano nel tempo (Johnson & Selnes, 2004). La conoscenza può essere dedotta quando gli individui si distinguono personalmente e si riconoscono reciprocamente. La relazione è caratterizzata da un senso di simpatia e ci si aspetta una reciprocità bilanciata e una presunta attrazione reciproca. L'ultimo livello del continuum è rappresentato dall'amicizia commerciale. Questo tipo di relazione comprende affetto, lealtà e doni reciproci, il tutto dentro i confini del rapporto commerciale (Price & Arnould 1999). Le amicizie commerciali sono caratterizzate da una reciprocità generalizzata, da un mix di contenuti economici e sociali e da un impegno affettivo, ossia il legame emotivo che genera senso di appartenenza, identificazione con l'altro e la convinzione che la relazione meriti di essere coltivata nel tempo (Morgan & Hunt, 1994).

### 2.2 Studio 2: Modello Simplex

Per misurare il Gradiente Relazionale, condurremo uno studio empirico basato sull'ipotesi che il gradiente segua una struttura a modello simplex (Bagozzi et al., 2012), in cui la forza della relazione tra i tipi di relazione diminuisce con l'aumentare della distanza concettuale. Useremo la modellazione a equazioni strutturali (SEM) per stimare un path model in cui ciascun tipo di relazione è connesso ai tipi adiacenti. Ogni relazione sarà rappresentata come un fattore di secondo ordine, definito da tre fattori di primo ordine che riflettono le dimensioni del gradiente. I dati verranno raccolti tramite un sondaggio online rivolto a clienti e FLE, basato su brevi scenari che descrivono diverse tipologie di relazione, seguiti da scale per misurarne le dimensioni sottostanti.

## 3. Discussione E Conclusione

Concepire le interazioni cliente–FLE come un continuum offre una prospettiva dinamica, capace di cogliere l'evoluzione naturale delle relazioni. In quest'ottica, concetti come l'amicizia commerciale o il rapporto non rappresentano che un punto lungo uno spettro più ampio. Non tutte le interazioni, infatti, evolvono positivamente: molte restano superficiali, altre degenerano. I modelli esistenti tendono a semplificare eccessivamente questa varietà, trascurando la complessità relazionale tipica degli incontri di servizio. Il gradiente relazionale mostra che la qualità delle relazioni può variare in profondità e direzione, coerentemente con una vasta letteratura sul comportamento organizzativo che documenta il crescente problema delle relazioni negative (Grandey & Groth, 2012). Integrare le dimensioni sociali ed emotive nel paradigma economico delle interazioni consente di cogliere meglio le diverse forme relazionali. Il quadro teorico proposto estende la teoria dello scambio sociale incorporando il ruolo delle connessioni emotive e della reciprocità attrattiva. Il nostro lavoro ha come obiettivo di concettualizzare e confermare la struttura del gradiente, pertanto, in futuro, la ricerca potrebbe approfondire i suoi antecedenti e le sue conseguenze, esplorando i meccanismi che favoriscono la progressione relazionale. È plausibile che variabili tradizionalmente associate alla qualità della relazione – come l'impegno o la lealtà – assumano significati e impatti diversi in base alla tipologia relazionale (es. Morgan & Hunt, 1994). Da un punto di vista pratico, il gradiente può guidare strategie relazionali personalizzate. Esso arricchisce la formazione e lo sviluppo professionale, fornendo un linguaggio e una maggiore consapevolezza per gestire situazioni relazionali, il lavoro emotivo e i rischi di eccessivo o scarso coinvolgimento. Il gradiente può facilitare l'allineamento tra design dei servizi e obiettivi relazionali, permettendo di configurare ruoli e flussi di lavoro in base al tipo di relazione desiderata. Alcuni contesti richiedono legami più superficiali per preservare i confini professionali, mentre altri beneficiano di legami più profondi. Inoltre, questo strumento legittima e chiarisce la gestione delle relazioni negative, consentendo alle organizzazioni di monitorarle proattivamente per tutelare il benessere dei dipendenti e prevenire escalation. In sintesi, il Gradiente Relazionale aiuta le organizzazioni a gestire le relazioni in modo strategico e differenziato, riconoscendo che non tutti i legami sono uguali e non tutti vanno sviluppati nello stesso modo.

# Investigating Acceptance and Rejection of Service Robots in Educational Settings

Stefano Paolo Russo[1], *, and Roberta De Filippis[1]

[1] University of Naples Federico II

*Corresponding author: stefanopaolo.russo@unina.it

## Abstract

Service robots are increasingly used in educational contexts for their ability to provide personalised and engaging learning experiences. Despite their potential benefits, their adoption faces challenges, including technical, logistical, and ethical barriers, as well as scepticism from users. This study investigates factors influencing service robot acceptance in education, expanding the Service Robot Acceptance Model (sRAM) to include contextual dimensions. Findings from field research in primary and university settings reveal that functional, socio-emotional, relational, and contextual factors play key roles in shaping acceptance, offering insights for future research and practical applications.

*Keywords: service robot, educational settings, acceptance model, value-in-context, context congruence.*

### 1. Introduction

Recent advancements in the adoption of technology, particularly in high-interaction settings such as educational environments, increasingly necessitate an understanding of students' intentions to use these technologies, alongside their levels of acceptance or rejection (Fussell & Truon, 2022; Terblanche et al., 2023). Service robots, in particular, have been gaining prominence in educational contexts due to their potential benefits (Fisk et al., 2022). Defined by Wirtz et al. (2018) as "system-based autonomous and adaptable interfaces that interact, communicate, and deliver services to customers, service robots in education offer personalised and tailored experiences for students (Belpaeme et al., 2018). These robots are often perceived as more engaging and enjoyable compared to traditional methods (Kidd & Breazeal, 2004; Köse et al., 2015). Notably, they may generate psychological and behavioural benefits, particularly when students trust the robot. This trust can alleviate feelings of anxiety and inadequacy, as students feel less judged than they might in interactions with human operators (Mennens et al., 2024). Despite these advantages, integrating service robots into educational settings is not without challenges.Technical limitations, shifts in educational practices, and logistical and ethical concerns present significant obstacles (Belpaeme et al., 2018).

Furthermore, scepticism among both students and educators regarding the adoption of these technologies highlights the need to identify and address the factors influencing robot acceptance (Bilquise et al., 2024; Roy et al.,2022). To this end, the present study seeks to explore the factors driving students' acceptance and rejection of service robots in education. Employing the Service Robot

Acceptance Model (sRAM) proposed by Wirtz et al. (2018) as a foundation, this research aims to expand the model by incorporating context-specific dimensions. The study adopts an abductive approach to provide deeper insights into the dynamics of service robot acceptance in educational environments.

## 2. Literature review

### 2.1. Service robots in education

Service robots are advanced technological systems engineered to function independently or in partnership with human operators. While manifesting in both tangible and digital formats (Wirtz et al., 2018), researchers have established consensus regarding four fundamental characteristics that influence user acceptance: embodiment, morphology, autonomy and assistive role (Čaić et al., 2019). The core functionality of service robots centres on facilitating interactive dialogue and delivering services (Wirtz et al., 2018). They can process and respond to spoken instructions and questions instantaneously (Wirtz et al., 2021) and can fulfil diverse functions, from practical assistance to providing companionship (Henkel et al., 2020).

Building on these foundational principles, educational service robots emerge as a specialised subset tailored to learning environments. These robots can take on a variety of roles, including tutor, peer learner, teaching assistant, social facilitator, motivator, and learning companion (Kanda et al., 2012). Scholars have validated their efficacy in enhancing both cognitive and affective domains. (Belpaeme et al., 2018). The physical presence of service robots is particularly advantageous, as students show greater compliance with physically present robots compared to virtual systems (Konijn et al., 2020). These robots also possess emotional and social skills that foster student engagement (Mondi et al., 2021), while their tangible embodiment stimulates creativity (Kim & Tscholl, 2021). However, limited attention has been given to the challenges associated with the adoption and rejection of service robots in educational contexts, with much of the existing research relying on broader models of technology acceptance.

### 2.2. Acceptance of service robots

Several scholars have used traditional technology acceptance models to assess users' acceptance of service robots (Li & Wang, 2022). Two of the most cited are the Technology Acceptance Model (TAM) by Davis (1989) and the Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh et al., 2003). TAM posits that perceived utility and ease of use determine a user's intention to use a system. The UTAUT model synthesises several theories, predicting use based on performance expectancy, effort expectancy, social influence, and facilitating conditions. However, when applied to studies on robot acceptance, these models face certain limitations, as robots are inherently more complex than other technological devices like computers (Flandorfer, 2012). In other words, accepting robots differs from accepting other technical innovations because users do not always perceive robots like other technologies (De Graaf et al., 2015). To address this, scholars developed specific models or questionnaires, including the Godspeed Questionnaire (Bartneck et al., 2009), the Almere Model (Heerink et al., 2010), and the Negative Attitude Toward Robots Scale (NARS) (Syrdal et al., 2009). Another model specifically designed for robotic agents is that proposed by Wirtz and colleagues (2018). The authors conceptualised customers' intentions to use or adopt robotic agents during service experiences by integrating cognitive beliefs, social influences, and relational contexts. Their study introduced the sRAM (Service Robot Acceptance Model), which extends TAM by distinguishing between functional dimensions, socio-emotional dimensions and relational dimensions. Despite the

diversity of models proposed by scholars, research has predominantly focused on human-centric factors influencing robot acceptance; additional empirical research is needed to clarify the role of the specific service context in shaping users' acceptance of robotic agents.

## 3. Research design

This study employed an abductive research process, requiring the researcher to move "back and forth" between empirical observations and theoretical insights (Dubois & Gadde, 2002). Abduction focuses on uncovering new concepts for unexpected phenomena that existing knowledge cannot account for (Kennedy & Thornberg, 2018), as creativity is essential to move beyond the constraints of deduction and induction (Kovács & Spens, 2005). To investigate the role of context in educational service robot acceptance, the ABii robot, developed by Van Roboticas, was implemented in two distinct educational contexts: a primary school with 31 children aged 5 to 9 years and a university with 34 students aged 18 to 23 years. In the school, ABii delivered lessons on social-emotional learning, while at the university, lessons focused on innovative technologies in service contexts. Data collection strategies included participant observation and informal interviews (Musante & DeWalt, 2010). These unstructured interviews relied on the researcher's recall and the extensive use of field notes (Bernard, 2011). For data analysis, an abductive thematic analysis was employed (Thompson, 2022). Twenty-two codes were delineated, including acceptance, rejection, and positive and negative versions for usefulness, ease of use, social norms, humanness, social interactivity, social presence, enjoyment, trust, rapport, and context. After coding, the data were organised into a co-occurrence table. The analysis examined the frequency of code usage and the interconnections among codes to identify key relationships.

## 4. A theoretical model for the acceptance of educational service robots

Through an abductive process that moves from literature review to empirical research, we propose a model that identifies key factors in the acceptance or rejection of an educational service robot. The proposed model builds upon the sRAM framework by Wirtz and colleagues (2018) by incorporating the role of value-in-context and context congruence. In the following sections, we examine the components of the proposed model, including the functional, socio-emotional, and relational dimensions, as well as context-related elements.

### 4.1. Functional

The findings suggest the important role played by functional elements in shaping acceptance or rejection of the service robot. These elements concern perceived usefulness, ease of use, and subjective social norms. In terms of perceived usefulness, children regarded the robot as an effective tool for acquiring socio-emotional skills, particularly for managing difficult emotional states. University students also expressed opinions on its utility; some found it useful for complex topics, while others doubted its utility compared to more common technologies.

*"I liked ABii because it helped me understand how to stay calm when I have a problem with a friend or when I have a problem at school".* (#child 3)

The ease of use emerged as a crucial factor contributing to the overall positive reception. Children quickly grasped ABii's lesson structure, which made their learning experience more intuitive. Similarly, university students appreciated its user-friendly design, highlighting its straightforward interface and seamless navigation. Notably, neither group reported significant challenges or frustrations, emphasizing ABii's effectiveness in catering to diverse age groups and learning contexts.

*"We did not have any problems using the robot... it is very intuitive"* (#student 27)

Subjective social norms also played a pivotal role in fostering acceptance of the robot. For children, the approval of parents and the encouragement or acceptance from their peers were key factors in shaping positive attitudes towards using the robot. This social validation made the interaction not only engaging but also more widely embraced within their immediate social circles. For university students, the use of robots in educational contexts was seen as a legitimate and progressive approach, aligning with the broader trend of integrating technology into learning. This perception of social acceptability further reinforced their openness to and acceptance of robot-mediated learning experiences.

*"Certainly, many students might find it interesting and stimulating to have lessons with this type of robot".* (#student 9)

### 4.2. Social-emotional

The robot generated reactions that went beyond simple functional evaluations, with acceptance depending on socio-emotional factors like perceived humanness, social interactivity, social presence, and perceived enjoyment. Many participants attributed human-like traits to ABii, and children, in particular, were drawn to its social capabilities, generating a strong sense of social presence.

*"ABii looks like a character from a cartoon I often watch. I greeted him, and he turned his head toward me and looked at me".* (#child 24)

While children generally found the robot's social interactivity engaging and satisfactory, some university students raised concerns regarding its responsiveness to communicative stimuli. These students noted that the robot occasionally struggled to respond dynamically or adapt to conversational cues, which affected their overall experience.

*"I think the robot could perhaps be programmed to respond better to other vocal inputs as well, so it would be a bit more interactive".* (#student 21)

Finally, perceived enjoyment proved to be a significant factor in the positive reception of ABii. Many participants expressed delight in the robot's celebratory dances and cheerful responses, describing them as highly entertaining and uplifting. These playful elements not only enhanced the overall learning experience but also created an engaging atmosphere that encouraged continued interaction with the robot.

*"It is very fun when ABii starts dancing because we all get up in the class and start dancing together".* (#child 6)

### 4.3. Relational

The relational dimension is defined by the level of trust users place in robotic systems and their ability to establish meaningful connections. In this context, learners demonstrated a general trust in the suggestions provided by ABii, perceiving them as reliable and valuable. Furthermore, participants reported feeling safe and comfortable during interactions, indicating that the robot successfully fostered a sense of psychological security and approachability.

*"I was calm during the robot's explanations, and the topics it covered were very thorough, so I believe the robot is reliable".* (#student 34)

As interactions progressed, participants reported a notable improvement in the fluidity of their engagement with the robot. This enhanced interaction fostered a sense of familiarity and rapport, leading many to perceive the robot as more than just a technological tool. Instead, they began to regard it as a study companion, reflecting the emergence of a personal connection and an increasing sense of relational affinity.

*"At first I had doubts, but in the end I found the robot likeable and friendly".* (#student 26)

### 4.4. Context

The acceptance of the educational service robot has depended on the value learners perceive within their specific contexts of use. Value-in-context highlights that value creation relies on integrating various resources and actors, shaped by contextual factors. This concept emphasises the importance of temporal, spatial, and network dynamics in the value creation process. In this study, the robot addressed specific educational purposes for students, who recognised its value within their contexts of use and evaluated it as more (or less) effective compared to alternative technological solutions commonly used in learning environments, such as computers and electronic whiteboards. This varying degree of preference arose from the robot's ability to combine educational content delivery with social interaction and responsiveness to specific needs. Consequently, the value generated through user-robot interaction depended on the contextual alignment of the robot's capabilities with the characteristics of the surrounding environment and the needs the robot could satisfy for learners at that specific time and in that particular situation.

*"I think ABii is more useful for learning new things than a computer or electronic whiteboards".* (#child 4)

*"I think that in a university context ABii is useful and that, with some improvements, It could satisfy different types of student needs…"* (#student 14)

Value considerations also depend on students' emotional responses to the robot, particularly its ability to meet their expectations. These are shaped by prior experiences with other technologies or human interactions, as well as by the inherent needs generated by the context itself. Such expectations led to judgments about the appropriateness of the robot's behaviour and capabilities for that specific context of use. From this perspective, context congruence emerged as a critical factor in the students' acceptance of the robot.

*"I think ABii is very useful to use at school because it helped me understand what to do in many situations when I am at school, and it tells me things that are not written in school books"* (#child 19)

*"I think ABii is a good example of an educational robot, but I expected a robot that had more improvisation skills and perhaps could respond better to external stimuli"* (#student 29)

## 5. Discussion

While acknowledging the importance of factors closely tied to user perceptions of robots, this work introduces a fresh perspective to service robot acceptance research by proposing the role of context as a novel dimension in shaping the acceptance or rejection of educational service robots. We expanded the sRAM model by Wirtz and colleagues (2018) by incorporating two additional features: value-in-context and context congruence. This study makes three significant contributions.

First, we highlight the importance of broadening discussions about service robot acceptance beyond purely functional, socio-emotional, and relational aspects (Wirtz et al., 2018; Heerink et al., 2010; Van

Doorn et al., 2017). We emphasise the critical need to examine the role of the service context in which user-robot interactions occur. Our findings suggest that even when users respond similarly across functional, socio-emotional, and relational dimensions, their usage intentions may still differ significantly. The service context, and how users perceive it, plays a fundamental role in shaping their overall perception of the service robot and mediating the influence of the three dimensions mentioned above.

Second, the proposed model underscores the role of value-in-context (Mele et al., 2020; Vargo, 2009), a novel dimension that enriches the original sRAM framework. Service robots operate in diverse environments characterised by varying resources, dynamics, and challenges. Learners exhibit diverse needs within their educational settings, and a variety of contextual factors can influence the extent to which the same resource meets those needs. In our study, learners' perceptions of the robot varied based on how it was perceived to address specific needs at a particular time and place, within the specific set of resources characterising the surrounding environment. Additionally, students evaluate how well the robot fulfils their requirements compared to other resources available in their context. For instance, some university students who are already accustomed to using AI programs and chatbots for learning perceived the educational robot as outdated. Conversely, children who did not use such AI tools, but only electronic whiteboards in their classroom, found the same robot highly beneficial. The concept of value-in-context highlights the intricate interplay between humans, robots, and environments, emphasising the unique boundaries that these networks create. These dynamics, combined with the learner's perception of the educational service robot, play a critical role in determining the acceptance or rejection of such robotic resources.

Finally, we contribute to the literature on educational service robot acceptance by introducing the role of context congruence. The evaluation of an educational service robot's acceptance or rejection arises from an understanding of what learners need and seek in specific circumstances, as well as how the robot's capabilities are perceived as aligning with the educational context in question. While children found the ABii robot suitable for school use, some university students expressed doubts about its appropriateness in their setting. Although recognised as a valuable technological tool, it was seen as inadequate for addressing the complexity of university environments. Additionally, while children's expectations were largely met, university students generally expected greater interactivity and adaptability to diverse user needs. From this perspective, the concept of context congruence acted as a mechanism enabling value-in-context to emerge. Further research is needed to elucidate the relationship between value-in-context and context congruence and to understand better their influence on the acceptance or rejection of service robots in educational and other service contexts.

## Abstract

This paper investigates how universities are approaching the integration of Generative AI (GenAI) within teaching practices, focusing on the ongoing transformation of the broader educational service ecosystem. Drawing from a qualitative, exploratory study grounded in the Gioia methodology, we analyze institutional policies, experiential practices, and stakeholder perceptions—along with reflexive insights from an AI agent (ChatGPT)—to explore how GenAI is framed, encouraged, or restricted. While universities engage in multiple missions—teaching, research, and third mission—this study deliberately focuses on teaching, a domain where contradictions are most visible, and where the tensions triggered by GenAI unfold with greater immediacy, according to both faculty and students that have been interviewed. The paper argues that the higher education service ecosystem is approaching a state of "edge of chaos," a condition of free complexity in which roles, norms, and value creation practices are being redefined or the ecosystem will collapse. The contribution offers theoretical and managerial insights on how universities might navigate this liminal state to remain relevant and generative actors in the future education ecosystem.

*Keywords: Generative AI, higher education, service ecosystems, frictions, institutional innovation, marketing*

## 1. Introduction

The emergence of Generative AI (GenAI) in higher education is not merely a technological innovation, but a profound institutional disruption that challenges the traditional structures, norms, and value systems of academic work. As GenAI tools enter university classrooms, they blur the line between students' own work and AI-generated assistance—raising new questions about what counts as learning, authorship, and intellectual honesty. In this landscape, universities are called upon to rethink their pedagogical models and regulatory frameworks while navigating a fluid and unstable environment.

Recent literature in marketing and management emphasizes that innovation should be understood not simply as the adoption of new tools, but as the outcome of processes of sensemaking, institutional negotiation, and value co-creation (Vargo & Lusch, 2016; Vargo et al., 2022; Greenwood et al., 2011). In educational contexts, GenAI disrupts not only teaching practices but the foundational logics that

structure educational services. It is therefore crucial to investigate how universities observe, regulate, and make sense of GenAI in ways that reflect their strategic positioning in an evolving ecosystem.

This paper adopts a service ecosystems perspective (Vargo & Lusch, 2016) to explore how GenAI is being interpreted and negotiated by universities. While GenAI has implications for research and third mission activities, this study focuses on teaching because it currently represents the most visible, contested, and regulated domain—thus offering a privileged lens to observe adaptive dynamics and institutional responses. We interpret this evolving scenario as a threshold condition—what Kauffman (1993) describes as the "edge of chaos"—where established academic norms are questioned daily in classrooms, and where faculty often express both enthusiasm and hesitation, sometimes within the same conversation.

Through the qualitative analysis of institutional policies, interviews with academic stakeholders, and insights from an AI agent (ChatGPT), this paper aims to uncover how universities interpreted as higher education ecosystems are navigating this uncertain landscape. Our objective is twofold: first, to explore the meanings and practices that surround GenAI in the higher education; and second, to examine the role of emerging tensions as indicators of possible institutional transformation (Polese et al., 2021) and leverages to exploit.

In line with the SIM Conference 2025 call for papers, we contribute to the debate on educational service innovation by highlighting how systemic complexity and institutional change intersect in the GenAI era. Our logic of inquiry adopts an "inverted funnel" trajectory: we begin with a broad ecosystemic view of higher education, before zooming in on the domain of master's programs and marketing-oriented curricula, which provide a fertile terrain for observing innovation challenges in GenAI-driven teaching and new universities' value propositions.

## 2. Theoretical Framework

This study builds on three key conceptual pillars that allow us to interpret the adoption of GenAI in higher education as a systemic and institutional phenomenon: the service ecosystem perspective, the notion of tensions and frictions, and the concept of free complexity.

Recent scholarly work has begun to explore the transformative role of Generative AI (GenAI) in higher education, particularly in relation to teaching and learning practices, academic integrity, and the evolving role of educators. Mollick and Mollick (2023) provide empirical insights into how GenAI can be used productively in classroom contexts, illustrating both its pedagogical affordances and its risks. Despite these emerging contributions, much of the existing literature remains either normative or tool-focused, lacking a systemic understanding of how universities as complex service ecosystems make sense of and integrate GenAI. This study addresses this gap by framing GenAI adoption not merely as a pedagogical challenge, but as a site of institutional friction and potential transformation.

### Service ecosystems and educational co-creation

Within the framework of Service-Dominant Logic (Vargo & Lusch, 2008; 2016), the university can be interpreted as a service ecosystem (Visvizi et al., 2023) in which heterogeneous actors (faculty, students, institutions, technologies) co-create educational value through interactions regulated by institutional logics (rules, norms, cultural meanings). GenAI, in this scenario, acts as a disruptive element that alters the relational dynamics and the value configuration (Edvardsson et al., 2014; Akaka et al., 2013). It redefines the ways in which teaching, learning, and assessment are carried out—not as a neutral tool, but as a socio-technical actor embedded in the co-creation process (Chandler & Vargo, 2011).

### Frictions: transformative tensions in complex systems

We use the term frictions (Hahn et al., 2015; Smith & Lewis, 2011) to refer to the tensions— latent or explicit—that emerge between conflicting logics, goals, expectations, and practices. These may take the form of dilemmas, trade-offs, or paradoxes (Jarzabkowski et al., 2013; Andriopoulos & Lewis, 2009). In an educational ecosystem integrating GenAI, frictions may arise around issues such as:

- innovation versus control;
- student autonomy versus evaluation standards;
- technological efficiency versus pedagogical authenticity;
- inclusiveness versus standardization.

Far from being dysfunctions, these frictions can serve as entry points for organizational learning (Farjoun, 2010) and institutional transformation (Zietsma & Lawrence, 2010).

### Free complexity and the edge of chaos

As highlighted in complexity theory (Mason, 2008; Davis & Sumara, 2006), educational systems exhibit emergent, non-linear properties (Vargo et al., 2022). In this context, GenAI acts as a catalyst for such emergent behavior, amplifying uncertainty but also enabling creative reconfiguration. Drawing on Anzivino et al. (2025) and De Toni et al. (2023), we refer to "free complexity" as a dynamic state in which institutional roles, norms, and practices are fluid and contested. This is not simply a zone of entropy, but a liminal space where transformation becomes possible.

Importantly, complexity here is not just a condition. It is inherent to service ecosystems (Gummesson et al., 2019) and it is both an enabler and an inhibitor of change. When properly leveraged, it fosters creativity and systemic evolution; when unmanaged, it risks pushing the system toward fragmentation or collapse. This duality positions higher education at the "edge of chaos" (Kauffman, 1993), where frictions signal not dysfunction, but the potential for institutional metamorphosis.

## 3. Methodology

The research design of this study is qualitative and exploratory, in line with the emerging and complex nature of the phenomenon under investigation (Creswell & Poth, 2016). The aim is not to produce generalizations, but to gain in-depth understanding of how universities are observing, regulating, and reinterpreting the integration of GenAI in teaching during what could be defined as a pre-institutional phase (Zietsma & Lawrence, 2010).

Data collection included:

- Document analysis of ten guidelines published between 2023 and 2025 by Italian and international universities and institutions, including Harvard University, University of Cambridge, ETH Zürich, National University of Singapore, University of Bologna, University of Padua, Jisc (UK), and the UNESCO guidelines (2024);
- Eight semi-structured interviews with faculty members, students, and instructional designers at an Italian university, with specific attention to marketing and management programs where the relevance of GenAI is perceived as particularly significant;

- A reflexive conversation with ChatGPT, considered not only as an enabling technology but as a computational actor with narrative memory of the frictions, practices, and questions it receives daily from students and faculty.

The analysis was conducted using the inductive model proposed by Gioia, Corley, and Hamilton (2013), which enables a progressive conceptual representation of the phenomenon through three levels: first-order concepts (grounded in data), second-order themes (interpretive patterns), and aggregate dimensions (theoretical categories).

This approach was chosen for its ability to capture the depth and dynamism of sensemaking processes (Weick, 1995), especially in contexts marked by institutional plurality and growing complexity (Greenwood et al., 2011). The combined use of policy documents, interviews, and computational reflection supports triangulation (Flick, 2004) and enables the exploration of an evolving ecosystem, capturing not only what is said, but also what is absent, implicit, or ambiguous: regulatory silences, experiential hesitations, and cognitive ambivalences.

A distinctive methodological feature of this study is the inclusion of a reflexive dialogue with ChatGPT, not merely as a tool, but as a repository of the everyday dilemmas voiced by students and faculty. In one such session, the AI was asked whether co-creation compromises learning. Its answer mirrored the ambivalence we observed in human interviews: helpful, yet unsettling in its neutrality. While not human, this "actor" functions as a proxy for capturing ambient tensions in the education ecosystem. Its narrative memory offers insights into how GenAI is perceived and problematized at scale—an unusual but revealing perspective on the edge-of-chaos state we aim to understand.

In this way, the chosen methodology does not merely describe emerging practices, but interprets them as signals of a broader metamorphosis of the educational institution as a whole (Anzivino et al., 2025).

## 4. Preliminary Results and Discussion

Preliminary findings suggest the emergence of frictions in four main areas (see figure 1):

- Regulatory frictions: Some institutions adopt restrictive policies, such as banning GenAI in exam settings—even when students report using similar tools informally during coursework. One student remarked, "They told us not to use AI in the exam, but never explained why it's okay for homework. It's confusing." These inconsistencies suggest that regulation is often reactive and fails to address the nuances of actual use. Rules are often reactive and more oriented toward risk avoidance than value co-creation.

- Cognitive frictions: Both students and faculty express uncertainty about what constitutes authentic learning in the age of GenAI. Faculty and students alike ask: is co-writing with AI still learning, or is it a detour from it? A faculty member noted, "I feel like I'm grading the AI, not the student." Conversely, a student argued, "I use ChatGPT to understand concepts better—it's like a tutor that doesn't judge me." These perspectives expose a shift in how knowledge and authorship are being redefined.

- Experiential frictions: Students encounter different practices across courses and instructors. Some promote AI-enhanced learning, others prohibit it. The resulting

inconsistency is perceived as a "learning lottery," undermining equity. Faculty also feel unsupported in making informed decisions about GenAI use, which fosters fragmentation.

- Institutional frictions: Universities appear torn between signaling innovation and preserving academic legitimacy. In doing so, they risk being perceived as passive or marginal in shaping the future educational landscape. Unless they actively engage in co-creating new learning paradigms, their institutional relevance could erode.

These frictions reflect a moment of free complexity—a transitional space where roles, norms, and value systems are unstable. Rather than being interpreted as dysfunctions, they can be seen as indicators of possible institutional metamorphosis.

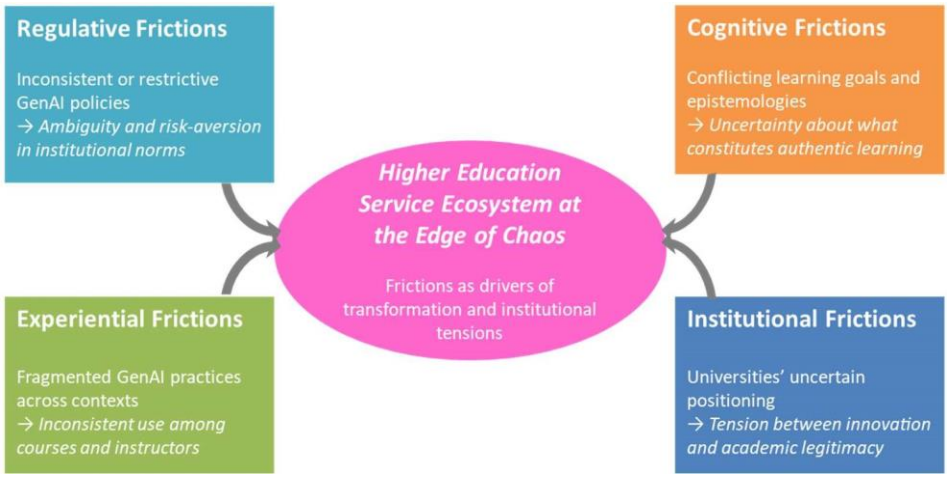

**Figure 1:** Higher Education Service Ecosystem at the Edge of Chaos.
Frictions as Drivers of Transformation and Institutional Tension

## 5. Conclusions and Implications

The adoption of GenAI in higher education is not only a technological event, but a systemic transformation with implications for identity, regulation, and value creation. Our findings highlight the usefulness of reading institutional responses as situated within a service ecosystem under pressure.

Theoretically, we suggest that these frictions are not failures, but signs that institutions are passing through a zone of interpretive struggle—where meaning, policy, and practice are negotiated daily, often informally and inconsistently.

From a managerial perspective, this means universities cannot simply regulate or prohibit the use of GenAI; instead, they must learn to inhabit and govern complexity. This involves cultivating internal capabilities for sensemaking, promoting AI literacy at all levels, and enabling participatory governance of new technologies. The aim shouldn't be to 'stabilize' the system, but to accept that uncertainty ("staying at the edge of chaos") is now part of the educational landscape—and to help educators and

students navigate it with clarity, ethics, and shared expectations.. In this respect, complexity is not a problem to be solved but a terrain to be navigated—one that can stimulate innovation or inhibit change depending on

how it is addressed. Universities that embrace this dual nature may reposition themselves not only as adaptive institutions, but as active shapers of the future educational ecosystem.

Methodologically, the use of policy documents, qualitative interviews, and AI-based reflection allowed us to triangulate interpretations and reveal blind spots, silences, and ambiguities. Future studies could extend the scope to different institutional contexts, cultural systems, and academic disciplines.

In conclusion, GenAI is reshaping the university's role in the educational ecosystem. The challenge is not only to manage GenAI but to rethink what a university is and whom it serves. As one interviewee put it, "We used to teach students how to think. Now we must teach them how to think with AI—and against it." At the edge of chaos, universities face a stark choice: adapt as co-creators of meaning or risk fading into irrelevance.

## Appendix A

Interview Guide

1. What is your general perception of the use of GenAI in university teaching and learning?
2. In which moments do you use it or see it being used?
3. Have you received clear guidance on what is allowed or not allowed?
4. Have you had ethical or practical doubts about its use?
5. Do you feel supported in the conscious and effective use of these tools?
6. How do you think GenAI is changing your way of teaching/learning?
7. In your opinion, how should the university regulate these tools?
8. What tensions, challenges, or conflicts have you observed in your experience?

# User Perception of Value Proposition Driven by Conversational Agents in the Public Service Context

Carmine Sergianni[1], *, and Marco Tregua[1]

## Abstract

The use of conversational agents in public services has expanded rapidly, driven by increasing digitalisation and the need for greater efficiency. However, existing literature has mainly focused on the technicalities and the chase for efficiency, still neglecting user perception. By adopting a Public Service Logic perspective, this study explores how AI-Conversational Agents affect the value proposition of Public Service Organisations, focusing on user perception.

Using a netnographic approach, the research analyses spontaneous conversations between users on Facebook, a platform frequently used by Public Service Organisations and their audiences. The analysis is guided by the Technology Acceptance Model (TAM), whose two key dimensions—perceived usefulness and perceived ease of use—serve as interpretive lenses for categorising user attitudes. By mapping user comments onto these dimensions, four personas emerge: the Supporter (high usefulness, high ease of use), the Opponent (low usefulness, low ease of use), the Skeptic (low usefulness, high ease of use), and the Traditionalist (high usefulness, low ease of use).

This framework, grounded in TAM, provides a valuable interpretive tool for designing technology-driven value propositions that better align with user perceptions, thereby contributing to the development of user-centred digital public services.

*Keyword: Value Proposition, Public Services, User Perception, Conversational Agents, Public Service Logic, Chatbot*

## 1. Introduction

In recent years, conversational agents such as chatbots, voice assistants, and AI-based conversational interfaces have become widespread in many areas (Crolic et al., 2022). Their ability to automate interactions, provide immediate responses, and customise the user experience has established them as essential tools for providing assistance in service contexts (Ranieri et al., 2024).

According to a report by Verified Market Research (2023), the global virtual assistant market is expected to reach $25.36 billion by 2027, growing at a compound annual rate of 34.2% between 2020 and 2027. This growth is being driven by the increasing adoption of remote working, a trend

exacerbated by the Covid-19 pandemic. This has prompted many companies to opt for more agile, scalable workforce solutions to efficiently respond to evolving needs.

In public services, conversational agent use has grown significantly (Maragno et al., 2022), making these tools popular for facilitating access to information, streamlining bureaucratic processes, and expanding service availability outside of traditional hours (Lee et al., 2023). The adoption of these tools responds to the need to improve service efficiency and continuity by reducing the human workload and making interactions more immediate.

However, while research in the private sector has focused primarily on customer service experiences and outcomes (Zhou et al., 2025), studies in the public sector have emphasised technical performance and operational efficiency (Lin et al., 2023). The crucial role of public trust is often overlooked in these studies. According to Aoki (2020), if users do not perceive these technologies positively, the implementation of technology could fail. Therefore, it is crucial to understand how users perceive the introduction of new digital solutions in public services and to address any factors that could undermine trust.

Adopting the theoretical lens of Public Service Logic (PSL), Zyzak and Martinussen (2024) call for future studies investigating users' perceptions of public services, in order to obtain more information on the effectiveness of Public Service Organisations' AI-embedded value propositions. Similarly, Strokosch and Osborne (2020) emphasised the importance of considering user perceptions when defining a new value proposition in public services. Designing or improving value propositions in public services without considering how they are perceived by users can jeopardise value co-creation.

However, this aspect has so far been neglected in the case of value propositions related to new AI-based systems, particularly when integrated into public digital platforms (Trischler & Trischler, 2022). Therefore, understanding how users perceive conversational agents within public services is crucial for evaluating the effectiveness of implemented technologies and for designing value propositions that truly align with user perceptions.

This study aims to contribute to the literature on PSL by exploring how the introduction of artificial intelligence, particularly conversational agents, affects the value proposition of public services from users' perspectives. In line with PSL relational orientation, the analysis focuses on users' perceptions, which are considered fundamental to understanding how value is co-created in interactions between users and Public Service Organisations (PSOs).

To achieve this, the study adopts a netnographic approach, analysing the spontaneous conversations and narratives of users on Facebook. This social platform is widely used by PSOs (Wirtz et al., 2020), and discussions about the value propositions of these organisations take place there, including debates on experiences of using conversational agents integrated into public services. Netnography provides access to in-depth qualitative insights, capturing the emotional, symbolic, and practical dimensions through which users attribute meaning and value to these tools, with the advantage of being unobtrusive, thus achieving an understanding of a phenomenon in an objective way, since there is no influence in data collection.

The analysis process is informed by the Technology Acceptance (TAM) Model (Davis, 1989), which emphasises the influence of perceptions of usefulness and ease of use on the adoption of new technologies. Although the TAM was originally developed in private businesses contexts, it is a useful

starting point for interpreting acceptance dynamics related to conversational agents in public service contexts, particularly when these dynamics emerge from spontaneous, unsolicited narratives.

The analysis reveals different categories who perceive the implementation of a conversational agent differently, and a theoretical framework emerges that describes different user personas based on recurring perceptions according to the adoption of a chatbot. This provides a useful interpretative tool to guide more targeted and informed future implementations.

The remainder of the paper is structured as follows: The next section provides a literature review on the use of conversational agents in public service contexts, as well as the concept of value proposition in the context of PSL. This is followed by the methodology section, which describes the adopted approach, as well as the data collection and analysis processes. The main results are then presented, followed by a critical discussion. The paper concludes with the theoretical and practical implications of the study, its limitations and suggestions for future research.

## 2. Literature Review

### 2.1 Conversational Agents in Public Service Context

Conversational agents have now taken on an increasingly central role in public services in response to the growing demand for efficiency, accessibility, and digitalisation (Ahn & Chen, 2020; Misuraca et al., 2020). These systems, which are based on artificial intelligence, are designed to interact with users through natural language, providing information, support and services in an automated and continuous manner (Lee et al., 2023). They are being adopted in various areas of the public sector with the aim of streamlining bureaucratic processes, reducing operating costs, and improving the user experience (Maragno et al., 2022).

The literature emphasises the potential contribution of conversational agents to make public services more inclusive and accessible to those who struggle to access traditional channels. Numerous studies demonstrate how conversational agents can facilitate interaction between users and PSOs by breaking down barriers related to opening hours, location, and technical capabilities (Wirtz et al., 2018; Larsen and Følstad, 2024). Recently, scholars focused on how artificial intelligence can be embedded into chatbots in order to make them more effective (Larsen and Følstad, 2024); indeed, artificial intelligence can be used in predicting the user intent and in ensuring service quality. Anyway, such conversational agents have fallen short due to a low ease of use from both employees and users. As it regards the first, technology providers offered support when infusing artificial intelligence in the ongoing system, while the problem is still open when it comes to users.

Despite the widespread use of conversational agents - both based or not on artificial intelligence -, studies focusing on user perception in the public services literature are lacking (Zyzak & Martinussen, 2024), mostly due to their newness. Understanding how users perceive conversational agents in public services is thus essential to ensuring satisfaction. Consequently, it is becoming increasingly important to understand users' experiences with conversational agents in order to develop solutions that are technologically advanced, accepted and appreciated by users.

### 2.2 Value Proposition in Public Service Logic

Within the framework of PSL, the value proposition is defined as the set of benefits that a PSO intends to provide to users through its services (Røhnebæk et al., 2024). PSL is a theoretical perspective analysing value creation dynamics in the realm of public services; it was initiated by Osborne (2018)

providing a shift from performance as the key metric of public service organizations (PSOs) and adopting a processual view. It has further evolved towards being a logic on its own, besides starting from some concepts brought by service logic and service-dominant logic. In this strand of literature, Eriksson et al. (2020) stressed the role of collaboration in enabling the process of value creation; such collaboration is not seen as a B2B or B2C tie, but as the sum of the interactions taking place in the social system centred on public services provision. Such systems are the *locus* where value propositions are set, rooted in the mission of PSOs and enabling the joint value creation process between public and private actors. The value proposition is not a static element determined uniquely by the provider (PSO), but rather a commitment to co-creating value realised through interaction between PSOs and their users (Osborne, 2018; Trischler et al., 2023).

In this context, value does not simply transfer from the PSO to the user; rather, it emerges dynamically from the user's active involvement in the service delivery and use process (Osborne, 2018). Therefore, PSOs can only propose value through the design and structuring of services; it is the user who attributes meaning to this proposal and determines its actual value in the specific context of use (the concept of value-in-use).

In line with these assumptions, PSL literature increasingly emphasises the need to investigate how user perception shapes the value proposition in public services. Understanding how users perceive the value proposition is essential for designing interventions that truly align with their needs, contexts, and expectations. User perception is therefore not a marginal element, but an active and decisive component in the process of co-creating public value (Strokosch and Osborne, 2020). Finally, recent studies highlight the need to analyse value perception in the users' sphere - besides recognizing the relevance of collective value, too - and call for investigation of such perception (Cui & Aulton, 2023).

## 3. Methodology

This study adopted a qualitative methodological approach (Yin, 2013) to investigate how users perceive the integration of conversational agents into public service organisations' value propositions. This approach is widely recognised in the literature as being well-suited to analysing emerging phenomena, such as the adoption of artificial intelligence in the public sector.

The methodological approach involves collecting data through netnographic analysis. This is defined as a valid 'qualitative research method that adapts netnographic research techniques to study cultures and communities that emerge through computer-mediated communication' (Kozinets, 2002, p. 62). This approach uses available online information to understand user perceptions (Mkono and Markwell, 2014), favouring objectivity in data collection, since it does not force users in stating considerations that would be necessarily appreciated by the person collecting data. The focus is on a series of cases concerning the adoption and implementation of chatbots by public sector institutions in Italy.

In particular, this research used Facebook as the main platform to gather empirical data, as it represents a widely used social media space where users actively share opinions, feedback, and criticisms regarding public services (Wirtz et al., 2020).

Indeed, Facebook has emerged as a significant platform for public service communication and citizen engagement. Public service broadcasters using Facebook have demonstrated higher performance in terms of content diversity compared to their television counterparts (Steiner et al., 2019).

This allowed us to explore users' spontaneous perceptions and narratives about the implementation of chatbots in public service delivery. The focus is on a series of cases concerning the adoption and implementation of chatbots by public sector institutions in Italy.

The research process is based on the TAM, a robust theoretical framework developed by Davis (1989) to analyse the factors influencing users' acceptance of technology. This model is particularly useful in the context of PSOs (Wirtz & Piehler, 2016) as it enables a systematic investigation into how users perceive and adopt digital solutions within public services.

As Piehler et al. (2016) have highlighted, TAM is a particularly suitable approach for analysing the specific context of PSOs. Specifically, the model enables us to explore two complementary dimensions: (i) the feasibility of using a conversational agent to automate communication activities and (ii) users' perceptions of adopting a conversational agent in public service delivery processes.

This study adopts the approach proposed by Tubaishat (2018) that perceived usefulness and perceived ease of use are the main determinants of users' intention to accept and use a new technology. These two key TAM constructs allow us to measure acceptance levels and gain an in-depth understanding of users' perceptions of introducing a chatbot to the public service experience.

### 3.1 Data Collection

This study collects data by analysing the Facebook pages of 8 PSOs. Specifically, 91 posts published between 2020 and 2024 containing the terms 'chatbot' or 'virtual assistant' are identified. For these posts, 206 user comments related to implementing chatbots in PSOs are systematically downloaded and documented, providing a robust basis for analysis. Finally, saturation was reached when no new themes or categories were identified despite the addition of new data; indeed, according to Guest et al. (2020), saturation was achieved as follows: first, the categories used to describe the reaction of users emerged as either positive or negative; the first part of the analysis led to highlight some comments showing the unfriendliness of the technology, instead of being just either positive or negative; this led to the third category. Then, after analysing the 30th post - namely the run as per Guest et al. (2020), approx. one-third of the sample - a new category emerged, namely scepticism; previous posts were reviewed, showing no need to re-categorize any post. From that moment on, no new categories emerged; thus, twice the number of the previously analyzed posts - from 30th to 91st - made categories stable in the series, showing saturation was achieved. Table 1 summarises the data collected for the study.

| **Public Service Organisation** | **Number of Selected Posts on Conversational Agents** | **Total Interactions (Likes, Comments, Shares)** | **Number of Comments** |
|---|---|---|---|
| Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | 67 | 4057 | 74 |
| Fondazione Policlinico Universitario Agostino Gemelli IRCCS | 6 | 1463 | 30 |

| | | | |

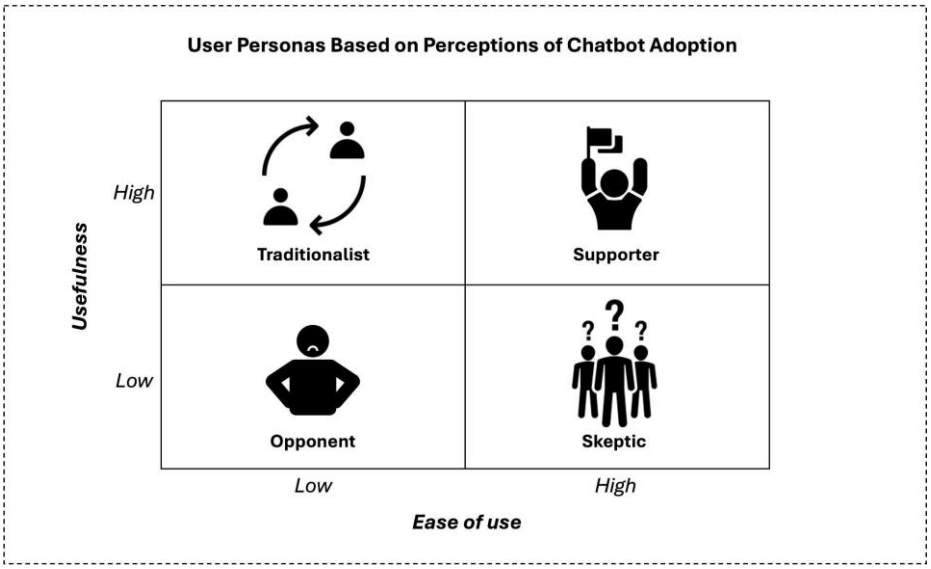
| **Total** | **91** | **7529** | **206** |

*Source: authors elaboration*

**Table 1:** Number of Posts, Interactions and Comments



### 3.2 Data Analysis

The collected data was analysed using a two-tiered approach, with each tier operating at a distinct level. At the first level, user comments on technology adoption were categorised manually according to the two main dimensions of the TAM (Tubaishat, 2018): perceived ease of use and perceived usefulness. Two researchers coded the material independently, working separately in the initial phase to improve reliability and minimise bias. They then compared their individual results, addressing any differences through discussion until complete agreement was reached to ensure consistent final categorisation. This process determined whether each user perceived the technology as easy or difficult to use and useful or not. A total of 47 comments were excluded from the analysis as they were not relevant.

The second level of analysis involved an automated content review using Sketch Engine software. The "word list" function was used to identify the most frequent terms in the dataset. These key terms, which were considered to be the most informative for interpreting user perceptions, were then explored in more depth through concordance checks and n-gram analysis. Combining manual and automated techniques provided a more comprehensive and objective view of public attitudes towards chatbot integration in public service organisations.

## 4. Findings

A netnographic analysis of users' spontaneous conversations about the use of conversational agents in public services revealed an interpretative model based on four recurring user personas: *Supporter, Opponent, Traditionalist* and *Skeptic* (see Figure 1). These summarise the main perceptions expressed by users regarding ease of use and usefulness — two central dimensions in the subjective evaluation of technologies according to TAM (Tubaishat, 2018).

*Source: authors elaboration*

**Figure 1:** User Personas Framework

Personas are not rigid categories, but rather recurring configurations of attitudes, expectations and experiences that help us to understand how conversational agents are adopted, accepted or rejected in public service contexts.

The *Supporter* has a positive attitude towards conversational agents, considering them to be useful and user-friendly tools. They recognise the added value offered by chatbots, particularly in terms of the speed and availability of the service and emphasise their advantages over traditional channels. The Supporter readily adapts to digital interaction and actively contributes to legitimising innovation, demonstrating widespread trust in the institution that introduced the tool.

At the opposite end of the spectrum is the *Opponent*, who clearly rejects conversational agents, perceiving them as useless, ineffective or frustrating. They criticise the chatbot's lack of understanding, its inability to handle complex requests and the resulting isolation from human contact. From this perspective, not only does the agent fail to produce value, it also compromises the public service experience, generating disaffection and institutional mistrust.

*Traditionalists* have a low level of familiarity with and confidence in digital technologies, which often generates cautious or slightly distrustful attitudes toward conversational agents. While they don't openly oppose innovation, they tend to view chatbots as tools that differ from their communication habits. They prefer direct human interactions because they find them more reliable and reassuring. They only use conversational agents when there are no alternatives or for simple tasks, and they do not feel a sense of mastery over the tool. This reflects a technology-unfriendly profile in which digital adoption is slowed not by ideological rejection but by a sense of alienation, insecurity, and attachment to traditional relational models.

The *Skeptic* is in an ambiguous position. The users shaping this persona potentially recognize the ease of use of conversational agents but doubt their usefulness. Their assessments are often influenced by

negative past experiences, a lack of confidence in the public body's ability to properly implement the technology, and unrealistic expectations. Chatbots are perceived as incomplete innovations that are still far from guaranteeing a satisfactory experience. Table 2 provides examples of comments related to each persona.

| **Personas** | **PSOs** | **Description Comment Examples** |
|---|---|---|
| Supporter | Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | *"Very interesting, I think the institute is getting ahead and can grow even more!"* |
| Supporter | Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | *"So far it has always been perfect. I've been happy with it. I hope it always goes on like this."* |
| Supporter | Comune di Siena | *"I thought it was mediocre ... instead right now it's perfect!"* |
| Supporter | Galleria dell'Accademia di Firenze | *"What a brilliant idea! I love it!"* |
| Opponent | Regione Toscana | *"It's just a big waste of time; you have to go back to using the phone cup or the physical cup."* |
| Opponent | Regione Toscana | *"The guaranteed way to lose your mind"* |
| Opponent | Parco Archeologico del Colosseo | *"Please don't, grace us!"* |
| Traditionalist | Regione Toscana | *"When are free courses for the digitally unfamiliar? We make ourselves available."* |
| Traditionalist | Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | *"How do you use it? On the Facebook page I can't find it ... thank you."* |
| Traditionalist | Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | *"How do you talk to Pasqualino???"* |
| Traditionalist | Università degli Studi di Salerno | *How do you chat with Matthew?* |
| Skeptic | Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | *"Interesting if it works."* |

| | | |
|---|---|---|
| Skeptic | Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | *"Wasn't an information office better?"* |
| Skeptic | Istituto Nazionale Tumori IRCCS "Fondazione G. Pascale" | *"And let's hope it works in the facts."* |

*Source: authors elaboration*

**Table 2:** Description Comment Examples

Finally, the results of the analysis show that perceptions vary depending on the public sector. For instance, the analysis shows an overall positive perception of usefulness and ease of use in the healthcare sector. Users appreciate the introduction of this technology because they find it useful and efficient for healthcare services.

In contrast, comments from the public administration sector reflect a predominantly negative perception. Users believe that the technology does not improve the service and prefer personalized human interaction.

## 5. Discussion

This research offers a new perspective on how users perceive the adoption of conversational agents in public services. The results highlight the importance of subjective factors in determining the perceived value of these tools. The emergence of four user personas — *Supporter, Opponent, Traditionalist,* and *Skeptic* — shows that adopting a conversational agent in a public service context is not a neutral or solely technical process. Rather, it is an experience mediated by past experiences, expectations, and trust in the institution promoting the innovation.

These findings reinforce the PSL assumption that value in public services is co-created through interaction between users and PSOs (Osborne, 2018). Therefore, it is crucial to consider users' perceptions when defining value propositions, particularly when implementing public digital services (Osborne, 2018; Trischler & Trischler, 2022).

Users do not merely "receive" an automated service; they also interpret its meaning, evaluate its usefulness, and compare it with pre-existing models of legitimacy and quality. In this dynamic, the conversational agent is a tool and a symbolic touchpoint that reflects — and sometimes challenges — the relationship between users and PSOs.

The articulation of personas along the two dimensions of *usefulness* and *ease of use*—which are central to the TAM—suggests that acceptance of Artificial Intelligence technologies cannot be interpreted exclusively in functional terms. For example, some users, such as *Skeptics*, may perceive a tool as easy to use but not very useful, while others, such as *Traditionalists*, may recognise its potential but doubt its reliability or ease of use.

These differences highlight the fact that PSOs cannot adopt a one-size-fits-all strategy when designing AI-embedded solutions. Instead, they must develop value propositions that address the specific expectations, concerns, and needs of each user. This requires technical design work as well as targeted cultural support, institutional communication, and trust-building measures tailored to different user

profiles. Only through this users-centred approach can promote the inclusive, informed, and sustainable adoption of Artificial Intelligence technologies in public service context.

## 6. Conclusion

The infusion of artificial intelligence in addressing value proposition through conversational agents proved being a proper way to widen the chances to experience public services; indeed, the use of such agents supports the breaking down of barriers as previously theorised (e.g., Wirtz et al., 2018) and supports the understanding of what users might want, namely their intent (Larsen and Følstad, 2024). In addition to what extant studies proposed, this research shows the understanding of the need supported by artificial intelligence. Therefore, the embedding of artificial intelligence is beneficial in this way. Anyway, it has not to be thought of as a one-fits-all solution, due to the differences emerging among users. Indeed, the use of artificial intelligence-driven conversational agents might clash with the perception of a very limited ease of use. This proved the suitability of TAM in studies on innovative ways of service provision (Tubaishat, 2018), while stressing the need for further development of tools. This is due to different backgrounds, willingness to participate in service provision, and personal features hindering some users from fully enjoying what the offering is about and how to experience it. This consideration is fully new when it comes to the use of artificial intelligence in conversational agents, also due to the newness of such solutions.

From these considerations related to the conceptual side some more derive with reference to managerial suggestions; indeed, public managers planning to introduce artificial intelligence in conversational agents should properly address the novel value proposition, otherwise the digital divide and the digital illiteracy would further isolate some users. This is very relevant in an area where service provision is very often related to urgent and basic needs for users, thus PSOs should properly know and assess the plethora of potential users to understand what can hinder the full acceptance of novel conversational agents and how to contrast such issues. A multiplicity of solutions and training in the use of new technologies can represent the way to widen the chance of accepting such value propositions for multiple users. Being social networks the research context for data collection there is a chance to consider the interplay among different users - according to the personas - to favour a mutual learning effect, thus leveraging on peer-to-peer interactions instead of just having a PSOs setting video tutorial, online support, or any other form of training.

Further research is needed to explore the distinctive characteristics of the four user personas that emerged, as well as the response strategies that PSOs should adopt. It is particularly important to investigate how the most reluctant figures, such as the *Skeptic* and the *Opponent*, can be guided toward more favorable positions.

Additionally, in line with the considerations above, this research would benefit from a wider understanding of the reasons why the ease of use and the usefulness are perceived as limited. Therefore, next research might address such limitations via the use of qualitative methodologies to investigate single users and have a wider interpretation of the considerations emerged from online comments. Moreover, time is another feature to be considered, since over time there might be self-learning processes or community effects to increase the ease of use and favour a higher understanding of the usefulness. Similarly, the direct interaction with the companies providing technology services to PSOs as well as to PSOs themselves in order to analyse data and better frame users' behaviour in the interaction with conversational agents.

Finally, further research might compare the evidence of this study with new ones carried out in other geographical contexts, in order to understand whether digital divide and illiteracy is an issue mostly affecting some areas. This would lead to consider the managerial implications for further service offering, since a great relevance of user digital illiteracy might lead to a limited application of some solutions in multiple countries, hindering the scaling up of new ways to offer services.

## Abstract

Understanding how financial advisors manage behavioral obstacles in client decision-making is critical for improving consumer outcomes in the financial services sector. While previous research has extensively exlored consumer biases and financial literacy gaps, little is known about how advisors themselves perceive and respond to these challenges in practice. This study investigates the communicative strategies used by financial advisors to address behavioral resistance and facilitate informed financial decisions. Through a thematic analysis of 15 in-depth interviews with professional advisors, four key themes emerged: (1) loss aversion as a psychological barrier to investment, (2) limited financial knowledge among clients, (3) empathy as a trust-building and diagnostic tool, and (4) the strategic use of examples and analogies to simplify complex information. The findings suggest that effective financial advising requires not only technical expertise but also adaptive communication, emotional intelligence, and narrative skills. The study contributes to the literature on behavioral finance and services marketing by highlighting the advisor's role as both educator and behavioral coach. Implications for advisor training and financial institutions are discussed, along with directions for future research on consumer-advisor dynamics.

*Keywords: Consumer behavior, Behavioral finance, Communication, Thematic analysis*

## 1. Introduction

In recent decades, financial decision-making has increasingly attracted the attention of scholars in the fields of marketing, behavioral economics, and consumer psychology (De Bondt & Thaler, 1995; Frydman & Camerer, 2016; Gärling et al., 2009; Greenberg & Hershfield, 2019; Martenson, 2008). Unlike low-involvement purchases, financial products are characterized by their complexity, long-term consequences, and inherent uncertainty, often requiring high levels of trust and cognitive effort from consumers (Lusardi & Mitchell, 2014). Despite the increasing availability of financial products and advisory services, many individuals continue to make suboptimal financial decisions: delaying investments, avoiding necessary risk-taking, or simply ignoring financial planning altogether (Douglas & Wildavsky, 1982; Kahneman & Tversky, 2013; Thaler & Sunstein, 2008). One of the key challenges in the financial services sector is that consumer behavior often deviates from the assumptions of rational choice (Faris et al., 2024). Cognitive biases such as loss aversion, status quo bias, and overconfidence systematically affect how individuals perceive financial information and make choices

(Barberis & Thaler, 2003; Benos, 1998; Chuah & Devlin, 2011). Among these, loss aversion, which is the tendency to prefer avoiding losses over acquiring equivalent gains, has been consistently identified as a primary obstacle to prudent financial behavior (Byrne, 2005). Financial advisors are frequently positioned at the intersection between complex product offerings and consumers with limited financial literacy and strong behavioral biases (Pearson, 2021). In this context, the advisor's role extends beyond technical expertise to include educational, emotional, and communicative functions (Gennaioli et al., 2015). Advisors translate abstract financial concepts into meaningful narratives and real-life examples, adapt their language to the client's level of understanding, and respond to emotional cues and behavioral resistance (Bhattacharjee et al., 2014; Mustafa et al., 2023). Yet, while the importance of financial literacy and behavioral finance is well documented, fewer studies have explored how advisors themselves perceive and manage the behavioral dynamics of their clients in everyday practice. Specifically, there is limited qualitative research investigating the communication strategies advisors adopt to mitigate biases and foster more informed financial decisions. Existing studies tend to focus either on consumer-side perspectives (e.g., investment behavior, trust, satisfaction) or on general principles of effective communication, rather than on the lived experiences and adaptive practices of financial consultants in the field (Lim et al., 2013; Van Rooij et al., 2011). This paper aims to address this gap by exploring how financial advisors interpret and respond to the behavioral challenges exhibited by clients during financial consultations. Through a thematic analysis (Braun & Clarke, 2006) of in-depth interviews with professional financial advisors, we identify the communication strategies they employ to manage behavioral resistance and enhance decision-making. It highlights the need to go beyond the "information deficit model", which assumes that poor decisions stem merely from a lack of knowledge, and to consider the relational and emotional dimensions of financial advising. As financial products become more customized and complex, advisors are increasingly required to act as interpreters of meaning, trust-builders, and behavioral coaches (Loewenstein et al., 2012). The paper is structured as follows: the next section reviews the literature on consumer behavior in financial services and the role of behavioral biases and communication. The third section outlines the research design, detailing the qualitative method and analytical approach adopted. The fourth section presents the preliminary findings of the thematic analysis, and the final section discusses their implications and suggests directions for future research.

## 2. Key Theoretical Background

Understanding consumer behavior in the financial services sector requires integrating insights from behavioral economics, marketing communication, and financial literacy research. Unlike traditional models of rational choice, behavioral finance emphasizes that individuals often rely on cognitive shortcuts and emotional heuristics when making financial decisions, leading to systematic biases such as loss aversion, mental accounting, and present bias (Gabhane et al., 2023). These biases are particularly influential in contexts involving uncertainty, delayed outcomes, and abstract information, as is typical of most financial products (Hofstede, 1994; Loewenstein et al., 2001). Simultaneously, numerous studies have documented widespread financial illiteracy among consumers, which exacerbates the effects of behavioral biases (Dervishaj, 2021) . Consumers frequently struggle to understand basic concepts such as compound interest, risk diversification, and inflation, impairing their ability to make informed choices (Van Rooij et al., 2011). In this context, financial advisors are not only product experts but also communicators and educators tasked with translating complex information into actionable knowledge (Wood, 2012). Communication theory in services marketing further highlights the relational dimension of advisor-client interactions (Bennett & Robson, 2005), indeed trust, empathy, and credibility have emerged as critical antecedents of effective financial advising and customer satisfaction (Gennaioli et al., 2015; Johnson & Grayson, 2005). Particularly in

high-stakes and emotionally loaded decisions, advisors must navigate not only informational asymmetries but also emotional states such as anxiety, regret, or fear of loss (Loewenstein et al., 2001). Despite these insights, the practical mechanisms through which advisors manage consumer biases and foster trust remain underexplored. Recent studies suggest that storytelling, metaphor, and analogical reasoning may serve as effective tools to make financial advice more relatable and cognitively accessible (Bhattacharjee et al., 2014). However, there is a lack of empirical work examining how these strategies are used in real-life advisory settings from the perspective of financial professionals themselves. The present study draws from this interdisciplinary theoretical background to explore how financial advisors experience and address consumer behavioral obstacles through everyday communicative practices.

## 3. Research Design

This study employed a qualitative research design based on thematic analysis (Braun & Clarke, 2006) to explore how financial advisors perceive and address the behavioral barriers encountered by clients in the context of financial product decision-making. The objective was to uncover patterns and interpretative themes that reflect the communicative strategies used by advisors to overcome cognitive and emotional obstacles such as loss aversion, low financial literacy, and client hesitation.

### 3.1 Data Collection

The data were collected through semi-structured interviews with a purposive sample of professional financial advisors operating in the Italian market. A total of 15 interviews were conducted, each lasting between 45 and 75 minutes. The interviews followed a flexible protocol designed to elicit reflections on clients' behaviors, communication challenges, and personal strategies used to facilitate decision-making. All interviews were conducted in person or via video conferencing, recorded with participant consent, and subsequently transcribed verbatim for analysis. The interview guide was iteratively refined as the fieldwork progressed, allowing for greater depth and exploration of emerging themes (Brinkmann & Kvale, 2018).

### 3.2 Data Analysis

The analysis followed a data-driven, inductive approach, allowing themes to be generated organically from the data rather than from predefined theoretical constructs (Braun & Clarke, 2006; Corbin & Strauss, 1990). The choice of thematic analysis was motivated by its flexibility and suitability for uncovering both explicit and implicit meaning in narrative data. This method enables researchers to generate rich, detailed, yet systematic accounts of lived experiences and to interpret how meaning is constructed and negotiated within specific contexts (Boyatzis, 1998; Braun & Clarke, 2013).

## 4. Preliminary Findings

The thematic analysis led to the identification of four core themes reflecting how financial advisors perceive and manage behavioral barriers in client decision-making. These themes, loss aversion, limited financial knowledge, empathy, and use of examples, highlight the complex interplay between cognition, emotion, and communication in financial advisory contexts.

*Loss Aversion as a Communication Barrier*

Advisors frequently referred to loss aversion as one of the most pervasive psychological tendencies encountered during consultations. Clients tended to overemphasize potential losses while undervaluing

possible long-term gains, leading to risk avoidance even when such risk was deemed necessary for achieving financial objectives. This was particularly evident in discussions about equity investments, insurance products, or pension funds. The findings suggest that rational explanations alone are often insufficient to shift client perspectives. Advisors must first acknowledge the emotional dimension of perceived loss before introducing alternatives that reframe risk in a more tolerable way.

*Limited Financial Knowledge and Cognitive Overload*

A recurring theme was the low financial literacy of many clients, regardless of their professional background. Advisors reported that clients often lacked a basic understanding of financial terminology, which created cognitive overload and reinforced passive or avoidant behavior. This lack of foundational knowledge often led advisors to simplify or re-sequence information, moving from tangible concepts (e.g., monthly expenses) to more abstract ones (e.g., interest rates, diversification). It also required careful calibration of language and pacing, avoiding jargon and adapting explanations to the client's level of familiarity.

*Empathy as a Trust-Building Device*

Empathy emerged as a central relational strategy, particularly in emotionally charged contexts such as inheritance planning, retirement decisions, or postcrisis repositioning. Advisors emphasized that establishing an emotional connection was not merely a soft skill but a strategic step toward effective communication. This finding aligns with existing literature on affective trust in service relationships (Johnson & Grayson, 2005). Empathy served both as a diagnostic tool to identify latent concerns and as a facilitator of decision confidence, helping clients overcome emotional paralysis.

*The Strategic Use of Examples and Analogies*

To bridge the cognitive and emotional gap, advisors frequently employed examples, stories, and analogies. These communicative devices were seen as essential in transforming abstract financial concepts into relatable narratives. For instance, advisors likened diversified portfolios to "baskets of fruit" or explained compound interest by referencing everyday savings habits. These analogies served two functions: they reduced complexity and activated intuitive reasoning, thus increasing message retention and engagement. Moreover, stories helped clients imagine future scenarios, encouraging longterm thinking and reducing the salience of short-term fears.

## 5. Discussion and Insights

This study explored how financial advisors perceive and manage behavioral obstacles in client decision-making. Thematic analysis revealed four key themes, loss aversion, limited financial knowledge, empathy, and the strategic use of examples, that shaped how advisors communicate and guide clients. The findings contribute to the literature on behavioral finance and services marketing, emphasizing the *communicative dimension* of behavioral bias management. While prior research has focused on the psychological mechanisms underlying consumer decisions (Barberis & Thaler, 2003; Kahneman & Tversky, 2013), this study highlights the advisor's active role in translating, reframing, and emotionally regulating information. This supports a more integrated view that connects behavioral economics with interpersonal communication and trust (Gennaioli et al., 2015; Johnson & Grayson, 2005). The use of storytelling and analogies emerged as a cognitive bridge between complex content and consumer understanding (Bhattacharjee et al., 2014), while empathy functioned as both a relational and strategic tool that promotes client openness and trust. Practically, these insights call for enhanced advisor training that integrates adaptive communication, metaphorical thinking, and active listening.

Institutions should also develop narrative-based toolkits to complement technical materials and better address emotional resistance. Moreover, given the persistent gap in financial literacy, advisors should be prepared to act as situational educators, tailoring explanations to each client's cognitive level. Some limitations must be acknowledged. The study focuses on Italian advisors and excludes client perspectives, which limits generalizability. Also, data were collected in a period of market stability, and results might differ during crises, when behavioral biases intensify. Future research should explore these dynamics further, using quantitative or experimental designs to test the impact of specific communication strategies. Studies could also investigate how robo-advisors manage behavioral resistance in the absence of empathy, or how advisor-client communication evolves to shape trust and financial behavior.

## Abstract

To foster sustainable growth in the MENA region, many countries are promoting entrepreneurship. While start-up activity is high, environmental challenges like climate change and water scarcity persist. This study will explore how MENA start-ups implement and communicate sustainable practices to engage stakeholders, aligning with UN SDG 9 on sustainable industrialisation. Using Hofstede's cultural dimensions, it also will examine how country culture shapes these practices. A comparative case study of start-ups in MENA and Northern Europe will be carried on, and their websites and social media will be analysed to understand if their sustainable practices differ, to what extent they use different communication approaches and to explore the impact of cultural values on their choices. The research aims to deepen understanding the relationship between culture and sustainable communication strategy.

*Keywords: Sustainable Practices, Mena Countries, Country Culture, Hofstede, Communication.*

## 1. Introduction

The Middle East and North Africa countries (MENA) are a thriving region, rich in terms of natural resources, such as substantial petroleum and natural gas reserves, primary commodities in the region (Aminova et al., 2020). Nevertheless, the economic development of the area is tightly dependent on the oil prices fluctuations' (Arezki et al., 2018). To overcome these barriers, many MENA countries have turned to entrepreneurship as a strategic lever for reducing reliance on oil, diversifying their economies, and promoting sustainability. Indeed, according to the Global Entrepreneurship Monitor (2018/2019), most MENA economies report a higher prevalence of start-ups compared to established businesses, indicating a dynamic entrepreneurial landscape with growth potential. At the same time, the sustainability dimension adds further complexity to the region's development trajectory. Indeed, MENA countries are among the most vulnerable globally to the impacts of climate change, including rising temperatures, water scarcity, and natural resource depletion (Liu et al., 2022).

Despite its complexity and diversity, the area is still understudied (Xiong et al., 2024), especially considering the local entrepreneurial ecosystem. Moreover, the growth potential of the MENA countries could significantly and positively affect all the Mediterranean countries, with which several

trades and business exchanges could be implemented. Also, the economic improvement of the area would be beneficial since it could become an interesting market for European and Asian products (Ferretti et al., 2025).

The present research focuses on the entrepreneurial ecosystems in the MENA countries, analysing how these organisations implement and communicate sustainable good practices to attract local and international stakeholders. As we know from the Agenda 2030, sustainable practices are becoming not only a possible source for the competitive advantage but a mandatory approach. Particularly, we focus on the 9th objective of the Sustainable Development Goals (SDGs) outlined in the Agenda, which is dedicated to promoting inclusive and sustainable industrialisation.

To answer our research aim, we will analyse the impact of country culture on the emergence of sustainable good practices in these countries. First, country culture will be studied through Hofstede's model (Hofstede, 2011), which is widely acknowledged in the field of Cross-Cultural Management (Engelen et al., 2009). Secondly, we will adopt a qualitative approach, particularly a comparative case study (Yin, 2009; Gustafsson, 2017), to highlight differences in the approach of communicating sustainable practices in the North European countries and in the MENA countries. We will consider the sustainable communication strategy of MENA start-ups, analysing the start-ups' websites and social media channels. This is a working progress study; thus, we can formulate the expected results regarding the effect of cultural dimensions on the sustainable strategy adopted in those countries.

## 2. Theoretical Framework

The establishment of businesses through green entrepreneurship enables companies to generate profits while creating environmental and social value. New ventures implement eco-innovation strategies to solve environmental problems. Their success depends heavily on their presentation methods (Khan et al., 2025). Green branding demonstrates a company's dedication to environmental protection. Small firms, including start-ups, can establish market differentiation through transparent sustainability practice communication, according to multiple academic researchers. These firms use green labels together with authentic sustainability narratives to attract environmentally conscious consumers (Suki,2016). The start-up environment presents substantial obstacles to businesses operating within this framework. The limited availability of financial resources and human personnel restricts their operational capabilities. The scepticism of consumers combined with their concerns about greenwashing practices makes it difficult for them to establish trust (Bending et al., 2024; Bhatnagar et al., 2022). The worldwide focus on sustainability has gained momentum through the United Nations Sustainable Development Goals (SDG 9), yet most empirical research has concentrated on developed nations. The study of sustainability practices in entrepreneurial ecosystems of the MENA region faces limited research (El-Khalil et al., 2018). Start-ups have gained recognition as essential drivers for sustainable economic transformations. Their ability to adapt quickly, their innovative nature, and fast response to new social requirements make them important contributors to sustainable development (Schaltegger & Wagner, 2011). These ventures can include sustainability practices in their products, operations, and stakeholder communication strategies. Sustainability communication effectiveness helps them gain legitimacy while securing resources and differentiating their market position (Cahyadi et al., 2023). This form of communication is particularly relevant in regions characterised by weak institutions or regulatory voids, such as many MENA countries, which currently face rising environmental pressures and must diversify their economy beyond fossil fuel dependence (El-Katiri, 2014; World Bank, 2020). In response, governments are encouraging entrepreneurship as a means to promote sustainable growth, job creation, and industrial renewal. In this context, it is essential to examine how start-ups adopt and communicate sustainable practices.

Another important dimension that requires further investigation is the influence of country culture on sustainability. Hofstede et al. (2010) argue that culture shapes individuals' perceptions of responsibility, risk tolerance, and long-term orientation. For instance, countries with high levels of collectivism and uncertainty avoidance (as seen in many MENA nations) may support socially oriented sustainability approaches but be less inclined to engage in transparent and direct external communication. In contrast, individualistic cultures with low power distance, such as those in Northern Europe, tend to favour openness and proactive sustainability discourse (Hofstede, 2001; Kaasa, 2015). Hofstede's cultural dimensions are a useful tool to understand cultural differences. The cultural values can influence how start-ups perceive environmental issues, who they think is responsible, and whether they choose proactive or reactive communication (Merkin et al., 2014). The institutional support and infrastructure of mature markets are absent in entrepreneurial ecosystems of emerging economies, which impacts both sustainability communication channels and credibility (Autio et al., 2014 ). Digital tools such as websites and social media platforms become essential because of this situation. Start-ups can use these digital platforms to communicate their

sustainability initiatives while overcoming institutional barriers and establishing relationships with external partners (Olanrewaju et al., 2020). Laasch & Conaway (2015) explain that digital sustainability communication serves both informative and performative functions. Through digital sustainability communication, start-ups can establish their position as global actors who embrace innovation alongside resilience and responsibility. The analysis gains additional depth through the comparison of startups operating in Northern Europe. These countries integrate sustainability into their public policies as well as consumer values and investor expectations (Høgevold et al., 2014). Northern European cultures with low power distance and low masculinity, and strong long-term orientation tend to promote transparency and stakeholder engagement and clear environmental commitment communication (Hofstede, 2010). The analysis of these regions will help us understanding which factors mainly affect sustainability communication differences.

## 3. Methodology and Expected Results

We will adopt a qualitative approach based on a comparative case study (Yin, 2009; Gustafsson, 2017). We will consider Tunisia as a representative of MENA countries and Sweden as a representative of the Northern Europe cluster. Indeed, we will first analyse country culture through Hofstede's model. Secondly, we will collect data from start-up websites and social media from each country, and we will perform a content analysis to understand whether the communication strategy of sustainable practices changes and if country culture impacts these discrepancies. The sample will include start-ups from Tunisia and Sweden, selected using the snowball sampling technique. This approach enhances access to respondents who may be difficult to reach via conventional techniques (Ting et al., 2025).

According to Hofstede's model, Tunisia presents the following cultural dimensions: Power Distance 70, Individualism 27, Motivation towards Achievement and Success 40, Uncertainty Avoidance 75, Long-term Orientation 24 and Indulgence 0. Tunisia is strongly oriented toward collectivism, where power and status are considered relevant in daily relationships and in doing business. However, the economic performance is not the primary goal (based on the Motivation rate), which entails an expected good sustainable approach for start-ups. On the contrary, the region presents a short-term orientation and a higher rate of uncertainty avoidance, suggesting that Tunisian people do not feel comfortable facing the unknown. Both dimensions are not coherent with the adoption and the communication of sustainable practices.

Regarding Sweden, the country presents the following dimensions: Power Distance 31, Individualism 87, Motivation towards Achievement and Success 5, Uncertainty Avoidance 29, Long-term orientation 52, and Indulgence 78. The low rate of the motivation dimension, since it regards the value people place on equality and inclusion, suggests a stronger focus on communicating the sustainable practices. In the same vein, the uncertainty avoidance rate advises a relaxed and open attitude towards ambiguity, promoting an openness to highly direct and unfiltered communication of the adopted sustainable practices. However, some dimensions contrast with this assumption: for example, the higher individualism and the higher indulgence suggest that the Swedish people are very self-centred and focus on satisfying their personal needs, which apparently contrast with a sustainable strategy. Our expected results, indeed, should confirm the effect of country culture on the promotion of sustainable practices. Particularly, we expect to find significant differences in terms of communication strategy. We expect that Swedish start-ups are more oriented towards a clear and strong communication of their practices, while Tunisian start-ups could be more oriented towards communicating the importance of the collective well-being.

## 4. Conclusions And Implications

This analysis will shed some light on how country culture affects the way start-ups present their sustainable practices to their audience. The research will apply Hofstede's model to Sweden and Tunisia to demonstrate how cultural values affect the sustainability communication approaches of start-ups. The cultural values of Tunisia lead to a communication approach that is both cautious and community-focused. Tunisian start-ups tend to present sustainability through narratives that emphasise social responsibility and collective well-being, and moral duty instead of using performance data or innovative approaches. The short-term orientation indicates that Tunisian startups might choose to focus on social benefits in the present rather than environmental goals in the future. The communication style of Swedish start-ups reflects an open and direct approach. Swedish start-ups will use data-based messaging that showcases their sustainable actions through visible channels while upholding values of inclusivity and equality, and personal responsibility. The combination of high individualism and indulgence creates a potential conflict between personal enjoyment and enduring sustainability obligations. These preliminary findings may have relevant implications. For instance, sustainability communication depends on cultural context because narratives which succeed in one environment fail to connect in different settings. The discovered insight holds essential value for international organisations, together with investors and policymakers who aim to promote sustainable entrepreneurship across different countries. A standardised approach to sustainability communication fails to consider the cultural elements which determine how sustainability messages are received by different audiences. In conclusion, our study sheds light on how cultural context plays a crucial role in shaping sustainable behaviours and in influencing how these behaviours are communicated. Recognising these differences is essential for fostering authentic and impactful sustainability narratives across diverse entrepreneurial ecosystems.

## Abstract

This paper investigates the characteristics and evolutionary dynamics of entrepreneurship ecosystems (EEs), focusing on their role in local socio-economic development. It aims to contribute to the literature by detailing EE features, focusing on actor interactions and the enabling potential of some specific resources, such as collaboration, education, digital technologies, marketing communication, and regulatory frameworks.

Employing a qualitative, interpretive case study analysis, the research examines the EE in Campania, a prominent Southern Italian region, through semi-structured interviews with key informants.

Findings highlight the enhancing roles of entrepreneurship education and digital technologies in the ecosystem's evolutive dynamics. The study reveals that "institutional" actors strategically approach entrepreneurship education, emphasizing collaboration, omnichannel communication, and regulatory compliance. Collaboration within the EE is multifaceted, with actors engaging formally and informally to mobilize resources and create value. Entrepreneurship education is crucial for fostering entrepreneurial mindsets and innovation, with a growing shift towards digital and smart technologies for personalized learning experiences. Communication approaches vary, but institutional actors prioritize strategic, integrated digital channels. The regulatory framework, though complex, is vital for entrepreneurial activities, with support from local institutions and incubators helping navigate bureaucratic hurdles.

This research extends the understanding of EEs by detailing their internal dynamics, emphasizing the influence of entrepreneurship education and lean marketing on competitiveness. It offers implications for theory and practice, underscoring the need for strategic collaborations, digital infrastructure investment, and streamlined regulatory policies to foster thriving entrepreneurial environments.

*Keywords: Entrepreneurship ecosystem, digital technologies, entrepreneurship education, lean marketing.*

## 1. Introduction

Entrepreneurship is a complex phenomenon that goes beyond the mere business creation because it also affects economic growth, social development, innovation, and job creation (Acs et al., 2017). This

led scholars and practitioners to focus on the complex interplay of different actors and scopes that characterize entrepreneurial phenomena. This makes it possible to approach it according to a system perspective to holistically manage "the regulating effect of contextual factors on individual actions" (Lafuente et al., 2023, p.105). In doing so, the concept of the Entrepreneurship Ecosystem (EE) emerges as a suitable theoretical and practical construct to approach entrepreneurship.

EEs have been defined differently due to the multidirectional causality and the high-order interactions that interconnect the factors essential for boosting entrepreneurship (Spigel and Harrison, 2018). Drawing on Autio et al. (2014), EE are complex, self-organizing, self-sustaining, and self-regulating complex systems. More recently, Macías-Prada et al. (2024) defined EEs as "a set of factors andconditions that encourage the emergence and development of innovative businesses and entrepreneurs in a specific territory" (p.50). These ecosystems are complex socio-technical systems shaped by the multi-actor networked interactions intended to create and share the new knowledge essential for innovating (O'Sullivan and Dooley, 2008). At the core of such complex systems lie an interconnected group of different actors — ranging from customers, suppliers, and universities to research centers, governmental institutions, policymakers, established companies, and nascent startups — who interact within a self-organized, scalable, and sustainable environment. These interactions are designed to mobilize entrepreneurial attitudes, abilities, and aspirations, ultimately driving innovation and contributing to the socio-economic development of the local context in which the ecosystem is shaped (Muldoon et al., 2024).

Despite the increasing application of the EE approach, significant challenges remain in both its conceptualization and practical implementation. A primary challenge lies in clearly defining their fluid and often permeable boundaries. This is also due to the recent advancements in digital technologies, which are increasingly blurring traditional local and national borders, enabling real-time connections and facilitating the rapid sharing and transfer of new knowledge (both formal and informal) among geographically dispersed actors. Moreover, the complexity that characterizes these ecosystems and which is constantly influenced by various dynamic forces and feedback loops requires effective "rules" or institutional arrangements that govern interactions, define roles, and ensure the legitimacy and participation of all actors (Barile et al., 2022). This paper aims to contribute to addressing these challenges, highlighting the dynamic interplay of interacting actors and the most common resource they mobilize for stimulating innovation and socio-economic growth. In doing so, this study has been inspired by the general systems theory, which posits that socio-technical systems are intricate, dynamic, and influenced by various forces that can stabilize or destabilize them (Monat and Gannon, 2015).

To better understand the current transformative dynamics of EE, it is essential to focus on those mechanisms of knowledge creation that are at the core of innovation and development (Collins, 2015). These mechanisms can be operationalized through entrepreneurship education, which in an EE represents "a key link in the establishment of new enterprises, cultivation of innovative talents, scientific, and technological innovation" (Liu et al., 2021, p.2). Defining entrepreneurship education is not easy because it is more than "teaching someone to run a business" (Raposo & Do Paço, 2011, p.455). Thus, entrepreneurship education is an integrated set of resources, practices, and activities designed to equip individuals with various skills, including the ability to take risks, innovate, and assume responsibility for their actions (Laspita et al., 2023).

Entrepreneurship education has been recently reconceptualized as related to the acquisition and the implementation of transformative skills to start entrepreneurial processes, to the potential of digital technologies (Sitaridis and Kitsios, 2024). It follows that this study integrates the concept of digital transformation with entrepreneurship education, acknowledging its pervasive and disruptive potential

in reshaping education as well as the co-creative interaction at the core of EE evolution and growth. This transformation involves the combination of information sharing, connectivity technologies, and education programs. To support ecosystem actors in navigating these complex changes and in exploiting the potential of digital technologies, this study also incorporates the nascent research field of Lean Marketing and Communication (Dewell, 2007). Inspired by the broader lean thinking philosophy, this approach emphasizes customer-centricity, continuous improvement, and the systematic elimination of non-value-added activities.

Despite the growing body of literature on EEs, digital transformation, and entrepreneurship education, a significant research gap remains. There is a limited comprehensive understanding of how lean marketing principles can specifically support and accelerate, together with other factors, the potential of digital transformation and entrepreneurship education programs within EEs. More precisely, the existing research has not fully explored its potential in promoting an experiential approach to learning that significantly enhances participants' personalization, motivation, engagement in knowledge creation processes, and the adaptiveness of content and pedagogical approaches.

To bridge this gap, the study employed a qualitative analysis underpinned by an interpretative case study method that will contribute to addressing the research question that inspired the analysis: *What are the main drivers that complement entrepreneurship education and digital technologies in boosting the evolutionary dynamics of EE?*

This methodological choice allowed for an in-depth description and discussion of the main characteristics and evolutionary dynamics at the core of a specific entrepreneurship ecosystem. Data collection involved conducting semi-structured interviews with 30 carefully selected key informants from diverse ecosystem actors within the Campania region, a prominent Southern Italian region. The results of this interpretative data analysis demonstrate several key insights into the EE's evolutive dynamics.

The remainder of the paper has been organized as follows. The first section is dedicated to reviewing the literature on the topic under investigation. Follows a detailed description of the implemented methodology and the presentation and discussion of the achieved results. Closes, theoretical, managerial, and policy implications, complemented by future research paths.

## 2. Theoretical Background

### 2.1 Building an Entrepreneurship Ecosystem

Over the past decade, significant socio-economic changes have profoundly changed how individuals and organizations collaborate, utilize resources, and manage operations, leading to new standards and solutions. This has also implied a big change "in a competitive environment and reshaped traditional business strategies, models and processes" (Elia et al., 2020, p.2). The complexity and unpredictability of current socio-economic scenarios call for new and more holistic approaches to address global challenges related to economic growth and the sustainability of new ventures.

In this context, the ecosystem approach appears to be a more effective solution for problems that neoclassical economic theories may not adequately address (Belitski et al., 2019). This perspective offers a "systemic" view of entrepreneurial phenomena, emphasizing their evolutionary, interactive, and non-linear characteristics (Mason and Brown, 2014).

The ecosystem approach has been built upon a biotic metaphor coming from the natural sciences, which has been further advanced in social sciences by the system theory (Von Bertalanffy, 1972). According to this theory, socio-technical systems are intricate, dynamic, and constantly influenced by various forces and feedback loops that can stabilize, reinforce, or destabilize them. While the ecosystem perspective was applied to evolutionary economic theory by Nelson and Winter (1982) to explain differing outputs in complex systems, its application in entrepreneurship literature has varied. Thus, Cohen (2006) defines EEs as "an interconnected group of actors in a local geographic community committed to sustainable development through the support and facilitation of new sustainable ventures" (p.3). Similarly, Acs et al. (2017) considered them "a set of interdependent actors and factors coordinated in such a way that they enable productive entrepreneurship within a particular territory" (p.5). More broadly, EEs can be described as a collection of diverse actors, including customers, suppliers, universities, research centers, social and cultural operators, institutions, policymakers, companies, startups, entrepreneurs, experts, professionals, and investors, who are dedicated to entrepreneurial actions. These actors interact within a self-organized, scalable, sustainable, and interactive environment, mobilizing their entrepreneurial attitudes, abilities, and aspirations (Autio et al., 2018). Often, a central actor (from industry, institutions, or academia) can inspire and guide the ecosystem's activities, setting the foundational rules for its system dynamics (Elia et al., 2020), which engage the different entrepreneurial elements that guide resource allocation and the creation of new ventures (Acs et al., 2017). Despite these definitions, further research is needed to clearly define the boundaries of EEs and the nature of interactive multi-actor dynamics that characterize them (Cobben et al., 2022; Correia et al., 2024).

Recently, the advent of digital technologies has increasingly blurred ecosystem boundaries and has also added complexity to the internal and external multi-actor interactions. Therefore, further research effort is needed to better understand how these interactions are evolving, especially in terms of new knowledge (both formal and informal) sharing and transfer across different ecosystem layers (Miah et al., 2025). To contribute to bridging this gap Zhang et al. (2023) reported that in EE knowledge creation and sharing is boosted by "a supportive culture, high-quality institutions, supportive policies, accessible resources, and well-developed service industries" (, p.1079), engaging both internal and external stakeholders.

The evolving nature of ecosystems does not negate the presence of internal rules, which establish conditions that either enable or restrict socio-economic interactions within a specific setting (Baumol, 1996). These rules, or institutional arrangements, are crucial for defining the legitimacy of actors (Granovetter, 1985) and, consequently, their ability to participate in ecosystem processes (Kuratko et al., 2017). According to institutional theory, institutions and institutional arrangements represent "the rules of the game in a society" (North, 1990, p.3). The first ones are socially created schemas, norms, and regulations that drive the behavior of socio-economic actors, making it predictable and meaningful (DiMaggio and Powell, 1991). The second ones are sets of institutions nested in multiple ecosystem levels, which set framework conditions that enable or limit socio-economic interactions in a specific context (Scott, 2013; Badawi et al., 2021). This means that institutions and institutional arrangements help manage the inherent complexity of an ecosystem, which arises from the coexistence of various actors with different roles, and the "changing factors that interact to determine the entrepreneurial performance of a region or locality" (Spilling, 1996, p.91). They achieve this by "regulating" the interactions among ecosystem actors to generate value within a specific territory (Mason and Brown, 2014).

## 2.2 The Role of Entrepreneurship Education in Ecosystems: The Perspective of Lean Marketing

Higher education institutions (HEIs) are even more fundamental "for contemporary societies in the field of education and knowledge generation" (Kobylinska and Lavios, 2020, p.118). Their growing disposition to cooperate with external individuals and organizations, which can be recognized as EE's actors (e.g., business incubators, technology transfer centers, funding institutions, etc.) (Meyer et al., 2020), configures them as a fundamental ecosystem actor for promoting national and regional development (Etzkowitz and Leydesdorff, 2000).

Building upon some studies (Etzkowitz and Zhou, 2017), the generative dynamics at the core of socio-economic development emerge from the intertwined interactions of three main actors, which in the so-called Triple Helix Model have been conceptualized as different helices: university, industry, and government. More recently, Pita et al. (2021) advanced this conceptualization, underlining that HEIs actively contribute to EEs' development through entrepreneurial education programs, essential for stimulating the creation of new enterprises, such as start-ups and/or spin-offs. This is possible thanks to these institutions' ability to create and share knowledge through innovative programs and approaches to boost technology transfer processes and, consequently, innovative entrepreneurial initiatives (Correira et al., 2024). This ability has been operationalized in specific entrepreneurship education programs; thus, entrepreneurship education "is a key link in the establishment of new enterprises, cultivation of innovative talents, scientific, and technological innovation" (Liu et al., 2021, p.3).

Drawing on managerial studies, entrepreneurship education is generally defined as "a process of providing individuals with the ability to recognize commercial opportunities and the insights, self-esteem, knowledge, and skills to act on them" (Jones and English 2004, p. 416). In a similar vein, Fayolle et al. (2006) clearly defined it as "any pedagogical [program] or process of education for entrepreneurial attitudes and skills" (p. 702). Even though research on entrepreneurship education is still undergoing quick advancement, it is at the forefront of institutional policies and corporate strategies (Carpenter and Wilson, 2022). This is mainly due to its potential to transform the current society and strengthen business culture, innovation orientation, and competitiveness (Ratten and Jones, 2021). However, in the last decade, entrepreneurship education has undergone a critical but still ongoing change, caused by digital transformation and the disruptive innovative potential of the "combinations of information, computing system, communication, and connectivity technologies" (Prasetyaningtyas et al., 2022, p.4). Thus, HEIs are struggling to effectively proceed with digital transformation, reorganizing the learning and teaching processes (Duraes et al., 2024). Unfortunately, they are still far from achieving a good technological readiness and efficient digital infrastructures, essential to aligning entrepreneurship education with the requirements of the current socio-economic scenarios (Sitaridis and Kitsios, 2024). Therefore, HEIs need to recognize and manage the deep changes occurring in knowledge creation and sharing among the different ecosystem actors (e.g., universities, companies, institutions, learners, digital service providers, etc.), who can be formally and informally involved in educational processes.

Studies (Rippa et al., 2022; Mu and Zhao, 2024; Park et al., 2025) have focused on HEIs' necessity to complement digital competences and infrastructures with other multifaceted resources, such as a data-driven approach, practice-oriented methods, personalized and adaptive content, students' ethical commitment, interdisciplinary integration, and a global perspective. In dealing with such complexity, HEIs must overcome some barriers related not only to technology acceptance and readiness but also to the socio-cultural differences that influence venturing processes and, consequently,

entrepreneurship education (Sitaridis and Kitsios, 2024). It follows that these elements also impact the ability of HEIs to offer experiential, action-based, and personalized entrepreneurship education programs (Haneberg et al., 2022). This is also true when these programs are powered by the most recent digital technologies (e.g., Artificial Intelligence, cloud computing, IoT, data analytics, etc.).

Studies on the topic (Ezzaim et al., 2024; Pan et al., 2024; Tiberius and Weyland, 2024) highlight that a personalized and ubiquitous access to digital programs of entrepreneurship education must be inspired by innovative pedagogical and training approaches as well as by a multi-perspective and ethical approach to the different social, economic, and political nuances that characterize venturing in different ecosystems (Ratten and John, 2021). Therefore, this study builds on the adoption of the lean marketing and management approach to support HEIs in overcoming the barriers mentioned above and in digitally transforming entrepreneurship education programs.

Research on lean marketing is still nascent; consequently, a clear and well-established definition of the concept is still lacking, even though lean marketing supports business organizations in meeting the willingness of the appropriate customers to obtain their satisfaction (Dekier, 2012).

Lean marketing, inspired by the umbrella approach of lean thinking, can support HEIs in understanding and meeting customers' individual expectations, identifying and eliminating non-value-added activities (Zhou, 2019). The essential assumption at the core of this approach is that clients must be placed at the core of the entire system, inspiring the prioritization of "each product or service characteristic while setting development targets for the product or service" (Akao, 1994, p. 339).

Based on these insights, this study aims to underline the potential of lean marketing to further support the digital transformation of entrepreneurship education programs, complementing the potential of specific digital technologies, such as AI and Machine Learning, to translate students' needs "into engineering characteristics and appropriate statistical test methods" (Yamamoto et al., 2019, p.23) for a specific learning program, rationally allocating the available resources.

Complementing the use of digital technologies with a lean marketing perspective and tools can support HEIs in improving learning experiences, thanks to the possibility of using data for creating individually tailored and adaptive teaching and learning facilities (Ali et al., 2025).

## 3. Methodology

### 3.1 Research design

This study has been based on a qualitative analysis conducted by implementing an interpretative case study method, based on specific theoretical foundations used to interpret the case under investigation (Yin, 2013). The analysis has been conducted assuming the EE perspective (Acs et al., 2017; Stam and Van de Ven, 2021) to understand the transformative dynamics that education and digital technologies, together with other factors, can trigger for stimulating entrepreneurial phenomena. Therefore, the analysis will understand and describe the most common enabling drivers of EEs' growth. In doing so, an interpretative approach has been implemented to further analyze and describe the Campania EE.

To gather data essential to perform the case study analysis, a semi-structured interview was administered with some ecosystem actors to incorporate their perspectives in the study (Bray et al., 2014), and some archival information was also analyzed to support data triangulation and to ensure a certain results' generalizability (Eisenhardt, 1989). Respondents were selected following a multi-level approach, which made it possible to identify and select people to be involved in the case study analysis

"from different hierarchical levels, functional areas, groups [...] actors who view the focal phenomenon from diverse perspectives" (Eisenhardt and Graebner, 2007, p. 28).

### 3.2 Data collection and analysis

Data collection has been based on semi-structured interviews with key actors in a regional EE, specifically in the Campania region, a southern Italian region which represents a unique context in which entrepreneurial phenomena occur and evolve over time. The main factors that characterize this ecosystem are 1) growing investments in R&D, 2) the specialization in knowledge-intensive sectors, 3) the existence of innovative technological clusters and excellence, 4) the presence of several specialized research centers, 5) a female and youth entrepreneurship rates above the national average, and 6) the increase in capital companies.

The interviews were conducted between January and March 2025 and organized according to a specific protocol to ensure a general coverage of the research themes defined according to the review of the literature on EEs (Acs et al., 2017; Stam and Van de Ven, 2021). The interviewees were selected using the key informant approach (Kumar et al. 2020). Consequently, some representatives of local institutions, companies and start-ups, universities and research centers, students, professional associations, and NGOs (Non-Governmental Organizations) were selected considering their interactions with the focal actor (a local university), practices, and role in the ecosystem. Follows the respondents' selection criteria (Tab.1).

| **Key informants** | |
|---|---|
| Country | Italy |
| Region | Campania |
| Type of organizations | Local institutions, NGOs, companies, start-ups, incubators, research centers, students, professional associations, universities. |
| Partnership | At least one project/initiative with the focal actors |

Source: authors' elaboration.

**Table 1:** Key informants selection criteria

The same interviews were carried out with 30 ecosystem actors in Italian and then translated into English. If possible, more than one interview was conducted per type of actor to overcome the limitations due to the participation of individual key informants, who sometimes are unable to report on complex issues (Hughes and Preski, 1997). The total number of interviews (30) has been set following the theoretical saturation criterion typical of qualitative research, which according to Starks

and Trinidad (2007) occurs when "the complete range of constructs that make up the theory is fully represented by the data" (p. 1375). The total number of interviews set for this analysis is in line with the grounded theory methodology, which sets the minimum sample size required between 15 to 30 participants (Morse and Clark, 2019). This led to addressing the research questions at the core of this study, recognizing the differences between the conceptual categories or themes used for the study, and better describing the relationships between them. The main characteristics of the interview respondents are summarized in the following table.

The interview's themes were approached neutrally and free from personal beliefs. To this end, questions about sensitive information were avoided to reduce possible bias, and respondents were anonymously classified using symbols and progressive numbers (Tab.2) (Saunders et al., 2012). Two researchers independently approached the interviews to ensure data validity and reduce their personal influence. Interviews lasted an average of 30 min., were conducted both in presence and online, recorded and verbatim transcribed, and translated to be then analyzed and discussed through summary tables.

| **ID** | **Type of actor** | **Respondent occupation** |
|---|---|---|
| LI1, LI2 | Local Institution | Public Manager |
| R1, R2 | Research Center/University | Senior Researcher |
| I1, I2 | Incubator | CEO |
| N1, N2, N3, N4 | NGO | Representative |
| P1, P2, P3, P4 | Professional Association | Manager |
| C1, C2, C3, C4 | Company | Marketing Manager |
| SU1, SU2, SU3, SU4, SU5, SU6 | Startup | CEO |
| S1 S2, S3, S4, S5, S6 | Student | Student |

Source: authors' elaboration.

**Table 2:** Interview respondents' main characteristics

Interview responses were analyzed using a thematic analysis (Braun and Clarke, 2006), conducted bysystematically organizing, coding, and analyzing the interview's narratives using ATLAS.ti, which facilitated the management of transcripts and the iterative process of theme development and refinement.

After the first phase of familiarization with the data, conducted transcribing and organizing interviews, the coding phases were conducted meticulously by labeling the text that captures distinct ideas or concepts pertinent to the research aim and in line with the main macro themes derived from the review of the literature (Tab.3). Then, these themes were reviewed, and some specific characteristics were derived to better define and articulate what each theme represents and how it contributes to the understanding of the main EEs drivers and, in particular, of the contribution of to their present and future growth of two specific ones: 1) entrepreneurship education, and 2) marketing communication.

Finally, the achieved results were organized and presented in a report, weaving a compelling narrative that introduces each theme.

| Themes | Description |
|---|---|
| Actors | Who is involved with different but complementary roles in value creation processes and interacts to determine the entrepreneurial performance of a region or locality. They are actively engaged in routinized practices of resource allocation. |
| Collaboration | The networked and intertwining interactions between ecosystem actors, shape a collaborative network to pursue entrepreneurial opportunities. |
| Education | One of the multiple services that ecosystems offers to socio-economic actors, and which provide the skills and knowledge to seize business opportunities. |
| Marketing communication | The practices of analogic and digital information sharing that enable ecosystem actors to interact for creating new knowledge and jointly approach problem solving, avoiding value co-destruction. |
| Regulatory framework | Formal/informal rules or coordinating mechanisms that define roles, interactions, collaboration, and resource mobilization. It "regulates" actors' activities and ensures fair competition, private property rights, and societal instances protection. |

Source: authors' elaboration.

**Table 3:** Themes for shaping an entrepreneurship ecosystem.

Finally, interview responses were triangulated with additional data sources (e.g., reports, news, press releases, and other web sources) to increase internal validity (Yin, 2003).

## 4. Results presentation

The interviews' analysis led to a better definition of two of the essential drivers of EEs' education and technologies, recognizing the differences between the conceptual categories (Collaboration, Education, Marketing Communication, and Regulatory Framework) used for the study and better describing the relationships between them. The achieved results have been organized and synthesized in the following tables.

Table 4 details the main dimensions of "Collaboration," pointing out how ecosystem actors (Local Institutions, Research Centers/Universities, Incubators, NGOs, Professional Associations, Companies, Startups, and Students) engage in EE dynamic interactions. The interview quotes report and detail their collaboration approach.

| **Collaboration** | | |
|---|---|---|
| Actor | Coded text | Main characteristics (sub-themes) |
| Local Institutions | We collaborate with several socio-economic actor to support local entrepreneurs, facilitating their approach to legal and institutional framework. (SI) | - Formal collaboration |
| Research Centers/Universities | As university, we have established several formal and informal collaborations for learning/ training reasons and for national/international entrepreneurial project. (RU1) | - Formal collaboration<br>- Informal collaboration |
| Incubator | We collaborate with local institutions, universities, research centers and professional organizations to support the local entrepreneurship ecosystem. (I2) | - Formal collaboration<br>- Informal collaboration |
| NGO | We cooperate with institutions, universities and entrepreneurs in developing projects and activities dedicated to local development. (N3) | - Informal collaboration |
| Professional Association | My association has established important partnership with institutions, large companies and local universities to work on innovative ventures. (P3) | - Formal collaboration<br>- Informal collaboration |
| Companies | We have established some collaborations with other companies to apply to international funding programs. We did it also with some regional universities. (C5) | - Formal collaboration<br>- Informal collaboration |
| Startups | We collaborate with universities, an incubator, and a local professional association to access financial and knowledge resources. (SU3) | - Formal collaboration<br>- Informal collaboration |
| Students | I participated to an international competition dedicated to the development of innovative business ideas. We collaborate also with some innovative start-ups, whose representatives mentored us. (S1) | - Informal collaboration |

**Table 5:** Theme 2 presentation

Table 6 depicts how ecosystem actors approach marketing communication. The reported quotes highlight the different communicative approaches, which range from the more structured and strategically oriented ones to the more emergent ones. Thus, some actors are more skilled and confident with a strategic, omnichannel, and personalized approach to communication than others.

| **Marketing communication** | | |
|---|---|---|
| Actor | Coded text | Main characteristics (sub-themes) |
| Local Institutions | My institution uses different communication channels to promote entrepreneurship-oriented initiatives, especially when they are powered by new technologies. It approaches communication integrating the website and the institutional social media to directly interact with citizens (SI) | - Integration and Consistency<br>- Interactivity |
| Research Centers/Universities | The promotion of entrepreneurship education in person and digital initiatives responds my university strategic orientation. This implies the integrated use of digital and traditional communication channels, and messages personalized for each stakeholder (RU1) | - Strategic orientation<br>- Integration and Consistency<br>- Interactivity<br>- Adaptation and personalization |
| Incubator | We have created a strong digital community. We interact with it through several integrated digital channels. This allows us to directly and personally involve them in our initiatives. (I2) | - Integration and Consistency<br>- Interactivity<br>- Adaptation and personalization |

| | | |
|---|---|---|
| NGO | My organization uses different communication channels to promote entrepreneurship-oriented initiatives. It approaches communication in a coordinated, integrating the website and the institutional social media to directly interact with citizens (N2) | - Integration and Consistency<br>- Interactivity |
| Professional Association | Over time my association recognized the importance to establish a direct connection with our audience. This led us to interact with the associates via social media to share information and enage them into our initiatives. (P3) | - Interactivity<br>- Adaptation and personalization |
| Companies | My company is used to strategically approach communication. This led us to use different integrated digital channel to inform and to stay informed. This communication led us to participate to innovative digital education/training programs (C3) | - Strategic orientation<br>- Integration and Consistency<br>- Interactivity<br>- Adaptation and personalization |
| Startups | We use different communication channels to gather and provide information about our business activities. We mainly use social media to send and gather personalized information, and to find out insights for innovation (SU3) | - Integration and Consistency<br>- Adaptation and personalization |
| Students | I regularly use different social media to stay tuned and gather the opportunity for interacting with other entrepreneurs to be, sharing information, ideas, and experiences. (S3) | - Interactivity |

**Table 6:** Theme 3 presentation

Table 7 depicts how actors approach law and regulation. The interview quotes offer insights into the different regulatory areas that must be addressed, the related issues, and the possible ways to address them. This highlights the diverse regulatory aspects impacting entrepreneurial activities.

| **Regulatory framework** | | |
|---|---|---|
| Actor | Coded text | Main characteristics (sub-themes) |
| Local Institutions | We support local entrepreneurs and start-uppers in their venturing process, encouraging them to apply to specific support measures, and education/mentoring programs. We also promote a culture of legality and transparency through initiatives pointing to detect and fight business frauds. (I1) | - Regulation for establishing a new company<br>- Fiscal regulation |

| | | |
|---|---|---|
| | | - Funding regulation and procedures |
| Research Centers/Universities | We regularly organize mentorship initiatives to promote a better exploitation of business ideas and to successfully access market. (RU1) | - Regulation for establishing a new company |
| Incubators | My incubator supports start-ups not only with operative activities but also with the complex normative and bureaucratic ones. We support start-ups with regulation for access fundings, and for accomplish the normative requirements for starting a business. (I2) | - Regulation for establishing a new company<br>- Fiscal regulation<br>- Funding regulation and procedures |
| NGOs | My organization supports companies with local bureaucracy, guiding them towards all the steps needed to start a new venture and in meeting all legal requirements. (N2) | - Regulation for establishing a new company<br>- Fiscal regulation |
| Professional Associations | We help Italian companies and start-ups with business registration, local and national taxes, all the laws related to workplace security, and human resource management. (P3) | - Regulation for establishing a new company<br>- Fiscal regulation<br>- Human resource management |
| Companies | Over time we have learnt how to manage fiscal, security and operative issues to be compliant with national and local regulation. Currently, we are focused on funding regulation because we want to start an innovative project to be financed. (C4) | - Fiscal regulation<br>- Human resource management<br>- Funding regulation and procedures |
| Startups | In this country starting a new business is not so easy because apart from an entrepreneurship education or training we need to know a lot about bureaucratic requirements. To me it wasn't easy to approach the laws and regulation to establish my company and choose and access funding opportunities. (SU4) | - Regulation for establishing a new company<br>- Fiscal regulation<br>- Funding regulation and procedures |

| | | |
|---|---|---|
| Students | Following a program on entrepreneurship education, I approached for the first time the legislative and administrative requirements for starting a new venture. At first it seemed a bit complex but now I feel more confident with this. (S6) | - Regulation for establishing a new company<br>- Human resource management |

Source: authors' elaboration.

**Table 7:** Theme 4 presentation.

The achieved results demonstrated that "institutional" and "well-structured" actors (e.g., local institutions, research centers/universities, Incubators, and companies) are more likely to approach entrepreneurship education initiatives strategically and holistically. This is possible assuming a clear collaboration orientation, investing in corporate omnichannel communication by leveraging the potential of digital channels, and recognizing the importance of compliance with current regulations and laws.

## 5. Discussion

This study investigated the dynamics of the EE settled in the Campania region, focusing on the roles of entrepreneurship education and digital technologies as enabling drivers for its growth. In doing so, the role and influence of a lean marketing approach to stimulate ecosystem actors' engagement and collaboration have been investigated.

The achieved findings, derived from qualitative analysis of interviews with diverse ecosystem actors, provided several key insights that both corroborate and extend existing theoretical perspectives.

First, the results underscore the multifaceted nature of "collaboration" within the EE, as depicted by the general commitment and willingness to collaborate of all ecosystem actors (Table 4). Each actor demonstrated a different approach to cooperation; thus, some of them were focused just on formal or informal forms of collaboration, enacting different roles, providing different resources, and establishing different types of relationships. Collaboration in ecosystems can change over time, reshaping the nature or the scope of the initial relationship. According to Ketchen et al. (2007), this can be due to 1) role evolution, 2) interpersonal or inter-actor informal dynamics and ties, and 3) the blurred and evolving nature of the ecosystem. Actors can freely decide to formalize or not collaboration according to the goals they want to achieve and the resources they are willing to mobilize (e.g., knowledge, finance, technologies, etc.). The possibility to differently collaborate also highlight the adaptive and self-organizing characteristics of EEs, where actors dynamically engage to mobilize resources and create value according to their specific characteristics and goals (Isenberg, 2016; Autio et al., 2018). However, both formal and informal collaborations are intended to facilitate access to resources and foster the future development of innovative business ideas. This aligns with existing literature emphasizing the importance of networked interactions for pursuing entrepreneurial opportunities (Manimala, 2008; Elia et al., 2020).

Second, the analysis reveals that actors' disposition to effectively and actively participate in knowledge creation processes, by sharing and combining their personal material/immaterial resources, is essential to develop and promote entrepreneurship education. Thus, almost all ecosystem actors recognize their crucial role in stimulating entrepreneurial mindsets, fostering innovation orientation, and promoting

personal empowerment (Table 5). This corroborates the view that education is a key link in establishing new enterprises and cultivating innovative talents (Liu et al., 2021). The emphasis on practical skills and tools, as well as on mindset development, reflects a holistic approach to entrepreneurial capacity building. This also resonates with the notion of HEIs as fundamental actors in EE development through entrepreneurial education programs (Pita et al., 2021), also focusing on new paradigms and approaches. In particular, an experiential approach to learning processes, implies participants' ability to act in a hybrid environment in which educators and learners can go beyond the traditional approaches, offering the possibility to digitally experience specific and highly personalized activities, such as business idea development, opportunity exploitation, networking competencies development, and project-based learning (Motta and Galina, 2023).

Findings also demonstrated that education and, in particular, entrepreneurship education is going digital. Thus, several of the interviewed actors reported their disposition to use digital and smart technologies for organizing and/or participating in education/training programs. This is in line with the extant literature, which highlights that entrepreneurship education is undergoing a significant shift due to digital transformation and the disruptive potential of information, computing, communication, and connectivity technologies (Prasetyaningtyas et al., 2022). This move towards digital and smart technologies support to the creation of hybrid learning environments, allowing for digitally experienced activities like business idea development, opportunity exploitation, and networking, as noted by Motta and Galina (2023). Moreover, findings also demonstrated that actors' willingness to embrace these technologies is a practical manifestation of the ongoing efforts to align entrepreneurship and its education with the requirements of current socio-economic scenarios. However, some issues related to technological readiness and the availability of efficient digital infrastructures remain (Sitaridis and Kitsios, 2024). Thus, HEIs are still striving to reorganize learning and teaching processes in line with this transformation (Duraes et al., 2024)

Third, the findings demonstrated the different attention that ecosystem actors paid to communication. Thus, they implemented a spectrum of approaches, from highly strategic and omnichannel to more emergent and unstructured (Table 6). The "institutional" actors (e.g., institutions, research centers/universities, and companies) demonstrated a strategic orientation towards communication, integrating digital and traditional channels and personalizing messages. This strategic approach, leveraging digital channels for interactivity and consistency, is crucial for knowledge sharing and joint problem-solving within the ecosystem (Akaka et al., 2013). The observed variations suggest that while the importance of communication is recognized, the maturity of its implementation differs across actors. Findings also demonstrated that the way actors approach communication is highly influenced by the pervasiveness of digital and smart technologies and their digital maturity level. Thus, not all the interviewed actors approached communication according to an omnichannel logic (Mateus, 2021; Ponomareva and Ponomarev, 2022), which is one of the primary effects of digital transformation, allowing for seamless and integrated interactions across diverse digital and traditional touchpoints. This strategic orientation, which involves leveraging digital channels for enhanced interactivity and consistency, directly reflects the capabilities unlocked by digital advancements.

The observed differences in communication maturity across different ecosystem actors reflect their ongoing journey in adapting to and harnessing the full potential of digital strategies and tools for communication, knowledge sharing, and collaborative problem-solving (Han et al., 2022). Moreover, by leveraging digital technologies, the assumption of lean marketing perspective can help to translate education/training needs into specific learning programs, ensuring that educational resources are rationally allocated and that the learning experience is tailored and adaptive.

Finally, the "regulatory framework" emerged as a critical, albeit complex, dimension influencing entrepreneurial activities (Table 7). Actors highlighted various regulatory areas, including company establishment, fiscal regulations, and funding procedures. The challenges associated with navigating these bureaucratic requirements, particularly for startups, underscore the importance of institutional arrangements in defining the "rules of the game" (North, 1990) and ensuring the legitimacy and participation of actors (Kuratko et al., 2017). The support provided by local institutions and incubators in this regard is vital for fostering a conducive entrepreneurial environment. This finding is in line with the entrepreneurship extant literature, according to which for new ventures the complexity of regulation and laws causes so many issues that often demotivate and make them unable to start or expand their business (Kumar, 2020). It follows that a proper entrepreneurial education background can contribute to reducing the negative impact of bureaucratic burden and support actors to overcome the possible barriers associated with compliance.

## 6. Implications and final remarks

This study extends the understanding of EEs, offering granular insights into their internal evolutive dynamics and the interplay of key elements. This pointed out the influence that some factors (e.g., entrepreneurship education and a lean approach to marketing communication) have in promoting ecosystem competitiveness and viability. In doing so, the results offered some interesting implications for the theory and practice.

Firstly, the analysis led to better define and describe the inner networked dynamics that bond ecosystem actors in a collaborative network essential to make them mutually open to mobilize their personal (material and immaterial) resources to start knowledge-based co-creative processes essential to innovate and, in doing so, making the ecosystem competitive and viable over time (Autio et al., 2018). This nuanced view extends existing theories on networked interactions in entrepreneurial contexts, highlighting how actors dynamically engage to mobilize resources and create value based on their specific goals and characteristics (Sørensen and Sørenson, 2003; Isenberg, 2016). Moreover, these interactions are not static but evolve over time, influenced by roles' evolution, interpersonal ties, and the blurred boundaries of the ecosystem.

Secondly, the study deepens the theoretical understanding of entrepreneurship education's role within EEs. As stated, the analysis has been conducted assuming the perspective of the ecosystem focal actor, a local university. This led to a better understanding of the importance of education in nourishing knowledge-based value-creation processes intended to innovate and, in doing so, support the ecosystem's competitiveness and growth (Wurth et al., 2022).

The analyzed EE universities, going beyond their traditional role, facilitate regional knowledge spillovers and multi-actors' collaboration, essential for innovation. This is due to the university's ability to orchestrate other actors' activities, making them willing to mobilize personal resources to cooperate with other actors (Gieure et al., 2020; Macías-Prada et al., 2024). However, HEIs' responsiveness and proactivity, essential for the growth of the knowledge economy and innovation-driven development, come from its ability to promote personalized and digital education initiatives, which can support other actors in better approaching the collaboration processes in which the resources they mobilize are implemented, according to the "rules" set by the common regulatory framework.

Thirdly, this study also demonstrated that education, based on networked and collaborative interactions, helps actors in defining and enacting new value-creation processes, essential to promote ecosystem sustainability through innovation (Jensen, 2014; Cosimato et al., 2024). When this

synergistic approach is enacted, ecosystem actors can locally benefit from knowledge spillovers that boost the creation of new start-ups, spin-offs, and scale-ups (Belitski et al., 2019). To achieve this goal, decision-makers should facilitate and promote education programs to facilitate knowledge transfer from actor to actor (Stam and Van de Ven, 2021).

Finally, the analysis contributes to the nascent literature on lean marketing communication, highlighting its potential for the advancement of EEs. Thus, this approach to communication makes ecosystem actors not only more informed but also engaged in the interactive dynamics essential for starting knowledge creation and sharing processes, essential for scouting business opportunities, disseminating innovative ideas, and achieving traction for faster desired outcomes (Ponomareva and Ponomarev, 2022). In doing so, the contribution of digital technologies is essential for reaching out to people and identifying the right data for better designing the innovative solutions to address customer needs and market specifications (Ponomareva and Ponomarev, 2022). Thus, if entrepreneurship education is essential to create that entrepreneurial culture at the core of the so-called "social structure" of innovation, communication is essential to stimulate actors' engagement in the operationalization of such a culture, possible also thanks a conscious use of digital technologies or of the "technological infrastructure" that is essential to make new ventures able to adapt to the current socio-economic and competitive scenarios (Feldman, 1994).

This study also offers some interesting practical implications.

From a managerial perspective, the research highlights the necessity for ecosystem actors to strategically cultivate both formal and informal collaborations. Firstly, this means that decision-makers and managers must be open to moving beyond the traditional, rigid organizational boundaries to create dynamic and evolving relationships with other ecosystem actors **(**Etzkowitz and Leydesdorff, 2000; Rippa et al., 2022). Secondly, HEIs' managers to exploit the potential of entrepreneurship education for nourishing the ecosystem evolving dynamics cannot ignore the potential of digital technologies and of a lean approach to communication. This will support them in proceeding towards the digital transformation and personalization of the education program, possibly by informing them of a clear and aware data-driven approach (Han et al., 2022). To achieve this goal, managers in these institutions must invest in robust digital infrastructures and complement technical competencies with data-driven, practice-oriented, and personalized learning experiences. This will enable the creation of hybrid environments, crucial for developing practical entrepreneurial skills like business idea development and opportunity exploitation (Motta and Galina, 2023). Finally, the varied communication approaches observed necessitate that managers adopt more strategic, omnichannel communication strategies, leveraging digital channels for enhanced interactivity and consistency in knowledge sharing and problem-solving. Addressing the technological readiness gaps among different actors through targeted training and resource allocation is also a key managerial challenge.

For policymakers, the study underscores several critical areas.

Firstly, there's a clear need to invest in and incentivize the development of digital infrastructure across the region to support the ongoing digital transformation of entrepreneurship education and communication within the EE **(**Prasetyaningtyas et al., 2022).

Secondly, simplifying and streamlining the regulatory framework is paramount. Policies should focus on reducing bureaucratic hurdles associated with company establishment, fiscal regulations, and funding procedures, particularly for startups and new ventures that are often demotivated by such complexities. Policymakers can also facilitate access to resources and foster innovation by designing

programs that encourage both formal and informal collaborations among diverse ecosystem actors. Finally, recognizing the enhancing role of entrepreneurship education and digital technologies, policies should actively promote and fund programs that not only impart entrepreneurial skills but also integrate the use of emerging digital technologies, thereby preparing individuals to navigate the complexities of the modern entrepreneurial landscape.

This study comes with some limitations to be addressed in future research. Thus, it is somewhat limited by the implementation of a qualitative method and the analysis of a single case study, set in a specific local area (the Campania Region located in the South of Italy). Therefore, future research will be conducted comparing different EEs set in different countries and/or regions, and to grasp similarities and differences between them quantitative methods will be also implemented.

## Abstract

This study investigates the cognitive and strategic factors influencing the readiness and resilience of women entrepreneurs and their new ventures in Italy during the COVID-19 pandemic. Utilizing logistic regression on a sample of 201 Italian women entrepreneurs who launched businesses between 2020 and 2021, our empirical analysis reveals several compelling insights. We find strong evidence that prior managerial or entrepreneurial experience significantly enhances entrepreneurial self-efficacy and perceived readiness to navigate crisis conditions. Similarly, self-confidence in marketing and sales capabilities is robustly linked to a heightened sense of entrepreneurial preparedness. Contrary to expectations, ventures that implemented broader business model changes were significantly more likely to report negative pandemic impacts, suggesting that such strategic adaptations often reflected reactive responses to severe disruption rather than protective or pre-emptive measures. Interestingly, the direct relationships between prior experience and innovative marketing responses, as well as the perceived usefulness of personal networks and strategic adaptations, were not statistically significant in this crisis context, suggesting more complex dynamics at play. Furthermore, the isolated impacts of tactical marketing adaptations and technological adoption appeared less conclusive and, in some cases, potentially indicative of post-shock coping mechanisms rather than proactive innovation. These findings deepen our understanding of entrepreneurial resilience in gendered contexts, highlighting the critical role of internal resources and the nuanced, context-dependent nature of strategic responses for women entrepreneurs facing acute environmental shocks. We offer theoretical implications for entrepreneurship and marketing literature, alongside practical recommendations for entrepreneurs, policymakers, and support organizations aimed at fostering crisis-responsive ventures.

*Keywords: Female Entrepreneurship; Entrepreneurial resilience; COVID-19; Self-Efficacy; Business model adaptation; Marketing adaptation*

## 1. Introduction

The COVID-19 pandemic caused unprecedented global disruption, forcing businesses to rapidly adapt. For new ventures, this meant navigating extreme uncertainty while striving to build trust and secure resources (Kraus et al., 2020). Within this challenging environment, understanding how diverse entrepreneurial groups responded is crucial. Among these, a vital yet often underserved demographic, face persistent structural barriers in entrepreneurial ecosystems, including limited access to markets,

financing, and institutional support (Brush et al., 2019). Despite these challenges, evidence suggests women entrepreneurs often demonstrate remarkable creativity, customer orientation, and resilience (Cesaroni et al., 2017; Henry et al., 2015), uniquely positioning them to leverage innovation and marketing capabilities.

While innovation and adaptability are recognized as critical for survival during crises (Eggers, 2020a; Kraus et al., 2020), less is known about how entrepreneurs, especially women, mobilize resources to respond. Existing research highlights individual cognitive factors like entrepreneurial self-efficacy (Bandura, 1997; Chen et al., 1998) and prior experience (Ucbasaran et al., 2009). However, empirical studies rarely examine how these resources inform the specific types of adaptations implemented during systemic shocks like COVID-19, particularly in women-led ventures where cognitive and strategic capabilities may play a compensatory role (Brush et al., 2019; Henry et al., 2015).

Building on Bandura's Social Cognitive Theory, Social Capital Theory, entrepreneurial marketing, and gendered entrepreneurship literature, this study addresses this gap. We examine how prior managerial or entrepreneurial experience, marketing and sales self-confidence, and adaptive strategic actions influenced the resilience and performance of women-led ventures launched in Italy during the pandemic's peak.

Focusing on Italy, a country severely impacted by COVID-19 with a dynamic landscape of female entrepreneurship, we investigate the cognitive and strategic mechanisms that enabled women entrepreneurs to mitigate crisis impacts. Specifically, we explore:

1. How prior experience affects entrepreneurial self-efficacy.
2. The link between marketing and sales self-confidence and perceived entrepreneurial readiness.
3. Whether prior experience increases innovative marketing responses during a crisis.
4. How business model changes (including marketing strategy and technological adaptations) impacted venture performance.

Analyzing survey data from 201 Italian women entrepreneurs who started ventures between 2020 and 2021, this paper connects individual cognitive resources with marketing capabilities and strategic adaptations. Our findings significantly advance the understanding of how marketing and innovation co-evolve in entrepreneurial ecosystems under severe environmental constraints, offering theoretical insights into entrepreneurial resilience and practical implications for policymakers and support institutions.

## 2. Conceptual Background

### 2.1 Entrepreneurial resilience and adaptive innovation in times of crisis

Systemic disruptions like the COVID-19 pandemic have profoundly emphasized the importance of entrepreneurial resilience—the capacity of entrepreneurs and their ventures to absorb shocks, reconfigure resources, and maintain goal-oriented behavior under adverse conditions (Ghomi et al., 2023). The pandemic acutely highlighted this need, destabilizing global markets, consumer behaviors, and supply chains (Kuckertz et al., 2020) and forcing rapid adjustments due to unprecedented challenges like restricted mobility and demand declines (Kraus et al., 2020).

Entrepreneurial resilience is not just an innate trait; it's a dynamic process involving continuous learning, feedback, and strategic reconfiguration (Bernard & Barbosa, 2016). Resilient entrepreneurs swiftly mobilize resources, interpret changing environments, and implement decisive strategic changes (Corner et al., 2017; Teece, 2007). This encompasses individual cognitive factors like perseverance and optimism (Sutcliffe & Vogus, 2003), alongside strategic behaviors such as proactive planning, opportunity recognition, and continuous experimentation (Duchek, 2020). These often manifest as rapid business model adaptations, accelerated digital transformation, and responsive market repositioning, especially when traditional customer engagement becomes unviable (Kraus et al., 2020; Guttena et al. 2024). The crisis thus served as a powerful impetus for necessity-driven innovation.

For women entrepreneurs, the COVID-19 crisis often exacerbated existing structural constraints like limited access to capital (Coleman & Robb, 2012), disproportionate care burdens (Manolova et al., 2020), and underrepresentation in high-growth sectors (Brush et al., 2019). Many women-led ventures responded by strategically leveraging digital platforms, adopting new sales channels, or realigning product offerings (Gómez et al., 2024; RE-FEM Report, 2023). These adaptations, often implemented with fewer resources, underscore the intricate link between gendered entrepreneurial contexts and resilience-based innovation. Ultimately, under crisis conditions, innovation frequently arises not just from deliberate opportunity-seeking but significantly from necessity-driven adaptation, demonstrating how constraint can catalyze novelty for nascent women-led ventures.

### 2.2 Prior experience and Entrepreneurial Self-Efficacy

Entrepreneurial self-efficacy (ESE), defined as an individual's belief in their capability to successfully perform entrepreneurial tasks, is strongly shaped by accumulated professional and entrepreneurial experiences. Evidence shows that repeated exposure to managerial responsibilities—such as organizational problem-solving and decision-making—enhances confidence in handling new ventures (Chen et al., 1998; Baum et al., 2011). Similarly, previous entrepreneurial stints provide direct learning about market dynamics, resource mobilization, and venture creation, thereby reinforcing ESE.

For women entrepreneurs, these experiences are especially impactful. Role models, mentorship, and leadership positions help counterbalance structural and cultural barriers by strengthening perceived competence and providing alternative pathways to skill acquisition (Bosma et al., 2012; Shinnar et al., 2014). Studies from diverse contexts, including crisis situations, indicate that prior exposure—whether through family businesses or previous managerial roles—predicts greater self-efficacy, adaptability, and persistence in pursuing entrepreneurial initiatives (Botha, 2020; Sharma & Rautela, 2022; Korber & McNaughton, 2017). Therefore, we hypothesize:

*H1: Women entrepreneurs with prior managerial or entrepreneurial experience report higher levels of entrepreneurial self-efficacy when starting a business during the pandemic.*

### 2.3 Marketing self-confidence and entrepreneurial readiness

While ESE reflects a broad sense of competence, domain-specific forms of self-confidence play a critical role in shaping concrete entrepreneurial behaviors (Zhao et al., 2005; Baluku et al., 2020). Marketing self-confidence, in particular, is crucial because it directly influences an entrepreneur's ability to engage customers, access markets, and compete effectively (Eggers, 2020a; Hills & Hultman, 2013). Confidence in managing marketing tasks reduces perceived risks, increases the feasibility of opportunity exploitation, and supports proactive decision-making. Formal training, mentorship, and hands-on experience in sales and promotion are key sources of this confidence (Politis, 2005).

For women entrepreneurs, this domain-specific confidence has added significance. Gendered norms and institutional biases often limit access to networks, promotional channels, and sales opportunities (Henry et al., 2015; Ahl & Marlow, 2012). Such constraints can generate tension between expected gender roles and entrepreneurial demands (Eagly & Wood, 2012; Koenig et al., 2011). In these contexts, marketing self-confidence provides a critical psychological resource, enabling women to act decisively, pursue opportunities more assertively, and persist in the face of resistance (Revell-Love & Revell-Love, 2016; Wilson et al., 2007). By reinforcing readiness to launch and grow ventures under uncertainty, marketing self-confidence emerges as a central driver of entrepreneurial preparedness. Therefore, we hypothesize:

*H2: Higher self-confidence in marketing and sales capabilities is positively associated with perceived entrepreneurial readiness.*

### 2.4 Prior experience and innovative marketing responses

Prior managerial and entrepreneurial experience not only shapes general self-efficacy but also equips founders with practical skills, tacit knowledge, and a broader cognitive framework to navigate market turbulence (Unger et al., 2011; Politis, 2005). Experienced entrepreneurs tend to possess advanced sensing and seizing capabilities (Teece, 2007; Helfat & Peteraf, 2015), enabling them to quickly identify shifts in customer needs, competitive landscapes, or technological opportunities. This allows them to effectively adjust their marketing mix, explore digital channels, or reposition offerings in response to environmental shocks. Their accumulated knowledge base provides a repertoire of solutions and a greater ability to recognize patterns in complex situations, fostering a more agile and proactive approach to marketing.

For women entrepreneurs, drawing upon robust prior experience becomes an even more critical asset. This experiential capital can compensate for external limitations, providing the mental models and confidence needed to pivot rapidly. During the COVID-19 pandemic, evidence indicates that ventures led by more experienced entrepreneurs were quicker to adopt innovative marketing practices, such as online sales, digital advertising, novel distribution partnerships, and creative customer engagement strategies, to maintain customer relationships and revenue streams (Sahu & Panda, 2024; Zahara et al., 2023). Their prior exposure to varied business contexts provides them with a mental model for adapting to unforeseen challenges, reducing the cognitive load associated with radical changes. This readiness to innovate in marketing is crucial for maintaining market presence and customer loyalty during periods of disruption. Therefore, we hypothesize:

*H3: Women entrepreneurs with previous professional experience in entrepreneurial or managerial roles are more likely to adopt innovative marketing strategies in response to the pandemic.*

### 2.5. The role of personal networks in strategic adaptation

Entrepreneurial activity is fundamentally embedded in social contexts. Personal networks—comprising family, friends, peers, mentors, and professional contacts—offer a broad range of resources critical to decision-making under uncertainty, including informational, emotional, and instrumental support (Jack, 2005; Davidsson & Honig, 2003). Especially during crisis periods, when formal institutional support may be insufficient or slow to respond, networks can play a compensatory role by providing rapid, context-sensitive feedback and facilitating access to resources that aid in rethinking strategies (Klyver & Schenkel, 2013).

Drawing on Social Capital Theory (Nahapiet & Ghoshal, 1998), entrepreneurs embedded in richer personal networks are more likely to identify opportunities, recognize environmental shifts, and overcome resource constraints through trusted relationships. These connections reduce uncertainty and facilitate learning, which is particularly important in contexts marked by sudden discontinuities such as the COVID-19 pandemic (Diaz Gonzalez & Dentchev, 2021). The ability to exchange ideas, receive moral support, or gain insights from others simultaneously facing similar challenges strengthens the capacity for adaptation (Mzid et al., 2019).

Strategic adaptation often takes the form of business model adaptation, understood as deliberate changes in how a firm creates, delivers, and captures value (Teece, 2010; Foss & Saebi, 2015). This may involve adjusting marketing approaches, reshaping value propositions, or modifying communication strategies. Pivoting toward digital channels, incorporating technological tools, and expanding online service delivery have also been widely observed (Kraus et al., 2020; Eggers, 2020a, 2020b). Because such reconfigurations are inherently information-intensive, entrepreneurs benefit from shared learning, external perspectives, and trusted peer validation within their networks (Hoang & Antoncic, 2003). Indeed, empirical research highlights the importance of networked information flows in shaping small firm responses and fostering innovation (Battisti & Deakins, 2017).

Women entrepreneurs, in particular, often rely more heavily on informal and personal networks than on institutional sources of support (Edelman et al., 2017). Some studies underline that during the COVID-19 pandemic, close-knit social ties (bonding capital) provided emotional support and motivation through shared responsibilities, while broader business connections (bridging capital) helped in identifying opportunities (Tiwari & Shastri, 2023).

As such, understanding how perceived network utility influences adaptive behavior may be especially salient in the context of women-led ventures during the pandemic. We therefore hypothesize:

*H4. Women entrepreneurs who perceive their personal networks as more useful are more likely to undertake strategic business adaptations in response to the pandemic.*

### 2.6. Business model adaptation and perceived crisis impact

Periods of acute environmental turbulence compel entrepreneurial ventures to adjust swiftly. Business model adaptation becomes central in these circumstances, enabling firms to mitigate perceived negative impacts and ensure survival. These adaptations may range from changes in product offerings and distribution channels to adjustments in cost structures and financing.

Unlike narrow operational shifts, business model adaptations represent more comprehensive reconfigurations. Entrepreneurs might reshape their core value propositions, transition to digital platforms, or create new revenue streams to engage different customer segments (Doz & Kosonen, 2010; Liguori & Pittz, 2020). Such transformations are particularly vital when conventional practices become unviable due to health restrictions or evolving consumer behavior (Kraus et al., 2020).

Among various adaptation areas, marketing strategy revision and technological adoption stand out. Marketing changes may involve modifying how firms position, promote, and deliver their offerings, often through digital channels or revised promotional strategies (Doyle & Stern, 2006; Morrish & Jones, 2020). Simultaneously, investments in online platforms or CRM systems enable operational continuity and expand market reach during periods of limited mobility (Verhoef et al., 2021; Kraus et al., 2020).

These adjustments reflect an entrepreneur's strategic agility and capacity for systemic change (Corner et al., 2017; McKelvie & Davidsson, 2009). By reconfiguring elements of their business models, entrepreneurs not only withstand crisis conditions but may also perceive their consequences as less severe (Branicki et al., 2023).

This dynamic is especially relevant for women entrepreneurs, who, despite often facing greater constraints, demonstrate resilience and responsiveness in challenging contexts (Manolova et al., 2020; Cesaroni et al., 2017). Their ability to reorient business models through adaptive strategies can therefore play a key role in lessening the perceived negative impact of the pandemic. Based on this reasoning, we hypothesize:

*H5: Women entrepreneurs who implement business model changes due to the pandemic are less likely to report negative impacts from it.*

Building on this argument, it is also important to distinguish between the different dimensions of business model adaptation. Prior research suggests that marketing-related reconfigurations and technology adoption constitute two particularly salient domains (Morrish & Jones, 2020; Verhoef et al., 2021). Marketing adaptation strengthens customer relationships and sustains demand under volatile conditions, while technological adoption not only enables continuity but also provides access to new business opportunities. Since these mechanisms address distinct facets of resilience, we explore their independent effects through the following hypotheses:

*H5a: Women entrepreneurs who adapt their marketing strategies due to COVID-19 are less likely to report negative impacts from it.*

*H5b: Women entrepreneurs who adopt new technologies due to COVID-19 are less likely to report negative impacts from it.*

## 3. Methodology

This study employs a quantitative research approach to investigate the cognitive and strategic mechanisms that enabled women entrepreneurs in Italy to mitigate the impacts of the COVID-19 pandemic. Our empirical analysis is based on survey data, allowing for the examination of relationships between individual attributes, strategic adaptations, and perceived outcomes during a period of unprecedented disruption.

### 3.1 Data collection and sample

The data for this study were collected in February 2025 through a structured survey administered to a sample of 201 Italian women entrepreneurs who launched new ventures between 2020 and 2021, precisely during the critical phase of the COVID-19 pandemic. This specific focus on nascent ventures initiated during a global crisis provides a unique context to explore entrepreneurial resilience under extreme uncertainty. The survey was designed to capture entrepreneurs' self-perceived readiness, their responses to the crisis, and the influence of their prior experience and personal networks.

### 3.2 Measures

All key constructs were operationalized using either single-item or composite indicators, rigorously grounded in relevant entrepreneurship, marketing, and crisis management literature. The measures are detailed below:

- Entrepreneurial Self-Efficacy (ESE) / Perceived Readiness: This was operationalized as an ordinal variable capturing the entrepreneur's self-assessed preparedness to face challenges related to the COVID-19 crisis. This measure aligns with the foundational notion of entrepreneurial self-efficacy, a widely validated predictor of venture resilience and proactive behavior rooted in Bandura's Social Cognitive Theory (Bandura, 1997; Chen et al., 1998). Higher scores indicate greater perceived readiness.

- Self-Confidence in marketing and sales: This construct was measured on a four-point ordinal scale, ranging from "not at all confident" to "very confident." This item serves as a robust proxy for domain-specific self-efficacy (Zhao et al., 2005), reflecting the entrepreneur's perceived capability in managing critical market-facing functions such as customer acquisition, promotion, and sales. Such confidence is particularly crucial in times of market uncertainty and disruption (Wilson et al., 2007; Eggers, 2020a).

- Usefulness of social networks: an ordinal five-point variable measuring the perceived relevance and helpfulness of personal and professional networks in overcoming pandemic-related challenges. Social networks are theorized to provide critical resources, information, emotional support, and opportunities for effective crisis responses and resource mobilization (Stam & Spigel, 2016).

- Prior managerial or entrepreneurial experience: these were captured as two distinct binary indicators indicating whether the respondent held previous managerial positions or had prior experience in launching or managing another business. These two variables were combined into a new binary variable equal to 1 when either prior managerial or entrepreneurial experience was equal to 1 and 0 when both the original variables were equal to 0. These measures operationalize key human capital elements, which are theoretically expected to positively influence entrepreneurs' cognitive schemas, adaptive capacity, and innovativeness in new venture creation (Ucbasaran et al., 2009; Politis, 2005).

- Business adaptation strategies: a set of binary indicators were derived from the survey to capture whether entrepreneurs adjusted specific aspects of their business plan in response to the crisis. This multifaceted construct encompasses:

    - Marketing adaptations: a binary variable indicating whether the entrepreneur modified their marketing strategies (e.g., shifts in communication channels, promotional activities) (Eggers, 2020a, 2020b; Kraus et al., 2020).

    - Technological adoption: A binary variable reflecting the adoption of new technologies for business operations (e.g., e-commerce platforms, digital collaboration tools) (Seetharaman, 2020).

    - Broader business model changes: A binary variable capturing more fundamental reconfigurations of the business model (e.g., significant changes in market offerings, finance and revenue streams, distribution and promotion channels). These indicators collectively reflect the firm's strategic flexibility and adaptive capacity, consistent with literature highlighting adaptation as a core entrepreneurial response to environmental shocks (Williams & Shepherd, 2016; Doz & Kosonen, 2010).

- Perceived negative impact of COVID-19: This was coded as a binary outcome variable (1 = significant negative consequences reported, 0 = no significant negative consequences/positive impact). This measure aligns with prior crisis impact assessments in small and medium enterprise

(SME) research, providing a direct indicator of the perceived severity of the pandemic's effects on venture performance (Diaz Gonzalez & Dentchev; Kraus et al., 2020).

### 3.3 Statistical analysis

This study tested the proposed hypotheses using appropriate regression techniques tailored to the nature of the dependent variables.

All statistical analyses were conducted using Python's statsmodels and scikit-learn packages, ensuring rigorous adherence to robust estimation standards and promoting the replicability of our findings.

To test the first two hypotheses, H1 and H2, which examine the relationships between prior experience, marketing self-confidence, and perceived entrepreneurial readiness, ordinal logistic regression was employed. This method was selected because the dependent variable, Perceived Readiness (or ESE), is measured on an ordinal scale. This approach allowed us to estimate the likelihood of women entrepreneurs reporting higher categories of readiness based on their prior managerial or entrepreneurial experience (H1) and their self-confidence in marketing and sales capabilities (H2).

For H3, which investigates whether previous professional experience in entrepreneurial or managerial roles increases the likelihood of adopting innovative marketing responses, a binary logistic regression was utilized. This method is suitable for assessing the impact of prior experience on the dichotomous outcome of engaging in innovative marketing.

To test H4, which investigates the relationship between the perceived usefulness of personal networks and the likelihood of undertaking strategic business adaptations, binary logistic regression was also applied. This allowed us to assess how network utility influences the dichotomous outcome of implementing adaptations in response to the pandemic.

Regarding the impact of strategic adaptations, H5 posited that women entrepreneurs who implement broader business model changes are less likely to report negative impacts from COVID-19. This hypothesis was tested using binary logistic regression, with the dependent variable being the dichotomous outcome of reporting negative COVID-19 impacts. H5a and H5b were both likewise examined using binary logistic regression, allowing us to assess whether these adaptation types played differentiated roles in shaping resilience outcomes.

For all logistic regression models, Maximum Likelihood Estimation (MLE) was employed. In addition to this, we also employed a non-parametric bootstrapping procedure to enhance the robustness of coefficient estimation and hypothesis testing, particularly given the modest sample size and potential data imbalances. For each hypothesis, we performed 1,000 resampling iterations with replacement, re-estimating model parameters across these replicates. For ordinal models, the bootstrapping was applied using the OrderedModel implementation with logit link functions; for binary outcomes, standard logistic regression was used.

For each bootstrapped distribution of coefficients, we computed the mean coefficient, its exponentiated odds ratio, and an empirical two-tailed p-value, calculated as twice the proportion of resampled coefficients whose sign differed from the mean estimate.

Odds ratios are used to facilitate the interpretation of effect sizes, providing a clear understanding of the magnitude of association between the independent and dependent variables. This robust

methodological approach ensures the reliability and validity of our findings in addressing the research questions.

## 4. Findings

Our study analyzed a sample of 201 women entrepreneurs from diverse sectors across Italy, representing new ventures launched during the critical phase of the COVID-19 pandemic. Table 1 provides a detailed overview of the sample's descriptive statistics.

| Variable | Most Frequent Category | Frequency (%) |
|---|---|---|
| **Sector** | Wholesale/Retail Trade | 64 (31.8%) |
| **Firm Size** | 1 employee | 110 (54.7%) |
| **Legal Form** | Sole Proprietorship | 119 (59.2%) |
| **Age** | 45–54 years | 65 (32.3%) |
| **Marital Status** | Married | 87 (43.3%) |
| **Education** | High School Diploma | 121 (60.2%) |
| **Business Origin** | Start-up | 108 (53.7%) |

**Table 1:** Descriptive statistics of the sample (n = 201)

As shown, the sample is largely comprised of micro-enterprises, with 54.7% having only one employee. The most common industry is wholesale and retail trade (31.8%), followed by hospitality and food services (14.4%) and personal services (11.4%). Sole proprietorships dominate the legal structure (59.2%), reflecting individual ownership. The majority of entrepreneurs are between 45 and 54 years old (32.3%), with a significant portion under 35 (22.4%). Most hold a high school diploma (60.2%), and over half of the businesses (53.7%) were launched as new start-ups.

### 4.2 Hypotheses testing results

To test the proposed relationships, a series of logistic regressions were conducted. Table 2 presents the main results for the core hypotheses.

| Hypothesis | Coefficient | Odds Ratio | P-Value | Supported (p < .05) |
|---|---|---|---|---|
| **H1** | 0.8618 | 2.3675 | 0.004 | Yes |
| **H2** | 1.1654 | 3.2071 | <0.0001 | Yes |
| **H3** | 0.2696 | 1.3095 | 0.414 | No |
| **H4** | 0.0053 | 1.0053 | 0.934 | No |

| | | | | |
|---|---|---|---|---|
| **H5** | 1.6189 | 5.0478 | <0.0001 | Yes |
| **H5a (Exploratory)** | 4.0608 | 58.0199 | 0.3483 | No |
| **H5b (Exploratory)** | Highly Unstable | N/A | N/A | No |

**Table 2:** Logistic regression results for main hypotheses

The statistical analysis provides strong evidence supporting H1, indicating that women entrepreneurs with prior managerial or entrepreneurial experience report significantly higher levels of entrepreneurial self-efficacy when starting a business during the pandemic. This relationship was highly significant ($p<0.005$), with a large odds ratio (2.3675). This finding strongly underscores the importance of experiential learning in fostering the confidence necessary to navigate uncertain times, aligning with established theories on self-efficacy (Bandura, 1997; Zhao et al., 2005).

Similarly, H2 received robust empirical support. We found that higher self-confidence in marketing and sales capabilities is significantly associated with perceived entrepreneurial readiness ($p<0.001$). The substantial odds ratio (3.2071) reinforces the critical role of domain-specific confidence in shaping a founder's perception of her ability to effectively engage with the market and undertake strategic action (Wilson et al., 2007). This highlights that confidence in a key functional area like marketing is a potent cognitive resource for entrepreneurial action.

Conversely, our analysis did not support H3. The expectation that women entrepreneurs with previous professional experience in entrepreneurial or managerial roles would be more likely to adopt innovative marketing responses was not statistically significant ($p=0.414$). Despite prior research suggesting a correlation between experience and opportunity-driven innovation (Rae, 2006; Eggers, 2020a), our results indicate that a direct, statistically significant relationship was not observed in this specific crisis context. This might suggest a more complex mediation or moderation at play, or perhaps that necessity-driven innovation pathways differ from opportunity-driven ones during acute shocks.

Furthermore, H4 was also not confirmed. The perceived usefulness of personal networks did not significantly increase the probability of strategic business adaptations ($p=0.934$). While the literature consistently highlights the role of networks in enabling resilience and providing critical resources (Davidsson & Honig, 2003; Elfring & Hulsink, 2003), our findings suggest that, in the acute phase of the pandemic for this sample of women entrepreneurs, the perceived utility of these resources did not translate directly into a statistically significant likelihood of undertaking strategic business adaptations. This may indicate that generalized network support might not directly or immediately lead to demonstrable strategic adaptation outcomes during rapid, high-stakes disruptions.

Finally, H5 yielded a statistically significant and substantial positive association between reported business model changes and the likelihood of perceiving negative impacts from COVID-19 (coefficient = 1.6189, odds ratio = 5.0478, $p < 0.001$). Contrary to initial expectations, this suggests that women entrepreneurs who made broader strategic adaptations were more likely, not less, to report adverse consequences from the pandemic. Rather than indicating a protective effect, this result might reflect a reactive pattern of adaptation: entrepreneurs may have undertaken significant business model changes as a response to severe disruption, rather than as pre-emptive resilience strategies. This interpretation aligns with crisis research showing that adaptive responses during environmental shocks

are often triggered by necessity and distress, especially when undertaken late or under constrained conditions (Kraus et al., 2020).

In addition to the main test of H5, we conducted exploratory analysis to examine the independent effects of specific adaptation types. Hypothesis 5a, testing the effect of marketing strategy adaptation, showed a strong positive coefficient (4.0608) and a very high odds ratio (58.0199), but this relationship was not statistically significant ($p = 0.3483$), likely due to wide variability and limited sample size. For H5b, the adoption of new technologies was associated with an extremely large coefficient (26.4288) and odds ratio ($> 3 \times 10^{11}$), and the effect was statistically significant ($p < 0.001$). However, the magnitude of these estimates is caused by a near-complete separation in the data, which suggests that caution need to be adopted in interpreting these results. They likely reflect that all respondents who adopted new technologies also reported negative outcomes, making the predictor a near-perfect marker of crisis impact rather than a mitigating factor. However, we also stress that only 5 out of 201 respondents adopted technology changes. Together, these exploratory findings reinforce the notion that adaptation, while crucial, is not uniformly effective, and that its presence often reflects the intensity of the challenges faced rather than a guaranteed buffer against them.

## 5. Discussion

Our study embarked on an exploration of the cognitive and strategic factors influencing the readiness and resilience of women-led new ventures during the profound disruption of the COVID-19 pandemic in Italy.

A central theme emerging from our analysis is the paramount role of individual cognitive resources in fostering entrepreneurial readiness, especially for women founders in challenging environments. The strong empirical support for H1 confirms that prior managerial or entrepreneurial experience significantly bolsters women entrepreneurs' self-efficacy, making them feel more prepared to launch ventures amidst a crisis. This aligns directly with Bandura's (1997) Social Cognitive Theory: for women, who often face unique systemic barriers to external resources, this internal reservoir of experiential capital becomes even more vital, acting as a crucial cognitive buffer against adversity. Complementing this, H2's robust support for the positive association between marketing and sales self-confidence and perceived entrepreneurial readiness further underscores the importance of domain-specific conviction. This finding reinforces that confidence in critical functional areas, particularly those tied to market engagement and revenue generation, is a powerful predictor of an entrepreneur's perceived ability to navigate the complexities of a new venture (Wilson et al., 2007). In essence, our results highlight that an entrepreneur's belief in her capabilities, cultivated through past experiences and specific functional expertise, is an indispensable asset for proactive market engagement and strategic action, especially during periods of profound market turbulence.

Perhaps the most revealing insight from our study concerns the ambiguous role of strategic adaptation in times of crisis. Contrary to our initial expectations, H5 revealed a strong positive association between reported business model changes and the likelihood of perceiving negative impacts from COVID-19. Rather than suggesting a mitigating or protective effect, this finding implies that women entrepreneurs who undertook broader strategic adaptations were more likely to have experienced substantial disruptions. This result challenges conventional interpretations of adaptation as a proactive resilience mechanism, and instead points toward a reactive adaptation pattern, where significant changes in the business model were prompted by acute distress or environmental shock.

This interpretation aligns with recent crisis entrepreneurship research (Kraus et al., 2020), which suggests that adaptive responses during systemic disruptions are often driven by necessity, particularly when ventures face severe constraints or delayed responses. Business model change, in this context, may represent a signal of crisis severity rather than a buffer against it. The notion of adaptation as a *symptom* rather than a *solution* is particularly salient for resource-constrained, women-led ventures operating under high uncertainty.

Further nuance is offered by our exploratory analyses. While marketing adaptation (H5a) displayed a large but non-significant positive coefficient, the lack of statistical significance suggests considerable heterogeneity in how such adaptations were deployed and perceived. More strikingly, the effect of technological adoption (H5b), though statistically significant, was inflated by near-complete separation in the data: all women entrepreneurs who adopted new technologies also reported negative impacts. This extreme correlation likely reflects post-hoc coping mechanisms rather than pre-emptive digital transformation. Moreover, the very low number of adopters (only 5 out of 201) raises caution regarding generalizability.

Taken together, these findings suggest that strategic adaptation, while crucial, is not uniformly effective, nor is it necessarily indicative of resilience. In our sample, adaptation often appeared reactive rather than transformative, undertaken in response to disruption rather than in anticipation of it. For early-stage, women-led ventures—often operating with limited slack resources—piecemeal changes may be insufficient unless embedded within a broader, coherent strategic reconfiguration. Crisis-driven innovation, in this light, appears to favour depth and timing over breadth, highlighting the need to distinguish between adaptive effort and adaptive efficacy in assessing entrepreneurial resilience.

Our findings also offer intriguing discordances with certain aspects of existing literature, prompting deeper theoretical reflection. The non-support for H3, which posited a link between prior experience and the adoption of innovative marketing responses, challenges the straightforward assumption that experience directly translates into specific innovation outcomes, especially during acute crises. While experience clearly fosters overall readiness (H1), its role in triggering specific innovative marketing actions might be more complex. This could suggest that during a "necessity-driven" crisis, innovation might emerge from urgent problem-solving irrespective of prior formalized innovation experience, or that the nature of prior experience (e.g., routine versus highly adaptive roles) plays a nuanced part. Similarly, the non-confirmation of H4, concerning the perceived usefulness of personal networks and strategic business adaptations, presents an interesting divergence from the widely accepted view of networks as key resources for entrepreneurial resilience (Davidsson & Honig, 2003; Elfring & Hulsink, 2003). This could imply that while general network usefulness is beneficial, specific, actionable ties that directly facilitate strategic pivots might be more critical during rapid crises. Alternatively, in the context of women entrepreneurs, networks might predominantly serve as sources of emotional support or general information rather than direct conduits for strategic guidance, especially when facing widespread market collapse rather than localized challenges.

### 5.1 Theoretical implications

This study significantly enriches the literature on entrepreneurial resilience by offering empirical evidence that nuances the understanding of adaptive responses during systemic crises. Rather than confirming the expected protective role of business model innovation, our findings indicate that higher-order strategic adaptations often co-occur with greater perceived hardship, suggesting that such changes may be reactive responses to disruption rather than proactive resilience mechanisms. This underscores the need for a more granular theoretical framework of entrepreneurial resilience—one

that moves beyond general notions of "adaptability" to account for the timing, trigger, and depth of adaptation. Specifically, our results challenge a simplistic "hierarchy of adaptation" where transformative changes are inherently superior or more protective than incremental ones. While transformative changes (like a complete business model overhaul) might be necessary responses to existential threats, our data suggest they can also be indicators of significant distress. In contrast, incremental adaptations (e.g., minor adjustments to marketing tactics or gradual technological adoption) might reflect less severe pressure or a more proactive, measured approach. Particularly during crises like COVID-19, radical strategic pivots may not reflect strength but exposure to greater vulnerability, challenging assumptions that equate extensive transformation with an inherently positive form of resilience.

In the context of gendered entrepreneurship, our findings reinforce the critical importance of internal cognitive resources, such as prior managerial experience and entrepreneurial self-confidence, in navigating uncertainty. For women entrepreneurs these internal capacities may not only shape readiness and strategy but also influence the very decision to adapt. This shifts the theoretical lens from a deficit-based cataloguing of barriers toward a strength-based recognition of agency and adaptive cognition, emphasizing the role of internal capabilities in shaping entrepreneurial trajectories under conditions of constraint.

Furthermore, our results contribute to the marketing-innovation nexus by complicating the notion that innovation in crisis contexts is inherently protective or performance-enhancing. Rather than indicating effectiveness, the strong association between business model changes and negative crisis impacts suggests that radical innovation may emerge as a reactive necessity, not a strategic advantage. In such cases, business model reconfiguration reflects firms' attempts to cope with severe disruption—changing how value is marketed and delivered under duress, rather than as pre-planned innovation. This challenges conventional assumptions about the positive linearity between innovation and resilience, and instead calls for greater theoretical attention to the temporal and causal asymmetries of crisis-driven innovation.

The non-significant findings regarding direct links between prior experience or network utility and specific marketing innovations further suggest that adaptive marketing responses may not be easily predicted by static entrepreneur-level variables. This opens important avenues for future research into mediating and moderating mechanisms—such as emotional regulation, timing of response, or access to digital infrastructure—that might shape the translation of entrepreneurial capabilities into effective strategic change during crisis periods.

### 5.2 Managerial implications

The findings of this study offer important implications for women entrepreneurs, entrepreneurship support organizations, and policymakers seeking to strengthen venture resilience during systemic crises. For women entrepreneurs, the evidence emphasizes the centrality of cognitive preparedness. Accumulating diverse managerial and entrepreneurial experiences plays a critical role in strengthening self-efficacy, a key psychological resource for navigating uncertainty. Proactively seeking opportunities that foster this experiential capital can build not only general confidence, but specific readiness to confront crises. Moreover, cultivating domain-specific self-confidence in marketing and sales emerges as especially vital—this functional competence supports strategic decisiveness in revenue-critical areas, enhancing entrepreneurs' capacity to act swiftly and assertively in volatile markets.

However, our results caution against overestimating the protective role of strategic adaptations. The strong association between business model changes and reported negative impacts suggests that adaptation alone is not inherently beneficial. Rather, it may reflect late-stage coping strategies under duress. Thus, entrepreneurs should approach strategic change not merely as an emergency reaction, but as a deliberate and pre-emptive process embedded in ongoing business model learning. Developing the foresight and cognitive flexibility to engage in transformative change before disruption peaks may distinguish resilient ventures from those simply trying to survive.

For entrepreneurship support organizations and policymakers, this study points to the limits of narrowly addressing resource access or encouraging ad hoc innovation. Programs should focus on building strategic foresight, cognitive resilience, and readiness for deep structural transformation, not just incremental operational change. Training curricula must go beyond surface-level marketing tactics to include scenario planning, business model reconfiguration, and strategic innovation under uncertainty. Additionally, support structures should aim to cultivate marketing and sales confidence among women founders—an often under-recognized but powerful driver of strategic engagement.

Furthermore, while network support remains valuable, our findings suggest that not all networks offer equal utility during crisis. General personal networks may provide emotional reassurance, but they do not necessarily translate into strategic decision-making support. Policymakers should consider facilitating access to high-leverage, actionable networks, such as experienced mentors or peer groups with direct expertise in navigating business pivots. Programs that match women entrepreneurs with strategic advisors—especially those with experience in crisis management and business model transformation—could offer more targeted value.

Ultimately, these implications underscore that resilience is not simply about enduring shocks, but about possessing the cognitive, strategic, and relational assets to proactively reshape one's trajectory. For women entrepreneurs, this means going beyond grit or flexibility to develop the capacity for deep, anticipatory adaptation—an imperative that should shape both personal development strategies and the architecture of entrepreneurial support ecosystems.

## 6. Conclusion, limitations and further research

This study sheds light on the critical cognitive and strategic levers that enabled Italian women entrepreneurs to navigate the severe emergence of the COVID-19 pandemic. Our findings underscore the profound impact of prior managerial or entrepreneurial experience and marketing and sales self-confidence in building a robust sense of entrepreneurial readiness. These internal resources proved indispensable, acting as vital buffers against external shocks, particularly for women who often face systemic barriers to traditional external support.

Crucially, the research highlights that strategic adaptation—particularly business model change—does not always indicate resilience. Contrary to expectations, women entrepreneurs who implemented such changes were more likely to report negative impacts, suggesting these shifts were often reactive responses to acute environmental shocks rather than proactive strategies. In this context, adaptation may reflect the severity of external pressures rather than operate as a protective mechanism. This invites a more cautious interpretation of transformation efforts during periods of instability, especially for resource-constrained early-stage ventures.

Interestingly, our analysis also revealed that, in this turbulent environment, prior experience did not directly translate into innovative marketing responses, nor did general personal network utility directly

lead to strategic adaptations. This hints at a more complex, perhaps necessity-driven, innovation pathway and suggests that the nature or specificity of network support might be more critical during rapid, high-stakes disruptions.

These results suggest concretely that future research and policy should not treat strategic change as a uniformly positive indicator. Instead, scholars and practitioners should differentiate between reactive and proactive adaptation, potentially through longitudinal studies that trace not only the type of strategic responses adopted, but also their timing and perceived voluntariness. For example, future work could develop typologies of "forced" versus "deliberate" business model innovation and test their respective outcomes in different crisis contexts.

Moreover, programs supporting women entrepreneurs would benefit from integrating diagnostic tools that help identify early warning signals of reactive adaptation—such as cash flow volatility or client loss—so that interventions can be offered before full-scale restructuring becomes necessary. In parallel, comparative studies across countries or regions with differing institutional support could reveal how context conditions moderate the effectiveness and perception of strategic adaptation.

While this study offers valuable insights, it's important to acknowledge its limitations. The cross-sectional nature of our data means we can identify strong associations but cannot definitively establish causality. Future research using longitudinal designs would be invaluable to trace the dynamic evolution of these factors. Additionally, our sample predominantly comprises micro-enterprises in Italy, which may limit the direct generalizability of these findings to larger firms or different national contexts. Future comparative studies across diverse firm sizes and institutional environments could provide broader insights. Finally, our measures for specific adaptations, such as innovative marketing and technological adoption, were binary. More granular, multi-item scales in future studies could uncover nuanced effects and explain why their isolated impacts were not consistently significant in our analysis, potentially revealing the specific conditions under which they become powerful drivers of resilience. These avenues offer fertile ground for deeper exploration into how entrepreneurs, particularly women, can best fortify their ventures against future unforeseen challenges.

# Leveraging Growth Hacking and Digital Marketing: Evidence from Tunisian Startups

Lala Hu[1], *, and Nesrine Agrebi[1]

[1] Università Cattolica del Sacro Cuore, Milan (Italy)

* Corresponding author: lala.hu@unicatt.it

## Abstract

This study explores how Tunisian entrepreneurs adopt digital marketing and growth hacking to support the development of their startups. The aim is to gain a better understanding of the marketing strategies of startups from emerging markets, in a context characterized by resource constraints. By adopting a qualitative, multi-case study approach to explore in depth how Tunisian entrepreneurs perceive and use digital marketing and growth hacking strategies. For this purpose, 15 semi-structured interviews were conducted with 10 founders of startups operating in various sectors, and five experts in marketing or entrepreneurial coaching. Findings highlight how entrepreneurs in Tunisia leverage digital marketing and growth hacking to compete in the business environment and seize market opportunities, while facing challenges within a fragmented entrepreneurial ecosystem.

*Keywords. Digital marketing; Growth Hacking; Startups; Tunisia.*

## 1. Introduction

Entrepreneurship is seen as an important solution to Africa's socio-economic challenges, offering ways to create employment, innovation, and economic diversification. Many African countries have exploded in start-up activity over the past decade, mainly due to younger populations, increased digital connectivity, and heightened interest from global investors (Liouane, 2024). However, this increase in power is not without obstacles. Most start-ups on the continent work in a very restrictive environment, characterized by limited access to capital, underdeveloped infrastructure, regulatory uncertainty, and low consumer purchasing power (Lay and Tafese, 2025). Tunisia represents a particularly interesting case study in the African startup landscape.

As a small North African country with a relatively solid educational infrastructure and high youth unemployment, Tunisia has made entrepreneurship a policy lever for socio-economic transformation. Initiatives such as the Startup Act have created a dedicated legal and fiscal framework to support early-stage businesses, offering benefits such as tax exemptions, seed funding, and streamlined administrative processes. These developments have earned Tunisia growing visibility as a booming technology hub in the MENA region, with reports showing a 205% increase in ecosystem value in 2023 alone (Siddiqui, 2024). Nevertheless, Tunisian startups are constantly faced with enduring challenges typical of many African ecosystems, which often prevent startups from developing effectively, despite viable products and strong local demand. In this context, marketing innovation is an essential tool for survival and growth, especially when developed at low cost.

In recent years, two strategies have become popular with the world's start-ups: growth and digital marketing. Growth laces are an experimental approach that focuses on data that can often be used to rapidly acquire users and optimize key performance indicators, through unconventional or low-cost techniques (Bargoni et al., 2023; Bohnsack and Liesner, 2019). Digital marketing, on the other hand, refers to the strategic use of online tools, such as search engine optimization (SEO), social media, content marketing and e-mail optimization, the development of customer brand awareness and long-term engagement (Tiago and Veríssimo, 2014; Olivieri and Testa, 2024). Although these approaches are often discussed separately in the literature, their combined applications are particularly relevant for startups operating in nexus environments such as Tunisia. Growth actions offer agility and speed, while digital marketing brings depth and sustainability. When effectively integrated, they can form a strong hybrid strategy that offsets short-term benefits through the creation of long-term value (Troisi et al., 2020; Sanasi, 2024).

However, empirical research on this integration, particularly in the context of emerging markets, is limited. Existing research on growth hacking and digital marketing generally focuses on startups in developed countries with robust digital infrastructures, mature consumer markets and access to abundant venture capital (Macca et al., 2024; Cavallo et al., 2023). These studies provide valuable references to the effectiveness of specific tactics or strategic models, but rarely consider the contextual realities of African startups. In Tunisia, for example, most startups are run by single or small teams and executed on a minimal budget, and strategy must be adapted to fragmented and highly competitive digital environments.

In addition, although some studies analyze the challenges of digital transformation in African companies, they often focus on large firms or standard digital tools, leaving aside marketing strategies that foster the initial development of startups (Chakraborti et al., 2022). There is also a lack of information on how Tunisian entrepreneurs perceive and implement growth, especially regarding the resources they have, the level of maturity of the ecosystem, as well as cultural or regulatory constraints.

This empirical study aims to address this gap by conducting qualitative research involving ten startups and five ecosystem experts in Tunisia. The main objective is to examine how Tunisian startups are adopting and integrating growth hacking techniques and digital marketing into their business.

## 2. Theoretical background

Over the past few years, growth hacking has become essential for new businesses that want to expand rapidly with few resources. Despite its growing adoption (Macca et al., 2025), this method is still poorly understood in the academic literature. Growth hacking is based on a culture of rapid, data-driven experimentation, enabling startups to test ideas, learn and adjust continuously. It encourages innovation, flexibility, and data-driven choices. However, its practical implementation faces various obstacles: lack of in-house skills, budget limitations, and fear of failure. These factors underscore the importance of better understanding the adoption of this method among entrepreneurs in general, but also more specifically in the Tunisian context.

Growth hacking is a mindset and approach developed to foster rapid growth in start-ups, using creative, data-driven, low-cost experiments (Bohnsack and Liesner, 2019; Sanasi, 2024). This method focuses on rapidly acquiring new users, testing hypotheses, and adapting based on immediate feedback. Techniques such as referral marketing, A/B testing, viral loops, and product-market fit optimization are essential to this method (Troisi et al., 2019).

One of the key strengths of growth hacking is its flexibility. This method enables start-ups to avoid traditional, budget-intensive marketing campaigns, relying instead on statistics, automation, and virality (Bargoni et al., 2023).

Digital marketing takes an organized and thoughtful approach, focusing on the use of digital tools to manipulate brand positioning, attract new customers and forge lasting bonds with them (Ritz et al., 2019). Key tools include search engine optimization (SEO), social networks, email campaigns, marketing content, and paid online advertising (Tiago and Veríssimo, 2014 ; Patel and Chugan, 2018).

Although growth hacking focuses primarily on short-term acquisition and testing, digital marketing aims to foster long-term customer engagement and develop brand image (Olivieri and Testa, 2024). Nevertheless, researchers are increasingly showing that these two methods can complement each other and that the right combination can allow startups to achieve solid, sustainable growth (Troisi et al., 2019 ; Bargoni et al., 2024). This combination is particularly important for young companies in the launch phase, which often need to rapidly acquire a customer base while gradually building a solid, sustainable brand image. Research suggests a growing need for studies that examine how these companies evolve from a phase of initial "hacks" to more elaborate marketing methods (Bargoni et al., 2023; Sanasi, 2024).

Implementing these approaches is not easy for startups as they encounter significant barriers such as budget constraints, lack of time, or even a lack of internal skills within the team to experiment with these new approaches. On the other hand, many start-ups are not in a position to experiment with new things or test new ideas for fear of failure, and the habit of using data in decision-making is not yet developed among entrepreneurs; these limitations reduce the possibilities of using growth hacking successfully (Macca et al.,2025). To minimize this phenomenon, it is necessary to provide support tailored to the needs of entrepreneurs, to help them understand these approaches and succeed in using them.

Most academic research on growth hacking and digital marketing is based on case studies from developed or Western countries (Macca et al., 2024; Cavallo et al., 2023). Ecosystems such as those in Silicon Valley, Berlin, or London offer startups significant access to funding, advanced technological infrastructure, qualified mentors and favorable regulations.

Generalized growth models derived from these ecosystems often fail consider the informality, resource limitations and market fragmentation typical of African startups (Liouane, 2024). They overlook the fact that many African startups cater to non-digital users or use channels that mix digital and offline, making their customer acquisition and engagement strategies more complex (Enpact, 2019). Thus, African entrepreneurs can choose to apply growth hacking and digital marketing strategies differently than developed countries. Global approaches can be merged with local tactics or focus on building community trust and informal networks rather than automation and virality. For instance, in Tunisia, creators often must rely on informal learning, their own intuition, or the help of their peers (Chakraborti et al., 2022). This gap between theory and reality raises crucial questions about how entrepreneurs in resource-constrained contexts like Tunisia perceive and use digital marketing and growth strategies.

Therefore, this study tries to address the following research question:

*RQ. How do Tunisian entrepreneurs adapt digital marketing and growth hacking strategies to support their startup's growth?*

## 3. Methodology

### 3.1 Research Setting

This research aims to analyze in depth how Tunisian entrepreneurs perceive and use digital marketing and growth hacking strategies. As the objective of the study is exploratory, the appropriate methodology to use is qualitative (Yin, 1994). Following previous studies on startups' digital marketing strategies and growth hacking (Foggetti et al., 2025; Macca et al., 2025), a case study approach is adopted. In particular, this research adopts a multiple-case study approach (Eisenhardt and Graebner, 2007) as it is more generalizable than the single case study.

### 3.2 Data collection

Data collection was carried out between November 2024 and May 2025 using the online platform Teams. The interviews lasted around 40 minutes. With the exception of two interviews conducted in English, the rest was conducted in French, as Tunisia is a French-speaking country and the interviewees were most comfortable with French. With the consent of the interviews, the interviews were fully recorded and the transcripts were then translated verbatim. Interviews were conducted according to a pre-established interview guide, while allowing some flexibility to enable participants to freely express their point of view and explore certain themes in more detail. In detail, 15 semi-structured interviews were conducted with:

- 10 founders of startups operating in various sectors (Agritech, Edutech, Tourism, Culture, technology and services) (Table 1); and
- Five marketing experts and professionals from incubators, organizations that support entrepreneurship active in the entrepreneurial ecosystem in Tunisia (Table 2).

| # | Role | Name | Industry | Year of Foundation |
|---|---|---|---|---|
| S # 01 | COO (Chief Operating Officer) | Startup 1 | Technology | 2022 |
| S # 02 | CEO (Chief Executive Officer) & CMO (Chief Marketing Officer) | Startup 2 | Edu tech | 2023 |
| S # 03 | CEO (Chief Executive Officer) | Startup 3 | Culture and travel tech | 2022 |
| S # 04 | CEO (Chief Executive Officer) | Startup 4 | Biotech | 2022 |
| S # 05 | CEO (Chief Executive Officer) | Startup 5 | Agri tech | 2022 |
| S # 06 | CEO (Chief Executive Officer) & CMO (Chief Marketing Officer) | Startup 6 | Data analytics | 2022 |
| S # 07 | CEO (Chief Executive Officer) | Startup 7 | Technology | 2022 |
| S # 08 | CEO (Chief Executive Officer) | Startup 8 | Technology & Tourism | |
| S # 09 | CEO (Chief Executive Officer) & CMO (Chief Marketing Officer) | Startup 9 | Urban Mobility | 2023 |
| S # 10 | CEO (Chief Executive Officer) & CMO (Chief Marketing Officer) | Startup 10 | Edu tech | 2022 |

**Table 1:** Startups involved in the study (Source: Our elaboration)

| | Role | Area of expertise |
|---|---|---|
| E # 01 | Director, Employability & Entrepreneurship Hub/Honoris united universities | Strategic business consulting |
| E # 02 | Professor, Marketing consultant, Entrepreneurship coach | Marketing expert who helps compagnies grow their business and marketing strategies |
| E # 03 | Alternative Investment Specialist Co Founder 1kub Incubator | Experienced in setting up an ecosystem, shared valuable insights into startup strategies and growth. |
| E # 04 | Business Coach, Trainer ,Speaker& Marketing Expert | Marketing expert who helps compagnies grow their business and marketing strategies |
| E # 05 | Expert and Trainer in Eco-entrepreneurship \| Business support | Strategic business consulting |

**Table 2:** Experts involved in the study (Source: Our elaboration)

## 3.2 Data analysis

The data analysis adopted Gioia's methodology (Gioia et al., 2013) and was supported by the use of NVivo 14 software to code the data, to identify first order concepts directly from the quotes cited by the interviewees. First-order concepts were then grouped into second-order themes to develop broader schemas on the data to identify three aggregate dimensions, which will be explained in detail in the next section.

## 4. Findings

The findings of this study highlight how entrepreneurs in Tunisia perceive, exploit, and evolve digital marketing and growth hacking approaches. The findings are structured around three aggregate dimensions that illustrate actual practices, the importance of the entrepreneurial ecosystem in Tunisia, and the marketing strategies implemented. Each aggregate dimension Entrepreneur's market orientation, Strategic role of the entrepreneurial ecosystem, Digital-Driven Marketing Strategy, and Capability are supported by two second-order themes.

### 4.1 Entrepreneur's Market Orientation

This study revealed that a large proportion of different business owners and specialists

recognized insufficient market knowledge as the main obstacle facing new businesses, hindering their growth. A weak grasp of consumer needs and the attributes of rival firms typically results in ineffective marketing plans, with entrepreneurs making choices without detailed investigations grounded in thoroughly evaluated information.

The professionals consulted mentioned how challenging it is for business owners to correctly determine their target market. Many business owners tend to focus more on their products than on understanding the requirements of their customers or the customers themselves.

Other entrepreneurs rely on personal experiences or impressions, spontaneous and unstructured interactions. Sometimes startup founders do not know how to proceed with adequate market research that fits their offer or service. What many entrepreneurs have in common is that they have no entrepreneurial experience, lack the necessary business knowledge, and rely solely on their technical skills.

If they had entrepreneurial skills, they would perhaps have a much better chance of knowing their market. They are unaware of the logic involved. On the other hand,

lack of financial and human resources prevents entrepreneurs from conducting in-depth market research.

This mismatch between supply and consumers' real needs represents a major obstacle to the performance of entrepreneurs' marketing strategies. To succeed in this strategic phase, the support of support structures is essential. Despite these initial difficulties, many entrepreneurs are trying to adapt their marketing actions to what is available on the market. We observed the emergence of a harmonization process based on customer feedback, experimentation, and the desire to increase brand awareness.

Entrepreneurs are increasingly orientated towards experimentation and the creation of prototypes to gain validation from small-scale potential customers. However, on the other hand, founders of startups are trying to exploit the strengths of digital content and enhance their digital visibility to gain notoriety and credibility with the target audience, thus building a good reputation. These are some of the simple ways that most entrepreneurs adopt in order to better reach a specific target.

Entrepreneurial mindset and learning ability play a major role in the implementation of an effective marketing strategy. Entrepreneurs who have the ability to adjust to change and who are receptive to criticism and questioning are the ones who succeed in laying the foundations for a robust strategy.

### 4.2 The Strategic Role of the Entrepreneurial Ecosystem

This study reveals a significant need to deepen and strengthen the entrepreneurial skills of Tunisian entrepreneurs. These needs go beyond the technical or functional aspects, but also touch on the ability to elaborate a solid marketing strategy, to acquire customers, build a relationship with them, and measure the effects of the actions carried out.

Although the Tunisian entrepreneurial ecosystem has seen the birth of many support structures over the past decade, many of the founders interviewed admitted to having acquired their knowledge in the field, without specific support from these structures. In addition, experts confirmed that the marketing aspect is not well explored within coaching programmes, which weakens entrepreneurs' strategic choice of marketing actions.

This reality creates a gap between the desire to expand and the actual ability to implement organized strategies. Many business leaders report a lack of means, processes, and indicators to effectively manage their communications or select their means of dissemination. They also note a challenge in setting priorities and making marketing decisions.

Incubators are still essential support organizations. They offer training in various fields related to entrepreneurship, and they also provide a meeting place for entrepreneurs and experts in any specialty, even marketing, except that the majority of entrepreneurs and experts have also declared that this support is standardized, poorly adapted to the situation of each startup and sometimes out of sync with their real needs.

The entrepreneurial landscape is seen as unbalanced: some areas of Tunisia receive a great deal of support, while others remain on the sidelines; support structures are located in the country's capital, which minimizes the chances of entrepreneurs in the regions taking advantage of these programmes.

However, the interviewed entrepreneurs also see promising avenues: a growing acceptance of entrepreneurship, the creation of support networks, and a younger generation more receptive to digital technologies. The real challenge lies in the ecosystem's ability to organize its services, improve connections between the various players and adjust support systems to the concrete needs of startups. Against this backdrop, many institutions have begun to turn to specialized work that will, in one way or another, help startups.

### 4.3 Digital-Driven Marketing Strategy and Capability

Data reveal that startup entrepreneurs in Tunisia make extensive use of digital marketing tools, particularly social networks, to increase their visibility and reach their customer base. However, their use often remains basic, intuitive, and haphazard. Most interviewed entrepreneurs say they share content, sponsor publications, or use WhatsApp to exchange, but without integrating these actions into an overall marketing strategy.

The principle of growth hacking is still partially understood or unclear for many of the current leaders.

entrepreneurs interviewed. Although some use similar approaches, they don't recognize them as such, nor do they use them in a vision of rapid growth or idea validation. The term 'growth hacking' sometimes generates confusion, and many people simply see it as an important use of social media or as a short-term visibility strategy.

However, there is a natural adoption of growth hacking strategies. Examples include sponsorship (inviting one customer to bring in another), the launch of 'limited offer' promotions, or the use of digital word-of-mouth. These initiatives demonstrate the ability to activate viral mechanisms, test offers, and rapidly obtain user feedback at low cost.

## 5. Discussion

### 5.1 Theoretical contribution

This research contributes to different areas of the literature on entrepreneurship and digital marketing with a focus on growth hacking. First, it highlights the importance of market orientation for start-ups, an idea already put forward by Narver and Slater (1990), while revealing a striking contrast in resource-constrained environments such as Tunisia. Entrepreneurs have limited knowledge of their target market, reinforcing the observations of Chakraborti et al. (2022) regarding the use of intuition to compensate for the absence of formal market research.

In addition, our results enrich research on the development of entrepreneurial skills. The analysis conducted by Kaffka and Krueger (2024) indicates that participation in structured returns through mentoring or coaching facilitates the acquisition of practical and strategic skills. This is in line with our findings that entrepreneurs in contact with experts or well-organized incubators are more successful in adapting their marketing methods to transform them into learning approaches.

Furthermore, this research calls into question the universal scope of the dominant models in digital marketing. Unlike studies carried out in advanced technological contexts (Cavallo et al., 2023), our findings show that the use of digital tools is often superficial, lacking a specific strategy. This indicates that Western-derived models cannot be applied as they are in emerging ecosystems and need to be adjusted.

Last but not least, our main contribution concerns growth hacking, an approach that is still poorly understood but is being implemented informally. The results corroborate the findings of Macca et al. (2025), who highlight the vagueness surrounding the application of growth hacking and the need for context-specific approaches. While the literature presents it as a flexible, data-driven strategy designed for resource-constrained environments (Bargoni et al., 2024), our results indicate that Tunisian entrepreneurs require the creation of hybrid models integrating learning, support, and simplified tools.

Finally, this research also enriches our knowledge of entrepreneurial ecosystems. Unlike most studies focusing on advanced economies (Kansheba and Wald, 2020), our results highlight that limitations related to infrastructure, financing and the culture of experimentation are key elements in entrepreneurs' strategic decisions, necessitating a reassessment of analytical frameworks.

### 5.2 Managerial implications

The research also presents important practical recommendations for entrepreneurs, incubators, and policy-makers. Firstly, the findings show a pressing need for tailored training programmes that focus not only on the use of digital tools, but also on the creation of a solid marketing strategy, focused on clear growth, conversion, and retention objectives. Secondly, support organizations need to re-evaluate the way they help startups during their creation. Incubators need to move away from a one-size-fits-all approach to individualized support, taking into account the field of activity, the stage of development of the project, and the skills of the team. This means including a strategic module on market positioning, customer acquisition decisions, and marketing performance evaluation. Third, it is

advisable to gradually apply the principles of growth hacking to support systems. Practical sessions focusing on experimentation, A/B testing, performance evaluation and rapid iteration cycles would offer founders the opportunity to learn how to develop agile actions adaptable to their specific situations. Finally, public officials and funders can act as catalysts by funding strategic marketing training, establishing regional skills clusters to reduce territorial inequalities, and fostering collaborations between startups and digital marketers. These initiatives would help strengthen the resilience of startups in Tunisia and promote their sustainable development. Beyond Tunisia, these suggestions could also serve as inspiration for other African ecosystems facing similar difficulties. The gradual introduction of support systems combining strategic marketing and experimental approaches could boost entrepreneurship across the continent.

## 6. Limitations and future research directions

This study is not exempt from limitations, which are first related to the generalizability of results as we conducted our analysis on a limited sample of startups based in one single country, Tunisia. Future research should enlarge the focus of the analysis to startups from other countries, e.g. African startups that share a similar business environment with Tunisian startups.

Furthermore, the focus of this research is on the company side and did not consider the

perspective of customers. Future research should investigate the consequences of startups' digital marketing and growth hacking strategies by also integrating the point of view of customers and investors.

Finally, quantitative methods could be applied to study this phenomenon to measure the key effects of the digital marketing and growth hacking strategies of startups.

### Abstract

In an era where consumers increasingly demand authenticity from brands, the emergence of Generative Artificial Intelligence (GAI) in activist communication poses new challenges. This study explores cross-cultural perceptions of GAI-generated brand activist messages through a qualitative thematic analysis involving 38 participants from Italy, Sweden, and the United States. It examines how different national contexts shape expectations of authenticity, emotional resonance, transparency, and responsibility in AI-generated communication. Findings reveal five key themes: authenticity and consistency, the role of human agency, transparency and accountability, limited empathy, and context-specific appropriateness. While AI was broadly accepted as a supportive tool, participants emphasized that credible activism still requires human presence: a deliberate, value-driven commitment rooted in authentic beliefs, along with the ability to feel, express, and respond to complex emotions, which AI tools are evidently unable to replicate. GAI was seen as more appropriate for environmental causes, perceived as data-driven, than for social justice issues demanding personal understanding and a human voice. Cultural differences shaped these views: Italians focused on sincerity and alignment with brand values, Swedes adopted a practical approach, assessing functional relevance and transparency, and US respondents evaluated whether activism matched the brand's business and offerings. Despite these differences, shared skepticism emerged toward fully AI-authored activism lacking human oversight and emotional credibility. This study contributes to branding and communication research by highlighting the sociocultural filters through which GAIgenerated activism is interpreted. It calls for hybrid, culturally sensitive strategies that preserve human authenticity while leveraging technological innovation in cause-related messaging.

# Sustainability on the Menu: How Framing and Ingredient Type Influence Upcycled Food Acceptance

## Abstract

Food waste represents one of the most pressing global challenges, with restaurants playing a central role due to their high use of fresh ingredients and frequent disposal of unused parts. Upcycling—the practice of transforming surplus or byproducts into new dishes—offers a sustainable solution, yet its adoption in hospitality settings faces strong consumer resistance. This study addresses this gap by examining the psychological barriers that hinder acceptance of upcycled food in restaurants.

Across multiple studies, the research identifies perceived contamination as the primary barrier. Consumers often associate upcycled food with being unsafe or unclean, though this reaction depends on the ingredient source. Preparation scraps and surplus stock are more positively received than buffet leftovers, which are strongly linked to contamination concerns. Restaurant type also plays a decisive role: in luxury settings, consumers perceive upcycling as innovative and sustainable, especially when framed as the outcome of chef craftsmanship. By contrast, in budget restaurants, the same practices may be interpreted as cost-cutting, reinforcing negative perceptions. Finally, communication proves critical—abstract, sustainability-oriented framing (e.g., "Artisan Alchemy") is more effective than literal descriptions in enhancing acceptance.

The findings advance understanding of consumer psychology in sustainable food innovation by clarifying how contamination inferences and construal level theory interact to shape acceptance of upcycled food. They highlight that ingredient type and consumption context jointly influence willingness to try, offering a more nuanced perspective on barriers to circular economy practices in hospitality.

For practitioners, the results suggest that upcycling can be successfully implemented in luxury restaurants if communicated through abstract narratives of sustainability and creativity. Managers should avoid emphasizing waste origins and instead highlight craftsmanship, innovation, and environmental value. Menu design, staff communication, and storytelling represent key levers to normalize upcycled dishes while maintaining the premium dining experience.

## Abstract

**Introduction.** Platform-mediated delivery services such as Uber Eats, DoorDash, Deliveroo, and Glovo have become pervasive in urban environments, reshaping not only consumer practices but also the structure of labor. These platforms mediate interactions between consumers and workers, organizing labor through algorithms, ratings, and app-based notifications (Huang, 2023). Delivery workers, framed as "independent contractors," operate under precarious conditions, subjected to continuous consumer evaluations and algorithmic oversight (Cant, 2019). Structural conditions such as stress, surveillance, and precarity exacerbate conflict; one in five food delivery workers in the U.S. have been physically assaulted while on the job (New York Post, 2024). This study asks how cultural representations of real conflicts on delivery platforms, as expressed in virtual spaces, reflect and reinforce intersectional inequalities, and what role social actors play in sustaining symbolic and structural violence against riders (Recuero, 2024). **Brief Literature Review.** Studies have examined algorithmic management (Woodcock & Graham, 2020), opacity of digital infrastructures, and shifts within digital capitalism (Couldry & Mejias, 2019). Platforms embed surveillance, algorithmic oversight, and affective modulation into everyday transactions. Comment threads and rating systems act as moral scripts reinforcing symbolic hierarchies (Cheng et al., 2014). Consumers are delegated co-governors who maintain platform operations through micro-interactions that blur the distinction between consumption and managerial oversight (Törnberg, 2023; Jhaver et al., 2021). **Methodology.** A qualitative and immersive netnographic framework (Kozinets, 2019) guided data collection. Digital media archives were analyzed to identify conflict cases, and transversal keywords were used to systematize searches across Twitter/X, TikTok, and Reddit. The dataset includes 45 news articles and 194 immersive journals with screenshots, comments, threads, and visual fragments. An immersive journal (Kozinets, 2023) supported reflexive interpretation. Inductive coding, informed by intersectionality (Collins & Bilge, 2020), traced co-occurring patterns of identity, affective, and symbolic elements. **Results.** Racism and xenophobia emerged as central axes: riders were mocked for names, accents, and origins, and immigrant communities reproduced dominant stereotypes to distance themselves from marginalized groups. Humor and memes normalize suffering and convert labor into entertainment. Gender based violence targeted women riders, who adopted gender-neutral profiles to avoid harassment and whose viral cases were often met with digital shaming. Nationalist narratives politicized immigrant riders, framing them as cultural threats and fueling restrictive immigration discourses. Spatial exclusion added further risk, with riders avoiding certain neighborhoods and facing intensified stress in affluent zones.

Studio finanziato dall'Unione Europea - Next Generation EU, Missione 4 Componente 2
CUP J53D23004110008
**Discussion and Conclusion.** Delivery work becomes a site where systemic inequalities are amplified through digital mediation. Consumer practices reinforce symbolic violence, aestheticize labor, and normalize stigma (Cortés, 2021). While some acts of solidarity challenge these narratives, they remain overshadowed by algorithmically amplified hostility. Findings highlight the need for comparative studies of platform design and mechanisms for abuse reporting, consumer accountability, and worker protection, as well as research into how riders mobilize digital spaces for resistance and alternative narratives.

### Abstract

In a context of intensifying competition in higher education, universities are increasingly leveraging branding strategies to engage stakeholders and attract funds to support their institutional initiatives. While branding literature has extensively explored brand identification and advocacy in business settings, there has been only limited research on how these mechanisms operate within universities, particularly in relation to financial support behaviours among different stakeholder groups. The present study addresses this gap by investigating how brand pride and brand knowledge influence brand identification, and how this, in turn, affects advocacy behaviours and funding intentions, specifically through crowdfunding, among students and employees. Both of these stakeholder groups are immersed in the university brand environment on a daily basis, but, unlike most prior studies that focus on either alumni or students alone, this research offers a comparative perspective, highlighting significant differences in the relational dynamics of brand identification and advocacy across these groups. Using data collected from an Italian university's pioneering initiatives on research crowdfunding, this study applies a multi-group structural equation model to test the proposed relationships. The findings show that brand pride is a consistent driver of brand identification for both students and employees, which is driven, in turn, by brand knowledge, but only for employees Furthermore, the study also highlights the mediating role of advocacy behaviours in the relationship between brand identification and funding intentions, and demonstrates that only employees convert one of these behaviours into tangible financial support intentions. The findings contribute to the stream of higher education branding literature by clarifying brand identification mechanisms and offering managerial insights for tailoring stakeholder-specific communication and engagement strategies.

## Abstract

This article presents a study designed to investigate and map dynamic trajectories of consumer-influencer relationships. Consumers described experiences related to the initiation and evolution of their relationships with their most loved influencers and most hated influencers. Participants, pertaining to different generations, were asked to graphically trace the course of their feelings toward their currently most loved influencers and to recall the events that influenced those feelings. Similarly, participants were asked to do the same for the most hated influencers. The path towards love followed five distinct trajectories. The path towards influencer hate followed three distinct paths. The formative experiences shaping these trajectories often include personal individual experiences that cannot be controlled by marketers.

*Keywords: Consumer-influencer relationships; parasocial relationships; consumer-influencer trajectories; Formative experiences; In-depth interviews*

With the growth of social media in the marketing landscape, influencer marketing has achieved a prominent role in social media strategies (Ye et al. 2021). The global influencer marketing industry is expected to achieve the value of $ 480 billion by 2027 (Rossum, 2024). As companies' interest in influencers has grown over the years, academic research on the topic has expanded significantly since 2017. So far, this research has focused on several broad themes: influencer characteristics (e.g., demographics, expertise, and personal branding); content characteristics (e.g., authenticity, narrative styles, and presentation); audience characteristics (e.g., audience size, engagement levels, and stakeholder perspectives); product characteristics (e.g., influencers' expertise and involvement with specific products); and regulatory characteristics (e.g., ethical concerns and disclosure requirements) (Spörl-Wang et al., 2025). More recent studies have noted that younger generations are increasingly aware of the commercial nature of influencer-brand relationships. They often perceive influencers as "mannequins" or lifeless figures whose sole purpose is to entertain and grab attention, without real human qualities or credibility as advertising messengers (Vizcaíno-Verdú et al., 2025). Besides, most studies examine how influencers nurture parasocial relationships for commercial gain. However, they typically adopt a cross-sectional perspective, overlooking how these relationships evolve over time. In other words, prior research lacks a dynamic view of consumer-influencer relationships (Tyrväinen & Karjaluoto, 2025), which is essential for identifying signals that enhance influencer marketing effectiveness or for recognizing those that lead to disengagement or influencer avoidance. Adopting a dynamic perspective on the development of these relationships can reveal critical factors that influence their strength, either positively or negatively, over time. This study covers this gap by tracing the dynamics in the trajectories of consumer-influencer

relationships and identifying formative experiences that shape those trajectories. This analysis of the parasocial dynamics in consumer–influencer relationships is crucial for both brands and influencers, as it helps identify signals that may weaken these relationships with consumers and followers (Ekinci et al., 2025). Additionally, the in-depth dynamic analysis of relationship trajectories offers insights into salient moments that warrant further attention and interpretation within the context of parasocial relationships (Tyrväinen & Karjaluoto, 2025). The study adopts a qualitative approach through in-depth interviews following a method employed in brand research to analyze the trajectories of brand love and brand hate (Lagner et al., 2016; Zarantonello et al., 2018). Theoretically, this study responds to recent calls for longitudinal studies on the consumer-influencer relationships by adopting a dynamic perspective on consumer-influencer parasocial relationships (Tyrväinen & Karjaluoto, 2025). It also contributes to the growing body of research on the dark side of influencers (Ekinci et al., 2025), exploring those experiences that lead to extreme negative or favorable feelings towards influencers that may lead to consumers' deceptive behaviors or adverse effects on consumer well-being or self-esteem. From a managerial perspective, this research provides influencers and brands with practical guidance on identifying the signals that strengthen or weaken their relationships with followers.

# From Awareness to Action: Strategic Communication for Customer Engagement in Prevention

Valentina Sbrolli[1],*, Laura Grazzini[1], Gaetano Aiello[1]

[1] University of Florence, Italy

* Corresponding author: valentina.sbrolli@unifi.it

## Abstract

This work-in-progress study explores the role of prevention within the health customer journey, with a particular focus on the effectiveness of engagement strategies in promoting preventive health behaviors. Specifically, it investigates how health communication strategies and associated factors positively or negatively influence individuals' willingness and ability to adopt preventive practices. Employing a mixed-method approach—combining qualitative focus group analysis with experimental designs—the study aims to generate actionable insights for healthcare professionals, policymakers, and communication strategists. The ultimate goal is to provide evidence-based recommendations to enhance patient engagement in prevention and to inform the development of personalized, effective, and culturally sensitive health communication interventions.

*Key words: health marketing; customer journey in healthcare; health communication strategies; preventive health behaviors.*

### 1.Introduction

Providing individuals with health-related information and support can foster behavior change, sustain healthy practices, and enhance both psychological and physiological outcomes. This, in turn, contributes to the prevention and reduction of chronic diseases, mortality, and overall disease burden. In this context, health communication plays a crucial role. However, limited evidence exists on the specific characteristics of effective health messages targeting preventive behaviors, and on the factors that shape public responses to such communication.

Despite increased investments in preventive care—including health promotion and communication, which rose from 2.9% in 2019 to 5.5% in 2022 in Europe (Eurostat, 2025)—data continue to show insufficient public engagement in preventive behaviors (ONS, 2023).

This study explores the role of prevention within the patient journey, focusing on the effectiveness of engagement strategies in fostering preventive actions. Acknowledging the multidimensional nature of patient engagement, the research seeks to understand why some strategies succeed while others fall short in encouraging active participation. By adopting a multimethod approach (focus groups and experimental studies), it investigates the health communication approaches most conducive to engagement and examines how individual-level factors—such as social identity, motivation, and risk perception—affect individuals' capacity and willingness to engage in preventive behaviors.

The study is guided by the following research questions:

RQ1. Which health communication strategies are most effective in promoting patient engagement in prevention?

RQ2. How do individual and social factors influence participation in preventive behaviors?

RQ3. What barriers hinder patient engagement, and how can communication strategies overcome them?

## 2. Theoretical framework

### 2.1 Customer journey in healthcare

In the digital age, the customer journey has evolved into a complex, multi-channel process characterized by non-linear interactions across various touchpoints (Grewal & Roggeveen, 2020). Conceptualized as a dynamic and iterative experience, the customer journey spans the entire purchasing cycle, incorporating behavioral responses, emotional engagement, co-creation, and technological influence (Lemon & Verhoef, 2016; Tueanrat, Papagiannidis & Alamanos, 2020). From a service design perspective, it integrates both procedural and experiential dimensions, offering valuable insights into service delivery and user experience (Følstad & Kvale, 2017).

Within healthcare, this concept is adapted as the patient journey, which encompasses the continuum of care and emphasizes patients' emotional, physical, and functional experiences during service encounters, particularly across transitions in care (Ponsignon, Smart & Phillips, 2018; Beleffi et al., 2021; McCarthy et al., 2016). A dynamic understanding of this journey allows for a more comprehensive assessment of the patient experience (Saragosa et al., 2023). Patient experience is a critical component of both preventive and therapeutic healthcare, directly influencing health outcomes (Ryan et al., 2014). Central to this is patient involvement in decision-making, which enhances satisfaction and care quality, reflecting principles of patient-centered care and empowerment (Birkeland et al., 2022; Castro et al., 2016). Empowerment involves fostering patients' understanding, knowledge, and participation within culturally responsive contexts (WHO, 2009), forming the foundation for meaningful engagement (Tambuyzer & Van Audenhove, 2013; Hickmann et al., 2022).

Effective engagement requires personalization, accessibility, commitment, and collaborative relationships between patients and providers (Higgins et al., 2017; Carman et al., 2013). In preventive contexts, engagement is influenced by individual characteristics, health conditions, and professional competencies (WHO, 2016). Communication plays a pivotal role, particularly for patients with varying levels of health literacy (Krist et al., 2017; Mazor et al., 2016). Promoting health literacy through education and supportive environments enhances patient autonomy and aligns with patient-centered care principles (Barello et al., 2020). Ultimately, fostering a culture of proactive, two-way communication is essential for advancing health promotion and prevention strategies (Luecking et al., 2020).

### 2.2 Health communication

Health communication plays a vital role in public health, as the rapid dissemination of information is essential for reaching broad audiences (Ceretti et al., 2022). Traditional one-size-fits-all strategies have proven limited, prompting a shift toward audience and message tailoring to improve outcomes. Younger populations' preference for digital tools—such as patient portals, mobile apps, and email—supports the effectiveness of online interventions for education and prevention (Clarke et al., 2020; Lana et al., 2014).

To enhance these strategies, behavioral theories offer key insights. Self-Determination Theory (SDT) emphasizes autonomy, competence, and relatedness as drivers of motivation (Ryan & Deci, 2000), while Social Cognitive Theory (SCT) focuses on observational learning and self-efficacy (Bandura, 1986, 2004). SDT-based interventions have improved patient motivation (Ntoumanis et al., 2021), and SCT highlights self-efficacy as critical to behavior change (Dishman et al., 2014).

Message framing, risk perception, and social norms further influence preventive behaviors. Gain-framed messages are particularly effective (Gallagher & Updegraff, 2012; Rothman et al., 2006), as are communications that address personal risk perceptions (de Bruin & Bennett, 2020) and include personalized assessments (Edwards et al., 2000). Social norms—both descriptive (what others do) and injunctive (what others approve)—shape behaviors across contexts such as adolescent health, social distancing, and mental health stigma (Martínez et al., 2021; Dixon et al., 2015; Silk et al., 2017; Malher et al., 2008).

Effective campaigns require understanding decision-making processes, identifying barriers, and tailoring messages accordingly (Snyder, 2007). Health literacy remains essential, especially in primary prevention (Berkman et al., 2010), and family communication plays a key role in hereditary conditions like melanoma (Wu et al., 2023; Gaber et al., 2013). Engaging individuals in message creation enhances relevance and impact. Involving young people fosters creativity, peer influence, and trust—key to effective and authentic communication (Schillinger et al., 2017; Zhu et al., 2018). This participatory approach supports a culture of shared responsibility in health prevention.

## 3. Methodology

This study adopts a mixed-method design (Davis et al., 2011), beginning with a focus group (Study 1) to inform two subsequent experimental studies (Studies 2 and 3). The aim of Study 1 is to explore effective health communication strategies for fostering patient engagement in preventive behaviors. Due to limited prior research, a qualitative approach was employed using the focus group method (Calder, 1977; Stewart & Shamdasani, 1990; Fern & Fern, 2001), which allows for rich, interactive data collection (Belzile & Öberg, 2012) and yields more nuanced insights than one-on-one interviews (Krueger, 2014).

The focus group, conducted in Italy in May 2025, involved twelve participants (10 women, 2 men; Mage = 24) and followed Fern and Fern's (2001) guidelines, including moderation by an experienced facilitator and a structured discussion protocol (Bell, Bryman & Harley, 2018). The 2-hour session began with general attitudes toward preventive behaviors and moved to communicative factors that support or hinder engagement. Participants received a clear explanation of the session's goals and procedures in advance. The discussion was audio-recorded, transcribed (Bazeley & Jackson, 2013), and independently coded by two researchers to ensure validity (Weber, 1990). Interrater reliability, assessed with Cohen's kappa (.83), confirmed strong agreement (Cohen, 1960). Thematic analysis followed Brocato, Voorhees, and Baker's (2012) categorization process. Open coding led to the development and refinement of a coding framework, allowing for increasing abstraction and consensus in interpretation.

Findings from Study 1 will inform the design of Studies 2 and 3, which will experimentally test the effectiveness of selected communication strategies, considering boundary conditions (e.g., health literacy, motivation, risk perception) and underlying mechanisms (e.g., perceived inefficacy of preventive measures).

## 4. Preliminary results

The qualitative findings reveal that preventive health behaviors are perceived as a sensitive and multifaceted issue, influenced by both facilitating and inhibiting factors.

Participants generally associated prevention with everyday choices—such as healthy eating, regular physical activity, and avoiding risky habits. However, several participants described prevention as a reactive rather than a proactive behavior, activated primarily in response to emerging symptoms or specific concerns. As one participant noted: "I don't actively research every type of prevention, but if I start having doubts about a potential illness or problem, then I look into that specific issue. I don't seek out information about everything on a daily basis."

The findings also identified a number of motivational and inhibitory factors shaping engagement in preventive behaviors. Key drivers included family upbringing, personal experiences, and health-related anxiety. Social influences—particularly from family members and peers—emerged as significant in encouraging or discouraging preventive actions. Several participants reported: "Partly because of the way I was raised—my parents always passed on the message of prevention and being careful—and partly because of my own will and anxiety, the fear of having something."; "In my family there's a lot of attention on this aspect. Since I'm also a blood donor, I have the results sent directly to my doctor; so I check my values quite regularly."; "Other important figures have been long-time friends, who have engaged in conversations about medical topics. They also care a lot about it, and since we've known each other for so long, they encourage me to do prevention and to pay attention. I have to say, they're a good influence."

Conversely, key barriers to engagement included systemic constraints—such as limited access to general practitioners and long waiting times—as well as economic burdens related to private screenings. Psychological resistance, particularly fear of discovering an illness, was another major inhibitor. Additionally, participants referenced gendered cultural norms, especially among men, that discouraged open discussion of health concerns or engagement in preventive behaviors, particularly in areas such as sexual health.

Many participants highlighted a lack of trust in healthcare providers, especially general practitioners, as a barrier to proactive health management: "Unfortunately, in Italy, the quality of general practitioners—who should be the first point of reference to guide you toward more in-depth exams—is lacking. So either you take care of things on your own, or you have to wait a long time to be seen, or you just leave it up to chance."

Fear was also frequently cited as a deterrent to engaging in preventive behaviors: "I didn't have anxiety about getting tests done, but rather a fear of discovering something, and that fear was stronger than the other side—it kept me from wanting to get checked. It was a fear I didn't even admit to myself, and I went through it very badly."

Finally, participants offered insights into the features of effective prevention campaigns. Several emphasized the importance of using real-life stories from relatable peers to foster identification: "I would focus on leveraging young people for communication efforts, because we feel closer to them." "If I see a young person getting checked, it motivates me more because I feel like we might have similar needs."

## 5. Conclusions and limitations

The originality of this study lies in its contribution to the ongoing debate regarding the effectiveness of health communication strategies in promoting preventive health behaviors. By examining the communication factors that influence the success or failure of various approaches—alongside individual-level variables such as perceived fear, motivation, and risk perception—this research offers nuanced insights into how patient engagement in preventive efforts can be maximized.

From a managerial perspective, the study aims to provide healthcare professionals, policymakers, and communication strategists with evidence-based recommendations for optimizing communication strategies to foster greater patient involvement in preventive care. By generating actionable insights, this research supports the development of more effective, personalized, and culturally sensitive health interventions. Ultimately, it seeks to empower individuals, promote proactive health management, and improve public health outcomes.

As a work-in-progress, this study is subject to several limitations. The exploratory nature of the research constrains the generalizability of the findings. In particular, the validity and reliability of the qualitative data may be affected by the sample size and demographic characteristics of the focus group participants. Furthermore, the potential for social desirability bias cannot be excluded, as participants may have

expressed views perceived as socially acceptable rather than their genuine opinions. To address these limitations and enhance the robustness of the findings, at least one additional focus group will be conducted. This step will serve to validate and enrich the preliminary insights, thereby strengthening the empirical foundation for subsequent experimental phases of the research.

This publication is funded by the European Union's Horizon Europe Research and Innovation programme under the MELCAYA project (Grant Agreement No 101096667).

### Abstract

In recent years, artificial intelligence (AI) has emerged as a technological enabler and strategic asset capable of transforming internal and external processes and redefining how service organizations interact with their stakeholders and in their networks. This study investigates how AI contributes to the value creation process in business-to-business (B2B) service. Through a cross-sectoral exploratory study, until now 8 semi-structured interviews have been conducted with key informants operating in B2B service firms. The preliminary findings of this ongoing study suggest that AI plays a key role in three major areas of value creation, i.e., (1) effectively positioning the brand of service firms, by enabling advanced analyses of the competitive environment and supporting the development of targeted branding strategies; (2) optimizing resource mobilization, by improving the allocation and utilization of both financial and human capital through predictive analytics; and (3) strengthening business relationships with key stakeholders, by facilitating more personalized and responsive interactions which enhance trust, loyalty, and long-term engagement. The results of this study contribute to the academic debate on the role of AI in value creation process of B2B service firms and present several managerial implications for professionals and policy makers operating in the service ecosystem.

# La donazione di sangue e le motivazioni alla base del dono e dell'attività di volontariato

Orazio Vella[1],*, Simone Guercini[1]

[1] University of Florence, Italy

* Corresponding author: orazio.vella@unifi.it

## Abstract

Questo articolo considera l'importanza assoluta che la donazione di sangue ha per il Servizio Sanitario Nazionale e come risulta essenziale raggiungere e mantenere l'autosufficienza del sistema trasfusionale italiano, intesa come la capacit‡ di garantire a tutti i pazienti che ne hanno bisogno quantit‡ di sangue e plasma della massima qualit‡ e sicurezza.

La nostra ricerca prende in esame il tema del dono e delle sue caratteristiche (completamente gratuito, anonimo, senza aspettativa di scambio e con il solo scopo di raggiungere il bene altrui). Abbiamo considerato lavori classici e lavori pi˘ recenti, ma ci siamo soffermati soprattutto sui contributi di Titmuss e Mauss, che fanno riferimento al tema della donazione di sangue, Titmuss, e al dono in generale, Mauss. Per entrambi gli autori, il dono comprende l'atto di donare e di ricevere, ma differiscono per l'atto di ricambiare, presente nell'analisi di Mass ma assente nel lavoro di Titmuss.

Malgrado l'autosufficienza, i centri trasfusionali attribuiscono sempre maggiore importanza alle azioni legate al marketing sociale, dal momento che in Italia abbiamo una bassa percentuale di donatori rispetto alle persone potenzialmente in grado di donare sangue. Di questi donatori, occorre conoscere le motivazioni, che ci portano a distinguere i volontari che durano nel tempo da quelli che invece dopo poco abbandonano l'attività di donazione.

Nel 2024, in Italia abbiamo avuto 1,67 milioni di donatori, di cui 1,4 milioni sono stati donatori periodici, donatori cioË su cui il sistema trasfusionale italiano puÚ fare un certo affidamento; 267mila sono stati donatori alla prima donazione e di questi 267mila, 75mila hanno avuto un'età compresa fra i 18 e i 25 anni; le donazioni sono state superiori ai 3 milioni, con un incremento dell'1,1% rispetto al 2023. Nella raccolta di plasma, la parte liquida del sangue che serve soprattutto per produrre medicinali plasmaderivati, come ad esempio l'albumina e le immunoglobuline, l'Italia non raggiunge l'autosufficienza e quindi dipende dall'estero.

In Italia il numero di donatori Ë pari al 6% della popolazione che per legge puÚ donare (le persone che per legge possono donare sangue sono quelle che vanno dai 18 ai 65 anni per la prima donazione, mentre i donatori periodici possono continuare a donare sangue fino a 70 anni). Fra una donazione e l'altra di sangue intero (450 ml), devono passare 90 giorni per gli uomini e per le donne in menopausa (categorie che quindi possono arrivare ad un massimo di 4 donazioni l'anno) e 180 giorni per le donne in et‡ fertile (che invece possono arrivare ad un massimo di 2 donazioni l'anno). Le associazioni di volontariato raccolgono tutte le informazioni sui potenziali donatori e procedono alla chiamata alla donazione, importante soprattutto per coinvolgere il donatore e per cercare di fidelizzarlo.

I non donatori sono rappresentati dai pigri, categoria nella quale rientrano anche le persone che manifestano fobie nei confronti del prelievo di sangue, dagli scettici, coloro che cioË manifestano un sentimento di pericolo e quindi di rifiuto verso la donazione, e dagli anticonformisti o minoritari, che

vedono come una discriminazione l'esclusione di alcune categorie a rischio. Nei confronti di queste categorie di non donatori si attuano strategie di convincimento, che consistono nel cercare di dare maggiore importanza alla valenza pubblica della donazione, per i pigri, nel cercare di migliorare la parte estetica del prelievo, per gli scettici, e nel modificare i questionari in modo da apparire neutrali soprattutto nei confronti di alcuni orientamenti sessuali, per gli anticonformisti o minoritari.

L'originalità della nostra ricerca sta nell'aver parlato di un tema, la donazione di sangue, poco dibattutto ma fondamentale per il funzionamento di un qualsiasi sistema sanitario. Alla donazione di sangue non viene data la rilevanza che merita, almeno fino a quando anche noi non siamo anche noi costretti a dover beneficiare della raccolta effettuata.

*Parole chiave: donazione di sangue, autosufficienza, dono, motivazioni, donatori, volontariato, non donatori.*

# Track 5 - Retailing, Sales, & Trade Marketing

# Does selling orientation shape customer satisfaction in B2C door-to-door food retailing? The mediating role of customer commitment

David D'Acunto[1],*, Valentina Mazzoli[1], Ivan Russo[1]

[1] University of Verona, Italy

* Corresponding author: david.dacunto@univr.it

## Abstract

In B2C door-to-door (D2D) selling, personal interaction between sales representatives and customers crucially shapes the overall experience. This study examines how two prominent selling behaviors (consultative vs relational) impact customer satisfaction, considering the mediating role of customer commitment to the salesperson. Building on Construal-Level Theory (CLT), it explores how customer-seller psychological distance affects satisfaction. Findings indicate that consultative selling, emphasizing value and expertise, has a positive direct effect on customer satisfaction. Conversely, relational selling, based on trust and rapport, positively impacts satisfaction only when this relationship is mediated by customer commitment. Results underscore the crucial role of customer commitment when considering different selling orientations in seller-customer relationships within D2D frozen food retail contexts.

*Keywords: personal selling orientations; customer satisfaction; customer commitment; door-to-door selling; Construal-Level Theory*

## 1.Motivation and background

Despite growing online shopping trends, direct selling maintains significant relevance in Europe, with a market size exceeding 40 billion euros in 2024 and the D2D frozen food retail market accounting for 2 billion euros, particularly appreciated by elderly populations and families prioritizing reliable service and quality delivery. In D2D selling, sales forces play a pivotal role in customer satisfaction due to the centrality of personal interactions between representatives and customers. The type of selling orientation exhibited by salespeople—whether consultative or relational—can profoundly impact customer perceptions, satisfaction, and future purchase decisions. Academic literature on selling orientation shows inconsistencies, with studies demonstrating negative, positive, or no significant effects on sales performance. This inconsistency motivates our research question: "How do personal selling orientations impact customer satisfaction in D2D sales?"

Drawing from the social dimension of Construal Level Theory (Trope & Liberman, 2010), this study explores consultative selling behavior —based on higher construal level— versus relational selling —based on lower construal level— in shaping customer satisfaction. The study considers customer commitment with the salesperson as a mediator, offering empirical insights from B2C door-to-door sales contexts.

## 2. Key methods or approach

The research context is a leading German company specializing in D2D sales and home delivery of premium frozen foods through van-based direct selling. Independent sales representatives personally visit customers every two weeks, directly managing customer relationships. A structured survey was used to collect the data offline (April-July 2023) and online (November 2023-February 2024). The final sample consists of 205 respondents (69.3% women), surveyed across different demographics including age cohorts (56.1% over 65), education levels (46.3% high school diploma), and income levels (67.4% <28k€/year). Existing scales from marketing and sales literature were adopted to assess sales representative consultative and relational selling behavior (IVs), customer satisfaction (DV), and customer commitment to the salesperson (mediator). Data analysis employed PROCESS model 4 (Hayes, 2017) on SPSS to test hypothesized relationships between selling behaviors and customer satisfaction, examining the mediating effect of customer commitment.

## 3. Main results

Two distinct models revealed different patterns of relationships. Model 1 (IV=consultative selling) demonstrated that consultative selling behavior positively influences customer satisfaction ($R^2$ = .55, F(112,58) = .53, p = .000), supporting our primary hypothesis. Furthermore, the indirect effect through customer commitment was also significant (= 0.18, BootSE = 0.05, 95% bootstrap CI [0.09, 0.30]) thus indicating a positive partial mediation effect. Model 2 revealed that relational selling behavior positively influenced customer commitment ($R^2$ = .14, F(28,53) = .022, p = .000), and customer commitment positively influenced satisfaction ($R^2$ = .46, F(72,83) = .053, p = .000). but no significant direct effect of the predictor was found on customer satisfaction. Hence, customer commitment fully mediated the relationship between relational selling behavior and customer satisfaction. These findings indicate that consultative selling provides direct satisfaction benefits while relational selling requires customer commitment as a necessary pathway to satisfaction, demonstrating distinct mechanisms through which different selling orientations operate in D2D contexts.

## 4. Brief discussion or implications

Our findings contribute to research on selling orientation effects on customer satisfaction, offering specific insights from D2D food retailing. Following CLT, when customer-salesperson relationships are driven by institutional rules (consultative selling; high-level construal), consumers tend toward higher satisfaction with weaker customer commitment mediation. Conversely, when relationships are driven by social rules (relational selling; low-level construal), customer commitment becomes crucial, fully mediating satisfaction effects. From managerial perspectives, results suggest training and incentivizing salespeople toward consultative selling may yield greater customer satisfaction returns compared to relational selling alone. Adopting relational techniques might be risky, particularly in such contexts with high salesperson turnover and low customer commitment levels, as these may not suffice to drive satisfaction. We recommend B2C firms adopting direct selling models invest in training and incentivizing salesforces toward consultative approaches. Similarly, we advise salespeople, especially early in careers, to invest in consultative orientations rather than focusing solely on relational aspects. These findings differentiate pathways through which selling behaviors affect customer satisfaction via customer commitment, contributing to personal selling and relationship marketing literature in B2C contexts.

## Abstract

As gaming environments evolve into immersive, participatory ecosystems, Free-to Play (F2P) platforms have emerged as hybrid commercial spaces where entertainment, identity construction, and retail dynamics converge (Statista, 2024; Welden et al., 2025). This study investigates how the traditional retail mix can be extended into F2P ecosystems through the introduction of the Virtual Retail Mix model. Drawing on semi structured interviews with expert gamers and immersive netnography (Kozinets, 2022), the research explores how the six levers of the retail mix (Levy & Grewal, 2023; Blut et al., 2018) - product, price, place, promotion, people, and presentation - are reinterpreted in virtual game environments. Findings show that symbolic product assortments and scarcity tactics, gamified pricing models, experiential and diegetic distribution, community-driven promotion, and synesthetic presentation design shape value creation and consumer engagement within F2P contexts. The Virtual Retail Mix highlights how transactional and experiential logics are blended, redefining the consumer role from buyer to player and co-creator. This model contributes to retail theory by framing immersive consumption as a strategic interface between commerce and play, while offering practical guidance for developers and brands in designing sustainable monetization strategies. Limitations include the exclusive focus on consumer perspectives, suggesting future research should integrate managerial insights. Overall, the study advances understanding of digital-native retail strategies and the convergence of retail and gaming.

# Memorable for the wrong reasons: a text mining analysis of negative memorable guest experiences in the hospitality sector

Mara Normando[1],*, David D'Acunto[2], Giampaolo Viglia[3]

## Abstract

While the Memorable Tourism Experience paradigm has traditionally emphasized positive episodes, this study introduces the concept of Negative Memorable Guest Experience (NMGE) to address a critical gap in tourism literature. Through text mining analysis of 1.2 million Booking.com reviews from Mediterranean destinations using LIWC-22 and Leximancer, we compare NMGE with ordinary negative reviews to identify distinctive characteristics. NMGE reviews are substantially longer (119 vs. 38 words) and demonstrate significantly higher analytical thinking, authenticity, and authoritative tone. They show lower ratings and garner more helpful votes, confirming greater influence on booking decisions. Emotional analysis reveals predominant sadness, suggesting deeper emotional wounds manifesting as reflective disappointment. Thematic analysis identifies room conditions and hotel operations as dominant concerns, followed by staff rudeness and cleanliness failures as primary memorability drivers. These service failures violate core hospitality expectations, triggering intense cognitive-emotional processing consistent with negativity bias theory. The study extends the MTE paradigm beyond its positive focus, demonstrating that memorable negative experiences undergo distinctive narrative processing characterized by analytical depth and emotional complexity. For practitioners, findings underscore that preventing memorable negative experiences requires prioritizing fundamental service quality over luxury amenities.

*Keywords: memorable tourism experience, negative memorable guest experience, text mining, hospitality management, Mediterranean tourism*

## 1.Motivation and Theoretical Background

The Memorable Tourism Experience paradigm has become central to tourism research, emphasizing how emotions shape memory formation and tourist behaviors (Tung & Ritchie, 2011). However, this framework exhibits systematic bias toward positive experiences, with measurement scales focused exclusively on pleasurable dimensions (Kim et al., 2012). This orientation overlooks the powerful role of negative experiences, despite cognitive psychology evidence that negative events achieve greater memorability through emotional intensity, a phenomenon known as negativity bias (Baumeister et al., 2001; Kensinger, 2007). Industry data reveals 94% of consumers avoid businesses after reading negative reviews, underscoring the disproportionate impact of negative experiences. While recent work explores

negative experiences in peer-to-peer hospitality (Sthapit & Björk, 2022), mechanisms through which negative experiences achieve memorability in traditional hospitality remain underexplored. This study introduces Negative Memorable Guest Experience (NMGE), examining how service failures transform into lasting memories shared through digital platforms.

## 2. Methodological Approach

We analyzed 1.2 million English-language Booking.com reviews across Barcelona, Venice, Verona, and Salerno, addressing the geographical bias in MTE research dominated by Asian and North American contexts (Hosseini et al., 2023). Following established protocols (Han & Anderson, 2021), negative experiences were operationalized through reviews rating ≤5 on a ten-point scale. The NMGE subset was identified using keywords from MTE literature (Hosany et al., 2022; Sthapit, 2018), yielding 142 NMGE reviews matched with a same size subset of ordinary negative reviews. Analysis employed LIWC-22 (Boyd et al., 2022) examining analytical thinking, clout, authenticity, and emotional tone, plus specific emotion categories. Leximancer facilitated thematic analysis through co-occurrence mapping. ANOVA procedures tested for significant differences between review types.

## 3. Main Results

NMGE reviews demonstrated significantly higher analytical thinking, clout, and authenticity scores (all $p<.001$), indicating structured, confident narratives. Most strikingly, they result three times longer (119 vs. 38 words) than ordinary ones. While overall negative language showed no difference, sadness-related language appeared more prominently in NMGE reviews (0.40 vs. 0.17; $p=.025$), suggesting reflective disappointment rather than anger or anxiety. NMGE reviews received lower ratings (3.04 vs. 3.70; $p<.001$) but more helpful votes (0.75 vs. 0.27; $p=.003$), indicating greater perceived value by platform members. Thematic analysis identified seven themes: room conditions (254 occurrences) and hotel operations (253) dominated, followed by staff rudeness (65), explicit memory references, location issues, cleanliness failures, and monetary disputes. Theme interconnection suggests memorable negative experiences involve multiple cascading failures rather than isolated incidents.

## 4. Discussion and Implications

These findings extend negativity bias theory (Baumeister et al., 2001) to digital tourism, demonstrating that memorable negative experiences undergo distinctive narrative processing. The prevalence of sadness over anger and anxiety reveals nuanced emotional landscapes consistent with emotional memory research (Kensinger & Schacter, 2006). Theoretically, the study advances MTE beyond its positive bias, revealing negative experiences achieve memorability through distinct psychological pathways. The dominance of tangible service failures and staff behavior confirm these breakdowns violate hospitality expectations profoundly, triggering intense cognitive-emotional processing (Davidow, 2003). Practically, NMGE reviews' greater length, analytical depth, their authentic and authoritative style and perceived helpfulness indicate a strong influence on booking decisions. Identification of specific failure points enables targeted prevention strategies. Investments in fundamental service quality, clean rooms, professional staff, may yield greater returns than luxury amenities in preventing damaging word-of-mouth.

As hospitality operates increasingly within digital ecosystems where experiences become public narratives, understanding and preventing NMGE formation becomes essential for maintaining competitiveness in contemporary tourism markets.

# 'Don't Take That Photo Yet': How Instagram Reels Turn Urban Spots into Tourist Stages

André Luiz Vieira Soares[1],*, Mara Normando[2]

[1] Università Cattolica del Sacro Cuore, Milan, Italy
[2] University of Salerno, Italy

* Corresponding author: andreluiz.vieirasoares@unicatt.it

*Keywords: Instagram Reels, Tourism, Symbolic Appropriation, Digital Micromobilities*

**Introduction.** Social media have changed how people choose and experience tourism. Instagram, particularly through Reels, rapidly circulates visual content that turns ordinary places into sought-after destinations (Sharma & Arora, 2024). This popularization alters dynamics, generating tensions between residents and tourists and raising debates on belonging and the limits of public use (Cohen & Cohen, 2019). Despite studies on tourism and social media (Gretzel et al., 2015; Xiang & Gretzel, 2010), there is still a gap in understanding how viral short videos transform urban territories. This study asks: how do Reels, by promoting ordinary locations as "hidden," trigger symbolic and practical transformations in perception and appropriation of these spaces? **Brief Literature Review.** Social media reshape the tourism industry, influencing selection, planning, and experience (Xiang & Gretzel, 2010). Urban space is a social product shaped through cultural practices and power relations (Gottdiener et al., 2019). Urry's tourist gaze (2002) helps explain how images mediate experience, now amplified by influencers and virality (Nixon, 2022). Influencer-generated content builds idealized images that create expectation–experience gaps and lead to discomfort (Huang et al., 2025; Pan et al., 2014; Arefieva et al., 2021; Egger et al., 2022). Soares (2025) identified this contrast across different Reel categories. **Methodology.** Netnography (Kozinets, 2020) was used to analyze Reels describing hidden spots around the Colosseum. The sample included 169 videos from accounts with more than 10,000 followers and high engagement (Campbell & Farrell, 2020) and over 5,000 comments. Data collection took place in July 2024 and was complemented by in loco observation in January 2025 at the two most featured locations. An immersive journal with 89 entries and photographs supported interpretation of digital representation versus spatial reality. **Results.** Secret narratives frame ordinary space as exclusive and desirable, but comments reveal resistance and contestation, showing the fragility of symbolic capital in the digital age. Reels transform space into a stage for tourist performance, visible in the offer of professional photography services and accounts of its use as a recurring photo set. Viralization generates overcrowding, obstructions, and tension between tourists and residents, fragmenting urban territory into micro microterritories. Comments also reveal insecurity, theft, environmental degradation, and inappropriate behavior, exposing social complexity. Photographers and tour guides act as agents of symbolic commodification, professionalizing the experience. Emotional ambivalence emerges, with users oscillating between gratitude and fear of overexposure, attempting to control virality by asking to delete videos. **Conclusion.** Instagram Reels act as cultural agents transforming spaces into performative microterritories and exposing tensions between discovery and saturation. Viralization reconfigures the visual and emotional geography of space, pressuring everyday uses (Urry, 2002; Gottdiener et al., 2019; Gretzel et al., 2015). Netnography revealed hidden social layers such as insecurity, damage, and conflict. The study highlights ethical challenges for content creators and urban managers and calls for future research on emotional governance, influencer roles, and strategies to mitigate viral tourism impacts.

# Beyond luxury: A dual perspective on exclusive tourism experiences

Vania Vigolo[1],*, Ilenia Confente[1], Angelo Bonfanti[1]

[1] University of Verona, Italy

* Corresponding author: vania.vigolo@univr.it

## Abstract

While "luxury tourism" has traditionally been associated with opulence, premium quality, and high price, recent studies indicate that its meaning is evolving (Iloranta, 2022; Japutra et al., 2022). As upscale amenities and services become more widely accessible, exclusivity is emerging as a key differentiator in the high-end travel sector (Lopes et al., 2023). Rather than being defined solely by lavish material comforts, luxury is increasingly conceptualized as the ability to access experiences that are difficult to replicate, meaningful, authentic (Hanks et al., 2024), and personally memorable (Kim et al., 2024). In the luxury services literature, exclusivity has been identified as a multifaceted construct—including monetary, social, and hedonic dimensions—that fundamentally shapes consumers' perceptions of luxury. In tourism, exclusivity often manifests through limited-access destinations, personalized itineraries, and one-of-a-kind activities unavailable to the "ordinary" traveler. Understanding how such exclusive experiences are designed and perceived is important for both theory and practice, as it reflects travelers' evolving expectations and offers insight into the future of luxury travel marketing

This paper focuses on the co-creation of exclusive tourism experiences within cultural destinations and specifically aims: 1) to identify the strategies and the enablers that tourism providers design in order to create exclusive experiences, and 2) to uncover the dimensions that tourists perceive as the most important in shaping exclusive experiences.

The study employs a qualitative research design. To address the first aim, in-depth face-to-face interviews were conducted with high-end tourism providers in a major Italian tourism destination (Verona). For the second aim, micro-narratives with international tourists were collected through an online panel (Ho et al., 2023). The data were analyzed through reflexive thematic analysis (Braun and Clarke, 2019).

The findings show that tourism providers adopt a variety of strategies to foster exclusivity, including tailoring experiences to tourists' needs, emphasizing uniqueness and authenticity, and creating opportunities for rich emotional engagement.

In addition, based on tourists' micro-narratives, some dimensions emerge as central to the exclusive tourism experience, including a sense of privilege, personal meaning, authentic connection, and emotional engagement.

The findings support the idea that exclusivity in tourism is achieved not simply by opulence or price, but by crafting moments that cannot be easily replicated. In addition, co-creation emerges as a key aspect of exclusive tourism experiences for both suppliers and tourists. The study contributes to tourism research by providing a dual perspective on exclusive experiences, offering a deeper understanding of exclusivity as a multifaceted construct that is co-created. These insights extend the luxury tourism literature and provide practical guidance for designing and managing exclusive experiences.

Proceedings XXII SIM Conference 2025 – The Marketing–Innovation Nexus: Past Insights for Future Challenges.
Società Italiana Marketing. ISBN 978-88-947829-3-6

The fact that the research was conducted in a single destination and with a specific sample profile may limit the generalizability of the findings. Future studies could expand the research context to other cultural destinations and adopt quantitative designs to test the relationships between perceived exclusivity of the experience and tourist satisfaction and loyalty to the provider or the destination.

*Key words: luxury tourism, exclusive experiences, co-creation, service providers, tourists, cultural destination*

## Smart Devices and the Amateur Cycling Experience: An Assemblage Theory Perspective

Daniele Dalli[1],*, Virginia Vannucci[1]

[1] University of Pisa, Italy

* Corresponding author: daniele.dalli@unipi.it

## Abstract

This study examines how smart devices are transforming amateur cycling by integrating physical and digital experiences. Using assemblage theory and object-oriented ontology, it conceptualizes cycling as a socio-technical assemblage. Through secondary data analysis, it explores how smart objects influence agency, practices, and subjectivities in contemporary cycling.

*Keywords: Amateur cycling, smart objects, assemblage theory, object-oriented ontology, self-tracking, digital sport*

### 1.Introduction

Amateur cycling has entered a "smart" era, where affordable devices and apps enable everyday cyclists to train and track performance like professionals (Crul, 2019). Cyclists now commonly use GPS bike computers, heart-rate sensors, and social fitness platforms like Strava and Zwift. This shift raises questions about how human and technological elements interact. While traditional sports science focuses on performance gains, there is a need to explore how technologies shape cycling practices, identities, motivations, and communities. This study applies assemblage theory and object-oriented ontology (OOO) to view amateur cycling as a socio-technical network. Our goal is to understand how cyclists and smart devices interact and how digital technologies impact amateur sport.

### 2. Theoretical Background

This research builds on assemblage theory and object-oriented ontology (OOO). Assemblage theory (Novak & Hofmann, 2019; DeLanda, 2016) posits that social phenomena arise from the interaction of diverse elements. Amateur cycling is viewed as an assemblage composed of human riders, bicycles, smart devices, roads, data platforms, and cultural norms. Each component retains autonomy, but their interactions shape cycling practices. For instance, a rider with a power meter and a training app forms an assemblage where body, machine, and data continuously influence performance (Barrie, Waitt, & Brennan-Horley, 2019). Key concepts include machinic assemblages (material components like bikes and sensors) and collective assemblages (expressive elements like sharing ride data). Assemblage theory also explores territorialization (stabilizing routines) and deterritorialization (disrupting routines). Smart

devices can shift a rider's focus from subjective feelings to objective metrics, creating new routines like the norm "if it's not on Strava, it didn't happen."

Object-oriented ontology (OOO) complements this by emphasizing the agency of objects. OOO argues that objects, such as bikes or apps, have their own existence and affect outcomes independently of human intentions (Harman, 2018). This view acknowledges that smart devices are active participants in cycling, shaping the experience. For instance, a GPS device can alter a rider's route or rankings, while training algorithms guide decisions. OOO reveals how non-human actors like sensors and algorithms influence cycling practices, contributing to a more-than-human understanding of amateur sports.

## 3. Methodology

This qualitative study uses secondary data, including academic literature, industry reports, forum discussions, and social media content. We aim to understand the socio-technical configurations of amateur cycling by analyzing how elements like devices, services, behaviors, and environments interact. The analysis follows three steps: identifying components of the assemblage, examining interactions, and interpreting the dynamics of how configurations emerge or shift.

## 4. Expected Results

We expect smart devices to alter the cycling experience by expanding the temporal and relational dimensions of the practice. These devices enable ongoing engagement through planning, data review, and gamification, transforming cycling into a digital activity. They also shape identities and hierarchies, as data-driven self-representations become central to how cyclists perceive themselves.

## 5. Conclusions

This study frames amateur cycling as a socio-technical assemblage, emphasizing that smart devices are active elements in shaping practices and relationships. The findings suggest further research is needed on how cyclists navigate the presence and authority of smart objects, which can inform both academic discussions and the design of future technologies.

### Abstract

Gamification is increasingly embedded in digital retail strategies, yet its effects on actual customer behavior and firm performance remain ambiguous. Existing research has focused primarily on engagement and attitudinal responses, leaving limited evidence on behavioral and financial outcomes. This study investigates how distinct gamified actions, such as subscribing to newsletters, adding products to wish lists, writing product reviews, and engaging with social media, shape consumer purchasing patterns and revenue. Using a two-year dataset from a major European e-tailer and addressing selection bias with robust matching techniques, the analysis reveals that gamification is not uniformly beneficial. Some actions, such as newsletters and reviews, accelerate the pace of repurchase without substantially increasing spending. Wish list additions, counterintuitively, are linked to lower purchase frequency and spending. In contrast, socially oriented actions like liking and sharing content are associated with both more frequent purchases and higher revenues. These findings highlight the need for retailers to design gamification strategies with strategic precision. Theoretically, the study contributes by moving beyond attitudinal outcomes to show how gamified actions differentially affect behavior and revenues, and by differentiating between personal and social forms of gamification. For practice, it provides guidance on how to prioritize gamification features that foster transactional momentum and social connection while avoiding mechanisms that encourage purchase deferral. Overall, this research bridges the gap between gamification theory and retail practice, offering a nuanced understanding of when and how gamification creates value for both customers and firms.

*Keywords: Gamification, Digital Retail, Customer Behavior, Revenue, Social Engagement, E-tailing*

The paper examines whether and how gamification in digital retail affects consumer behavior and revenues. It aims to clarify the heterogeneous impact of different gamified actions, addressing a key gap in literature that has often overlooked financial outcomes.

**Methodology.** We analyze a two-year dataset from a large European e-tailer that implemented a comprehensive gamification program. Actions include newsletter subscriptions, wish list additions, product reviews, and social media engagement. Propensity score matching is used to control for self-selection, ensuring robust comparisons between participants and non-participants in gamification.

**Findings.** Results demonstrate that gamification effects are action-specific rather than universal. Actions tied to personal engagement (e.g., newsletter subscriptions, product reviews) shorten repurchase cycles

but have limited effect on spending. Actions tied to deferred consumption (e.g., wish lists) reduce both purchase frequency and expenditure. Socially oriented actions (e.g., liking, sharing) drive both more frequent purchases and greater revenues, underlining the value of social connection in gamified retail environments.

**Research Limitations and Implications.** The study focuses on a single European retailer, which may limit generalizability. Future research should examine other industries, cultural contexts, and longitudinal effects of gamification. Conceptually, the findings suggest that distinguishing between personal and social gamification is critical for advancing theory.

**Practical Implications.** For managers, the study highlights that not all gamified actions are equal in value creation. Socially engaging activities should be prioritized to boost revenues, while wish list mechanics may require redesigning to avoid discouraging purchases. Gamification should be applied with strategic precision, emphasizing mechanisms that reinforce purchase momentum and community engagement.

**Originality and Value.** This paper provides rare field evidence on the financial impact of gamification in digital retail. By linking gamified actions to behavioral and revenue outcomes, it advances academic understanding and offers actionable insights for practitioners, thereby bridging the gap between theory and practice.

# The Impact of Privacy Communication Formats on Data Disclosure and AI App Adoption

Giacomo Gistri[1],*, Daniele Scarpi[2], Niccolò Testi[1]

[1] University of Macerata, Italy
[2] University of Bologna, Italy

* Corresponding author: giacomo.gistri@unimc.it

## Abstract

This study investigates how the format of privacy communications (text, infographic, audio) affects users' willingness to provide personal information (WPPI) and intention to use an AI-based app (ITU). Drawing on Construal Level Theory, we propose that communication formats shape psychological distance and construal levels, thereby influencing data disclosure and adoption behaviour. A 3 (privacy communication format: text vs. infographic vs. audio) × 1 between subjects experiment was conducted with 396 participants and a hypothetical AI powered sport app as a scenario.

Findings show that audio messages significantly reduced WPPI compared to text, whereas infographics had no effect. The effect of communication format on ITU is mediated by willingness to share personal data. Further, subjective privacy literacy (SPL) moderated the relationship between the format and the WPPI: individuals with higher SPL were less negatively affected by audio compared to text, indicating that privacy literacy buffers against defensive reactions to certain formats. In contrast, privacy concerns did not moderate the relationship between format and WPPI.

These results demonstrate that message design shapes disclosure behaviour and indirectly affects app adoption. Rather than assuming formats are interchangeable, firms should recognize that audio messages may heighten perceived risks, particularly among less privacy-literate users, thereby reducing willingness to share data and, indirectly, adoption of AI apps.

# How GenAI-Enhanced Content Shapes Engagement on Social Media

Selahattin Onur Karlık[1],*, Matteo De Angelis[1], Rumen Pozharliev[1]

[1] LUISS Guido Carli University, Rome, Italy

* Corresponding author: sokarlik@luiss.it

## Abstract

Recent advancements in Generative Artificial Intelligence tools have not just transformed but revolutionized content creation and consumption patterns. Marketers are increasingly integrating AI technology due to its potential to create effective marketing content at a fraction of the cost and significantly increase efficiency in marketing campaigns (Ashbridge, 2024; Gibson, 2024). According to a recently published report, 55% of marketers use AI for text-based content creation, but only 7% of them do not edit AI outputs (HubSpot, 2025). People still work on AI outputs to make them better. Therefore, it is important to note that AI tools do not replace humans; instead, they enhance them through collaboration (Raisch & Krakowski, 2021). We define content created through human–AI collaboration in the content creation process, which is the primary focus of this study, as "GenAI-enhanced Content" (GEC).

While previous studies have generally compared content generated entirely by GenAI or by humans (Castelo et al., 2019; Hartmann et al., 2025), there is limited understanding of how consumers respond to content generated by human–AI collaboration, which is GenAI-enhanced content. Answering this question is important because faster content generation with GenAI may lead to the perception that content creators are spending less effort. Previous research has shown that the amount of effort spent is related to perceptions of morality (Amos et al., 2019; Bigman & Tamir, 2016). Therefore, the perception that content enhanced by GenAI requires less effort may lead to influencers being viewed as less moral, particularly in areas such as influencer marketing, where success is tied to the creator's reputation (Cocker et al., 2021), and this can negatively impact important marketing outcomes such as social media engagement.

In this context, research examines the effect of GEC on social media engagement (eWOM and follow intention) through four experimental studies. Specifically, we propose that the perception that GEC requires less effort leads to a more negative moral evaluation of the influencer, which in turn reduces social media engagement. Additionally, we investigate how consumers' individual differences influence the positive relationship between an influencer being perceived as more moral and their posts achieving higher engagement rates. In this context, we test whether individuals' "capacity for trust"—the tendency to forgive others and see the good in people (Soto et al., 2022)—functions as a moderator.

Study 1 (n = 200) revealed that participants in the GEC condition reported less eWOM (M = 2.02, SD = 1.28) than those in the human-generated condition (M = 2.64, SD = 1.54) and less follow intention (M = 1.69, SD = 1.11) than those in the human-generated condition (M = 2.29, SD = 1.52). Study 2 (n = 210) revealed that participants in the GEC condition reported less perceived morality (b = –1.39, SE = 0.19, t = –7.22, p < .001), with perceived morality increasing eWOM (b = 0.79, SE = 0.05, t = 13.41, p < .001) and follow intentions (b = 0.68, SE = 0.06, t = 10.60, p < .001). Study 3 (n = 200) revealed

Proceedings XXII SIM Conference 2025 – The Marketing–Innovation Nexus: Past Insights for Future Challenges.
Società Italiana Marketing. ISBN 978-88-947829-3-6

that the negative effect of GEC is sequentially driven by perceived effort and morality on both eWOM (b = –0.78, 95% CI [–1.08, –0.52]) and follow intentions (b = –0.56, 95% CI [–0.81, –0.33]). Study 4 (n = 280) revealed a significant moderated mediation on both eWOM (b = 0.22, SE = 0.06, t = 3.61, p < 0.001) and follow intentions (b = 0.35, SE = 0.06, t = 5.10, p < 0.001). We also found a significant interaction effect between perceived morality and capacity for trust on eWOM (b = 0.22, SE = 0.06, t = 3.61, p < 0.001) and follow intentions (b = 0.35, SE = 0.06, t = 5.10, p < 0.001).

The results show that consumers interpret the effort spent in content creation as a moral signal and that the use of GenAI weakens this perception.**References**

## Abstract

Consumers have the possibility to multitask in chat-based service interactions, therefore, providing time-related information may be crucial for improving their experience. Study 1 analyzes over 100.000 chat messages exchanged between agents and customers of a telecom provider, showing that frontline agents using direct time adverbs (e.g., next, soon) achieve higher customer satisfaction. Exploratory evidence suggests this effect may be driven by perceived caring. This work contributes to service research by studying the overlooked dimension of time communication and shows how subtle variations in speech parts can positively influence customer satisfaction. Practically, it suggests that embedding time cues in frontline communication can boost customer satisfaction by potentially enhancing perceptions of caring.

*Keywords: time adverbs, customer satisfaction, digital interactions, customer service, perceived caring.*

Live chat has become one of the preferred customer service channels, with many consumers favoring it over traditional ones (Leggett, 2016; Leshchenko, 2018). Yet, a high number of customers is not confident to get the best online service resolution in a reasonable amount of time (Baun, 2023); this may be partly due to the widespread use of canned responses (Digital Minds BPO, 2025). However, waiting in a live chat context is not inherently negative and may matter less than the quality of the response itself (Patterson, 2022). Indeed, consumers usually multitask while using live chat (Freshworks, 2024). Thus, they seek reassurance regarding both timing and resolution, aiming to optimize their experience and make the most of their time (Thompson, 2022).

Prior literature has explored the role of time in offline and online service settings, above all in terms of waiting times, that are typically associated with lower satisfaction (e.g., Tom and Lucey, 1997; Masuch et al., 2024). However, the temporal dynamics of online chat remain underexplored, despite its distinct nature as a text-based channel. Although speed has been shown to matter in service failure recovery (e.g., Tang et al., 2018; Harun et al., 2018), little attention has been paid to how time communication shapes customer experience and evaluation in online interactions. Language plays a central role in shaping customer perceptions and behaviors in digital settings (Villarroel et al., 2014; Packard et al., 2018). Notably, existing literature in this domain has neglected the role of adverbs. They represent a particularly powerful part of speech, as they modify verbs, adjectives, or other adverbs, answering various questions such as "when?" (Kronrod, 2022; Purnell, 2022). Unlike other time-related words, time adverbs do not refer to objects or entities but instead modify the action itself, offering additional information about it (Vlach, 1993; Betti, 2022). Within this category, direct time adverbs – those answering to the question "when?" – provide crucial timing information (Richards, 1982). This makes them potentially relevant in online service interactions, considering that live chat users often multitask (Caruelle et al., 2023) and look for cues to manage their time efficiently to fully leverage this capability (Thompson, 2022). Therefore, signaling an awareness of the customer's time investment – through small

but intentional cues – may be a way to positively influence the customer experience. Based on this, we hypothesize that:

H1: Greater use of direct time adverbs by frontlines in chat-based interactions increases customer satisfaction.

Communicating time enhances clarity and transparency, showing respect and care (Roet-Green, 2023). This aligns with research suggesting that care can be communicated through body language or effective communication (Kumah, 2019). Building on this, providing time-related information may activate the mechanism of perceived caring, which reflects an individual's perception of being seen and heard (Roos et al., 2023). This is very relevant, since previous studies in healthcare have revealed that nurse caring behaviors are associated with higher patient satisfaction scores and service quality evaluations (King et al., 2019; Labrague et al., 2020). Considering this, we suggest that:

H2: The positive effect of using direct time adverbs on customer satisfaction is mediated by frontline's perceived caring.

To test these hypotheses, we analyzed 100.438 individual messages exchanged between customers and agents from a North-European telecommunication company. Satisfaction was estimated using the Net Promotor Score. Direct time adverbs were measured through a self-made dictionary resulting in a list of 40 words (e.g., "later", "now"). We also included a set of control variables in our regression model, to account for unobserved heterogeneity. As predicted, we find a significant and positive effect of direct time adverbs on NPS ($\beta = .235$, $SE = .045$, $t = 5.25$, $p < .001$), even after accounting for control variables and various robustness checks. Given H2, we tried to preliminarily explore this mediation through moderation in our dataset. The idea is that if the positive effect of time adverbs on NPS is driven by a sense of being cared for, then when caring is explicitly conveyed through another means – such as caring language – the main effect of time adverbs should be mitigated. To gauge the degree of caring signaled by frontlines' messages, we developed a dictionary of 50 caring words (e.g., "care", "help"). Consistent with our prediction, the direct time adverbs*caring interaction is significant and negative ($\beta = -.184$, $SE = .038$, $t = -4.91$, $p < .001$), even after accounting for control variables and after robustness checks.

This research demonstrates that frontline messages containing direct time adverbs are associated with higher customer satisfaction, as measured by NPS in our dataset. Ancillary analyses provide preliminary support for the proposed underlying mechanism of perceived caring. In future studies, we plan to establish the causal effect of direct time adverbs through controlled experiments and to formally test the mediating role of perceived caring. These findings highlight how subtle linguistic cues in frontline communication can meaningfully influence customer perceptions and behaviors.

### Abstract

Mass media plays an increasingly influential role in shaping consumer perceptions of service providers. This research investigates how televised portrayals, specifically those from popular Italian competition shows 4 Ristoranti and 4 Hotel, affect consumer sentiment toward service providers. While these shows aim to celebrate local identity and culinary authenticity, the resulting exposure can have unintended consequences. Drawing on the Dunning-Kruger effect, we propose that such shows may inadvertently inflate viewers' confidence in their own ability to judge service quality. Using a Difference-in Differences (DiD) design and over one million Tripadvisor reviews, we estimate the causal impact of appearing on these shows on consumer sentiment. Results show that media exposure often leads to a decline in sentiment, suggesting a backlash driven by overconfidence and heightened expectations. These findings offer a more nuanced perspective on media visibility, emphasizing that while it brings attention, it also invites intensified scrutiny. For small and family-run service providers, this can result in a reputational paradox: celebrated on screen yet criticized in practice. The study contributes to research on consumer behavior, media effects, and hospitality marketing, while shedding light on the psychological mechanisms that shape consumer evaluations following media exposure.

## Abstract

Customer experience (CX) has emerged as a critical source of competitive advantage in contemporary service markets (Gahler et al., 2023). While extensively examined in B2C contexts, it remains underexplored in B2B settings, where CX management is more complex due to the involvement of multiple actors, extended decision-making processes, and relational as well as organizational dynamics (De Keyser et al., 2025). The unique characteristics of business-to-business (B2B) service environments demand distinct theoretical and managerial approaches (Zolkiewski et al., 2017; Witell et al., 2020). Despite growing practitioner interest, academic understanding of how B2B service firms can strategically leverage CX remains fragmented and underdeveloped.

This study aims to explore how B2B service firms can strategically manage CX to create value across heterogeneous market segments. Drawing on service-dominant logic (Vargo and Lusch, 2016) and adopting Wirtz et al.'s (2025) CX management archetypes framework, we conduct an in-depth case study of Your Kitchen Group (YKG), a B2B food service provider operating across luxury hospitality and industrial catering segments.

We adopt an interpretive case study methodology to examine CXM in YKG (Stake, 1995). We examine the provider's and customers' viewpoints through in-depth interviews, and we anticipate the findings will reveal critical gaps between intended and perceived CX value propositions, suggesting that strategic effectiveness depends on CX management maturity and contextual alignment with segment-specific customer goals.

We expect our findings to contribute to service management theory by: (1) empirically validating the contingent nature of CX management strategies in B2B contexts, (2) revealing the co-created nature of CX value through provider-customer alignment analysis, and (3) demonstrating how service firms must orchestrate different CX management approaches within their portfolio to achieve competitive advantage. These insights advance understanding of strategic service management in complex B2B environments.

While this study's single-case design enables deep analysis, it inherently limits the generalizability of the findings. Future research needs to explore how the findings from the specific context of food service in Namibia can be transferable to other B2B service contexts. Additionally, quantitative testing of the alignment-performance relationship could provide generalizable insights about the financial impact of strategic CX management.

### Abstract

Consumer neuroscience has attracted growing interest in recent years. Nevertheless, its integration into marketing practice remains limited, primarily due to the low scalability of neuroimaging techniques. A recent shift in the literature moves attention from the brain to the body, highlighting the potential of scalable tools, such as webcam-based eye-trackers and wearable physiological sensors, as cost-effective, non-invasive, and ecologically valid alternatives for collecting consumer data in real-world settings. Their increasing adoption in everyday life further enhances consumer engagement and enables real-time behavioral and physiological data collection.
This paper provides an overview of the most promising tools, evaluating their suitability and ease of integration into marketing research and practice. Drawing on concrete examples, we illustrate how these tools can inform marketing decisions through an adaptation of the 4Ps framework (product, promotion, place, and price). We also discuss key barriers to adoption and propose actionable solutions for their integration into existing workflows. Finally, we identify high-potential application domains, particularly in healthcare and public services.

*Keywords: Consumer Neuroscience; Scalable Neuromarketing Tools; Wearable Technologies; Consumer Behaviour*

### 1.Introduction

Consumer neuroscience is a recent field in consumer behaviour research (Smidts et al. 2014). It has the objective of identifying the neural and physiological correlates of consumers' decision-making, and eventually predict their purchase behaviour ("neuroforcasting"): e.g., purchase intentions, willingness to pay, memory recall, emotional engagement, etc. (Hubert and Kenning 2008; Genevsky, Yoon, and

Knutson 2017). The novelty of consumer neuroscience in the marketing field consists in the ability to gather information otherwise undetectable with traditional marketing tools, e.g., subconscious processes underpinning consumers' decision-making (Bazzani et al. 2020). Consumer neuroscience experiments are usually carried out applying sophisticated neuroscientific techniques exploring brain activity, such as electroencephalography (EEG) and functional magnetic resonance imaging (fMRI) (Plassman, Ramsøy, and Milosavljevic 2012).
Despite the promising potential real-world applications of consumer neuroscience, the introduction of this methodology into marketing practice is still scarce.

We have traced three main barriers to the adoption of consumer neuroscience in marketing activities:

(i) The expensiveness and invasiveness of some of the techniques used (e.g., fMRI) (Kenning and Linzmajer 2011).

(ii) The long times required to conduct experiments of this kind (e.g., Alvino et al. 2020), hardly compatible with companies' roadmaps.

(iii) The lack of standardized experimental protocols, which makes the setup of experiments challenging for newcomers. Moreover, consumer neuroscience experiments typically take place in a laboratory setting, so that the corresponding findings are not always generalizable to real-word business scenarios (Kasai et al. 2015; Pozharliev, Verbeke, and Bagozzi 2017).

In the present paper, we review the literature to identify the tools that can be more feasibly integrated into marketing practice. To this end, we examine technologies derived both from neuroimaging and human physiology research, following a growing trend that shifts the focus from the brain to the body as a valuable source of data for understanding consumer behavior. For example, Chlitero et al. (2024) highlight the potential of using wearable technologies to track consumer's physiological signals – such as heart rate, skin conductance, and facial affective responses – to obtain dynamic insights into consumer experiences across both physical and digital environments.
We use the term neurophysiological tools broadly referring to instruments that measure either central nervous system activity (e.g., EEG) or autonomic physiological signals (e.g., heart rate variability, electrodermal activity) that reflect emotional and cognitive states. When referring specifically to peripheral signals we use the term physiological tools.
We discuss the most promising tools in terms of their suitability and scalability, which can help overcome current barriers to adoption, including costs, complexity of experimental protocols, and limited ecological validity.
We identify as scalable those tools that are (i) cost-effective, (ii) non-invasive, (iii) easily deployable across users and environments, and (iv) compatible with data collection in ecological (real-world) settings.
Our aim is to outline a series of methodological approaches that offer greater applicability for marketing professionals while maintaining scientific rigor. We adopt the perspective that a broader adoption of consumer neuroscience tools in business contexts may, in turn, enable marketing researchers to expand their theoretical and empirical research agendas.

## 2. Literature Review

### 2.1 Promising Neurophysiological Tools for Marketing Research

Recent technological advancements in neurophysiology, a branch of neuroscience, have made it easier to use scalable techniques for collecting physiological parameters. For example, wearable eye-trackers (Ye et al. 2012), wrist actigraphs (Martin and Hakim 2011), and smart sensors (Kim et al. 2019) are now more accessible. Given their versatility, these devices offer a promising solution for collecting consumer physiological data on a large scale.

Among the many scalable technologies available for acquiring neurophysiological and physiological data, eye-tracking and wearable sensors stand out due to their ease of use (Oyama et al. 2019), low costs (Alvino et al. 2020), and wide range of applications (dos Santos et al. 2015). While eye-tracking is already well-known in marketing (Wedel and Pieters 2008), wearable devices are also seeing increased use (e.g., Ragot et al. 2017).

Eye-tracking – Eye-tracking is a technique that measures eye movements and gaze locations over time in response to various stimuli or tasks (Carter and Luke 2020). Eye-trackers vary in shape and sampling frequency, making them suitable for diverse applications, from neuropsychiatry to social psychology and marketing (Papagiannopoulou et al. 2014; Rahal and Fiedler 2019). The use of eye-tracking in marketing dates back to the early 2000s (Schall and Bergstrom 2014). Eye-tracking can provide insights into consumers' gaze behavior, the number of blinks, and, under controlled conditions, even pupillary behavior (dos Santos et al. 2015; Popa et al. 2015; Lemarcier et al. 2014).

Researchers typically identify two main "gaze events": fixations and saccades. A fixation is defined as maintaining gaze on a single point, while a saccade is the eye's movement from one gaze point to another (Salvucci and Goldberg 2000).

Several gaze metrics can be calculated based on fixations, including: the number of fixations; (ii) the duration of fixation; (iii) the time to the first fixation; (iv) the path (distance) scanned by the eye (Manippa et al. 2017; Bradley, Moulder, and Lang 2005; Casado-Aranda and Sanchez-Fernandez 2022).

These metrics can be computed for the entire visual stimulus or for a specific Area of Interest (AOI) defined by the experimenter. When using portable eye-tracking devices like glasses, visual targets can change, especially in field experiments (e.g., in a supermarket). In such cases, visual targets might include actual products on a shelf or printed advertisements (Rayner et al. 2001; Bialkova, Grunert, and van Trijp 2020). five main topics, including decision-making, well-being, and consumer attitudes towards wearables. Data collected through wearable technologies can serve as a valuable source of information for marketers (Kalantari 2017).

While few experimental studies in marketing research have specifically assessed consumer reactions to marketing stimuli based on physiological data from wearables, there are notable examples. For instance, Kakaria et al. (2022) provide an overview of heart rate variability in marketing research. Similarly, sleep deprivation and circadian rhythms have been studied in relation to purchase behavior (Venkatraman et al. 2007; Li et al. 2020). Therefore, sleep parameters obtainable with wearable devices, such as wrist actigraphs (Marino et al. 2013; De Zambotti et al. 2019), could be of significant interest to marketers.

Combining Techniques – Consumer neuroscience researchers often recommend combining different techniques to obtain richer data on consumer behavior (e.g., Lin, Cross, and Jones, 2018). A particularly effective combination is eye-tracking with EEG, which has been increasingly adopted to capture both visual attention and neural correlates of preference and decision-making (Khushaba et al., 2013; Bazzani et al., 2020; Alvino, Herrando, and Constantinides, 2024). Portable versions of eye-trackers and EEG headsets make these techniques particularly suitable for out-of-lab studies and increasing their applicability in real-world marketing contexts (Meißner et al., 2019; Roberts et al., 2018).

### 2.2 What Makes Neuromarketing Tools Suitable for Marketing Practice?

Data derived from scalable neurophysiological tools can significantly aid in customer segmentation, product customization, personalization of communication messages, and maximization of consumer experience.

Customer segmentation – Consumers differ in demographic traits, purchase needs, and personality (e.g., Tynan and Drayton 1987; Dibb and Simkin 1991; Aaker 1997; Wedel and Kamakura 2002; Goldsmith 2016). Several studies have already highlighted the promising contribution of neurobehavioral models to segmenting consumers (Hubert and Kenning 2008; Venkatraman et al. 2012; Smidts et al. 2014; Van Der Laan and Smeets 2015; Plassmann and Weber 2015). Venkatraman et al. (2012) proposed a conceptual framework explaining neuroscience's role in understanding individual variability.

Scalable neurophysiological tools can provide insights into individual differences based on physiological characteristics, leading to more accurate and systematic segmentation. Supporting this, a previous work (Trieste et al., 2021) showed a significant negative association between food literacy and individual preference for circadian activity (a neurophysiological parameter called chronotype; Adan et al. 2012). In that sample, evening chronotypes tended to have lower food literacy scores, and high food literacy levels were associated with greater attention to the nutritional content of everyday products.

Customization of Offerings and Communication Messages – Customer profiling forms the foundation for personalizing offerings and promotions (Vesanen and Raulas 2006; Chandra et al. 2022). The market increasingly demands customized goods, whether in terms of pricing (e.g., Tomczyk et al. 2022) or aesthetic features (taste, colors, packaging type) and functionalities (e.g., Homburg, Schwemmle, and Kuehnl 2015; Pallant, Sands, and Karpen 2020). Simultaneously, customizing services can increase customer satisfaction and loyalty (Coelho and Henseler 2012), also echoing corporate communications (Ball, Coelho, and Vilares 2006).

Consumer neuroscience can help explore cognitive and emotional differences in consumers to tailor messages accordingly (e.g., Chua et al. 2009; Falk et al. 2015). By detecting individual differences based on (neuro)physiological parameters, consumer neuroscience studies can be valuable far beyond simply testing commercial ad effectiveness.

Maximization of Consumer Experience – For consumers entering a store with a smartwatch, the stream of physiological data (e.g., heart rate) can provide objective correlates of their experienced pleasantness for environmental features like thermal comfort, background music, or ambient scent (e.g., Berčík et al 2021; Mansi et al. 2021; Kakaria et al. 2022; Jiang et al. 2022). Furthermore, EEG systems can expand real-life applications of consumer neuroscience, particularly in multisensory and immersive experiences (e.g., Kumar et al. 2016; Hofmann et al. 2022).

Ecological validity – Using scalable tools, consumer reactions can be captured in ecological settings (Harris, Ciorciari, and Gountas 2018). Experiments with webcam-based eye-tracking or wearable devices can be conducted in real stores (Huddleston et al. 2015; Meißner et al. 2019; Bialkova, Grunert, and van Trijp 2020), home settings, or urban environments (Salamone, Masullo, and Sibilio 2021).

Moreover, user-friendly interfaces (e.g., digital platforms, mobile apps) can visually represent collected data with graphs or indexes that stakeholders – consumers, marketers, scholars, and even policymakers – can use to immediately grasp the meaning of parameters monitored minute-per-minute over time (Wang et al. 2015; Classen et al. 2018; Alvino et al. 2020). This ease of data use can also engage stakeholders, starting with consumers' curiosity, which in turn fosters the wider diffusion of such tools.

### 2.3 What Makes Neuromarketing Tools Feasible for Marketing Practice?

Reducing Expensiveness – Scalable technologies offer two main advantages over neuroimaging instruments such as fMRI: lower costs and simpler experimental protocols (Harris, Ciorciari, and Gountas 2018). While fMRI scanners can cost up to $1 million per Tesla (Sarracanie et al. 2015), eye-trackers range from $30 to $30,000 (Alvino et al. 2020; Mantiuk et al. 2012). Wearable devices have a similar price range, from $150 to $1,690 (Ueafuea et al. 2020). EEG systems also have comparable prices, from $750 (for research editions) to $50,000 (medical-grade devices) (Sawangjai et al. 2019).

Furthermore, EEG and eye-tracking systems are evolving towards being less invasive. For instance, eye-tracking glasses now resemble common market glasses, and many studies show a trend toward using EEG systems with fewer electrodes (e.g., Bazzani et al., 2020).

Standardization of Protocols – In terms of experimental protocols, the time required to set up an experiment with wearable technology or a webcam-based eye-tracking system is relatively short. Many systems offer a plug-and-play setup and easy-to-understand software interfaces, making it simpler to use multiple devices in parallel given their relatively low costs (e.g., Bánki et al 2022). Ensuring accurate time synchronization across multimodal signals from different devices remains a persistent challenge (e.g., Xiao et al. 2022).

Facilitating the use of these tools can also promote the reproducibility of consumer neuroscience experiments on large samples, thus making corresponding findings more robust.

Another critical point is experimental design and the interpretation of collected data. The degree of expertise required to interpret neurophysiological and physiological data limits the widespread dissemination of consumer neuroscience for real-world applications (Plassmann et al. 2015). The multidisciplinary nature of this field implies a variety of skills that are difficult to find in the marketing or R&D departments of an average company. Therefore, close collaboration with consumer neuroscience experts is an advisable approach for marketers (Bazzani et al. 2020).
The introduction of scalable tools could help resolve this tricky trade-off by reducing the time and economic costs of experiments.

## 3. Operational Contributions of Scalable Neurophysiological Tools

To map out the practical contribution of scalable tools to marketing actions, we adopt the classical 4Ps framework (McCarthy, 1960): product, promotion, place, and price. This model provides a structured lens for analyzing how neurophysiological data can inform core marketing decisions (Bazzani et al., 2020). For each "P," we reference a seminal study to guide scholars and practitioners in designing consumer neuroscience experiments, emphasizing how scalable tools can enhance the applicability of such methods in real-world contexts (see Figure 1).
To enrich this operational mapping, we draw on an adapted framework from Festa et al. (2016), originally proposed in the wine sector. Below each "P," we have therefore indicated a corresponding experiential dimension ("E"): Experience, Emotion, Environment, and Expectation.
We argue that this combined framework is particularly well-suited to multisensory product categories, which are especially conducive to consumer neuroscience approaches.

| | Product | Promotion | Price | Place |
|---|---|---|---|---|
| | *Expertise* | *Education* | *Evaluation* | *Experience* |
| **Traditional consumer neuroscience** | Khushaba et al. 2013 | Falk et al. 2015 | Plassmann et al. 2008 | Horská and Berčík 2014 |
| **Scalable Neurophysiological Tools** | Bialkova, Grunert, and van Trijp 2020 | Ramsøy, Michael, and Michael 2019 | Roberts et al. 2018 | Meißner et al. 2019 |

Figure 1 - Contributions of Scalable Neurophysiological Tools to the 4Ps of Operational Marketing.

## 4. New Scenarios Opened by Scalable Tools: The Case of the Healthcare Sector

In this final section, we focus on the application of scalable tools in the healthcare sector. There are two main reasons behind this choice. First, many of these tools have already been adopted in the health and well-being domain, both for self-monitoring and clinical applications, such as wearable devices for stress

tracking Hickey et al. 2021) and telemedicine platforms for outpatient settings (Perednia & Allen, 1995). Wearable sensors and eye-trackers are already used in medical diagnostics: telemedicine systems monitor patients' physiological signals remotely (Ekeland, Bowes, & Flottorp, 2010; Kuan et al., 2022), and eye-tracking is applied in psychiatry (Levy et al., 1994) and neurodevelopmental disorders (Papagiannopoulou et al., 2014). However, most of these applications have primarily focused on the clinical interpretation of the collected data. We argue that such physiological information could also be leveraged to analyze patients' behavior as service users. For instance, tracking implicit reactions during the use of hospital interfaces, digital platforms, or rehabilitation devices could provide actionable insights to improve service design, user satisfaction, and compliance. Second, the healthcare sector is characterized by continuous technological innovation aimed at improving patient outcomes and quality of life. In this dynamic context, consumer neuroscience techniques can offer valuable insights by capturing in-field, implicit, and non-verbal reactions from healthcare professionals, patients, and caregivers. For example, within the Fit4Medical Robotics (Fit4MedRob, https://www.fit4medrob.it) Initiative, scalable consumer neuroscience techniques are being explored to assess the acceptance of new robotic rehabilitation systems during real-world use, in comparison to standard care. From a public health perspective, the relatively low cost and minimal infrastructure requirements of scalable tools mean they can be deployed in any setting with basic IT capacity. This opens a way for democratizing access to healthcare, particularly for underserved or remote populations (Appuswamy & Desimone, 2020; Xu et al., 2021). Furthermore, they can help identify vulnerable segments of the population (Johnson & Picard, 2020), enabling more targeted and effective health promotion campaigns (Kreps & Neuhauser, 2015). Indeed, these tools hold promise in the domain of social marketing. Eye-tracking and physiological monitoring can be used to evaluate the effectiveness of public service announcements (Falk et al., 2016; Harris, Ciorciari, & Gountas, 2018). Finally, insurance companies have begun incorporating wearable technologies into their service models, using data to compute risk-based health scores and offering personalized plans or incentives for healthy behaviors (Dinh-Le et al., 2019; McCrea & Farrell, 2018; Neumann, Tiberius, & Biendarra, 2022). This signals a broader shift toward data-driven preventive care and individualized service provision, an area where scalable tools are poised to play a growing role.

## 5. Research and Managerial implications

We propose three main impactful directions opened by scalable tools both for scholars and practitioners:
1) They allow for longitudinal data collection, enabling the study of customers' decision-making over their journey, and the assessment of long-term marketing outcomes.
2) Their low costs and invasiveness make these tools optimal candidates for using consumer neuroscience in ecological settings and on larger samples. Also, it opens their accessibility also to small and medium-sized enterprises (SMEs).
3) They are easier to use and combine, opening their applications to the study of interactions between consumers (social consumer neuroscience).

From a managerial perspective, they hence offer practical solutions for assessing consumer behavior, and specifically for customers' segmentation, product customization, and targeted communication.
Public institutions could also benefit from the use of scalable tools to design public health campaigns, improve educational strategies, and reach underserved communities.

## 6. Limitations and Agenda for future research

Covering all unconventional applications of neurophysiological and physiological tools in marketing is beyond the scope of this paper.
Additionally, the generalizability of the methodological approach proposed is limited by the heterogeneity of existing studies and the lack of longitudinal validation in many cases.

Nevertheless, scalable tools represent a promising innovation, particularly due to their ease of use and affordability, which reduce barriers to adoption for companies.

Two key challenges remain to be addressed:

1. Data quality in real-world contexts – Experiments conducted in naturalistic settings often generate noisy or low-quality data. Addressing this challenge will require the development of robust algorithms and advancements in hardware to ensure accurate signal processing and valid interpretation.

2. Data governance – The use of physiological data raises important privacy, ethical, and legal concerns (Segura Anaya, 2018). Although a full discussion of this topic lies beyond the scope of this paper, it is crucial for building public trust and promoting responsible data management. A related issue is consumer reluctance to share physiological information, particularly in sensitive domains such as health. This highlights the need for transparent communication and robust ethical safeguards that ensure individuals maintain control over their personal information.

## 7. Concluding remarks

In this paper, we reviewed the emerging literature on the application of neurophysiological and physiological tools in marketing research, focusing on their scalability and practical feasibility. We introduced the term scalable tools to describe a class of technologies that enhance the ecological validity of consumer neuroscience while lowering financial and operational barriers. We discussed how these tools can contribute to more accurate segmentation, personalized offerings, and enhanced consumer experiences, with particular attention to applications in healthcare. We emphasized their potential for democratizing access to consumer neuroscience, enabling also SMEs and public institutions to integrate these tools into their workflows.

Finally, we outlined some key limitations and identified areas for future research, including data quality and data governance. We call for interdisciplinary collaborations to develop theoretical and applied frameworks that ensure the responsible and effective use of scalable tools in both commercial and societal contexts.

# How Far is Too Far? The impact of the Perimeter-of-Origin on the Willingness to Pay

Federico Frezzetti[1]*, Valentina Cucino[1], and Laura Michelini[1]

[1] LUMSA University, Italy

* Corresponding author: federico.frezzetti@hotmail.it

## Abstract

The origin of products is a key factor in consumers' decision-making process (Bilkey & Nes, 1982). With the growing attention to product traceability, companies increasingly see the use of labels indicating national or local sourcing of products throughout the supply chain as a strategic asset.
The Country-of-Origin (COO) literature has highlighted that consumers perceive "Made in Italy" products as high-quality, especially in the fashion, food and beverage, accessories, mechanical, and technology sectors (Cappelli et al., 2019).
Studies on consumer ethnocentrism (CE) suggest that people often show a bias in favor of local products and brands compared to foreign ones (Shimp & Sharma, 1987).
Furthermore, buy-local literature highlights that the preference for local products extends beyond the national perimeter and also applies to smaller geographic areas (Fernández-Ferrín & Bande-Vilela, 2013). However, most of these studies are limited to the food industry.
A gap in the literature remains to be addressed: although COO and CE have been well documented, the impact on consumers of varying perimeters of origin (considering also sub-national dimensions) has been scarcely explored in the non-food industry.
Perimeter-of-Origin (PO) is defined by the author as the perceived geographical scope of a product supply chain, ranging from local (within 100 km of the purchase point), to national, continental and global.
This work aims to analyze the impact of different levels of the Perimeter-of-Origin (PO) on consumers' willingness to pay (WTP), while controlling the role of quality and assessing the moderating role of CE, through a Discrete Choice Experiment (DCE).

### 1.Introduction

In many sectors, labels such as "Made in Italy", "100% Italian" or "Local Product" are becoming a key element of differentiation and market positioning. Although the geographical origin of products is gaining relevance, its impact on the willingness to pay varies significantly across studies and contexts (Thøgersen, 2023; Yeh & Hirsch, 2023).
According to Social Identity Theory (Tajfel, 1970, 1974; Tajfel & Turner, 1986), individuals show a preference for their own group (in-group bias) resulting in more favorable evaluations and attitudes. This bias not only influences interpersonal evaluations but also consumption preferences, leading consumers to favor local products over imported ones (Shankarmahesh, 2006). To measure individual differences in national products preference, called consumer ethnocentrism, Shimp & Sharma (1987) developed a 17-item scale, the CETSCALE.
Beyond ethnocentrism, the effect of product origin on purchasing preferences has been extensively documented by more than 1,000 studies on the Country-of-Origin (COO) effect (Samiee & Chabowski,

2021). These studies have demonstrated the existence of a halo effect of the COO on the products that can be broken down into four different dimensions: the general country image, the general product country image, the specific product country image and the partitioned country image (Oduro et al., 2024). Over 80% of the studies on consumer ethnocentrism have used surveys in order to investigate the phenomenon (Baber et al., 2024). One of the main limits of using selfreport measures is that results can be affected by social desirability and other biases. This creates a problem of generalization, as argued by Yildiz et al. (2018), ethnocentrism was in fact not a strong predictor of real local product purchase.
The DCE methodology involves the use of implicit measurement that is expected to bypass the aforementioned biases, providing evidence of the Perimeter-of-Origin effect on consumer behavior and the moderating role of ethnocentrism.

The research questions that are going to be addressed are:

i. To what extent is the willingness to pay of consumers based on the PO of the product?

ii. To what extent does ethnocentrism moderate the effect of the PO on the WTP?

## 2. Literature Review and Hypoteses

### 2.1 Country-of-Origin

The Country-of-Origin (COO) effect has been extensively studied since the 1980s (Al-Sulaiti & Baker, 1998; Bilkey & Nes, 1982), showing that the COO image has a positive though moderate effect on consumers' evaluation of products (Peterson & Jolibert, 1995).
Furthermore, the COO is not a unidimensional construct, but can be measured by using four different dimensions: general country image; general product country image, namely the general image of the products of a Country; specific product country image, namely the specific competence attributed to a Country in the realization of a specific class of goods or services; and partitioned country image, namely the impact of the Country of design (COD), parts (COP), assembly (COA), brand (COB) and manufacture (COM) (Chowdhury & Ahmed, 2009). The main impact on brand image is due to the general product country image, followed respectively by partitioned country image, general country image, and specific product country image (Oduro et al., 2024).
Within COO literature, consumer ethnocentrism is another deeply studied phenomenon. The consumers in fact show a domestic country bias (Balabanis & Diamantopoulos, 2004), that manifests in a higher buying intention and a better perception of the product.
The importance of the "Made in Italy" label has increased over the years according to KPMG (2010), and brands are stressing the Italianness of their products in order to gain competitive advantage, especially in fashion (Piancazzo et al., 2024).
Fashion, together with food and beverage, accessories, mechanical and technology, are, in fact, sectors where the "Made in Italy" label is associated with an increased willingness to pay of consumers (Cappelli et al., 2019).
Accordingly with aforementioned literature, it is possible to forecast that WTP will result negatively correlated with the scope of the PO, and consequently, a higher WTP for national products compared to foreign ones is expected.

### 2.2 Buy local

Local products are defined by Meyerding et al. ( 2019) as "less the 100 km from home", while a report of JRC states that "'Local Food Systems' as those where the production, processing, trade and consumption of food occur in a defined reduced geographical area (depending on the sources and reflections, of about 20 to 100 km radius)" (2013).

Buy local literature is primarily focused on food sector, but it offers interesting insights into consumers' decision-making drivers. Feldmann & Hamm (2015) found that motives for the purchase of local products can be divided into two categories: egoistic and altruistic. The former includes perceived higher quality, while the latter relates to sustainability and to the support to the territory.
Therefore, WTP is expected to be found higher for local products compared to national and foreign ones.
Most of the literature on the topic adopts a binary perspective, differentiating between local and non-local, without considering the nuances that can occur both within and between the categories. The concept of PO allows a multilevel analysis that makes it possible to capture these nuances. Defined by the author as the perceived geographical scope of a product supply chain, ranging from local (within 100 km of the purchase point), to national, continental and global, the integration of the PO concept allows a more detailed analysis on the effects of different gradations of proximity on the WTP.
This leads to the following hypothesis:
H1: consumers' willingness to pay decreases progressively from local to national, continental, and global origins of products.

### 2.3 Consumer ethnocentrism

Ethnocentrism is born as a sociological construct denoting the favoritism towards people sharing the same cultural background, and aversion towards people with a different one (Sumner, 1907). It was later used in the studies on consumer behavior to indicate the preference for local products compared to foreign ones (Shimp & Sharma, 1987), regardless of their quality and price (Shankarmahesh, 2006). Starting from the 1980s the interest for the construct has
always increased over the years (Baber et al., 2024).
The most widely used theoretical framework explaining the phenomenon is Social Identity Theory (SIT) (Tajfel, 1970, 1974; Tajfel & Turner, 1986). According to SIT, people tend to favor the members of their group (in-group bias), being more indulgent towards them, and attributing them better characteristics. The propensity to buy local products compared to foreign ones is therefore linked to the same bias.
Baber et al. (2024) have highlighted how antecedents of ethnocentrism can be divided in socio-cultural factors (patriotism, conservatism, country image), political factors (concern for political pressure, COO), and demographic factors (cultural identity, social class).
Willingness to pay, repeated purchase, brand preferences, and product judgment can be identified as consequences of ethnocentrism.
Many mediators and moderators have been found to be relevant: cosmopolitanism, materialism, perceived brand prestige among the ones in the former category and perceived quality, perceived necessity and imported product judgment among the latter.
H2: CE moderates the relation between WTP and PO, increasing WTP among consumers with high levels of CE.

## 3. Methodology

To examine the effect of the Perimeter-of-Origin on consumers' decision-making processes, a Discrete Choice Experiment has been designed. Specifically, the experiment examines how the Perimeter-of-Origin and the quality of the product affect the willingness to pay of a non-food product, a 100% cotton t-shirt.
Since, as suggested by literature, the origin of the product is at least partially correlated with the perception of quality, a variable distinguishing between "standard", "high" and "excellent" quality has been used, in order to isolate the specific effect of the PO.
The levels assigned to the variable PO are: "Imported", "Made in EU", "100% made in Italy" and "Local product". Since the last two levels could overlap, it will be explicitly specified that "Local Product" should be interpreted as a product that has a local (within 100 km from the purchase point) supply chain (design, manufacturing, assembly and components).

For the price level, starting from the average price of a 100% cotton t-shirt, 7 price levels have been obtained through a consecutive 10% price increase.
This 7x4x3 design generates a total of 84 scenarios.
To construct a D-efficient design and ensure comprehensibility, a pre-test consisting of 16 random paired choice scenarios will be conducted on a pilot sample. The pre-test is necessary to ensure respondent comprehension of the questionnaire and to derive the coefficients necessary to structure a D-efficient design. According to literature, the pre-test sample will be of 30-50 subjects.
After the experimental phase, the subjects will complete a questionnaire, containing demographic questions, and the CETSCALE to assess CE.
The sample will be of 150-200 subjects, recruited by online platforms (Prolific). The study will be administered via Qualtrics, and will consist of an introduction, the experiment and finally the questionnaire.
The results of the DCE will be analyzed through a Multinomial Logit Model (MNL), and a Mixed Logit, to assess the impact of the PO and quality on the WTP, also
incorporating the heterogeneity of the subjects.
The results of the CETSCALE will be used to evaluate the moderating role of the CE through a regression.

## 4. Expected results

According to the hypothesis, expected findings include: (i) a significant and negative correlation between the WTP and the scope of the PO; (ii) a significant and positive correlation between WTP and perceived quality; (iii) higher WTP for local and national products for subjects with higher levels of CE.

## 5. Conclusions

This paper analyzes the impact of the Perimeter-of-Origin on the Willingness to Pay of consumers, considering the roles of quality and ethnocentrism. Through a Discrete Choice Experiment, consumers' preferences for imported, European, Italian and local products will be measured.
A key theoretical contribution lies in the expansion of the Country-of-Origin literature, going beyond the duality of national/foreign products, by analyzing different levels of the Perimeter-of-Origin and testing the moderating role of ethnocentrism. Furthermore, the experimental method allows the understanding of consumer preferences from a behavioral perspective.
The results of this study could support companies in defining pricing and positioning strategies. Companies could benefit from a specific labeling indicating the PO of their supply chain, and influence consumers' WTP. Furthermore, the moderating effect of CE can be used to segment their audience, targeting ethnocentric consumers with tailored communications highlighting territorial identity. Finally, the findings may encourage local investments, as well as higher transparency in the supply chain.

# Towards the Use of Lean Six Sigma and the Integration of Blockchain to Enable Supplier Procurement in Tourism: A Model Proposal

Raffaele Tardio[1]*, Anton Straetemans[2], Silvia Verdura[1], and Chiara Cardona[1]

[1] University of Tuscia, Italy
[2] Independent Researcher

* Corresponding author: raffaele.tardio@unitus.it

## Abstract

The tourism industry faces increasing pressure to transform amid rising demand for personalized, transparent services and a fragmented supplier landscape. This study examines how Lean Six Sigma (LSS) principles, known for reducing variability and enhancing quality through continuous improvement, can be further enhanced by integrating blockchain technology as a digital enabler. While LSS frameworks offer structured tools for process optimization, their effectiveness in tourism is hindered by poor data standardization and low inter-organizational trust. Blockchain, with features such as immutability, transparency, and smart contracts, can address these shortcomings by providing a secure, decentralized infrastructure that aligns well with the data-driven requirements of the DMAIC cycle. We propose a blockchain-enabled LSS procurement model. The model facilitates real-time transparency, automated compliance, and stakeholder accountability, turning a static supply-centered approach into a dynamic, customer-driven procurement ecosystem. Moreover, it encourages co-creation between customers and suppliers by supporting the design of shared services, decentralized feedback mechanisms, and reputation systems. This framework aims to operationalize the flexible, feedback-rich ideals of LSS within the variable and fragmented context of tourism. While theoretical, the model provides a blueprint for scalable and resilient procurement strategies, inviting future empirical testing and refinement. It contributes to emerging literature on digitally enabled service ecosystems and highlights the synergistic potential of combining LSS methodologies with blockchain infrastructure for enhanced tourism procurement.

## 1. Framing of the research

### 1.1 Lean Six Sigma Approach

Faced with a dynamic shift towards the demand for personalized services, a conscious push for transparent and socially responsible services is shaping the transformation within the tourism industry. A change is needed from the rigid traditional linear service delivery towards a dynamic ecosystem of suppliers. This transformation could be supported by a methodology historically rooted in manufacturing and developed from a combined approach of Lean and Six Sigma principles, integrating with each other to create Lean Six Sigma (LSS) (Ramphal,2017).

Lean Six Sigma (LSS) is a hybrid management methodology that combines lean waste-reduction principles with Six Sigma's data-driven quality improvement approach through variability elimination (Pyzdek & Keller, 2014). Lean is derived from the Toyota production system, which was developed to eliminate non-value-adding activities within manufacturing through waste reduction. This was achieved by tools such as Just-In-Time (JIT). The philosophy behind the tool was that the factory would only produce when requested, based on consumer demand. This aimed to minimize excess stock and eliminate waste within the process. It also allowed for greater customer input as the product could be made to specifications requested by consumers (Womack & Jones, 2003).

The data-driven Six Sigma methodology is a rigid system that operates as a data-driven decision-making tool that aims to reduce defects and process variation. One of the tools that helps make data-driven decisions is the DMAIC framework (Define, Measure, Analyse, Improve, Control). The tool acts as a cornerstone. Using the framework helps organisations to analyze and optimize process flows by identifying root causes and measuring KPIs (Antony, 2006). Through data, the process flows can be controlled and continuously improved. The integration of lean and Six Sigma into LSS provides a comprehensive toolkit for organizations to enhance value creation by simultaneously reducing waste and improving product quality (Snee,2010; Chakraborty & Tan, 2013).

The potential implementation of these LSS tools shows significant promise. However, the implementation of these tools in tourism is not as standardized as in manufacturing (Abliwi et al., 2015). With the high variability of personalized demand, on top of being an intangible service that is highly influenced by customer interaction, standardization and defect measurement become inherently more complex (Kokkranikal et al.,2013). The fragmentation of suppliers further enhances these challenges. Tourism procurement environments often consist of small, independent suppliers and numerous stakeholders who create information silos and hinder coordinated quality controls due to high variability of unique experiences (Jovanovic et al., 2023). Though these challenges persist throughout the entire industry, you must face one obstacle when implementing LSS. With the successful implementation of it hinging on the organizational culture, an unavoidable barrier is that the data infrastructure and mindset need to be aligned to allow continuous improvement (Kumar et al., 2009). LSS needs reliable, real-time data, as it is crucial to the performance of the DMAIC process (Ramphal & Nicolaides, 2018). Tourism faces problems in collecting such data. With issues of inconsistent data sources or a lack of quality data on top of low inter-organizational trust, there is limited data to build a foundation of quality data. Due to the challenges procurement faces in tourism, emerging digital enablers could provide potential efficient solutions, such as blockchain, offering the tools to build the foundation to operationalize LSS by improving transparency, traceability, and stakeholder coordination (Baydeniz, 2024).

### 1.2 The Blockchain concept and framework

Blockchain has become a buzzword when discussing digital transformation trends. As various industry models show, customer expectations for transparency and customization have increased, making the need for change more prevalent. This digital transformation is accelerating the shift toward on-demand, experience-based travel (Rashideh, 2020; IBM, 2022). Blockchain has emerged as a possible foundational enabler of a secure, automated, and data-rich service ecosystem that aims to improve service transparency, verify supplier authenticity, and automate contractual relationships. It supports the key challenges that the dynamic tourism procurement environment faces (Zhang et al, 2022; Lansiti & Lakhani).

Blockchain is a digital peer-to-peer ledger that records transactions immutably and transparently across multiple nodes. A network of sorts. Each transaction is grouped into a "block", time-sampled, cryptographically hashed, and attached to a chain of prior transactions (Tripathi et al., 2019). Traditional centralized databases are prone to failure and do not ensure data validity, as there remains the possibility of manipulation. Unlike these conventional databases, blockchain systems offer no single point of control or failure and operate on consensus mechanisms to ensure data validity. Enterprise settings, such as tourism and our focus point of procurement, require a slightly different approach. Permissioned

blockchains are chains where only verified participants can view or add information to. These are preferred within these settings to ensure privacy and compliance concerns (IBM,2022).
Several key foundational characteristics are especially relevant to procurement within tourism. These key building blocks in the blockchain consist of immutability, transparency, smart contracts, traceability, and decentralization (Rashideh, 2020). The data once entered within the blockchain cannot be altered without consensus from the network. ensuring traceability of the phases in procurement, such as booking confirmations, delivery logs, and compliance audits. Within a Permissioned blockchain, authorized stakeholders have shared access to the same source of truth. A feature that helps to enhance collaboration as service providers across platforms, and customers can collaborate on an equal playing field reducing disputes and building trust (Lansiti & Lakhani, 2020). Self-executing digital agreements, better known as smart contracts, automatically act upon programmed transaction triggers based on predefined conditions. These can automatically enforce the rules set on the predefined conditions helping automate payments, applying penalties for service-level breaches, and enforcing refund policies. Removing a lot of the hassle associated with it (Chatterjee et al., 2021). The traceability of the data gives end-to-end visibility across the supply chain. This data can help control the origin and quality of the services. Verifying these experiences or products can help to ensure standardization within the tourism industry (Baralla et al.,2020; Zhang et al., 2022). These features can enable collaborative service design and flexible bundling of offerings, fostering an environment of co-creation across the tourism value chain. Decentralizing authority over the data across nodes reduces the reliance on intermediaries to manage the network and update it with data, giving authority to the suppliers and customers, fostering a more agile and customer-driven procurement environment (Rashideh, 2020).

### 1.3 Merging the Lean Six Sigma approach and the blockchain framework

Blockchain features can make it not just a mere transactional technology, but will help it thrive as a systemic trust mechanism. This is especially suitable for environments that require inter-organizational coordination and verification, such as within an LSS-based procurement model, where it can be the infrastructural backbone for a more transparent, adaptive and efficient supplier network in tourism. Where key features like blockchain's immutability support key features of LSS, such as the Measure and Control phases in DMAIC, smart contracts can facilitate process standardization and automation during their improvement and control phases. The merging of the two approaches has the potential to create that backbone that will propel the tourism industry into an adaptive and customer-driven industry.
There is a potential path for integrating blockchain into a Lean Six Sigma-based procurement model. It presents a compelling synergy through reinforcing tools. Therefore, intersecting these two methodologies can potentially address operational and structural limitations observed in tourism procurement (Kumar & Sharma, 2023; Zhang et al., 2022). The current LSS framework operates to reduce variability and enhance process efficiency through continuous data-driven improvement (Pyzdek & Keller, 2014). The model struggles to adapt in operationalizing such a fragmented and highly personalized service sector. A lack of reliable, standardized data and low inter-organizational trust have limited its operational efficiency (Ramphal & Nicolaides, 2018; Erol et al., 2022). Blockchain can operate as the technological infrastructure to bridge the gap. The digital ledger inherently characterizes itself as a tool that enhances transparency, immutability, and decentralized governance, providing a technical edge that can help mitigate the existing barrier (Baralla et al.,2020; Lasiti & Lakhani, 2020). The DMAIC framework requires quality data to operate efficiently. The digital ledger infrastructure can provide such data in a tamper-resistant, real-time manner in a secure environment (Zhang et al., 2022; Abeywardena et al., 2023). Once embedded within this architecture, smart contracts can facilitate automated process enforcement and adaptive contract execution (Wei, 2022), potentially, operationalizing the control aspects of LSS in dynamic supplier networks (Kumar & Sharma, 2023). The auditable nature and immutable, transparent manner of operating create trustworthy data. This data can be used for quality control, supplier accountability, and customer engagement (Rashideh, 2020; Fragniere et al., 2022). These concepts resonate with the voice of the customer with the data helping to facilitate continuous feedback loops

(Chatterjee et al., 2021; Melkic & Cavlek, 2020). The infrastructure that the ledger provides shows the potential for operationalizing LSS and its inherent synergy (Li et al., 2023; Erol et al., 2022).
Blockchain would not operate as an add-on technology to enhance value creation but as an infrastructural enabler for a more adaptive, scalable, and customer-centric LSS procurement model (Zhang et al., 2022; Tripathi et al., 2019). This is explored within subsequent sections through potential use cases. This paper seeks to illustrate how blockchain may be embedded within the infrastructure of a procurement framework to enhance supplier verification, streamline contract execution, and promote transparency and data-driven quality assurance (Baralla et al., 2020; IBM, 2022).

## 2. Methodology

This research employed a qualitative approach, including data collection, desk analysis and interpretation from the blockchain use in tourism literature and internal observation and inspection of the operational processes of the Golden Moments Worldwide business case study. The research methodology offered the possibility to further develop the new customer-oriented integrated service procurement management model suggested and structured by Tardio and Straetemans (Tardio & Straetemans 2025) introducing and including the blockchain framework within the existent theoretical model in order to develop a more efficient record of information, impacting the customised product build up and the supplier procurement and performance evaluation process. The frame was designed using a case study of a tourism business operating online with a digital platform, namely Golden Moments. Golden Moments Worldwide Ltd is an experience provider website that counts 14 European digital platforms. The Italian Market is currently the most active of the overall businesses operating as a booking tourist service agency. Golden Moments was founded by the Cheatle twin brothers in 1999, and it is based in Southsea in the United Kingdom. Since its foundation, the agency has always pushed to be innovative and to grow its online presence as a digital company operating in Europe with a tourist main vocation. The goal of this analysis has consisted of picturing new business operations when LSS tools have been introduced and implemented, also supported by the theoretical adoption of a blockchain framework within the service procurement process.

## 3. Results

The Golden Moments procurement model is in transition towards a customer-driven approach. The model currently used as a sample, is based on the LSS methodology and operationalized for tourism. The LSS model emphasizes waste reduction and efficiency through Just-in-Time (JIT), a methodology derived from TPS that aimed to align production closely with real-time demand (Womack & Jones, 2003). While these principles work well in theory, application in the tourism sector has proven difficult due to a fragmented supplier network, high service variability, and low inter-organizational trust due to a lack of standardization (Kokkranikal et al., 2013; Ramphal & Nicolaides, 2018). The Golden Moments original supplier-driven model operated on a fixed-contract basis, resulting in low flexibility and supplier inactivity when consumer demand fluctuated. The shift toward a customer-driven procurement model helped reposition the customer as a prosumer, actively co-creating their experiences with suppliers through transparent and traceable interactions facilitated by digital blockchain infrastructure, with the model centered on LSS methodologies. The model helped to reposition the customer as a service cocreator making the consumer the one who generates and codesigns their experience (Niezgoda, 2013).
A capable infrastructure must be in place to realize this flexible pull-based model. This is where the paper proposes the integration of blockchain into the framework, building upon the existing model of Tardio & Straetemans (2025) by giving it the foundational infrastructure required. The technological infrastructure aims to provide the capacity to improve transparency, decentralize trust, automate processes, and create an interactive supplier network (Zhang et al., 2022; Rashideh, 2020). The model consists of an interconnected blockchain system that facilitates the supplier blockchain, customer blockchain, and hybrid customer-supplier blockchain, which is facilitated within the procurement blockchain. These layers help to facilitate process optimization and control within the DMAIC cycle and are aimed at resolving inefficiencies within the tourism procurement model (Tripathi et al., 2019; Chatterjee et al., 2021; IBM, 2022).

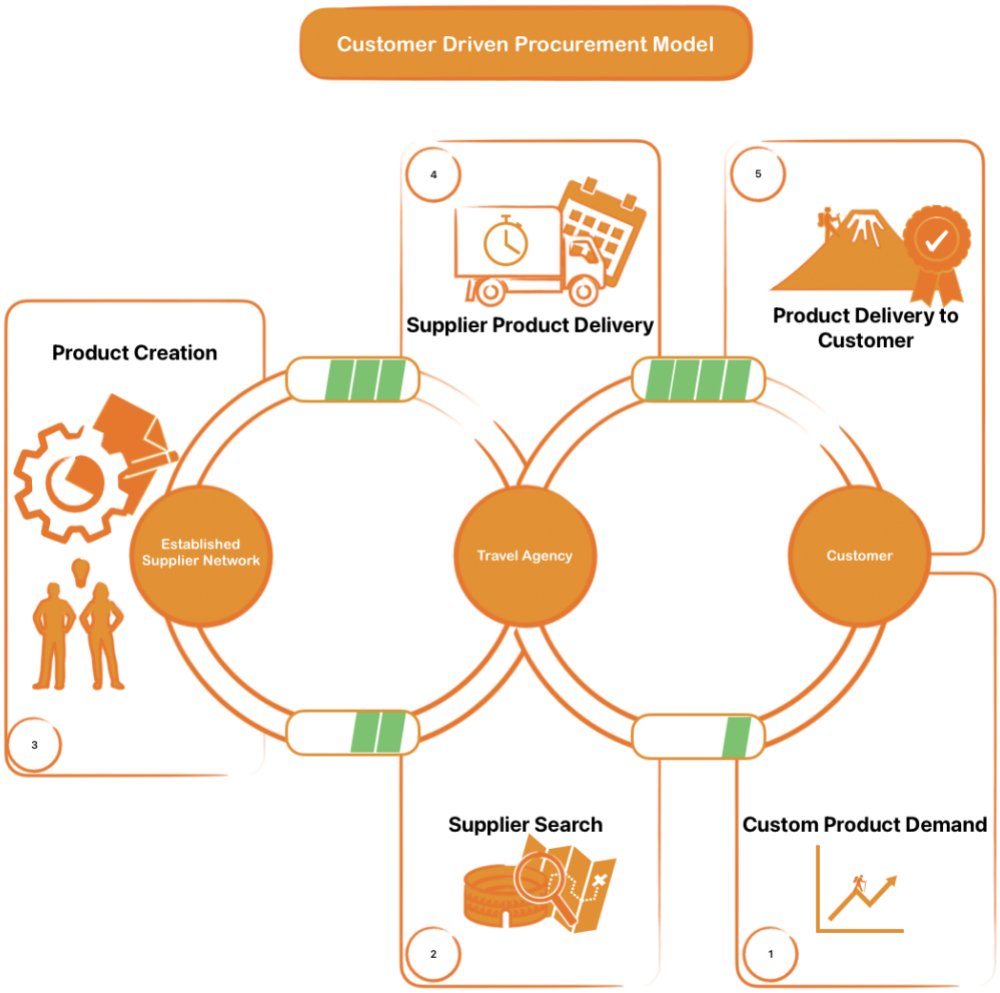

Figure 1. Lean Six Sigma Procurement Model (Tardio & Straetemans, 2025)

Integrating blockchain into the procurement model aims to realize the full potential of the flexible pull-based model on which the booking agency operates. The system requires the necessary digital infrastructure to deliver on real-time transparency, adaptive supplier matching, and trusted performance verification. This layer will help automate and improve operational processes. These capabilities will foster the foundation beyond just a data record, smart contract enforcement, validating decentralized reputation systems, and synchronizing feedback loops across stakeholders (Tripathi et al., 2019; Chatterjee et al., 2021). The immutable nature of the technology supports a JIT approach by ensuring that only verified suppliers are engaged when demand arises. Reinforced by smart contracts, the fulfillment of these experiences is empowered by reduced lag and error in the process and penalization when specific criteria aren't met (IBM, 2022; Iansiti & Lakhani, 2020). The decentralisation of data can be useful to consumers and suppliers, empowering them with actionable insights and creating the trust and traceability needed to coordinate agile experiences at scale. The infrastructure enables the evolution of LSS from a dynamic supplier network in theory, but a static supply-centered system in practice, into a dynamic data-driven procurement ecosystem envisioned in the original design, with the capability of responding to the demands of modern tourism with precision and resilience (Zhang et al., 2022; Rashideh, 2020).

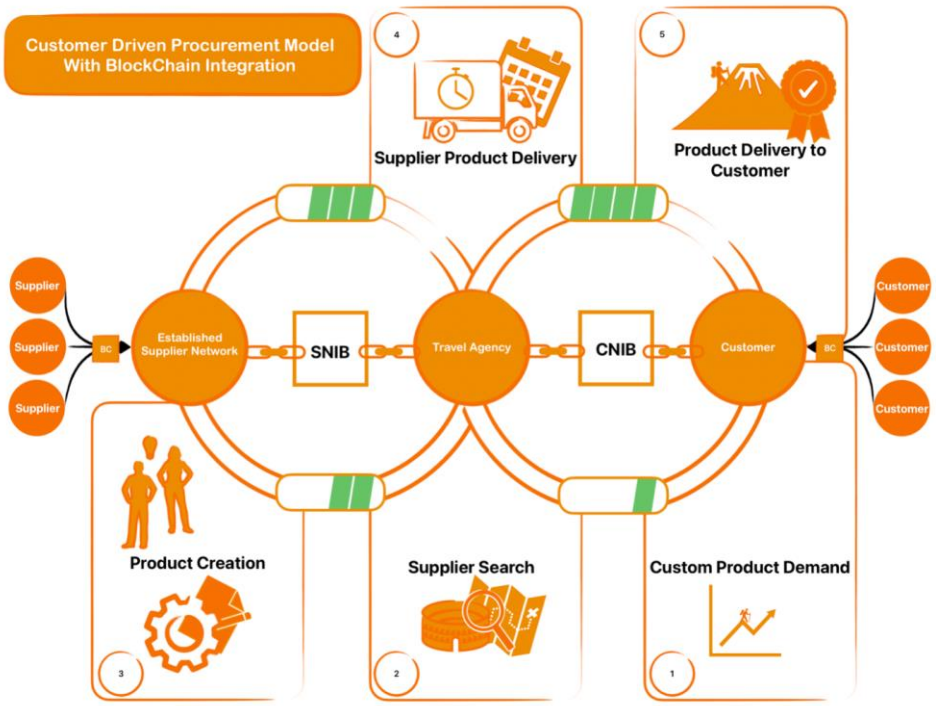

Figure 2. Blockchain integration procurement model

Tourism procurement often suffers from a lack of consistent supplier quality, traceability, and process accountability (Jovanovic et al., 2023). Creating immutable supplier profiles helps generate and validate the network. Hashes comprising metadata, certifications, delivery history, and customer ratings would form the profile (Abeywardena et al., 2023). These profiles help to establish a transparent network to improve trust, providing a reliable dataset for the Measure and Control phases of DMAIC (Zhang et al). The data can be used in various ways, with a key regulator being smart contracts able to automate supplier compliance through the contracts' pre-defined service level agreements that must be adhered to. Penalization is a significant consequence for not following the regulations by automatically triggering penalties or payments based on performance metrics (Chatterjee et al., 2021). The automation of vetting minimizes manual work, eliminates errors, and reinforces the control phase digitally.

Additionally, the transparency of performance and supplier profile creates a peer-monitored environment. A self-regulating supplier network where standards are enforced not by centralized procurement but through transparent competition in the network (Baralla et al., 2020). Aligning well with the principles of kaizen and continuous improvement, and supporting the improvement phase of DMAIC (Erol et al., 2022). This network would foster continuous service refinement. The transparency and access to shared service data allow suppliers to co-create experiences by bundling offerings or coordinating availability. Facilitating a unique proposition to be in the network. This layer would reduce redundancy and encourage collaboration, increasing the overall value stream in the LSS framework (Snee, 2010).

In tourism, the production journey is the deliverable itself. The customer side would benefit from the traceability of co-creation of that journey, on top of the accountability of suppliers, by integrating blockchain. The customer blockchain would store immutable records of each customer's preferences, reviews, and transaction history (Li et al., 2023). A user profile can be used to curate the network. This historical data can be accessed via cryptographic hashes, forming the foundation of personalized experiences. Customer reviews and journey logs influence future supplier selection by operating as decentralized feedback loops. Once a review is submitted, the chain cannot be altered, enhancing the

credibility and enabling data-driven adjustments in procurement (Melkić & Čavlek, 2020) empowering customers through the voice of the customer, which is central to LSS (Chatterjee et al., 2021).
The data-rich environment of the user profiles is facilitated on the chain, which can inform agents and customers about suppliers' past performance and set expectations. This helps the agent to curate the customer experience and gives them the tools to adjust if unsatisfied. The resulting procurement environment enables the use of data not just to validate but also to improve personalization and satisfaction helping in the Define and Analyze phases of DMAIC by outlining the requirements of consumers and pinpointing deviations (Pyzdek & Keller, 2014).
The hybrid layer operates as an intersection of customer data and supplier metrics, potentially enabling real-time co-creation between high-performing suppliers and consumers through dynamic preference matching and decentralized trust mechanisms. Acting as a trust broker, it enables real-time matching between verified, high-performing suppliers and customers whose preferences are transparently hashed (Fragnière et al., 2022; Wei, 2022) enabling continuous improvement through the aforementioned feedback loops where the consumer impact can be directly felt as a supplier, it impacts interactions with them. Either negative or positive, they can adapt to consumer feedback within their specialty, not just their own. These loops align with the improve and control phases of LSS, where the network maintains a dynamic performance evaluation system (Erol et al., 2022).
Empowered Choice is a key feature. Consumers become effective service cocreators and collaborate with agents to tailor their journey. The data-driven environment helps meet their needs and preferences. Facilitated through the reputational indicators in the network. The immutable infrastructure ensures that the preferences and reviews are honoured for future interactions of the same consumer or impacting another's journey. The participatory governance structure supports decentralized yet coordinated procurement and reduces information asymmetry (Zhang et al., 2022).

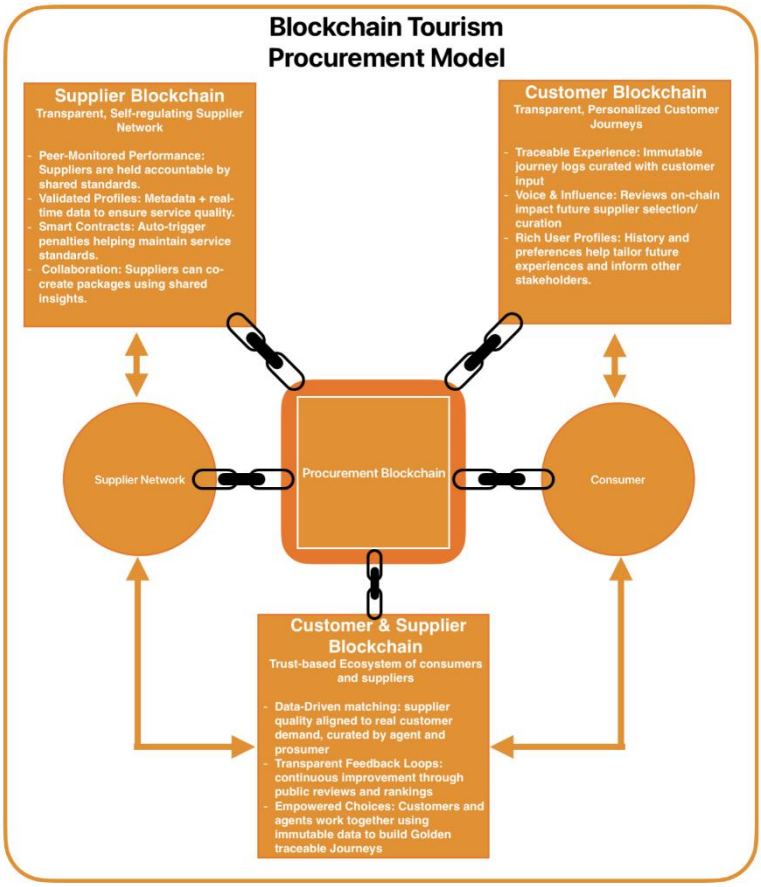

Figure 3. Blockchain Use Model in Tourism Sector

The procurement blockchain serves as the operational command center at the model's center. This layer houses various facilitators and acts as the infrastructural backbone such as smart contracts that define the rules of service engagement, payment release, dispute resolution, and performance validation (IBM, 2022; Tripathiet al., 2019). It transforms the procurement lifecycle from a manually managed process to an automated, rule-based digital environment contributing to waste reduction by eliminating redundant work and ensuring faster, trigger-based actions. Embedded in the control phase, they can ensure service quality and timelines are enforced without manual intervention (Iansiti & Lakhani, 2020).
The integrated data from the supplier and customers into a single ecosystem allows real-time procurement decisions, efficient resource allocation, and the development of traceable service journeys, giving the tools to the agent to align with either the supplier or the consumer when procuring an experience. The shared data facilitates the quality needed to improve the analysis and the improvement phases of LSS (Pyzdek & Keller, 2014). The reputation-based access requirements helps to maintain the network by pushing visibility and trust ranking of suppliers that meet KPIs and customer expectations, while underperforming suppliers can be filtered out (Rashideh, 2020; Abeywardena et al., 2023). The digital implementation of this control strategy enhances accountability and drives continuous improvement through transparency. The model proposes a data-rich, transparent, and adaptive system that addresses challenges faced in the LSS framework in dynamic and highly variable environments such as tourism helping to operationalize the DMAIC cycle by acting as an infrastructural enabler. Embedding Lean Six Sigma principles into the procurement model, allows a data-driven trust and performance-based network that facilitates the co-creation of quality experiences.

## 4. Research Limitations

The paper aims to locate itself within the quite recent literature concerning the strategic use of blockchain technology and framework within the tourism sector. As many other papers belonging to the same research category, this work and the application of the proposed model, presents a list of limitations. First of all, the practical application of blockchain in tourism still needs to be implemented and tested (Rashideh, 2020) and the potential low level of adaptability of tourism professionals in accepting and starting to use the new technology might represent a main barrier for its implementation (E. Fragnière et al. 2022). Also, this paper remains linked to a theory based approach since, at the moment, there are not yet direct and concrete applications of the blockchain technology in the tourism market sector (S.Melkic et N.Cavlek 2020). Moreover, in tourism, as in other business sectors, the fast recording and storage of personal data might cause a security and privacy issue by applying the blockchain technology (I. Tyan et al, 2021). Besides, as it has been revealed and discussed in other studies concerning the theme, the application of the innovative blockchain technology could be subject to face regulatory fences on the market and, in the wide range of business sectors,the regulatory adaptation needs could be different over multiple states and territories (G. Baralla et al. 2020), Finally, it needs to be underlined that the validation of the suggested model will require a long term testing phase across multiple markets and suppliers.

## 5. Originality of The Paper

The paper presents a unique approach that aims to combine the LSS method and the use of innovative blockchain technology to improve and enable faster and more efficient relationships between a wide range of stakeholders within the tourism business sector. This paper explores a niche and relatively recent research area in blockchain that aims to link potential new technologies and managerial practices in the tourism sector. The blockchain framework reinforces a potentially unconventional data-driven approach. The paper, which is theory-based due to the novelty of the explored tools in the field of practice, proposes a new service procurement model that aims to facilitate an innovative methodology to collect data concerning customer needs and supplier performance evaluation. The suggested new model wants to identify a path to reconfigure the managerial approach, addressing an innovative methodology to build and establish a solid and, at the same time, dynamic and flexible supply chain structure for travel agencies and tourism businesses focused on reinforcing service assembly packages, through digital enablers that support customer-supplier co-creation and performance-based collaboration, with them operating as

stakeholders' intermediaries in multiple areas of the tourism sector. Moreover, through this work and the presented combination of LSS methodology and blockchain technology, there is the intention to inspire new avenues of research practice for implementing and applying innovative operational strategies within tourism firms. Finally, whether the suggested customer-oriented procurement model has been built focusing on the tourism business sector, the application of the proposed flow paradigm could be adapted and applied in other service fields.

## Ethical AI Literacy for Future Managers: Insights from a Systematic Literature Review

Maria Giovanna Confetto[1]*, Claudia Covucci[2], and Christian Califri[1]

[1] University of Salerno, Italy
[2] Universitas Mercatorum, Italy

* Corresponding author: mconfetto@unisa.it

## Abstract

As artificial intelligence (AI) becomes increasingly embedded in organizational decision-making, business education must equip future managers not only with technical awareness but also with the ethical literacy needed to govern AI responsibly. While recent literature acknowledges the ethical implications of AI in education, there is a notable lack of pedagogical frameworks tailored to the managerial context. This paper addresses that gap by conducting a systematic bibliometric and content analysis of 581 publications at the intersection of AI, ethics, and higher education. The findings reveal a fast-growing field, driven by the rise of generative AI and regulatory developments, yet characterized by limited attention to practice-oriented educational models for management students.

In response, the paper introduces the Ethical AI Literacy Framework for Management Education, a four-layered model grounded in the literature and designed for integration into university-level business programs. The framework includes: (1) Conceptual Foundations to build AI fluency; (2) Ethical Reasoning and Reflection to develop normative judgment; (3) Applied Managerial Contexts to situate learning within business functions; and (4) Instructional Strategies and Assessment to support effective pedagogy. Anchored in principles of interdisciplinarity, contextualization, and active engagement, the framework offers a practical roadmap for embedding AI ethics into management curricula.

By reinterpreting AI literacy as a core strategic and ethical competence, this study contributes both theoretically and practically to the design of future-facing business education. It concludes by outlining directions for empirical research on implementation, evaluation, and long-term impact of shaping responsible AI leadership.

*Keywords: Artificial intelligence; AI literacy; AI education; AI ethics; Responsible AI; Management education*

### 1. Introduction

Artificial intelligence (AI), together with big data, machine learning, and related digital technologies, is reshaping the socioeconomic and organizational landscape in profound and irreversible ways. While these tools enable unprecedented advancements in efficiency and innovation, they simultaneously give rise to critical ethical dilemmas around algorithmic discrimination, privacy invasion, opacity, accountability, and disruptive social consequences (Patel et al., 2021; Binns, 2018). Despite business leaders are central to deploying and governing these technologies, current management education often falls short in integrating ethical considerations into AI literacy training (Mittelstadt, 2019; Stahl et al., 2021). This oversight risks creating technically skilled but ethically unprepared professionals.

Scholars increasingly advocate for ethics as a core component of AI literacy, not just an afterthought. Mittelstadt (2019) specifically criticizes AI literacy programs that prioritize technical knowledge, advocating for curricula that emphasize ethical aspects like bias, fairness, and accountability. Stahl et al. (2021) echo this, asserting that critical moral capacities are essential for responsible AI professionals. Neglecting ethics in AI education could lead to a technocratic mindset detached from AI's societal and moral implications (Floridi et al., 2018). This imperative has become even more compelling in light of the EU Artificial Intelligence Act, which embeds ethical principles throughout its provisions, particularly emphasizing human oversight, transparency, non-discrimination, and respect for fundamental rights for high-risk AI systems (Article 4(1)(e), Recital 35). Crucially, Article 3(56) defines "AI literacy" to include awareness of AI's ethical and societal implications, signaling that ethical understanding is now a regulatory expectation.

Historically, ethical AI instruction has been concentrated in philosophy, humanities, computing, and engineering programs (Erduran, 2023; Umbrello & van de Poel, 2021). However, these initiatives have rarely extended into business education, where ethics is often treated as a separate or elective topic, rather than as an integral component of AI governance and strategic leadership (Johnson & Mohamed, 2025).

This paper focuses on educational offerings within higher education curricula aimed at professional formation—that is, university-level programs such as undergraduate and graduate degrees in management, business administration, and related fields, situated between secondary education and workplace entry. Existing research highlights a persistent gap in these programs, where the integration of AI ethics remains marginal, fragmented, or superficial (Zawacki-Richter et al., 2019; Floridi & Cowls, 2022). In response to this misalignment between regulatory expectations and pedagogical practice, the paper proposes a framework that identifies the essential components for developing ethically grounded AI literacy among future managers.

## 2. Theoretical Background

### 2.1 Defining AI literacy: A multidimensional construct

AI literacy is a central concept within Artificial Intelligence in Education (AIED), focusing on what individuals need to know and do to engage effectively and ethically with AI (Baker et al., 2019; Holmes et al., 2019). Unlike the broader field of AI education, which encompasses teaching processes, AI literacy represents the outcome: a combination of skills, knowledge, and attitudes for informed and responsible AI engagement (Miao et al., 2020; Zhao et al., 2022).

Scholars offer various definitions, reflecting different disciplines and technological advancements. Long and Magerko (2020) define AI literacy as the ability to recognize AI, understand its function, and critically reflect on its ethical and social implications, emphasizing critical thinking over purely technical skills. Ng et al. (2021) reinforce this perspective, stressing that AI literacy involves technical knowledge, critical awareness, and ethical sensitivity, linking AI's functionality to its impact on people and institutions.

More recent contributions expand this construct. Kong et al. (2022) include cognitive, affective, and sociocultural dimensions, aligning AI literacy with broader digital literacies. Wilton et al. (2022) and Wang et al. (2023) propose multidimensional models that cover awareness, usage, evaluation, and ethics. These models suggest AI literacy isn't just about using AI tools, but also assessing their suitability, identifying potential harms, and reflecting on automation and algorithmic decision-making.

AI literacy is increasingly seen as intersecting with data literacy, information literacy, and digital literacy, forming a broader set of competencies for data-driven societies (Carolus et al., 2023; Schüller, 2022; Stolpe & Hallström, 2024). Some scholars believe AI literacy will soon be as fundamental as reading and writing (Aoun, 2017), requiring integration across all educational stages, from early childhood (Burgsteiner et al., 2016; Su & Yang, 2022) to professional settings (Cetindamar et al., 2022).

Despite these advancements, much of the academic literature still largely confines AI literacy to STEM (Science, Technology, Engineering and Mathematics) fields, especially computer science and engineering (Touretzky et al., 2019). Even when AI ethics is included (e.g., in Responsible AI), it's typically for developers and technical experts (Umbrello & van de Poel, 2021), overlooking leadership and decision-

making roles. This narrow focus prioritizes system operation over critical evaluation, neglecting the broader ethical and strategic responsibilities of future managers (Luckin et al., 2022).
Consequently, AI literacy remains underdeveloped in business and management education, often reduced to operational tool fluency or innovation management rather than a core ethical and strategic competence. Addressing this gap requires fundamentally rethinking AI literacy as an indispensable interdisciplinary and values-informed capability for navigating AI's profound organizational and societal impact.

### 2. 2 The ethical challenges of Artificial Intelligence: why AI literacy must include ethics

The ethical risks of AI systems—such as algorithmic opacity, bias, accountability gaps, and privacy erosion—have been widely examined (Zarsky, 2016; Selbst & Barocas, 2018). While traditionally approached as technical challenges, a growing literature argues that ethical oversight cannot rest solely with developers. Instead, it must extend to those who commission, deploy, or govern AI systems—roles typically held by managers and organizational leaders (Binns, 2018; Morley et al., 2021). These actors shape how AI is implemented in practice, often in ways that carry significant moral and social consequences, even when intentions are benign (Dignum, 2019).
Mittelstadt et al. (2016) stress that algorithmic systems generate moral consequences irrespective of the designer's intent, especially when used in organizational decision-making. Bryson (2018) similarly highlights that delegating decision-making to machines requires moral competence from those who choose to automate. Within this view, AI literacy in managerial contexts must go beyond technical fluency to include the ability to recognize ethical dilemmas, weigh normative trade-offs, and evaluate downstream impacts.
This expanded notion of AI ethics is particularly relevant in business contexts, where reputational damage, regulatory liability, and public trust are at stake (Floridi et al., 2018; Alkire et al., 2024). As Morley et al. (2020) and Stahl et al. (2021) argue, ethical instruction in AI is often fragmented or relegated to CSR modules, failing to prepare future managers for the real-world ethical complexity of AI deployment (Jobin et al., 2019; Dwivedi et al., 2021).

### 2. 3 Educational gaps in preparing managers for the ethical governance of AI

Despite growing recognition of AI's transformative impact, business and management education continues to lag in preparing students for the ethical governance of these technologies. Studies consistently point to a lack of integrated, interdisciplinary approaches that connect technical understanding with normative reflection (Stahl et al., 2021; Holmes et al., 2019). A comparative OECD (2023) report confirms that while AI ethics is gaining ground in computing and engineering curricula, it remains rare in business management education—especially at undergraduate and MBA levels. This curricular gap is especially concerning in light of recent policy developments. The EU AI Act frames AI literacy—including ethical awareness—as a professional requirement, yet university-level business management programs still tend to approach AI as a purely strategic asset (Johnson & Mohamed, 2025; Guzman, 2018). As a result, graduates often lack the tools to critically assess AI's societal implications, focusing instead on efficiency and innovation.
In the Italian context, the issue is even more pronounced. A recent national survey found that only 23% of university students had received any AI-related training, despite high usage of AI tools in academic and professional settings (Rome Business School, 2025). Gottardello and del Mar Pàmies (2019), through interviews with Italian business faculty, reveal that ethics and sustainability are often perceived as marginal to core management instruction. Industry-level analyses corroborate this disconnect: firms report a lack of ethical training despite increased AI adoption (OECD/BCG/INSEAD, 2025; Cisco, 2024).
These findings point to a structural tendency to treat ethics as an optional or peripheral concern in management education. Without embedding ethical competencies into the core training of future leaders, business schools risk producing professionals ill-prepared for the socio-technical challenges of AI integration.

## 3. Methodology

This study adopts a Systematic Literature Review (SLR) design to explore how ethical training related to artificial intelligence (AI) is addressed in management and business education. The aim is to critically examine the current academic landscape at the intersection of AI ethics, higher education, and managerial preparation, and to lay the groundwork for developing a pedagogical framework aimed at fostering ethically grounded AI literacy among future decision-makers.
The review process adheres to the PRISMA 2020 guidelines (Page et al., 2021), which provide a structured and transparent protocol for the identification, selection, and analysis of literature.

### 3.1 Data sources and search strategy

The literature search was conducted using two major academic databases—Scopus and Web of Science (WoS)—both renowned for their comprehensive indexing and multidisciplinary coverage in fields such as education, management studies, digital technologies, and ethics. Their integration ensures a more inclusive and balanced retrieval of relevant publications, reducing the risk of omitting significant studies due to database-specific coverage limitations (Falagas et al., 2008).
The search query was formulated to capture the intersection of artificial intelligence, ethics, and pedagogy in the context of management education. The final string used was:
("artificial intelligence" OR "AI" OR "digital technologies") AND ("ethics" OR "ethical principles" OR "responsible AI" OR "algorithmic ethics") AND ("higher education" OR "university curriculum" OR "business schools" OR "management education" OR "teaching" OR "pedagogy").
The search was restricted to peer-reviewed articles in English published between 2015 and 2025, to reflect recent and emergent academic contributions. In Web of Science, the query was limited to categories related to education and management; in Scopus, the scope was narrowed to the Social Sciences and Business, Management and Accounting classifications.
This search yielded 432 records from Web of Science and 377 from Scopus, for a total of 809 initial articles. After removing 228 duplicates through automated and manual procedures, the final dataset for analysis included 581 unique publications.

### 3.2 Bibliometric Analysis

The full dataset of 581 articles was subjected to bibliometric analysis using the open-source Bibliometrix R package (Aria & Cuccurullo, 2017). This analysis aimed to provide a macro-level mapping of the scholarly landscape, focusing on:

- Trends in publication volume over time;
- Distribution of documents across journals;
- Frequency and co-occurrence of keywords;
- Thematic evolution and trend topics.

The bibliometric analysis allowed for a longitudinal understanding of how the academic discourse on AI ethics in higher education has evolved over the past decade.

### 3.3. Content analysis: screening and eligibility criteria

The screening process involved a multi-phase evaluation of the retrieved records. During the identification and screening phases, all 581 articles were imported into a reference management system and independently reviewed by three researchers. Titles, authors' keywords, and abstracts were analyzed to determine alignment with the scope of the study.

To be retained for further consideration, articles needed to address at least one of the following three intersecting dimensions:

- Ethical dimension: Explicit reference to ethical principles, dilemmas, or frameworks related to AI or digital technologies.

- Corporate or managerial relevance: A clear focus on organizational settings, leadership, or business decision-making in relation to AI use.

- Educational and pedagogical dimension: Discussion of curricular design, teaching practices, or conceptual models for AI literacy or ethics education.

This preliminary qualitative screening was designed to identify studies relevant to the goal of understanding how AI ethics is (or is not) integrated into the training of future managers. Based on these criteria, 109 articles were selected for an in-depth full-text content analysis using NVivo software. A hybrid coding approach, combining deductive and inductive methods, was employed to systematically extract relevant information (Fereday & Muir-Cochrane, 2006; Braun & Clarke, 2006):

- The deductive coding scheme was informed by established ethical constructs, such as transparency, accountability, fairness, and privacy, as articulated in major academic and policy frameworks (e.g., Mittelstadt, 2019; Morley et al., 2021; European Commission, 2024). This approach allowed us to identify predefined ethical principles and their application within the context of AI in business and management education. The focus was on extracting specific content, principles, and approaches related to ethical considerations that could serve as foundational inputs for the construction of our framework.

- The inductive coding allowed for the emergence of novel themes directly from the data (Thomas, 2006), including barriers to curriculum integration, conceptual definitions of AI literacy, and cross-disciplinary challenges in business school contexts. Through this bottom-up approach, we sought to uncover unanticipated insights, teaching methods, and pedagogical strategies that could also inform the development of the framework, beyond the pre-established ethical constructs. This included identifying specific teaching methods, curricular structures, and practical examples of ethical AI integration.

This phase of the analysis was designed to generate deeper insights into the pedagogical approaches, theoretical underpinnings, and institutional dynamics that shape the integration of ethical AI training into management education. Following this comprehensive content analysis of the 109 full-text articles, 22 articles were deemed particularly relevant and useful for the research. These 22 articles were then further analyzed in detail, without the intermediation of software, to extract nuanced insights. A synthesis of the findings from these 22 key articles is presented in the subsequent findings section.

## 4. Findings

The bibliometric analysis highlights a rapidly expanding field at the intersection of artificial intelligence, ethics, and higher education, with increasing relevance to business and management studies. The literature has grown significantly over the past decade, with 581 publications across 381 sources, and an impressive annual growth rate of 54.2%. The average document age of just 1.52 years confirms the field's dynamism and early-stage maturity.

This growth has not been linear. From 2015 to 2019, scholarly output remained limited, with fewer than ten articles per year. A modest increase began in 2020, likely in response to the ethical uncertainties that accompanied the sudden digital acceleration triggered by the COVID-19 pandemic. A more pronounced surge occurred between 2021 and 2022, followed by an explosion of publications in 2023 and 2024—coinciding with the mainstreaming of generative AI tools and heightened debates on academic integrity, fairness, and responsible technology use. Preliminary data from 2025 suggest this momentum is continuing.

Terminological patterns in the literature further illuminate the field's contours. Terms such as "artificial intelligence," "AI ethics," and "higher education" dominate, reflecting the core focus of scholarly attention. More recent entries—like "OpenAI," "generative AI," and "large language models"—signal growing interest in specific technologies and their implications for educational practice. Meanwhile, the

emergence of terms such as “AI literacy,” “academic integrity,” and “assessment” points to an ongoing shift from abstract ethical concerns to more practical, curriculum-level challenges.
The literature is notably interdisciplinary, drawing on contributions from educational technology, ethics, psychology, and sustainability. Journals such as Computers and Education: Artificial Intelligence, Education and Information Technologies, and the International Journal of Artificial Intelligence in Education have emerged as key publishing venues, reinforcing the field’s cross-sectoral character.
Taken together, these findings suggest that the ethical dimensions of AI in education are no longer peripheral, but central to current scholarly discourse—especially as universities grapple with the pedagogical implications of emerging AI technologies. This evolving landscape calls for educational models capable of addressing not only the technical capabilities of AI but also the ethical and strategic questions that accompany its use in professional training contexts.

### 4. 1 Thematic Map Analysis

This section discusses the findings from the thematic analysis, drawing insights from both the thematic map generated by Bibliometrix and the thematic network visualization.

The thematic map, segmented into four quadrants based on "Relevance degree (Centrality)" and "Development degree (Density)," provides a clear overview of the intellectual structure of the research domain.

- Motor Themes (High Centrality, High Density): This quadrant, indicative of well-developed and highly relevant topics, prominently features "covid-19" and "datafication." Their high centrality suggests they are foundational to the field, while high density implies a substantial body of literature and ongoing research. The emergence of "covid-19" as a motor theme underscores its significant and pervasive impact across various research areas, likely driving new inquiries and applications.

- Basic Themes (High Centrality, Low Density): This quadrant highlights themes that are central to the field but may not be as extensively developed or are perhaps foundational concepts. "Artificial intelligence," "education," and "AI ethics" are clustered here, notably marked by a red circle in the provided image, indicating their significant centrality. Other themes in this quadrant include "assessment," "ethical implications," "ethical principles," "information literacy," "professional ethics," "medical education," "critical thinking," and "medicine." The strong presence of ethical considerations ("ethical implications," "ethical principles," "AI ethics," "professional ethics") alongside "artificial intelligence" and "education" strongly indicates that the intersection of AI, ethics, and educational contexts is a critical and widely acknowledged area within the field.

- Niche Themes (Low Centrality, High Density): These themes represent specialized or emerging areas of research that are well-developed internally but may not yet have broad connections across the entire field. "Autonomy," "applied ethics," "digital health," "digital competencies," "data justice," "scale development," and "authentic assessment" fall into this category. "Digital illiteracy," "curriculum design," and "disruptive technologies" also appear here. These themes suggest focused research clusters with significant depth, potentially indicating new directions or highly specialized sub-fields. For instance, "data justice" and "authentic assessment" could represent burgeoning areas of specific inquiry.

- Emerging or Declining Themes (Low Centrality, Low Density): This quadrant typically contains themes that are either nascent and not yet widely integrated, or those that are losing prominence. "Machine ethics" appears here, suggesting it might be an emerging concept still seeking broader integration or a topic with less sustained attention compared to the other themes. "Innovation," "sustainability," and "equity" are also present, which, despite their general importance, may not yet be deeply embedded as central research themes within this specific domain's current discourse, or their connection to other topics is still developing.

The thematic network analysis further supports the central role of artificial intelligence, education, and ethics within this research domain. These terms consistently emerged as the most prominent and interconnected keywords, confirming their foundational importance.
The analysis clearly showed that ethical considerations are not isolated; terms like "ethical implications," "ethical principles," and "AI ethics" are strongly linked to core concepts such as "artificial intelligence," "education," "assessment," and "digital technology." This illustrates that ethics is deeply interwoven with both the practical and theoretical aspects of AI in education, rather than being a peripheral concern.
While some areas like "digital health" and "digital competencies" might appear as niche themes, the network provides a more granular view of their specific connections within the literature, detailing how they relate to broader concepts.
Collectively, the analysis reinforces the overwhelming focus of this research domain: the strong connections between "artificial intelligence," "education," and various "ethics" terms explicitly demonstrate that the responsible and pedagogical integration of AI is a paramount concern in the current scholarly landscape.

### 4. 2 Content analysis results

Following a detailed content analysis of 109 full-text articles and a subsequent in-depth review of 22 highly relevant studies, this section synthesizes the key insights that directly inform the development of an ethically-informed AI literacy framework, particularly for business and management education. These findings reveal emerging themes, prevalent ethical considerations, diverse pedagogical approaches, and identified gaps in current educational practices.
The 22 studies, sourced from various journals and conferences, collectively highlight a growing recognition of the need to integrate ethical considerations into AI education. While some studies address the general challenges of AI implementation or the importance of "ethical by design" principles (Molina-Espinosa, n.d.; Vanhée, n.d.), a significant portion delves into the specifics of embedding ethics within educational curricula across different domains. The summary of the 22 analyzed articles, in table 1, highlights their relevant contributions to understanding AI ethics and its integration into managerial training.

| Author(s) (Year) | Relevant contribution to ethical AI literacy of managers |
|---|---|
| Molina-Espinosa & Ramírez-Montoya (2025) | Highlights general AI implementation challenges in education, including implicit ethical concerns in using generative tools like ChatGPT. This is crucial for managers navigating AI risks in business. |
| Vanhée & Borit (2022) | Emphasizes the importance of integrating ethics into the AI design phase ("ethical by design"). This is a critical concept for managers who commission and oversee AI system development. |
| Weidener & Fischer (2024) | Proposes a structured method for teaching AI ethics that can be adapted to managerial contexts. This helps train future leaders in applying ethical principles when dealing with AI. |
| Masters (2023) | Outlines principles for the ethical use of AI in a professional context. This offers a model for applying AI ethics to managerial decisions across various sectors. |
| Cornejo-Plaza & Cippitani (2023) | Analyzes the legal and ethical aspects of AI in education, underscoring the need for managers to understand the regulatory framework and legal implications of AI use. |
| Vilaza & Bækgaard (2022) | Provides practical insights into teaching ethics in system design. This is relevant for managers who need to evaluate the usability and ethical implications of user interaction with AI. |

| | |
|---|---|
| Alonso-Rodriguez (2024) | Contributes to the discussion on structuring ethics in AI education, providing elements for a managerial framework to guide AI-related decisions. |
| Ronaghi (2024) | Introduces innovative methodologies for business ethics education, suggesting how AI (e.g., VR) can be used to simulate complex ethical dilemmas for future managers. |
| Pierce (2024) | While more general on business ethics, it highlights the increasing relevance of ethical considerations in the global business context, which is directly applicable to AI integration. |
| Dash & Bharathi (2025) | Proposes a pedagogical approach to familiarize future managers with fundamental AI concepts through the Turing Test, stimulating reflection on AI's capabilities and limitations. |
| Lu & Lin (2025) | Defines what AI literacy entails for non-technical users, providing a basis for understanding what managers, as "non-experts," need to know about AI beyond technical skills, particularly regarding its societal implications. |
| Majidi (2024) | Discusses the broader implications of AI for human intelligence and consciousness, implicitly highlighting the need for management education to prepare leaders to navigate these profound changes and their ethical considerations. |
| Luckin (2025) | Emphasizes the need to redefine education to foster human intelligence in an AI-driven world, suggesting that management education must adapt to prepare leaders for new ethical and strategic responsibilities. |
| Yue et al. (2025) | Offers a pedagogical framework for AI literacy, even at early ages, which can inform foundational principles for AI ethics education across all levels, including management, by emphasizing design and responsible creation. |
| Ndungu (2024) | Proposes a framework for integrating basic AI literacy into broader information literacy, relevant for managers to understand how to critically evaluate AI-generated information and its ethical implications. |
| Atenas et al. (2025) | Advocates for critical and creative pedagogies in AI and data literacy, stressing "data justice." This highlights the need for managers to address issues of fairness, equity, and ethical data governance in AI systems. |
| Domínguez Figaredo & Stoyanovich (2023) | Explicitly advocates for a stakeholder-first approach to responsible AI literacy, which is crucial for managers to consider the diverse impacts of AI on all affected parties and ensure accountability. |
| O'Dea et al. (2024) | Focuses on generative AI literacy, directly addressing the ethical considerations and necessary competencies for students (and future managers) to effectively and responsibly use advanced AI tools. |
| Zhang et al. (2023) | Explores the integration of ethics and career implications with technical AI learning. This model suggests that early and holistic ethical integration is vital for building a foundation for future managers. |
| Ng et al. (2021) | Provides a broad overview of AI literacy, including its definition, pedagogical approaches, evaluation methods, and ethical dimensions. This offers comprehensive input for designing AI literacy programs for managers. |

| | |
|---|---|
| Yang et al. (2024) | Focuses on developing AI literacy through project-based learning in STEM. While for middle school, its emphasis on practical application and goal-oriented learning provides transferable insights for managerial training. |
| Yim & Su (2025) | Reviews AI literacy education in primary schools, indicating the foundational nature of AI concepts and ethics. This indirectly supports the idea that ethical considerations should be introduced early and built upon throughout educational pathways, including managerial ones. |

Table 1. Summary of key studies on AI ethics for managerial training

### 4.2.1 Key themes and insights

The in-depth analysis of these 22 articles revealed several recurring themes and provided critical input for our proposed framework:

- the inseparability of AI ethics and managerial decision-making: several articles underscore that ethical considerations are not merely technical add-ons but are intrinsically linked to strategic and operational decisions made by managers. Studies by Masters (2023) and Weidener and Fischer (2024) demonstrate how ethical frameworks are vital for professionals making decisions about AI implementation, even in non-technical fields. This extends to business, where Ronaghi (2024) highlights a shift towards practical, context-specific ethical training.

- multidimensionality of Ai literacy beyond technical skills: consistent with our earlier discussion on AI literacy as a multidimensional construct, several studies emphasize the need to move beyond purely technical proficiency. Research by Lu & Lin (2025) and insights from Ng et al. (2021) directly explore the various facets of AI literacy, including critical evaluation and ethical understanding. This supports the notion that managers need to comprehend the societal implications of AI, as explored by Cornejo-Plaza and Cippitani (2023).

- diverse pedagogical approaches for ethical Ai education: the analyzed articles present a variety of methods for integrating ethical AI into education. Vilaza and Bækgaard (2022) discuss insights into practical ethics instruction. Yue et al. (2025) propose a pedagogical framework for AI literacy, suggesting early intervention. For management education, Dash and Bharathi (2025) indicate creative approaches to conceptualizing AI. These diverse methods provide valuable guidance on how ethical AI literacy can be effectively taught across different educational levels and disciplinary contexts.

- focus on stakeholder impact and responsible AI: a strong emphasis emerged on understanding the impact of AI on various stakeholders and promoting responsible AI development and deployment. Domínguez Figaredo & Stoyanovich (2023) explicitly advocate for considering all affected parties. This resonates with broader ethical discussions in papers like Alonso-Rodriguez (2024). This highlights that ethical AI literacy for managers must encompass an understanding of accountability and the broader societal implications of their AI-driven decisions.

- addressing the generative AI landscape: the advent of generative AI tools, particularly large language models, has introduced new ethical considerations. Reviews by Molina-Espinosa & Ramírez-Montoya (2025) and O'Dea et al. (2024) specifically address the ethical implications and literacy needs related to this rapidly evolving technology. These findings underscore the dynamic nature of AI ethics and the continuous need to update educational content to reflect new technological advancements and their associated ethical challenges.

- the interdisciplinary nature and current gaps in management education: While the need for ethical AI understanding is evident, several papers, including Majidi (2024) and Luckin (2025), implicitly or

explicitly point to the current deficit in management education concerning comprehensive AI ethics. Atenas et al. (2025) emphasize the need for interdisciplinary approaches, which are often lacking in traditional business curricula.

These collective findings provide a rich empirical basis for developing a framework that not only defines the essential components of AI literacy for future managers but also integrates a robust ethical dimension, moving beyond abstract principles to actionable insights for responsible AI leadership.

## 5. Discussion

The results of this study reveal a rapidly expanding research field at the intersection of AI, ethics, and education, catalyzed by the diffusion of generative AI and accelerated by the COVID-19 pandemic. Thematic mapping shows that ethical considerations—such as fairness, academic integrity, and AI literacy—are central but still underdeveloped, highlighting a lack of actionable pedagogical guidance.
While the discourse around AI ethics in education is growing, most contributions remain situated within STEM or general education contexts, with limited translation into management education. Ethical AI literacy is rarely addressed as a core managerial competence, and when it is, it often lacks operational depth and contextual specificity. Existing models seldom reflect the real-world complexity of AI deployment in business functions such as HR, finance, or marketing, and few offer concrete teaching strategies or assessments suitable for business programs.
This disciplinary and pedagogical disconnect underlines the urgent need for structured educational frameworks that bridge ethical principles with managerial relevance. The content analysis emphasizes the importance of moving from abstract ethical awareness to applied, domain-specific competence.
These findings directly inform the development of the Ethical AI Literacy Framework for Management Education, which aims to address these gaps through a layered, actionable, and pedagogically grounded model, presented in Scheme 1. This framework is a synthesis of key insights and pedagogical approaches emerging from the most relevant reviewed literature, structured into four interconnected layers designed to be implemented within university-level programs in management, business administration, and related fields.
At its core, the framework rests on the premise that AI literacy for managers must go beyond basic familiarity with technological concepts. It must enable students to critically interrogate the ethical dimensions of AI in the contexts where they will be expected to make decisions. This means building a foundation of conceptual understanding, fostering ethical reasoning, connecting learning to applied business domains, and supporting implementation through appropriate instructional strategies.
The framework is anchored by three core pedagogical principles: interdisciplinarity, recognizing that AI ethics cannot be effectively taught in disciplinary silos; contextualization, emphasizing the relevance to real-world decision environments; and active engagement, prioritizing student-centered, experiential learning. Designed to be modular and flexible, the model allows for either standalone implementation or seamless integration into existing courses, providing a concrete roadmap for embedding AI ethics into business education.

| Layer | Key Elements & Description |
|---|---|
| **Conceptual Foundations** | **Goal:** Interpret and contextualize AI systems.<br>**Description:** This layer introduces students to fundamental AI concepts, including:<br>- **AI types** (e.g., narrow vs. general AI)<br>- **Core functions** (e.g., prediction, classification, generation, optimization)<br>- **Capabilities and inherent limitations** of these systems.<br>The intention is not to train students as developers, but to provide sufficient technical fluency to interpret how AI systems work, assess their relevance and trustworthiness in business settings, and anticipate where their application may raise ethical or strategic concerns. This foundational knowledge is crucial for critical evaluation. |

| Layer | Key Elements & Description |
|---|---|
| | **Relevant concepts:** Algorithms, automation, machine learning, large language models (LLMs), deep learning, data sets, etc. |
| **Ethical Reasoning & Reflection** | **Goal:** Equip students with the capacity to evaluate AI systems through normative frameworks.<br>**Description:** This layer focuses on engaging students with ethical principles and teaching them to identify, analyze, and resolve ethical dilemmas arising from AI deployment. The aim is to cultivate genuine ethical awareness beyond mere compliance.<br>**Key principles:** Fairness, accountability, transparency, privacy, justice, human oversight, non-discrimination, beneficence, non-maleficence, etc.<br>**Methods/Activities:** Structured debates, case study analyses (real-world and hypothetical), moral reasoning exercises, reflective writing, ethical frameworks application (e.g., utilitarianism, deontology, virtue ethics). |
| **Applied Managerial Contexts** | **Goal:** Situate ethical reflection within concrete areas of business practice.<br>**Description:** This layer connects ethical theory to the real-world challenges managers encounter when integrating AI tools into various organizational functions. Students learn to identify and navigate ethical trade-offs in specific managerial contexts.<br>**Business domains:** Human Resources (e.g., automated hiring, performance reviews), Finance (e.g., credit scoring, fraud detection, algorithmic trading), Marketing (e.g., customer profiling, personalized advertising), Logistics & Operations (e.g., inventory optimization, supply chain management), Cybersecurity, Product Development, Strategy, etc.<br>**Activities:** Simulations, ethical audits of AI systems, stakeholder role-plays, business case analyses, project-based learning with ethical constraints. |
| **Educational Strategies & Assessment** | **Goal:** Ensure pedagogical viability and scalability of the framework.<br>**Description:** This layer addresses the practical methods for embedding AI ethics content into existing management curricula. It encourages diverse teaching methods and robust assessment approaches to measure ethical judgment and competency.<br>**Approaches:** Active learning methods (e.g., flipped classrooms, problem-based learning, project-based learning), interdisciplinary co-teaching across faculties (e.g., business, ethics, computer science), modular design for flexible integration into existing courses, blended learning formats.<br>**Tools/Assessments:** Portfolios demonstrating ethical reflections and AI project analyses, dilemma-based evaluations, ethical audits of hypothetical or real-world AI systems, peer reviews of ethical analyses, simulations with ethical decision points, reflective journals, presentations on ethical AI cases. |

Scheme 1. Ethical AI Literacy Framework for Management Education

The Ethical AI Literacy Framework for Management Education is built on three developmental layers focused on student learning—conceptual understanding of AI systems and their limitations; ethical reasoning and reflection; and applied engagement with managerial functions such as HR, marketing, and operations—complemented by a cross-cutting layer dedicated to educational strategies and assessment, designed to progressively cultivate comprehensive ethical AI literacy in future managers. It moves beyond mere technical understanding to emphasize critical ethical engagement.

The framework begins with Conceptual Foundations, which ensure students grasp core AI concepts and limitations, not to make them developers, but to empower them to critically interpret and assess AI systems in business. This understanding is vital for evaluating AI's claims and anticipating ethical challenges. This foundational knowledge is supported by studies from Ndungu (2024), Ng et al. (2021), Zhang et al. (2023), O'Dea et al. (2024), and Yue et al. (2025).

Next, the Ethical Reasoning and Reflection layer focuses on developing students' capacity to analyze AI through normative frameworks, engaging with principles like fairness and transparency. This layer aims to foster genuine ethical awareness, moving beyond compliance through activities such as debates and case studies that promote critical thinking and moral reasoning. This approach is informed by contributions from Domínguez Figaredo and Stoyanovich (2023), Weidener and Fischer (2024), Cornejo-Plaza and Cippitani (2023), Alonso-Rodriguez (2024), and Lu and Lin (2025), who emphasize ethics as a dynamic, practiced competence.

Applied Managerial Contexts then grounds this ethical reflection in real-world business challenges. It addresses how managers integrate AI tools across various functions, from HR to finance, using experiential methods like simulations and ethical audits to help students navigate the practical tensions and trade-offs of AI deployment. The importance of grounding ethical literacy in authentic managerial scenarios is underscored by authors such as Domínguez Figaredo and Stoyanovich (2023), Atenas et al. (2025), Zhang et al. (2023), Weidener and Fischer (2024), and Yang et al. (2024).

Finally, Educational Strategies and Assessment layer ensures the framework's pedagogical viability. This layer details how AI ethics can be integrated into existing management curricula via modular and interdisciplinary approaches, promoting active learning and diverse assessment tools to measure students' applied ethical judgment in an ever-evolving AI landscape. This draws on practical and integrative recommendations from Ndungu (2024), Atenas et al. (2025), Vanhée and Borit (2022), Yang et al. (2024), and Ng et al. (2021).

This framework provides a structured yet adaptable roadmap for embedding ethical AI literacy into management education, equipping students to become not just competent users of AI, but responsible and reflective decision-makers in an increasingly automated world.

## 6. Theoretical and Practical Implications

The proposed Ethical AI Literacy Framework contributes to both the theoretical discourse on AI education and the practical design of pedagogical strategies within management programs. Theoretically, the framework advances the field by shifting the focus of AI literacy from STEM-dominated narratives toward a multidimensional, interdisciplinary understanding that is specifically tailored to the ethical and strategic demands of business leadership. It underscores the need to interpret AI literacy not only as a set of technical skills or general awareness, but as a layered construct encompassing ethical reasoning, contextual judgment, and reflective capacity—dimensions that are underrepresented in existing literature on management education.

Practically, the framework offers a blueprint for educators and curriculum designers seeking to integrate AI ethics meaningfully into business school programs. Each layer of the model translates high-level concepts into pedagogically actionable content, providing guidance on what to teach, how to teach it, and how to assess learning outcomes. For example, the focus of Layer 3 on applied managerial contexts ensures that ethics is not taught in isolation but embedded within the decision-making domains future managers will encounter. Similarly, the emphasis Layer 4 on educational strategies and assessment supports the realistic integration of AI ethics into modular and interdisciplinary course designs.

The framework is also relevant for institutional actors aiming to align business education with emerging regulatory expectations, such as those outlined in the EU AI Act and other global governance initiatives. By promoting a version of AI literacy that includes ethical, legal, and organizational dimensions, the model equips future professionals not just to use AI tools, but to question and guide their deployment in ways that are socially responsible and strategically sound.

In short, the framework operationalizes ethical AI literacy as a managerial competence. It can be adopted in the design of new courses, serve as a foundation for executive education, or be used to revise existing curricula in strategic management, HR, marketing, or operations to reflect the new realities of AI-infused business practice.

## 7. Conclusion and future research

This paper responds to a growing recognition that future managers must be prepared not only to work with AI, but to govern its use responsibly within complex organizational environments. Despite the rapid expansion of research at the intersection of AI, ethics, and education, there remains a clear gap in pedagogical strategies that translate these concerns into meaningful instruction for business students. Most current models of AI literacy fail to capture the domain-specific ethical and strategic challenges that managers face when adopting AI technologies.

To address this gap, we have developed a layered pedagogical framework grounded in a systematic analysis of the literature. The Ethical AI Literacy Framework for Management Education proposes a structured yet adaptable approach to cultivating ethically competent business leaders. It emphasizes conceptual understanding, ethical reflection, contextual application, and effective instructional design, all anchored in pedagogical principles of interdisciplinarity, contextualization, and active engagement.

The framework aims not merely to increase AI awareness among students, but to embed ethical reasoning into their professional identity as future decision-makers. In doing so, it contributes a concrete, implementable model for aligning business education with the ethical imperatives of the AI era.

Future research should explore the practical implementation of this framework in diverse institutional contexts, assessing its impact on students' ethical reasoning, managerial judgment, and readiness to handle AI-related dilemmas. Empirical studies are also needed to evaluate the effectiveness of specific teaching strategies—such as simulations, ethical audits, or dilemma-based assessments—in developing these competencies. Additionally, longitudinal research could examine how graduates trained under such frameworks apply ethical AI literacy in their professional trajectories, thereby closing the loop between educational design and responsible leadership practice.

By reframing AI ethics as a central pillar of managerial education, this work lays the foundation for a new generation of business professionals capable of leading with both technological fluency and ethical integrity.

## Abstract

To date, technologies based on artificial intelligence (AI) tools have transformed various work contexts, from the managerial to the academic field, supporting data analysis, decision-making, and research operations. However, the adoption of these technologies has raised questions not only about their functionality but also about the quality of the outputs generated. Research has highlighted the potential of these tools in increasing work efficiency by reducing work time, but it has also exposed various categories of risks. Among these are algorithmic biases, systematic distortions that influence the results generated by AI systems, which can lead to unfair decisions and various forms of discrimination, especially when the training data reflect pre-existing human judgments. Additionally, the issue of opacity in decision-making processes emerges, making it difficult to understand how an algorithm arrives at a certain conclusion. This phenomenon, known as the black-box problem, risks undermining user trust and the accountability of decisions, particularly in sensitive contexts such as healthcare, law, and education. In light of these issues, this study aims to analyze various AI tools to assess their integrity, focusing on fairness, reliability, and transparency, and to provide an ethical framework to stimulate critical reflection on their implementation and use in the academic field.

*Keywords: Artificial Intelligence (AI), AI integrity, Research Integrity, Academic Research.*

### 1.Introduction

In recent years, integrity in academic research, defined as the set of moral and ethical standards underlying various scientific activities (Zhaskylyk et al., 2023), has gained increasing importance. These standards encompass fundamental values such as honesty, transparency, reliability, and, more generally, responsible conduct at every stage of research. At the same time, artificial intelligence, increasingly integrated into daily life, has taken on a crucial role in both professional and academic contexts. The use of these tools has raised numerous ethical issues arising from their application (Mensah, 2023). The introduction of AI in research (defined here as observations, investigations, and experiments) has generated questions about the reliability, fairness, and transparency of the outputs. In this context, scientific integrity becomes a fundamental requirement, not only for AI models, processes, and methods but also for the researchers themselves. The latter must necessarily possess ethical competencies across three distinct dimensions: ethical sensitivity, reflective capacity, and dialogical capacity (Lacroix et al., 2017). Ensuring scientific integrity is essential to protect the credibility of the entire academic ecosystem. This requires the collective and continuous commitment of the academic community to define shared principles, correct behaviors, and timely responses to any violations of best practices. In light of these considerations, it becomes urgent to adopt a coherent approach that harmonizes the key concepts of academic integrity. Only in this way will it be possible to avoid the multiple interpretative ambiguities and promote behaviors aligned with

the principles of fairness in different disciplinary and cultural contexts (Tauginiene et al., 2019). In particular, the research questions this study aims to answer are as follows:

• RQ1: To what extent do the AI tools currently used in academic research adhere to the principles of honesty, reliability, and transparency?

• RQ2: What are the main challenges and strengths found in the different types of AI tools used in academic research?

## 2. Methodology

This study adopts a qualitative approach through a case study (Yin, 2019) in order to assess the level of integrity of different AI tools, with a particular focus on their application in academic research contexts. Specifically, the research concentrated on three potential integrity profiles: honesty, understood as the tool's ability to recognize its own limitations; transparency, meaning openness and technical accessibility; and reliability, in relation to the traceability, auditability, and accountability of the various outputs. A subset of 13 tools was selected through a multi-step filtering process from the initial corpus of 83 AI tools. Three criteria guided this reduction:

• Functional relevance: effective use or potential application within academic research workflows;

• Degree of diffusion: documented adoption or evidence of use in research or professional contexts;

•Application heterogeneity: representation of different clusters, including generative models, bibliographic exploration, data science, and ESG-related tools.

Specifically, 8 tools are focused on idea generation, literature exploration, and data science, while 5 are employed in the accounting/ESG domain (Moser & Korstjen, 2018). The inclusion of ESG-related AI tools is intentional. ESG reporting and monitoring constitute a paradigmatic domain where transparency, accountability and integrity are particularly critical. These tools reflect a rapidly expanding area of application, driven both by regulatory requirements and by societal demand for sustainability, and they directly influence policy-making as well as corporate behaviour (Lee et al., 2024). At the same time, the use of AI in this field raises significant methodological challenges, including the risk of undisclosed data sources and greenwashing practices, which undermine credibility and trust (Boedijanto et al., 2024; Moodaley et al., 2023). The reduction of the sample responds to the need for analytical feasibility and depth of analysis in order to compare the different AI tools, in line with the principles of qualitative research, whose goal—unlike quantitative studies—is to understand the phenomenon in a contextual and deep manner, rather than aiming for statistical generalization (Patton, 2002). In detail, to ensure greater reliability of the analysis results, a process of document triangulation (Denzin, 1978) was implemented, based on cross-examination of various sources for each AI tool: from technical manuals and official documentation to white papers, corporate communications, peer-reviewed scientific articles, and independent sources.

Information was ultimately collected according to the three dimensions of honesty, transparency, and reliability, to structure a comparative analysis. This process highlighted common trends, challenges of AI tools, and best practices, providing a foundation for broader reflections on the responsible use of AI in the production and management of knowledge.

## 3. AI Tools

In this study, the various AI tools were divided into two macro-clusters:

• AI for Management: This includes generative models, tools for literature exploration, and platforms for predictive analysis. Specifically, ChatGPT, Gemini, and DeepSeek represent advanced examples of Large Language Models, designed to understand natural language and generate text, code, or summaries that are theoretically coherent with the prompts provided.

Literature exploration tools, such as Connected Papers and Research Rabbit, use semantic algorithms to visualize connections between scientific articles and facilitate the discovery process in literature. RapidMiner, IBM Watson Studio, and BigML represent tools applied in the fields of data science and machine learning. They offer interfaces for building and training predictive models, with features oriented towards classification, regression, clustering, and advanced data analysis.

• AI for ESG Accounting: This cluster includes tools such as Green Watch, Sensefolio, Greenlytics, Climate TRACE, and ChatClimate. These integrate various sources: from climate and geospatial data to document-based sources, to support the assessment of environmental impacts and, more generally, non-financial reporting and monitoring of ESG performance.

### 3.1 Management AI Tools

This section is dedicated to the eight AI tools belonging to the "Management" macrocluster, listed in Table 1.

| Cluster | AI Tool | Main function |
|---|---|---|
| **Generative AIs** | GPT-4o | Text, code, summaries, and responses generation |
| | Gemini | Multimodal generation, Q&A, reasoning support |
| | DeepSeek | Open-source LLM with a focus on knowledge extraction |
| **Literature Exploration AIs** | Connected Papers | Visual map of semantically related articles |
| **Literature Exploration AIs** | Research Rabbit | Tracking and discovery of relationships between papers and authors |
| **Data Science AIs** | RapidMiner | Visual platform for predictive modeling and automated analysis |
| | BigML | Interpretable machine learning, with support for supervised models |
| | IBM Watson Studio | Environment for the development, training, and deployment of AI and AutoML models |

Table 1: Classification of the main AI tools by functional area.

### 3.2 ESG AI Tools

This section is dedicated to five AI tools belonging to the "ESG" macro-cluster, as shown in Table 2. The acronym refers to: Environment, Social, and Governance. These dimensions refer to the assessment of non-financial performance trends of organizations, offering a broader perspective compared to traditional performance indicators (Galbreath, 2013). Specifically, the AI tools are distinguished based on:

• The relevant ESG pillar;

• The type of AI: Driven or Plug-In. Driven AI refers to artificial intelligences that autonomously guide decisions, processes, and operational logic. They are roactive and often responsible for key decisions. Examples include ChatClimate and Climate TRACE. Plug-In AI, on the other hand, refers to artificial intelligences integrated into pre-existing systems. This means that, unlike Driven AI, the user retains control over the various functions, while the AI enhances certain support functionalities, such as translation, grammar correction, or analysis. Examples of Plug-In AI tools include Green Watch, Sensefolio, and Greenlytics.

| Cluster | AI Tool | Main function | ESG Pillar |
|---|---|---|---|
| **Greenwashing verification and contrast** | Green Watch | Analyzes corporate environmental claims and compares them with real emission data | E |
| **Scoring and ranking ESG** | Sensefolio | Calculates ESG scores for 30,000+ companies using NLP and ML on public sources | E + S + G |
| **Global Emission Tracking** | ClimateTRACE | Maps global GHG emissions with near real-time satellite data | E |
| **Educational conversational AI** | ChatClimate | Provides accessible answers on IPCC reports and climate-related topics through LLM | E |
| **Energy sustainability optimization** | Greenlytics | Applies predictive AI to support operational decisions in the energy sector | E |

Table 2: Functions and ESG areas of the main AI tools for sustainability.

## 4. Findings

From the analysis conducted on the heterogeneity of AI tools, it emerged that only a limited number of tools currently used in academic research adhere to the principles of honesty, reliability, and transparency. The main challenges include the lack of independent external audits, technical documentation, and transparency regarding the training data and the operational logic of the various models. Furthermore, systematic differences are evident between the different clusters of AI tools:

• Generative models exhibit high functional performance but low structural transparency, meaning that details on how they operate internally are unclear or inaccessible;

• Literature exploration tools are intuitive but not replicable or technically documented;

• Predictive platforms offer greater traceability, but only some (such as BigML) provide native explainability—defined as the explanation of how predictions or results are generated—and access to the models;

• Finally, within the ESG macro-cluster, there is significant heterogeneity between tools like Climate TRACE, which is highly documented, and others (such as Green Watch, ChatClimate, etc.) that have poor transparency and verifiability.

The evidence presented in the following subsections will provide a detailed analysis for each of the clusters reviewed.

### 4.1 Generative AI Tools

LLMs are highly powerful in terms of functionality. Technically, the documentation of the models is publicly accessible for all three AI tools analyzed, but there are significant differences in structural transparency:

• The training dataset is not publicly available for ChatGPT and Gemini, while it is partially documented for DeepSeek through technical reports;

• Audit systems are limited and internally managed by the development teams of ChatGPT and Gemini, while they are not provided for DeepSeek;

• The model code is partially available on GitHub for DeepSeek, whereas it is not accessible for ChatGPT and Gemini;

• The model architecture is briefly described for ChatGPT, published through technical reports for DeepSeek, and only available in the form of a company whitepaper for Gemini.

These elements highlight that, despite the accessibility and functional effectiveness of LLMs, there are still barriers related to transparency, replicability, and epistemic accountability. A comparative summary of the collected evidence is presented in Table 3.

| Aspect | ChatGPT | DeepSeek | Gemini |
|---|---|---|---|
| **Technical documentation** | Available and updated | Available and open source | Available via Google Cloud |
| **Training dataset** | Not public | Partially documented | Not public |
| **External audit** | Limited, internal only | Absent | Limited, internal only |
| **Model code availability** | No | Partial on GitHub | No |
| **Described architecture** | Brief description | Technical report | Google-only whitepaper |

Table 3: Comparison between ChatGPT, DeepSeek, and Gemini.

### 4.2 Literature Exploration AI Tools

The bibliographic exploration tools operate based on external bibliometric data, mainly sourced from Semantic Scholar, CrossRef, and PubMed. The technical architecture is not publicly documented, and the models that determine the relationships between articles are neither accessible nor explicitly described. Analyzing the two AI tools individually, for Research Rabbit, there is no available white paper, API, or detailed description of the algorithms used. In fact, the official website only provides an overview of how the tool works. The same applies to Connected Papers: the "About" webpage provides only generic information on the use of semantic similarity and graph construction but does not make the source code, internal architecture, or API available. A comparative summary of the collected evidence is presented in Table 4.

| Aspect | Connected Papers | Research Rabbit |
|---|---|---|
| **Technical documentation** | Partial, Outreach | Partial, Outreach |
| **Available dataset** | Non available | Non available |
| **Aspect** | **Connected Papers** | **Research Rabbit** |
| **External audit** | Absent | Absent |
| **Data source** | Semantic Scholar | Semantic Scholar, CrossRef, PubMed |
| **Replicable output** | No | No |

Table 4: Comparison between Connected Papers and Research Rabbit.

### 4. 3 Data Science AI Tools

Data science and predictive analytics tools, unlike the previous AI tools, have more comprehensive and well-organized technical documentation, but they differ in terms of openness and transparency. BigML, for example, offers greater accessibility to the models and native explainability (i.e., making its decisions understandable without requiring the user to adopt interpretation techniques), while Watson Studio tends to operate on more closed cloud-based logics. None of the three undergoes true independent external audits, despite the IBM team claiming to adopt strict internal ethical policies. A comparative summary of the collected evidence is presented in Table 5.

| Aspect | RapidMiner | BigML | IBM Watson Studio |
|---|---|---|---|
| **Technical documentation** | Extended | Very detailed | Extensive and professional |
| **Available dataset/model** | Partial | Wide access | Limited (depends on the plan) |
| **External audit** | Limited | Absent | Partial (internal only) |
| **Explainable output (XAI)** | Available | High level | Partial (not always) |

Table 5: Comparison between RapidMiner, BigML, and IBM Watson Studio.

### 4. 4 ESG AI Tools

Regarding AI tools focused on ESG issues, a strong heterogeneity has been observed between tools that seem similar in purpose but are very different in terms of transparency and reliability:

• ClimateTRACE is the most virtuous tool in ethical terms, thanks to the availability of detailed technical documentation, accessible datasets, and a methodological approach that focuses on replicability and verifiability of outputs.

• In contrast, tools such as Green Watch, Sensefolio, ChatClimate, and Greenlytics are characterized by limited or absent technical documentation, a lack of independent external audits, and unspecified or vaguely indicated data sources.

Furthermore, when analyzed based on the Plug-In or AI Driven classification, tools like Green Watch and Greenlytics do not explain their internal models or decision making processes, reducing transparency and hindering ethical assessment. ClimateTRACE and ChatClimate, on the other hand, take a more active role in data generation and interpretation, but only the former, among the last two mentioned, meets the minimum integrity requirements. A comparative summary of the collected evidence is presented in Table 6.

| Criterio | Green Watch | Sensefolio | ClimateTRACE | ChatClimate | Greenlytics |
|---|---|---|---|---|---|
| **Technical documentation** | Limited | Limited | Detailed | Limited | Limited |
| **Available dataset** | Not available | Not available | Available | Not available | Not available |
| **External audit** | Not specified | Not specified | Not specified | Not specified | Not specified |
| **Data source** | Not specified | Generic public sources | Satellites and sensors | IPCC | Not specified |

Table 6: Comparison between Green Watch, Sensefolio, ClimateTRACE, ChatClimate, and Greenlytics.

## 5. Discussions

Following the results that emerged, it is necessary to recap how the integrity of different AI tools radically varies depending on their application domains and the type of tool itself (AI Driven or Plug-In): Generative models exhibit significant structural deficiencies in terms of transparency, especially regarding the lack of access to training datasets, the unavailability of source code, and the absence of independent control and verification systems. Additionally, when faced with questions for which they lack appropriate knowledge, these models tend to generate seemingly plausible but unfounded answers, rather than recognizing the inability to provide a correct response (Shen et al., 2023). Bibliographic exploration tools prove useful in the early stages of research work, but the lack of technical documentation on similarity algorithms and the inaccessibility of underlying architectures hinder methodological replicability, a key element in scientific contexts. Predictive analysis and data science platforms show a better balance between functionality and document openness.

However, due to the absence of independent external audits, they cannot be classified as fully reliable tools. Among ESG tools, only Climate TRACE exhibits a high level of methodological integrity, unlike tools such as Green Watch, Sensefolio, ChatClimate, and Greenlytics. Consequently, the adoption of AI tools in research requires careful evaluation not only of performance but also of the ethical and scientific consistency of the tools used. AI integrity is an essential requirement, especially in areas where the quality of knowledge and trust in results are crucial, as it impacts both the validity of the scientific process and the public trust in science. For this reason, it is critical to adopt a critical stance when using such technologies, always requiring verification of the information obtained. Ethical principles are not only necessary for ensuring high-quality academic production, but also facilitate collaboration among researchers, shared responsibility, and the protection of the collective interest (Resnik D. B., 2024). In a context increasingly permeated by the human-AI symbiosis, ethics thus becomes a necessary critical lens to ensure behavior, impact, and use of technologies that are collectively accepted. The goal is to ensure dignity, equity, and freedom in research and the production of knowledge. Possessing and disseminating a solid culture of integrity in research is a fundamental prerequisite for the scientific community to maintain its foundational values and make a tangible, credible, and responsible contribution to the development of society (Zhaksylyk et al., 2023), reaffirming the importance of the collective responsibility of researchers, institutions, journals, and readers in safeguarding the quality, credibility, and reliability of scientific knowledge.

## Abstract

The strategic business implications of artificial intelligence (AI) in the digital era remain insufficiently explored across various sectors, including the media industry, despite its proliferation of digital products and expansive advertising potential. The impact of AI on media-related domains continues to be ambiguous, primarily because its demonstrated utility in material-intensive industries does not readily extend to the media sector. The distinctive characteristics of the media market may account for the divergent applications and outcomes of AI in comparison to other fields. This study examines the operational integration of AI within media enterprises, focusing on its influence across the value chain and the implementation challenges that arise in the process. Contemporary applications of AI in media include content recommendation algorithms that facilitate audience discovery, interactive functionalities that enhance user engagement, improvements in user experience, and the optimization of messaging strategies. A persistent challenge lies in organizations' efforts to balance operational efficiency with strategic effectiveness, particularly as they navigate the inherent tension between algorithmic decision-making and human cognitive processes.

## 1. Introduction

The industry widely accepts artificial intelligence (AI) as the transformative power of the digital age which functions as a new electricity for our times to fuel everything (Ng, 2017). AI capabilities have become so essential that businesses now must choose between adopting AI immediately or facing strategic delays in their implementation. AI creates its greatest worth through developing organizational capabilities instead of providing single tools (Edeigba, 2025). AI continues to expand at a fast pace while transforming entire industries which makes "wait and see" an impractical approach to risk avoidance. The strategic adoption of AI skills has become essential for maintaining business success in industries that historically relied on human judgment and creative decision-making including media (Wang et al., 2025). The media industry

experienced a complete transformation when tech giants Netflix, Amazon, Apple, Google and Facebook entered the market. The competitive advantages of media companies face a major challenge in this unstable market environment. Artificial intelligence stands as the following defining technology according to Bilow (2022) due to its revolutionary capabilities. The growing body of literature about AI applications and their consequences does not include sufficient research about the media industry. The media industry operates with unique characteristics because it requires both intuition and interpretation skills along with creativity and communication abilities and specific market and audience patterns (Picard, 2005). The sector's unique characteristics create doubts about AI's ability to achieve the same impact in media industries as it does in physical goods industries. Media companies face obstacles when they try to implement AI in their platform systems and editorial offerings because of societal implications from media content. This research investigates the essential strategic advantages of AI in media operations alongside its position in the value creation process and the difficulties that arise during implementation. This research centres on strategic implementation rather than theoretical exploration (Dissanayake et al., 2024; 2025).

## 2. Literature Review

Research about artificial intelligence (AI) business applications represents a recent academic development. Research on this subject remains scarce because scientific inquiry demands strict methodological standards according to Duan et al. (2019) and others (Brynjolfsson & McAfee, 2017). According to Brynjolfsson & McAfee (2017), AI has achieved its most important development through enhancing perception capabilities (for instance, image or voice recognition) and cognition capabilities (such as claim automation) within business processes. According to Agrawal et al. (2019), AI functions best when predicting uncertain scenarios to enable better decision-making. Academic research has evaluated AI's role in human-machine collaboration and innovative business models and digital ecosystems and its impact on labour markets and value creation within sectors (Bolton et al., 2018; Garbuio & Lin, 2019; Kelley et al., 2018). The industrial value chain benefits from AI implementation because it transforms actor relationships and enables new business platforms and better data utilization according to research. Through operational decision automation it achieves better efficiency and effectiveness alongside improved expert performance and innovative process optimization (Kelley et al., 2018). According to Duan et al. (2019), AI has established its most important application through decision-making support functions as well as human judgment replacement capabilities. Additional research should investigate three critical areas regarding AI adoption: measurement approaches for AI usage and its effects on system implementation and decision-making processes along with cultural and ethical and legal aspects of AI adoption. Businesses experience both economic benefits and risks when they implement AI solutions. The challenges of interpreting human-machine interactions along with verification problems emerge from statistical truths and ethical dilemmas among regulators and employees (Brynjolfsson & McAfee, 2017; Wright & Schultz, 2018). Zhang et al. (2018) assert that the value chain functions as a basic framework for understanding business AI deployments. Firms can use Porter's (1985) established framework to establish strategic activities by applying it to their operations. The framework allows organizations to study their operational structures to discover cost patterns and find value sources and competitive differentiators. The framework provides a useful structure to study AI value creation in the media sector through activity identification for technological transformation. Porter defines business activities into two main categories which include primary and support. Businesses perform three main primary activities when creating products or services and promoting them and delivering them to clients and providing follow-up services. Support activities serve as the foundation for primary activities by supplying essential infrastructure and resources. However, this model has faced criticism. Various researchers point out that this framework fails to represent firm globalization while showing better fit for physical products instead of services and maintains a linear view of value creation and ignores emerging actors such as venture capital firms and underestimates the value networks compared to internal processes (Hasen & Birkinshaw, 2007). A media company does not require complete vertical integration of all its value chain activities. The traditional businesses within this sector choose to focus on acquiring content while creating it and promoting it through advertising and

distribution channels (Picard, 2002). The relationship between media and technology exists because content distribution systems and access systems create strong connections between them. Research supports the need for a user-centred model which includes external user actions and social media and interfaces that generate internal operational changes through feedback mechanisms. The media value chain receives contribution from audiences through their content production and their ability to provide advertisers with important market data (Chan-Olmsted & Shay, 2016). Multiple potential applications of AI in media operations have been identified by researchers in existing studies. The existing research lacks both completeness and a systematic framework to describe these findings (Feher, 2024).

## 3. Preliminary Results

### 3.1 Contents recommendation.

The largest tech-media company Netflix demonstrates the most powerful use of artificial intelligence to recommend content and help users discover new content. The company stands out as one of the pioneers that tested algorithms for multiple public decision-making processes. The core business model of Netflix relies on AI to deliver personalized content according to Lynch (2022). The algorithms at Netflix control all elements of user experience through their influence on homepage row selection and title display and image presentation for films and alternative title suggestions. News and audio companies use natural language processing (NLP) technologies to create more accurate products for their user base. The mobile application developed by Quartz used NLP to find articles that match specific people, events or thematic content. The audio domain benefits from NLP through two applications which enable users to search evergreen content contextually and discover podcasts and on-demand radio shows more effectively (Chen et. al, 2020). The intelligent content recommendation and discovery capabilities of AI have become vital for maintaining audience satisfaction and loyalty because digital on-demand content continues to expand at an exponential rate. Many consumers who belong to younger demographics now prefer to find content through visual search methods using images according to Yang et al. (2017).

### 3.2 Public engagement

Cognitive technologies serve to improve audience interaction by creating more significant and meaningful experiences. The three key areas that show the most notable improvements are real-time engagement, rapid participation and the use of AI-powered assistants. Machine learning is used by OTT content providers to manage metadata which results in the collection of useful information to optimize audience engagement (Pihlajarinne & Alén-Savikko 2022). The Washington Post uses the "Knowledge Map" cognitive tool to correlate complex data which provides readers with a straightforward way to follow ongoing news stories and adds context and deeper insights when needed. The Guardian has tested Facebook chatbots as a tool to help users find articles and information. Virtual voice assistants have revolutionized audience interaction throughout the content search process and discovery phase and navigation phase. AI technologies that interpret linguistic features and emotional tone and user intent enable these interactions to become more fluid and natural. The National Basketball Association together with its teams uses AI-powered chatbots on social media platforms and websites to deliver statistics and match updates and instant ticket sale and availability information (Gabriel et al., 2024). AI-enhanced real-time and context-aware audience engagement in today's fragmented media landscape creates a strong bond between media brands and their audiences.

### 3.3 Message improvements

The application of artificial intelligence for personalizing marketing communications through message optimization represents the main focus of this context. The effective implementation of this technology delivers advantages to both audiences and media companies. The real-time analysis of content through AI enables video product indexing. The analysis of content through AI enables advertising partners to deliver messages that match their target audience while maintaining both contextual relevance and strategic marketing alignment (Lieb, 2017). The system improves both advertiser visibility and transparency and accountability according to Pihlajarinne & Alén-Savikko (2022). The same principle

applies to audio content. The delivery of appropriate messages through digital audio ad servers becomes possible through AI technology which also introduces new tracking methods for campaign analysis particularly useful for data attribution and modelling. The advancement brings radio media into alignment with digital media platforms according to Chen et al. (2017). The optimization of ad delivery through AI technology demonstrates strong potential to develop user experiences that are both coherent and satisfying.

## 4. Implications: towards a conclusion

The adoption of artificial intelligence technologies according to Castellanos (2018) extends to multiple industries which includes the Internet sector. Media companies face a crucial decision regarding cognitive technology implementation because they must decide when to establish an AI foundation that will boost current operations and identify fresh business opportunities. The real matter revolves around using AI capabilities in transparent and equitable ways rather than questioning its potential for evil actions (Browne, 2018). The review backs previous research findings by showing how AI enables automation and generates insight while enhancing audience engagement through perception and cognitive processes (Duan et al., 2019; Locker et al., 2018). The term "automation" describes the use of data to perform repetitive low-value tasks which are currently done by humans. Machine learning implementation by The New York Times reduced the time needed for article comment moderation thus improving operational efficiency through automated moderation. The second aspect refers to the ability of machines to interpret large datasets which enables real-time decision-making support for human operators. The algorithm used by Netflix analyses viewer data to generate strategic recommendations for content promotion and development strategies. Lachman & Joffe (2021) identifies this context as one of the most complex yet promising areas for media companies because it demands solutions to departmental data fragmentation while preserving human judgment together with machine intelligence. The achievement of this equilibrium needs workers who possess exceptional expertise. The implementation of these systems needs organizations to maintain solid alignment and substantial resource investments according to Locker et al. (2018). The definition of engagement consists of enabling large-scale consumer interaction while maintaining consistent quality and relevance in services. Media companies can now create value through AI-generated interactions using voice assistants and chatbots. The development of natural language processing (NLP) technology will make consumer communication interpretation increasingly difficult. The process of assessing consumer comfort levels together with thematic choices during automated conversations will prove especially challenging. Research on human–machine interaction and communication will need to expand significantly because of its importance for audience engagement and strategic decision-making and innovation. Media firms must address three critical obstacles to maximize AI benefits: uniting human and machine intelligence through interaction and developing analytical skills for AI implementation in existing operations. The research uses exploratory and descriptive methods to examine limited theoretical frameworks supported by academic literature. This study aims to provide a detailed examination of a vital matter within media management. Future research should investigate how AI implementation affects market performance through specific application studies and primary firm data collection.

# The Mimicry of Negative Valence in Online WOM: A Cognitive Approach

Andrea Pelaez Martinez[1]*, Lauren Block[2], Mahima Hada[2], and Ujwal Kayande[3]

## Introduction and Theoretical Framework

We document the linguistic mimicry of negative valence in online word-ofmouth (WOM) as a diagnostic component of review's information value. One field study and two experiments conducted in different consumption settings (hotels, study areas, and work experiences) demonstrate that consumers, when writing reviews, tend to mimic the negative valence of proximate posts. Using a decompositional technique, we also provide evidence that online linguistic mimicry is part conscious and part nonconscious. Our results suggest that the nonconscious component of review mimicry is six times that of the conscious element. Given that consumers heavily rely on online reviews to inform their purchasing decisions, managers and webmasters need to recognize that consumers,
regardless of their consumption experiences, tend to systematically express more negative opinions about a product when negative evaluations are included in nearby reviews.
Further research might explore potential interventions to curb this bias.

*Keywords: WOM, Mimicry, Negative Valence, Nonconscious processing.*

Although positive reviews are more prevalent (De Angelis et al., 2012), negative reviews pose a problem for firms as they impact sales (e.g., Chevalier & Mayzlin, 2006; Varga & Albuquerque, 2023). One might think that negative content in reviews comes exclusively from negative customer experiences. However, extant research in online WOM has indicated the presence of systematic biases in both the likelihood of consumers leaving reviews and the characteristics of the contributed content (Godes & Silva, 2012; Moe & Schweidel, 2012; Schlosser, 2005, 2009). The present work provides empirical evidence of consumers systematically mimicking the negative valence of proximate reviews.
Prior research on the impact of negative reviews on subsequent posters shows mixed results. On the one hand, Schlosser (2005) demonstrates how consumers adjust their evaluations downward as a self-presentational strategy only when previous reviewers have posted negative opinions about the target product. She theorizes that these negative evaluations are perceived as a signal of higher competence and standards. In contrast, Moore and McFerran (2017) predict and find that only positive words are mimicked in online reviews since consumers seek to affiliate; by contrast, negative words do not aid in affiliation. In the present work, we extend the work begun by Schlosser (2005), Moore, and McFerran (2017) on linguistic mimicry in online WOM by providing supporting evidence of the mimicry of negative valence from a cognitive perspective rather than the dominant social perspective in linguistic mimicry.
We also make a significant theoretical contribution to the domain of mimicry by demonstrating the proportion of linguistic mimicry that occurs consciously versus nonconsciously. While the literature has suggested that mimicry can occur either consciously or nonconsciously (e.g., Ki & Kim, 2019), using process dissociation methodology, we uniquely show the proportion of online review mimicry attributable to each process. In summary, we hypothesize:

**H1:** Consumers mimic the review negative valence of proximate reviews such that the greater the negative valence of the proximate reviews, the greater the negative valence of the focal review.

**H2:** The mimicry of negative valence in consumer reviews is primarily driven by non-conscious (vs. conscious) processes.
We adopt a multimethod approach, supporting H1 with results from a field study (TripAdvisor hotels) and two controlled experiments (Study 2: study areas; Study 3: work experiences). We employ a dissociative procedure in Study 3 to support H3. Based on previous research on evaluative content in reviews (e.g., Schindler & Bickart, 2012), we measured the negative valence of reviews in all our studies by calculating the number of negative words using the LIWC 2022 dictionary ('tone_neg').

**Study 1: Reviewers mimicking the negative valence in the field (hotels)**

We relied on an older dataset of Tripadvisor reviews (from 2004-2008) wherein reviews were always displayed in reverse chronological order to every visitor (Wang & Chaudhry, 2018). Upon examining various websites (TripAdvisor, Airbnb, Yelp), we observe that three reviews are typically visible on a webpage. Therefore, we capture the negative valence of each focal review and the average of its three proximate reviews, which were previously written for the same hotel. The following equation[1] illustrates the general model of mimicry. For focal review *i* of hotel *j* of reviewer *k* at time *t,*

$$\boldsymbol{NegVal_{ijkt}} = \beta_0 + \boldsymbol{\beta_1 NegVal_{ijk}(Average\ t{-}1\ to\ t{-}3)} + \beta_2 NegVal\ Reviewer_{i(j-1)k(t-1)}$$

$$+\theta_n Content\_Controls_{ijk}(Average\ t{-}1\ to\ t{-}3) + \delta_n Hotel\_Controls_j + \alpha_k + \gamma_t + \varepsilon_{ijkt}$$

*Results:* Supporting H1, a Negative Binomial (NB) regression yielded significant results, showing that the greater the average negative valence of the proximate reviews, the greater the negative valence of the subsequent review (model without controls: $\beta$*Negative Valence ijk (Avg. t-1 to t-3)* = .13, $p < .001$; and with controls: $\beta$*Negative Valence ijk (Avg. t-1 to t-3)* = .02, $p = .039$).

**Study 2: Reviewers mimicking the negative valence in the lab (study areas)**

Consistent with Study 1, we presented participants with three reviews allegedly written by fellow students and then asked them to write about their own experiences using the study areas at their university [https://aspredicted.org/MGV_ZK8]. The reviews they read were either lower or higher in negative valence, with the same length, and similar levels of emotionality and extremity across conditions. 459 undergraduate students (53.2% female, *M*age = 21.3 years) completed the online study in exchange for partial course credit. The manipulation worked as intended.

*Results:* Supporting H1, an NB regression showed consistent and significant results.
Participants who read higher negative reviews wrote 68% more negative words compared to their peers who read lower negative reviews ($\beta$*HigherNeg* = .52, $p < .01$, *MLowerNeg* = .25, *MHigherNeg* = .42).

**Study 3: Conscious vs. Nonconscious Components of Mimicry (work experiences)**

We employ a process dissociation technique (Kramer & Block, 2008; Fitzsimons & Williams, 2000), which utilizes simultaneous equations based on experimental conditions. These must include one scenario where conscious and nonconscious processes align (magnification) and another where they conflict (reduction). The study used a 2 (context: negative review vs. neutral control passage) × 2 (helpfulness rating of the content's author: magnification vs. reduction) × 2 (attention: full vs. divided) between-subjects design.[2]

---

[1] $NegVal_{ijkt}$ (focal review's negative valence), $NegVal_{ijk(Avg\ t-1\ to\ t-3)}$ (average negative valence for the three proximate reviews), $NegVal\ Reviewer_{i(j-1)k(t-1)}$ (negative valence of the previous review written by the same reviewer), $Content\_Controls_{ijk(Avg\ t-1\ to\ t-3)}$ (vector representing content control variables on the proximate reviews, including length, length squared, emotion, certitude, language complexity, topic overlap, and linguistic style matching LSM), $Hotel\_Controls_j$ (vector representing control variables accounting for hotel characteristics, including average hotel rating, price, and Hotel Travel Index HTI), $\theta$n and $\boldsymbol{\delta_n}$ (vectors of regression coefficients capturing the impact of the *N (where n* = 1 to N) control variables on the outcome, $\beta$s (regression coefficients, which capture the impact of each variable on the outcome of interest), $\gamma_t$ (time effects), and $\varepsilon_{ijkt}$ (error term).

[2] The context factor tests for negative-valence mimicry, expected under the review condition but not the control condition. Helpfulness manipulates the strength of mimicry by providing participants with a rational motivation to mimic or not mimic, while attention is altered through a multitasking audio task. This enables calculation of the mimicry effect across four conditions: FM(full-attention-

magnification), FR(full-attention-reduction), DM(divided-attention-magnification), and DR(divided-attention-reduction) detailed in Table 1.

| | |
|---|---|
| (1) $FM = NC + CS_f + CSHelp_f$<br>(2) $FR = NC + CS_f - CSHelp_f$<br>(3) $DM = NC + CS_d + CSHelp_d$<br>(4) $DR = NC + CS_d - CSHelp_d$ | $NC$ (nonconscious component), $CS_f$ (conscious component under full attention), $CS_d$ (conscious component under divided attention), $CSHelp_f$ (component due to conscious reduction-magnification manipulation under full attention), and $CSHelp_d$ (component due to the conscious reduction-magnification manipulation under divided attention). |

Table 1 Set of equations- Process Dissociation Technique

Results: Supporting H1, an NB regression showed that participants who read the review wrote reviews with a significant higher number of negative words than the participants who read the control passage (Mreview = .66, SD = .04, Mcontrol = .38, SD =.04; □ review=.59, z =2.55 p =.01). See Figure 1 to see the means pattern.

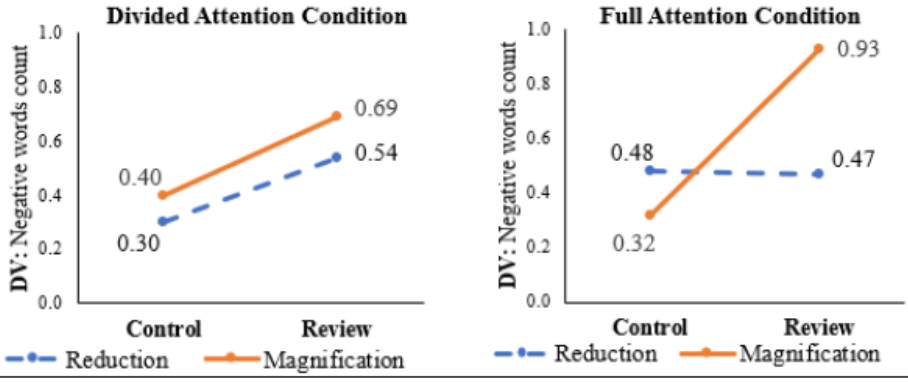

Figure 1 Negative Valence Mimicry, Study 3

We computed the total effect of mimicry, both conscious and nonconscious, as represented by the equations in Table 1. The magnitude of the mimicry effect is represented by the difference in negative words between a condition that was shown the negatively-valenced review and one that was not. We find that the conscious component of this effect (derived from the context manipulation) leads to a 12.32% increase in negative words (CSf = .04, 6.56% of FM). By contrast, the nonconscious component of the mimicry effect contributes an increase in the number of negative words of 80.10% (NC = .26, 42.62% of FM), approximately six times the relative size of the conscious effect (CSf) observed.

## Discussion

We document a systematic bias in the online WOM generation where consumers mimic the negative valence of proximate reviews. We adopt a cognitive perspective to expand the understanding of this phenomenon and estimate the conscious and nonconscious components behind the mimicry of negative valence in online WOM. We find that the nonconscious component is six times the conscious component. It appears that consumers do not engage much in this type of mimicry strategically. Instead, this phenomenon predominantly manifests beneath the threshold of conscious awareness. Further research might explore potential interventions to curb this negativity, especially when it is induced via mimicry. Extant research in online WOM has documented several potential interventions to mitigate negative reviews, such as providing firm's responses over time (e.g., Wang & Chaudhry, 2018; Herhausen et al., 2019). One potential path is to propose and test methods not to mitigate negative reviews but the mimicry of negative valence in reviews, motivating consumers' authenticity and uniqueness in their reviews, and creating awareness of the detrimental mimicry phenomenon.

## Abstract

This study outlines a research design conceived to examine the impact of Ethical Organizational Culture and Service Design on Human Thriving, with decent work serving as a mediator, ultimately supporting human thriving Although previous research highlights the significance of decent work and psychological well-being, few studies have combined these concepts within a service-oriented framework that considers organizational factors and contextual differences. This study is currently under development and employs a crosssectional design to investigate the proposed relationships between EOC, Service Design, Decent Work, and Human Thriving, drawing on survey data from employees in various European service industries. Structural Equation Modeling (SEM) is applied to test the proposed relationships and use multi-group analysis to examine how service context influences these relationships. Our research suggests that organizations that prioritize ethical organizational culture and service design are more likely to create work environments that respect dignity, autonomy, fairness, and inclusion, essential elements of decent work. These conditions boost employees' vitality and learning, which are key to human thriving. The strength of these relationships may differ across service sectors due to specific constraints or enablers, such as institutional norms, client interaction intensity, and resource availability. Ultimately, the research endeavours to offer a theoretically sound and empirically testable model that aids scholars and practitioners in understanding how valuesbased organizational strategies can lead to sustainable and thriving workplaces within service sectors.

*Keywords: Transformative Service Research, Ethical Organizational Culture, Service Design, Decent Work, Human Thriving*

### 1. Introduction

In today's knowledge-based economy, service organizations must promote employee wellbeing, learning, and meaningful engagement. At the heart of these goals is decent work, defined as productive work carried out with freedom, equity, security, dignity, and alignment with social values (Deranty & MacMillan, 2012; Duffy et al., 2016; Ragadu & Rothmann, 2023). While the importance of decent work for well-being is widely acknowledged (Deci & Ryan, 2000), current models predominantly focus on how individual and contextual factors such as marginalization and career adaptability influence decent work. In doing so, they tend to overlook organizational-level factors, particularly within service ecosystems. Meanwhile, research at the intersection of needs theory and humanistic management has underscored the role of job resources such as ethical leadership, autonomy, and supportive work design in promoting employee thriving (Demerouti et al., 2001; Duffy et al., 2016; Ryan & Deci, 2017). However, macro-level

organizational factors such as ethical organizational culture and service design, which can significantly shape work quality (Sreejesh & Roy, 2024), have received comparatively less empirical attention. Although decent work is increasingly emphasized as central to work and well-being, its systemic and organizational origins remain underexplored. These limitations are particularly relevant as scholars continue to call for transformational, system -level approaches in service management research (Blustein et al., 2016; Colbert et al., 2018).

To address this gap, this paper outlines a research design aimed at empirically examining the influence of Ethical Organizational Culture (EOC) and Service Design on Human Thriving, with Decent Work serving as a key mediating construct. EOC refers to the values, norms, and managerial practices that promote dignity, fairness, transparency, and integrity in interactions and decisions (DeBode et al., 2013). Service Design encompasses the structure and coordination of service processes, stakeholder engagement, and holistic planning across service ecosystems (Lynn Shostack, 1982). We argue that these organizational-level constructs are essential enablers of decent work in service settings.

Drawing on the principles of humanistic management, EOC directly supports dignity (Melé, 2016) and inclusive decision-making that respects all stakeholders (Duffy et al., 2016), which are foundational to meaningful and well-being-centered work environments (Melé, 2016; Pirson & Lawrence, 2010). Likewise, from the perspective of Transformative Service Research (TSR), service design is valued for its systemic and inclusive nature, contributing to both individual and societal well-being (Anderson et al., 2013). Integrating these perspectives, our model explains how organizational ethics and systemic service design translate into decent work experiences, ultimately enabling human thriving, which is characterized by psychological vitality, continuous learning, and meaningful engagement at work (Brown et al., 2017).

Our study aims to create a model that is both theoretically robust and empirically grounded, using a quantitative, cross-sectional survey design to examine the proposed connections between EOC, Service Design, Decent Work, and Human Thriving. This will help scholars and practitioners better understand how value-driven organizational strategies, namely ethical culture and human-centered service design, foster decent workplaces that promote human flourishing. By clarifying these connections, our model provides practical guidance for designing sustainable, high-performing service industry work environments.

## 2. Literature Review

### 2.1 Hypothesis development

Organizations with a strong ethical culture create a work environment that values fairness, integrity, and trust (DeBode et al., 2013). This leads to positive psychological and behavioral outcomes. Prior studies have shown that a work climate focused on ca ring and integrity can improve employees' emotional well-being by providing them with meaningful experiences (Joplin, 2024). Additionally, studies on organizational behavior suggest that employees are more committed and engaged when their values align with the company's values and moral standards (Huhtala & Feldt, 2016). In the context of decent work, a work environment that prioritizes ethics provides the necessary resources for employees to work decently and productively (Ragadu & Rothmann, 2023). Based on this, we prop ose the following hypothesis:

H1a: *Ethical Organizational Culture will have a significant positive impact on Decent Work.*

Service design is about planning processes, interactions with stakeholders, and underlying infrastructure to improve user experiences (Lynn Shostack, 1982). These ecosystem -level design efforts not only benefit users but also impact job characteristics, increasing the variety of skills, the meaning of tasks, and autonomy. According to JD–Resources theory, meaningful design enhances psychological states (Huang & Hsu, 2009).) and working conditions (Pagliaro et al., 2018). These better job conditions align with the elements of decent work, such as autonomy, work-life balance, and fair treatment, suggesting that service design fosters decent employment environments. Therefore, we propose that:

H1b: *Service Design will have a significant positive impact on Decent Work.*

Human thriving, characterized by vitality and continuous learning, is a key outcome of positive job design and supportive work environments. It highlights that decent work satisfies essential human needs, directly contributing to improved well-being and flourishing (Ragadu & Rothmann, 2023). Empirical meta - analyses confirm strong positive links between decent work and indicators such as mental health, career adaptability, and subjective well-being. Based on these, we hypothesize that:

H2: *Decent Work will have a significant positive impact on Human Thriving.*

Although both ethical culture and service design promote thriving, their effects are indirect. Earlier studies show that ethical work environments boost employee well-being primarily through channels like meaningful work and aligning with values (Joplin et al., 2021; Schwepker et al., 2021). Likewise, some other studies highlight decent work as the key link between external work conditions and psychological outcomes (Ragadu & Rothmann, 2023). Decent work is essential for turning ethical culture and service design into a foundation for human well-being by addressing psychological needs and preserving dignity (Melé, 2016; Pirson, 2017). It offers access to resources, opportunities for growth, and overall well-being, particularly in service industries where job security is often uncertain (Zientara et al., 2024). In environments characterized by inequality or bias, decent work helps reduce frustration and flourishing (Che et al., 2022; McCrudden, 2014). Service design improves job roles by boosting autonomy, skill variety, and clarity. These features closely align with decent work, providing resources that drive positive results. Studies have shown that job design plays a key role in promoting work settings that are both livable and flourishing (Ragadu & Rothmann, 2023). As a result, well-organized and ethical systems within organizations support human thriving primarily by shaping the quality of work conditions. Therefore, we hypothesize that:

H3a: *The positive impact of Ethical Organizational Culture on Human Thriving is mediated by Decent Work.*

H3b: *The positive impact of Service Design on Human Thriving is mediated by Decent Work.*

## 3. Methodology

This study is currently under development. This study will use a quantitative, crosssectional survey design to empirically examine the proposed relationships between EOC, Service Design, Decent Work, and Human Thriving. Adopting a deductive approach, grounded in existing theory and literature, we aim to validate a proposed research model using Structural Equation Modeling (SEM). The target population comprises frontline service employees across various European service sectors, including healthcare, education, and hospitality. These sectors are selected because of their importance in delivering peoplecentered services (Dodds et al., 2022; Hunter-Jones et al., 2023; Sanz et al., 2021), where organizational values, job design, and employee well-being are especially significant (Bansal et al., 2025; Rezapouraghdam et al., 2019; Wang et al., 2024). Participants will be recruited using a non-probability purposive sampling method via Prolific, a reputable online platform known for its high data quality and diverse respondent pool. A minimum sample size of 384 will be targeted to meet SEM requirements for model stability and accurate parameter estimation (Hair et al., 2019).
Participants will complete an online survey independently, and participation will be optional and confidential. Informed consent will be obtained from respondents before their participation, outlining the study's purpose, data protection, and how to contact them if needed. All constructs will be measured using validated multi-item scales adapted from previous research, including 15 items scale of decent work by Duffy et al. (2017), human thriving scale of 10 items by Porath et al. (2012), and EOC scale by DeBode et al. (2013) with 32 items. Control variables will include gender, age, tenure, sector, and education level.

Data analysis will proceed in multiple steps, using SPSS for descriptive statistics and reliability testing, and SmartPLS for SEM.

## 4. Findings and discussion

Despite the extensive literature affirming decent work as a crucial determinant of well-being (Duffy et al., 2016), there is a lack of empirical research on its organizational antecedents. This study bridges this gap by focusing on ECO and service design as crucial drivers of decent work. Our proposed research model builds upon the TSR model, suggesting that systemic changes in services can enhance well-being (Anderson et al., 2013). We anticipate demonstrating how an employee-centered approach to service design, combined with an ethical culture, can improve internal work environments, promote human well-being, and thriving.

Frontline service employees often face emotional demands, inherent unpredictability, and a high risk of burnout. By concentrating on this group, the study is expected to offer targeted insights into how service organizations can retain, empower, and support this vital workforce. Furthermore, given the varying levels of institutional protection and prevalent cultural norms across Europe, the empirical validation of our model in this diverse context will offer valuable cross-national implications, thereby enriching the international human resources and organizational behavior literature

5. Practical and Managerial Implications

This study is poised to offer practical implications for managers seeking to build an ethical organizational infrastructure, including formal elements such as codes of conduct, leadership training, and transparent reporting systems, by showing how such systems help to create a psychologically safe environment that supports decent work and enhances human thriving in the service industry. Our findings will advocate for service Design processes that extend beyond customer experience mapping to include employee journey mapping. By developing an inclusive service architecture where employee voices shape workflows, organizations can enhance autonomy, purpose, and staff retention. Rather than viewing well-being initiatives as optional, organizations should strive to create an environment where people can thrive, linking this goal to their ethical culture and design choices. Companies across various service sectors can utilize this model to evaluate their ethical climate and design practices, informing HR actions based on evidence. This model directly supports Sustainable Development Goal 8, which focuses on Decent Work and Economic Growth. Moreover, Organizations can also use this framework for enhanced corporate reporting and alignment with broader ESG goals.

## Real-Time Biometric Framework for Marketing Automation: Reshaping Consumer Behaviour through IoT-CGM Integration

Tatiana Tolusso[1]*

[1] IULM University, Italy

* Corresponding author: tatiana.tolusso@studenti.iulm.it

### Abstract

The evolution of marketing automation is increasingly shaped by real-time data analytics, predictive modelling, and hyper-personalisation. Yet, the growing availability of information and consumer choice may result in cognitive overload and decision fatigue, leading to disempowerment, rather than empowerment.
Drawing on Daniel Kahneman's dual-process theory and building on the previously developed GIRTM framework, this study reframes marketing automation through a biometric dimension, focusing on glucose as a strategic proxy for cognitive and behavioural patterns. Indeed, literature has demonstrated that glucose significantly influence decision-making; particularly, lower glucose levels are associated with heuristic-based responses. In this perspective, glucose emerges as a valuable and novel biometric indicator, made measurable thanks to the convergence of IoT technologies with Continuous Glucose Monitoring (CGM) systems, that enable continuous and real-time tracking of glucose data. Thus, IoT-CGM systems offer a promising avenue for integrating biometric insights into marketing automation strategies, supporting applications such as dynamic personalisation and campaign optimisation. Through a review of current literature, this conceptual contribution advances the understanding of how glucose through IoT-CGM systems can enrich real-time consumer behaviour analysis and lead to a new frontier in marketing automation.

# Track 4 - Business-to-Business Marketing

## Rethinking B2B Networks through Digital Transformation and Value Co-Creation

Elisa Martina Martinelli[1]*, and Alessia Anzivino[1]

[1] University Cattolica del Sacro Cuore - Milan, Italy

* Corresponding author: elisamartina.martinelli@unicatt.it

### Abstract

Companies today operate in rapidly changing environments marked by high levels of uncertainty and pressure, under the impact of exogenous disruptive events.
Digital transformation (DT) profoundly influences organizational capabilities and broader societal change, reshaping business models, strategic approaches, marketing practices, customer engagement, and supply chain dynamics. DT has the capacity to affect all dimensions of business activity, with marketing emerging as one of the most impacted domains. In order to sustain competitive advantage in the digital era, it is essential for the marketing function to undergo continuous adaptation (Caliskan et al., 2021). While the rapid progression of digital technologies has spurred increased scholarly attention toward DT and marketing, a significant gap persists in research examining its implications within the broader business landscape—especially regarding the interaction between enabling factors and implementation challenges (Vial, 2021).
In such volatile environments, leveraging established business relationships is frequently regarded as a strategic means of navigating unpredictable external phenomena, whereby firms utilize existing resources to pursue a range of potential outcomes (Sarasvathy, 2001). Nevertheless, these same relationships can become liabilities, exacerbating the impact of exogenous disruptive events due to the interconnected nature of business networks (Abosag et al., 2016). More broadly, firms must develop the capacity to adapt, recover rapidly, and enhance organizational resilience (Williams et al., 2017). As a result, scholarly interest in business marketing has increasingly focused on how business-to-business (B2B) firms cultivate and adapt themselves in complex networked environments (Gölgeci and Kuivalainen, 2020).
In particular, business networks are composed of diverse actors who collaborate to generate greater value than providers could deliver independently (Hofacker et al., 2020). Therefore, understanding the network context in which value is co-created is essential for comprehending how these actors interact with and respond to their surrounding environment, including the effects of exogenous disruptions (Munksgaard et al., 2024). DT has given rise to new forms of interaction and relationship-building that have become central to value creation in B2B companies, while also reshaping actor engagement and resource integration (Corsaro and Anzivino, 2021). In this regard, Hofacker et al. (2020) emphasize the critical need to explore the transformative and disruptive effects that digital technologies exert on value co-creation processes within B2B settings. Given the ongoing reconfiguration of industrial market structures and dynamics driven by these technologies, a thorough and systematic investigation into their effects on business environments remains crucial (Matt et al., 2023). Specifically, scaling technology adoption—for example, in relation to emerging technologies such as generative AI—requires a supportive external environment in which user trust and readiness, viable business model economics, regulatory clarity, and talent availability play critical roles. Moreover, managers are facing increasing complexities and must align

long-term objectives related to technology adoption with internal resources, while also considering the broader external ecosystem to effectively integrate new technologies into their operations (McKinsey, 2024).
Therefore, the present study explores the impact of DT on business networks, placing specific emphasis on how it shapes value co-creation dynamics within B2B environments. Thus, the main research question is: How does digital transformation impact business networks for value co-creation?
In detail, particular attention will be devoted to understanding this impact through the identification of the dimensions most affected by DT, as well as the effects of DT on the value co-creation process. For this reason, in order to address the macro research question, the study focuses on two sub-research questions: (SubRQ1) What are the main dimensions affected by digital transformation? And (SubRQ2): What are the main specific effects of digital transformation on the value co-creation processes on business networks?
Therefore, a qualitative research method was employed, including 30 semi-structured interviews with key informants and secondary data analysis. The study reveals three key dimensions influenced and impacted by the DT: execution of activities, strategic adjustment of resource allocation, and redefinition of stakeholder roles. The research highlights the multifaceted impact of DT on B2B network. Its originality lies in identifying that three main value processes involved in value co-creation within business networks are affected by specific effects related to the three dimensions influenced by DT. Furthermore, the study provides a practical framework to guide managers in navigating technological transition and fostering value co-creation throughout their networks.

# Track 8 - Digital Marketing

# Investigating Intergenerational dynamics in voice search behavior: implications for brand engagement

Giulia Miniero[1]* and Lamberto Zollo[1]

[1] University of Milan, Italy

* Corresponding author: giulia.miniero@unimi.it

## Abstract

Voice search behavior is becoming increasingly pervasive, driven by advancements in artificial intelligence (AI; Ford et al., 2023). Users now rely on voice commands for a variety of tasks, such as navigating while driving, setting timers, controlling smart home devices, and searching for products via platforms like Google. Our homes are increasingly equipped with smart speakers (Lee and Cho, 2020, Ford et al., 2023) whose global sales continue to grow and are projected to exceed 350 million units by 2029 (Statista, 2023). Virtual assistants such as Alexa, Siri, Cortana, and Amazon Echo— accessible through smartphones and other digital devices—enable users to search for information and complete purchases using voice commands. Despite this incessant use of AI in our daily life, scholars report a growing feeling of skepticism and fear toward technology-based tools as pervasive elements of our life (Zhou et al., 2024). This leads to a need for a better and deeper understanding of the underlying behavioral dynamics, especially of the youngest generation, such as Gen Alpha as they are primarily relying on voice search behavior: do they embrace totally AI tools – such as voice search behavior – or do they show some typologies of reluctance in such technologies as older generations? Through a mixed method approach this study aims at shedding light on the intergenerational dynamics in relying on voice search behavior and its implications on engagement with the brand.

*Keywords: voice search behavior, brand engagement, AI trust, social learning.*

According to Statista (2023), approximately 25% of individuals report using voice speakers multiple times per day. Users engage in voice search because it is fast, convenient, and hands-free. Recent scholars found that, compared to conventional typed search queries, dictated searches provide more specific and detailed description of what consumers are looking for (Melumad, 2023). Hence, 'vocalized search' is increasingly perceived as more effective and satisfying. This mode of searching is particularly well-suited to multitasking and is commonly used in situations such as driving, traveling, or cooking— contexts in which typing on a phone or tablet becomes increasingly impractical. Voice search is based on AI and operates through systems of speech recognition, which are processed by natural language models and subsequently integrated with search algorithms (Sun et al., 2019). From the user's perspective, voice queries tend to be more informal and conversational, allowing for longer and more natural question formats compared to traditional typed searches.

For advertisers, users' engagement in voice search represents an enormous opportunity to get closer to the potential customer, to increase engagement with the brand thanks to a more personalized and intimate

interaction (Sands et al., 2025), to provide relevant and in-the-moment recommendations, thus customizing the customer journey based on AI (Longoni and Cian, 2022).

Among the individuals most inclined to rely on voice search—due to its perceived ease of use and convenience—are members of Generation Alpha. Defined as those born from 2010 onward, Gen Alpha represents a distinct cohort of emerging consumers with unique digital behaviors (Patrick and Arora, 2025). Growing up entirely in the 21st century, they are deeply immersed in technology and highly value personalized, interactive digital experiences. They move fluidly across multiple platforms, making them particularly receptive to microtargeted advertising and gamified shopping environments (Patrick and Arora, 2025). Consequently, marketers and advertisers are increasingly encouraged to tailor search optimization strategies to meet the expectations of this generation— adopting longer and more conversational queries, platform-specific keywords, and interactive content formats that resonate with younger users eager to engage with brands through technologically mediated experiences (Hollebeek et al., 2024).

However, despite their digital fluency, Gen Alpha consumers are still children and pre-teens. Their technology use and consumption behaviors are significantly influenced—and often mediated—by their parents, who belong to Millennial or Gen Z cohorts. While these parents may be less instinctively inclined to use voice search, their proximity to Gen Alpha may expose them to it indirectly.

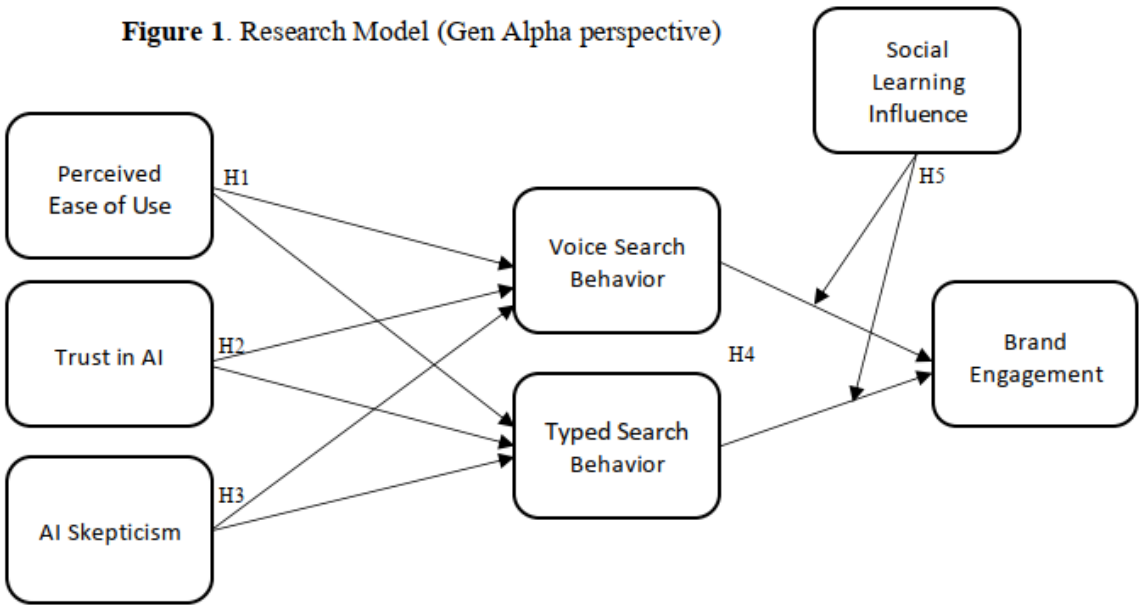
According to Social Learning Theory (Bandura, 1977), individuals can acquire behaviors not only through personal experience but also through observation of others. This suggests that voice search practices may evolve through both individual trial and modelled behavior within the family unit: specifically, as Gen Alpha children demonstrate fluency and comfort with voice AI, skeptical or less tech-savvy parents may become more open to trying it. Yet, does the opposite social learning influence work? In other words, what is the influence of parents' traditional use of typed search on their children search behavior?

At the same time, existing research shows that many adult consumers exhibit forms of algorithm aversion or skepticism toward AI-based technologies (Arango et al., 2023; De Freitas et al., 2023). These tendencies—such as reluctance to trust or delegate decisions to algorithms—may contrast with the attitudes of Gen Alpha, who are growing up with AI as a natural art of their environment. This intergenerational dynamic raises important questions about how voice search behavior and trust in AI are shaped through both direct interaction and social learning within families and challenges the overall effectiveness of voice search in terms of engagement with the brand

This leads to three central research questions:

• RQ1: How do Gen Alpha and their parents differ in how they phrase

voice search?



• RQ2: How do trust levels in voice AI vary between Gen Alpha and

their parents, and to what extent are younger users influenced by their parents' skepticism and vice versa?

• RQ3: how should advertisers adapt voice search optimization strategies to increase brand engagement, while accounting for generational differences in language use, query structure and trust in AI based search results?

Building on this, we propose the following conceptual model:

**Figure 1**. Research Model (Gen Alpha perspective)

By adopting a mixed-method approach that combines individual surveys with direct observation of parent–child dyads performing voice searches, this study aims to explore intergenerational differences in voice search behavior. Specifically, it investigates how patterns of usage, phrasing, and trust in voiceactivated technologies differ between Gen Alpha consumers and their parents, while also examining the dynamics of mutual influence and social learning within the dyad. Through the integration of observational and self-reported data, the study seeks to uncover how voice search practices are not only individually shaped but also co-constructed within family interactions.

In addition to its theoretical contribution to understanding social learning and AI trust gaps, the study also offers practical implications for advertisers and marketers. By analyzing the language patterns and behavioral responses observed across generations, the research provides actionable insights for refining voice search optimization (VSO) strategies with the aim of increasing consumers' engagement with brands. This includes adapting content, query structure, and keyword targeting to align with the distinct habits and expectations of both younger and older users in voice-assisted environments.

# Seen Together: How the Visual Co-Presence of Helpers and Victims Affects Social Media Engagement

Sofia Pansoni[1]*, Giacomo Gistri[1], and Stefania Farace[2]

[1] University of Macerata, Italy
[2] University of Bologna, Italy

* Corresponding author: s.pansoni@unimc.it

## Introduction and Theoretical Framework

In the last decade, social media has become a strategic tool for nonprofit organizations (NPOs) to raise awareness, engage supporters, and secure funding. Institutions like the UNDP describe this environment as a fast-moving, overcrowded space where attention is fleeting and continuous adaptation is essential (UNDP, 2024). In this context, visual storytelling is critical to capturing attention and fostering emotional engagement. Research shows that human faces, especially those of identifiable beneficiaries, foster empathy and prosocial behavior (Small & Loewenstein, 2003; Nikulina et al., 2024). As research has largely focused on the persuasive role of beneficiaries, with little attention to operators' visual presence, this study examines how the co-presence of operators and beneficiaries, compared to beneficiaries alone, influences Instagram engagement. A long-standing body of research in social psychology demonstrates that individuals are less likely to engage in helping behavior when others are perceived to be present, a phenomenon known as the bystander effect. As originally proposed by Darley and Latané (1968), the Diffusion of Responsibility Theory posits that when multiple potential helpers are present, the responsibility to intervene becomes psychologically shared, leading to a reduced sense of personal obligation to act. This process is well documented through the lens of the bystander effect (Kuppuswamy & Bayus, 2017) whereby observers may feel that the moral "quota" has already been met by others, thus reducing their own motivation to help. In particular, the presence of humanitarian workers in visual content might lead viewers to infer that someone is already "taking care of it", thereby reducing their own felt responsibility. For this reason, we state:

**H1:** The co-presence of both beneficiaries and operators in an image is associated with lower engagement.

If co-presence of operator and beneficiary reduces engagement, possibly through diffusion of responsibility, it is crucial to examine whether face visibility can weaken or strengthen this effect. In co-presence conditions, showing operator's face may help counterbalance the negative effect of shared responsibility by introducing a recognizable prosocial agent into the visual narrative. The face of the humanitarian worker may trigger a different psychological response, such as identification with the helper, admiration, or a sense of social connection with those providing aid. Drawing on theories of social presence (Short et al., 1976), emotional contagion (Hatfield, Cacioppo, & Rapson, 1993), and prosocial modeling (Bandura, 1977), we propose the following hypothesis:

**H2**: When both a beneficiary and a operator are depicted in the image (co-presence), showing the face of the operator increases engagement.

While prior studies have demonstrated that showing a beneficiary's face increases empathy and engagement (Small & Loewenstein, 2003), these effects may not generalize to all visual configurations. Specifically, when a humanitarian worker is also present in the image, the emotional impact of the beneficiary's face may be altered. One possible explanation is that the presence of a second actor (the

humanitarian worker) modifies how viewers interpret the image. According to the Persuasion Knowledge Model (Friestad & Wright, 1994), when emotional cues appear embedded within an explicitly designed narrative, viewers may perceive the image as strategically crafted, reducing authenticity and prompting resistance. Accordingly, we posit:

**H3**: When both a beneficiary and an operator are depicted in the image (co-presence), showing the face of the beneficiary decreases engagement.

## Methodology

We conducted a field study analyzing Instagram posts from seven major Italian nonprofit organizations. Data were collected via Apify, which enabled automated scraping of public posts published between May and August 2024. Only image-based posts were included; videos were excluded to ensure visual consistency.
Each image was manually annotated for: co-presence of beneficiaries and operators (e.g., humanitarian workers), visibility of each subject's face, presence of logos, and overlay text (TO). We also extracted caption data and coded the following control variables: word count, emoji count (using the Para classifier; Luangrath et al., 2022), valence/arousal scores (computed via the VAD lexicon; Mohammad, 2018), organization's sector, follower count. The dependent variable (Total Engagement) is a non-negative count variable, highly right-skewed, with variance ($2639.1^2$) far exceeding the mean (1287.3), indicating overdispersion.

## Results

The overall model was statistically significant, and the test for overdispersion confirmed the appropriateness of the negative binomial specification over a Poisson model. Results show that co-presence of beneficiaries and operators was significantly associated with a decrease in total engagement, compared to posts featuring only beneficiaries **(**B= - 1.110, $p < .001$), confirming H1. The interaction between copresence and operator's face visibility was positive and significant (B=1.380, p=.005), possibly indicating that when both subjects are present, the visibility of the operator's face may help counteract the negative effect of co-presence, in line with H2. Conversely, the interaction between co-presence and beneficiaries' face visibility was negative and statistically significant (B= -1.018, p=.023) coherently with H3.

## Conclusions and Future Development

These findings highlight how subtle variations in visual composition may influence how viewers interpret nonprofit imagery. This study is not without limitations. First, as a field study based on real-world data, it may be affected by contextual and platformspecific factors that cannot be fully control. For this reason, we plan to conduct experimental studies to test the effect of co-presence on engagement under controlled conditions and to investigate the psychological mechanisms, such as perceived authenticity, diffusion of responsibility, empathy, and reactance, that may help explain the patterns observed in the field.

## Monetary and Non-Monetary Interventions to Stimulate Green Purchase Behavior

## Abstract

Consumers state they value sustainability, yet green purchasing remains low. We study price discounts and descriptive social norm nudges, separately and combined, expecting lower perceived monetary sacrifice and higher green trust to produce the largest immediate impact and the strongest habit formation in green purchase behavior.

*Keywords: Green purchase behavior, Monetary Intervention, Non-monetary Intervention, Trust*

### Introduction and Theoretical Background

Many firms promote green practices, yet consumers often bypass green options due to higher prices, doubts about green claims, and perceived sacrifices (Acuti et al., 2022). A large intention to behavior gap remains, and evidence on effective interventions is mixed (Shehawy, 2023; He & Li, 2025). We focus on two interventions: price discounts that reduce perceived monetary sacrifice and descriptive social norm nudges that build green trust. Perceived monetary sacrifice is a key barrier; discounts can lower this cost and raise green purchases (Monroe, 2003; Tseng, 2016). Social norms guide behavior, so showing that many choose green can increase trust and purchase (Cialdini et al., 1991; Ng et al., 2025). We propose that using both together strengthens effects by lowering monetary sacrifice and raising trust, and we test habit formation to see whether gains persist once incentives end (Greene et al., 2024; von Mutius & Huchzermeier, 2021).

### Overview of the studies

This research uses two pretests, one online experiment, and one field study. Pretest 1 selects a familiar, frequent purchase category. Pretest 2 calibrates the discount using market data and value ratings. Study 1, between subject with four conditions (discount, social norm, combined, control), tests main, joint, and mediation effects via perceived monetary sacrifice and green trust. Study 2 randomizes the same four conditions in a supermarket and records real choices.

### Conclusion

Combining monetary discounts with descriptive social norm nudges advances green consumption research and clarifies mixed findings on green purchase behavior. We expect the results point to lower perceived monetary sacrifice, higher green trust, and habit formation; guiding retailer led strategies at scale.

## Acknowledgment

This study was funded by the European Union - NextGenerationEU, Mission 4, Component 2, in the framework of the GRINS -Growing Resilient, INclusive and Sustainable project (GRINS PE00000018 – CUP B43C22000760006).
