# Introduzione alla Conferenza

La Società Italiana Marketing (SIM) rappresenta, dal 2002, la principale comunità accademica italiana dedicata allo sviluppo e alla diffusione degli studi di marketing. La SIM promuove la collaborazione scientifica tra studiosi, istituzioni e imprese, favorendo il dialogo interdisciplinare e il trasferimento di conoscenze verso il sistema economico e sociale. Attraverso conferenze, pubblicazioni e gruppi di ricerca, la SIM contribuisce alla crescita culturale e metodologica del marketing come disciplina e come pratica manageriale.

La SIM Conference é la conferenza annuale della Società Italiana Marketing e rappresenta il più importante momento di incontro della comunità scientifica nazionale nell'area del marketing. Ogni anno, studiosi, ricercatori e professionisti si confrontano sui temi emergenti della disciplina, condividendo evidenze empiriche, prospettive teoriche e implicazioni manageriali. La conferenza offre un contesto stimolante per il dibattito accademico, la creazione di reti collaborative e lo sviluppo di progettualità di ricerca.

La XXII edizione svoltasi nel 2025 è stata dedicata al rapporto tra marketing e innovazione, un legame che ha profondamente influenzato l'evoluzione dei mercati e delle strategie aziendali. Il tema *"The Marketing-Innovation Nexus. Past Insights for Future Challenges"* ha invitato a riflettere su come le intuizioni del passato possano guidare la gestione di sfide future caratterizzate da trasformazioni tecnologiche, digitalizzazione, sostenibilità e nuovi modelli di consumo. L'obiettivo era favorire un dialogo critico capace di integrare le radici storiche della disciplina con i più recenti sviluppi concettuali e applicativi, in modo da delineare scenari di ricerca e pratiche manageriali orientate all'innovazione responsabile e al valore per la società.

Il Presidente SIM, Prof. Daniele Dalli, afferma:

*"Ci siamo specializzati sia lato ricerca che lato professione nel cercare di prevedere e anticipare il futuro. Abbiamo pensato che il marketing fosse lo strumento per capire dove andare e, a volte, ci siamo dimenticati di guardare nello specchietto retrovisore. Il marketing può essere la chiave di lettura che tiene insieme queste due dimensioni: la necessità di innovare e di muoversi verso il futuro, e l'importanza della direzione da cui veniamo per non perdere autenticità, credibilità e identità." -*

Il Prof. Michele Simoni, Co-chair della XXII SIM Conference, aggiunge:

*"Il nesso tra marketing e innovazione si manifesta in un interplay continuo tra tradizione e futuro. La comunità della Società Italiana Marketing si distingue per energia, rigore e spirito di collaborazione: ogni Conference è un'occasione stimolante e piacevole di confronto e crescita."*

Conclude la Prof. ssa Maria Rosaria Napolitano, Co-chair della XXII SIM Conference*:*

*"Nell'heritage delle organizzazioni risiede la genesi del futuro. Valorizzare il passato e le radici consente di leggere il presente e progettare l'avvenire. L'edizione 2025 conferma lo slancio della comunità SIM, con ampia partecipazione di studiosi, imprese e ospiti internazionali."*

# Introduction to the Conference

Founded in 2002, the Italian Marketing Society (SIM) is the leading academic community in Italy dedicated to the advancement and dissemination of marketing studies. SIM promotes scientific collaboration among scholars, institutions, and businesses, fostering interdisciplinary dialogue and the transfer of knowledge to the economic and social system. Through conferences, publications, and research groups, the Society contributes to the cultural and methodological development of marketing as both an academic discipline and a managerial practice.

The SIM Conference is the Italian Marketing Society annual gathering and represents the most important event for the national academic community in the field of marketing. Each year, scholars, researchers, and professionals come together to discuss emerging issues in the discipline, sharing empirical evidence, theoretical perspectives, and managerial implications. The conference provides a stimulating environment for academic debate, the creation of collaborative networks, and the development of research projects.

The XXII edition, held in 2025, was dedicated to the relationship between marketing and innovation, a nexus that has profoundly shaped the evolution of markets and business strategies. The theme *"The Marketing–Innovation Nexus: Past Insights for Future Challenges"* invited participants to reflect on how insights from the past can guide the management of future challenges, shaped by technological transformation, digitalization, sustainability, and new consumption models. The goal was to foster a critical dialogue that integrates the historical foundations of the discipline with its most recent conceptual and managerial developments, aiming to outline research paths and practices that promote responsible innovation and societal value.

Professor Daniele Dalli, President of the SIM, notes:

*"We have specialized, both in research and in professional practice, in trying to foresee and anticipate the future. We believed that marketing was the tool to understand where to go and, at times, we forgot to look in the rear-view mirror. Marketing can be the interpretive key that holds these two dimensions together: the need to innovate and move toward the future, and the importance of the direction we come from, so as not to lose authenticity, credibility, and identity."*

Professor Michele Simoni, Co-chair of the XXII SIM Conference, adds:

*"The nexus between marketing and innovation emerges in a continuous interplay between tradition and the future. The community of the Italian Marketing Society stands out for its energy, rigor, and collaborative spirit: every Conference is an inspiring and enjoyable opportunity for dialogue and growth."*

Professor Maria Rosaria Napolitano, also Co-chair of the XXII SIM Conference, concludes:

*"Within the heritage of organizations lies the genesis of the future. Enhancing the past and one's roots allows us to interpret the present and shape what is yet to come. The 2025 edition confirms the momentum of the SIM community, with broad participation from scholars, companies, and international guests*

Con la collaborazione di Marco Ferretti per la Special Track UNESCO Chair.

## Ringraziamenti

La Società Italiana Marketing ringrazia l'Università degli Studi di Napoli "Parthenope" per l'ospitalità, le istituzioni locali per il sostegno, e gli sponsor e partner che hanno contribuito alla realizzazione della Conference 2025, con una menzione speciale per i membri del Consiglio di Presidenza SIM e dei gruppi di lavoro che si sono impegnati per la realizzazione di questo importante evento. Un grande grazie va a tutti gli studiosi e ai professionisti che, con la loro partecipazione attiva, mantengono viva la missione SIM: costruire conoscenza e promuovere innovazione nel marketing.

## Acknowledgements

The Italian Marketing Society (SIM) extends its gratitude to the University of Naples "Parthenope" for hosting the event, to the local institutions for their support, and to all sponsors and partners who contributed to the realization of the 2025 Conference. A special thank-you goes to all scholars and professionals whose participation keeps the SIM mission alive: fostering knowledge creation and promoting innovation in marketing.

# Track 1
# International Marketing

Coordinators: Barbara Francioni & Giada Mainolfi

L'organizzazione e gestione delle attività di marketing in una dimensione internazionale vedono uno spazio di azione che può portare, da un lato, ad enfatizzare la replicazione all'estero delle pratiche sviluppate nell'ambito dei confini nazionali, a prescindere dall'esistenza di differenze di contesto tra paese di origine e di destinazione, che potrebbero, tuttavia, richiedere degli adattamenti; dall'altro a focalizzare l'attenzione sulla gestione su scala internazionale della diversità ambientale attraverso approcci differenziati in ogni singolo contesto-paese. Questo spazio può dare luogo ad una pluralità di strategie, in capo a grandi multinazionali, piuttosto che piccole e medie imprese esportatrici. Temi rilevanti riguardano, ad esempio, le modalità di entrata nei mercati internazionali, la gestione dei canali e della comunicazione internazionale, l'international branding, il ruolo della cultura per le decisioni di marketing internazionale, la country image a il country of origin effect, l'impatto delle tecnologie digitali sul marketing internazionale, la gestione delle relazioni aziendali in chiave internazionale.

In questi ambiti, si promuove un approccio interdisciplinare, che incoraggia lavori che presentano una visione olistica del fenomeno del marketing internazionale e che indagano sulle interdipendenze tra il marketing e le altre attività aziendali (corporate strategy, operations, R&D, etc.).

La sezione di Marketing Internazionale si prefigge di sviluppare questo temi promuovendone gli studi in Italia e all'estero. A questo fine, vuole essere sede del confronto tra i migliori paper nell'ambito del convegno nazionale, motore di iniziative di ricerca e didattiche che coinvolgono più sedi, ma anche favorire sinergie tra ricerca e imprese per lo sviluppo del marketing nell'ambito di un contesto internazionale.

International marketing operates between two approaches: replicating domestic practices abroad, even when contextual differences may call for adaptation, and tailoring strategies to the specific conditions of each country. This range enables diverse strategic choices for both multinationals and SMEs, touching on themes such as market entry modes, international channels and communication, branding, cultural influences, country image and country-of-origin effects, digital technologies, and the management of global business relationships.

The section promotes an interdisciplinary and holistic view of international marketing, examining its links with other corporate functions. It aims to advance research in Italy and abroad, provide a venue for high-quality scholarly discussion, encourage multi-institutional initiatives, and foster collaboration between academia and industry in the international marketing field.

# Cross-Cultural Perspectives On Generative Ai-Driven Brand Activist Messages: A Comparative Thematic Analysis Of The United States, Sweden, And Italy

Alice Aiudi [1], Roberta De Cicco [2],*, Barbara Francioni [2], Ilaria Curina [2] and Mauro Dini [2]

## Abstract

In an era where consumers increasingly demand authenticity from brands, the emergence of Generative Artificial Intelligence (GAI) in activist communication poses new challenges. This study explores cross-cultural perceptions of GAI-generated brand activist messages through a qualitative thematic analysis involving 38 participants from Italy, Sweden, and the United States. It examines how different national contexts shape expectations of authenticity, emotional resonance, transparency, and responsibility in AI-generated communication. Findings reveal five key themes: authenticity and consistency, the role of human agency, transparency and accountability, limited empathy, and context-specific appropriateness. While AI was broadly accepted as a supportive tool, participants emphasized that credible activism still requires human presence: a deliberate, value-driven commitment rooted in authentic beliefs, along with the ability to feel, express, and respond to complex emotions, which AI tools are evidently unable to replicate. GAI was seen as more appropriate for environmental causes, perceived as data-driven, than for social justice issues demanding personal understanding and a human voice. Cultural differences shaped these views: Italians focused on sincerity and alignment with brand values, Swedes adopted a practical approach, assessing functional relevance and transparency, and US respondents evaluated whether activism matched the brand's business and offerings. Despite these differences, shared skepticism emerged toward fully AI-authored activism lacking human oversight and emotional credibility. This study contributes to branding and communication research by highlighting the sociocultural filters through which GAIgenerated activism is interpreted. It calls for hybrid, culturally sensitive strategies that preserve human authenticity while leveraging technological innovation in cause-related messaging.

## 1. Introduction

In recent years, brand activism has emerged as a contemporary corporate and marketing communication strategy (Kotler & Sarkar, 2018). Unlike traditional corporate social responsibility, which often centers on risk mitigation and compliance, brand activism entails companies taking a public stand on contentious social, political, or environmental issues

(Vredenburg et al., 2020). This approach reflects a broader shift toward purpose-driven branding, where organizations align themselves with causes that resonate with consumer values in order to build deeper emotional connections and longterm loyalty (Hajdas & Kleczek, 2021). In doing so, brands become active participants in public discourse, influencing societal norms and expectations.

This rise of brand activism reflects a growing consumer expectation: audiences demand concrete action over declared values and reject superficial "greenwashing" or "wokewashing" that lack authenticity or substance (Mirzaei et al., 2022).

As consumers increasingly expect activist brands to demonstrate authenticity not only through their actions but also in how they communicate their values, this demand now risks colliding with a major technological shift. Generative Artificial Intelligence (GAI) is transforming the way brand messages are conceived and delivered, automating the creation of content that was once crafted by humans. Companies can now generate complex campaign materials, including texts, visuals, and multimedia, automatically and at scale, using tools such as ChatGPT, DALL·E, and Midjourney (De Cicco et al., 2025).

The rise of GAI presents a new paradox for brand activism: while audiences expect activist campaigns to convey personal commitment, emotional connection, and genuine values, brands may increasingly rely on automated systems that lack the human depth as well as the moral and emotional resonance typically associated with authentic activist messaging. This introduces important tensions: although GAI offers efficiency, creativity, and cost savings, it may also raise concerns about perceived authenticity, especially in domains that require emotional or moral engagement (Brüns & Meißner, 2024).

To date, there is a surprising lack of research exploring how GAI-generated content is perceived when used in brand activism. While a growing number of studies have examined consumer responses to AI-generated content (AIGC) in marketing (De Cicco et al., 2025; Song et al., 2024; Arango et al., 2023), none have focused on the emotionally and ethically charged context of activist communication, where authenticity, empathy, and trust are not just desirable but essential. This represents a critical gap, especially as more brands begin to experiment with GAI to scale up their value-driven messaging.

Another important aspect that has been largely overlooked in the literature is that understanding consumer perceptions of GAI content by activist brands requires acknowledging that cultural context can shape how brand activism and emerging technologies like GAI are interpreted.

To address this gap, the present study explores aspects such as consumers' perceptions of authenticity, emotional resonance, and ethical expectations in response to GAIgenerated activist campaigns.

The study adopts a qualitative approach and a cross-cultural perspective by comparing Italy, the United States, and Sweden. These nations differ in their levels of cultural tightness-looseness, that is the extent to which societies enforce social norms and tolerate deviations (Gelfand et al., 2011), which may help explain varying degrees of openness to disruptive innovation and to brands that adopt unconventional or valuedriven stances.

In sum, this exploratory research investigates i) how AI-generated activist campaigns are perceived by individuals and (ii) how cultural context shapes responses to such communication, offering timely insights for brands operating within an increasingly technological and purpose-driven landscape.

## 2. Literature background and conceptual framework

In an increasingly polarized and socially conscious marketplace, brands face growing pressure to take public stances on sociopolitical issues. This form of engagement, known as brand activism, represents both a powerful strategic tool and a potential reputational minefield (Kotler & Sarkar, 2018). Research conducted to date on this topic has established that brands perceived as genuinely engaged in activism, and whose actions align with their historical mission and business practices, are more likely to gain consumer legitimacy. In contrast, when activism is perceived as a reactive marketing tactic or lacks substantive commitment, it is often regarded as inauthentic (Vredenburg et al., 2020).

A cornerstone of effective brand activism is perceived authenticity, defined as the extent to which consumers believe that a brand's activist messaging genuinely reflects its core values and practices (Dwivedi & McDonald, 2018). Authenticity is not a decorative feature, but a prerequisite for credibility and impact. When absent, activism risks being perceived as opportunistic and merely performative, potentially provoking backlash and eroding consumer trust (Key et al., 2023). Authentic brand activism demands deep alignment between a brand's values, its internal culture, and its public messaging. Empirical evidence underscores that authenticity enhances brand trust, particularly when consumers perceive alignment between the brand's stance and their own values (Nguyen et al., 2023). This effect is amplified when the brand's messages are seen as transparent, emotionally attuned, and consistent across platforms such as social media, advertising, and corporate behavior (Chu et al., 2023).

The need for a deeper comprehension of this dynamic emerges when examining how authenticity is perceived and negotiated. Consumers are far from passive recipients; they actively assess not only the content of a brand's message but also the way it is conveyed, paying close attention to whether the brand listens and responds in a meaningful way. Moral clarity, openness to dialogue, shared empathy, and the ability to address complex and potentially controversial topics without appearing self-serving are essential to this process (Sibai et al., 2021).

The heightened vigilance of today's audiences requires brands to ensure strong internal coherence before engaging in activist communication, in order to avoid the risks and repercussions of lacking genuine commitment to the values they publicly endorse (Ahmad et al., 2024). When audiences detect such dissonance, the reputational fallout can be severe (Francioni et al., 2025).

Authenticity must be cultivated at every level of the organization, as without this holistic integration, activist messages are unlikely to persuade or endure (Ahmad et al., 2024). Rather than being a static attribute, authenticity should be understood as a dynamic construct shaped by consumers' ongoing interpretation of a brand's values, actions, and communications. It is formed through a continuous evaluation of cues that go beyond the message itself (Mathur & Nayak, 2025).

Among the various cues considered by consumers, the authorship of content has gained relevance in the era of GAI. Emerging research indicates that GAI content is often perceived differently compared to content created by humans, with implications for authenticity judgments that are not uniformly positive (Arango et al., 2023). Studies demonstrate that audiences tend to judge content more harshly when it is attributed to GAI rather than a human, highlighting that AI-driven messages, even when factually correct or stylistically effective, can elicit discomfort or distrust if they are not accompanied by signals of human sensibility and oversight (e.g. De Cicco et al. 2025). As brands explore GAI-driven campaigns, attracted by their potential for efficiency, personalization, and scalability, they

also encounter a new challenge: preserving authenticity when the 'communicator' is no longer human (Brüns & Meißner, 2024). While GAI content may be widely accepted in contexts that are informational or functional, its application in emotionally or morally significant messaging creates a delicate balance between efficiency and credibility (Kirk & Givi, 2025; Arango et al., 2023). Consumers often perceive messages authored by humans as more emotionally resonant, morally grounded, and trustworthy (Kirk & Givi, 2025). These qualities are particularly important in the context of activist communication, where sincerity and ethical awareness are essential to establishing credibility. When the source of a message is understood to be an algorithm rather than a human being, doubts about the message's authenticity may emerge. This skepticism becomes especially pronounced when GAI content is perceived as emotionally flat and lacking in contextual sensitivity (Garcia, 2024).

Consumers critically assess the alignment between a brand's activist messaging and its broader values (Vredenburg et al., 2020; Sibai et al., 2021), paying particular attention to the perceived authenticity and depth of commitment in how such messages are delivered. Considering recent literature on brand activism and consumer responses to GAI-generated content, this raises a pressing challenge: as brands increasingly rely on GAI technologies to communicate, questions arise as to whether this reliance may compromise perceived authenticity, and how any resulting decline in credibility and trust could be mitigated (Spálová, 2023).

The integration of GAI into brand communication has brought renewed attention to how authenticity is perceived, highlighting the influence not only of message content but also of the cultural context in which it is received.

Previous studies show that GAI-generated messages are perceived differently across distinct cultural settings, for example, between Western and East Asian countries (Wu et al., 2020), suggesting that such evaluations are culturally specific rather than universal. These differences are particularly relevant when GAI is used in emotionally and ethically sensitive areas such as activist communication. Examining how audiences from different cultural backgrounds respond to GAI activist messages is therefore a necessary step in assessing whether this type of communication supports or undermines the perceived legitimacy of brand activism.

This exploratory study examines three countries: the United States, which plays a central role in both technological innovation and public discourse on activism, and Italy and Sweden, two member states of the European Union that, despite their geographical proximity and shared European political framework, exhibit significant differences in their approaches to social issues and in the acceptance and adoption of AI. These national differences in cultural orientation and technological adoption provide a relevant foundation for understanding how GAI activist messages may be received differently across contexts.

Sweden is characterized by high levels of societal trust, proactive governmental policies on AI, and strong openness toward innovation (AI Commission, 2024). Italy, by contrast, adopts a more cautious stance toward technology, with AI uptake still limited among both citizens and businesses. A significant portion of the population faces difficulties with basic digital skills, and the country records the lowest percentage of ICT graduates in the European Union (European Commission, 2024). These factors contribute to the slow integration of AI into everyday life. The adoption of AI technologies remains limited among Italian companies, reflecting broader societal skepticism and relatively low levels of digital literacy (Eunews, 2025). By contrast, the United States holds a distinctive position in the global AI landscape, characterized by technological leadership and the early, widespread adoption of AI applications (Microsoft, 2025). US consumers are highly exposed to AI-powered services and tend to feel comfortable with technological innovation. However, their perception of AI

remains context-dependent, with more favorable attitudes emerging when applications are perceived to enhance efficiency and personalization (Pew Research Center, 2023). This comparison allows the study to explore how cultural factors influence the perception of messages created through GAI and intended to communicate meaningful brand values. It provides an important initial contribution to understanding whether GAI supports brands in conveying activist messages that resonate with audiences or, conversely, generates a sense of detachment and skepticism.

The research also investigates whether the reception of such messages varies according to the thematic focus of the campaign, such as social, political, or environmental issues, and how this may affect perceptions of authenticity and emotional engagement.

This line of inquiry offers significant contributions from both theoretical and managerial perspectives. From a theoretical standpoint, it deepens the current understanding of the relationship between GAI and value-driven communication in culturally diverse contexts. From a managerial perspective, it provides timely insights for brands aiming to engage in activist communication while preserving perceived authenticity and supports more informed decision-making when using AI in emotionally sensitive campaigns.

## 3. Methodology

In an increasingly polarized and socially conscious marketplace, brands face growing pressure to take public stances on sociopolitical issues. This form of engagement, known as brand activism, represents both a powerful strategic tool and a potential reputational minefield (Kotler & Sarkar, 2018). Research conducted to date on this topic has established that brands perceived as genuinely engaged in activism, and whose actions align with their historical mission and business practices, are more likely to gain consumer legitimacy. In contrast, when activism is perceived as a reactive marketing tactic or lacks substantive commitment, it is often regarded as inauthentic (Vredenburg et al., 2020).

A cornerstone of effective brand activism is perceived authenticity, defined as the extent to which consumers believe that a brand's activist messaging genuinely reflects its core values and practices (Dwivedi & McDonald, 2018). Authenticity is not a decorative feature, but a prerequisite for credibility and impact. When absent, activism risks being perceived as opportunistic and merely performative, potentially provoking backlash and eroding consumer trust (Key et al., 2023). Authentic brand activism demands deep alignment between a brand's values, its internal culture, and its public messaging. Empirical evidence underscores that authenticity enhances brand trust, particularly when consumers perceive alignment between the brand's stance and their own values (Nguyen et al., 2023). This effect is amplified when the brand's messages are seen as transparent, emotionally attuned, and consistent across platforms such as social media, advertising, and corporate behavior (Chu et al., 2023).

The need for a deeper comprehension of this dynamic emerges when examining how authenticity is perceived and negotiated. Consumers are far from passive recipients; they actively assess not only the content of a brand's message but also the way it is conveyed, paying close attention to whether the brand listens and responds in a meaningful way. Moral clarity, openness to dialogue, shared empathy, and the ability to address complex and potentially controversial topics without appearing self-serving are essential to this process (Sibai et al., 2021).

The heightened vigilance of today's audiences requires brands to ensure strong internal coherence before engaging in activist communication, in order to avoid the risks and repercussions of lacking genuine commitment to the values they publicly endorse (Ahmad et

al., 2024). When audiences detect such dissonance, the reputational fallout can be severe (Francioni et al., 2025).

Authenticity must be cultivated at every level of the organization, as without this holistic integration, activist messages are unlikely to persuade or endure (Ahmad et al., 2024). Rather than being a static attribute, authenticity should be understood as a dynamic construct shaped by consumers' ongoing interpretation of a brand's values, actions, and communications. It is formed through a continuous evaluation of cues that go beyond the message itself (Mathur & Nayak, 2025).

Among the various cues considered by consumers, the authorship of content has gained relevance in the era of GAI. Emerging research indicates that GAI content is often perceived differently compared to content created by humans, with implications for authenticity judgments that are not uniformly positive (Arango et al., 2023). Studies demonstrate that audiences tend to judge content more harshly when it is attributed to GAI rather than a human, highlighting that AI-driven messages, even when factually correct or stylistically effective, can elicit discomfort or distrust if they are not accompanied by signals of human sensibility and oversight (e.g. De Cicco et al. 2025). As brands explore GAI-driven campaigns, attracted by their potential for efficiency, personalization, and scalability, they also encounter a new challenge: preserving authenticity when the 'communicator' is no longer human (Brüns & Meißner, 2024). While GAI content may be widely accepted in contexts that are informational or functional, its application in emotionally or morally significant messaging creates a delicate balance between efficiency and credibility (Kirk & Givi, 2025; Arango et al., 2023). Consumers often perceive messages authored by humans as more emotionally resonant, morally grounded, and trustworthy (Kirk & Givi, 2025). These qualities are particularly important in the context of activist communication, where sincerity and ethical awareness are essential to establishing credibility. When the source of a message is understood to be an algorithm rather than a human being, doubts about the message's authenticity may emerge. This skepticism becomes especially pronounced when GAI content is perceived as emotionally flat and lacking in contextual sensitivity (Garcia, 2024).

Consumers critically assess the alignment between a brand's activist messaging and its broader values (Vredenburg et al., 2020; Sibai et al., 2021), paying particular attention to the perceived authenticity and depth of commitment in how such messages are delivered. Considering recent literature on brand activism and consumer responses to GAI-generated content, this raises a pressing challenge: as brands increasingly rely on GAI technologies to communicate, questions arise as to whether this reliance may compromise perceived authenticity, and how any resulting decline in credibility and trust could be mitigated (Spálová, 2023).

The integration of GAI into brand communication has brought renewed attention to how authenticity is perceived, highlighting the influence not only of message content but also of the cultural context in which it is received.

Previous studies show that GAI-generated messages are perceived differently across distinct cultural settings, for example, between Western and East Asian countries (Wu et al., 2020), suggesting that such evaluations are culturally specific rather than universal. These differences are particularly relevant when GAI is used in emotionally and ethically sensitive areas such as activist communication. Examining how audiences from different cultural backgrounds respond to GAI activist messages is therefore a necessary step in assessing whether this type of communication supports or undermines the perceived legitimacy of brand activism.

This exploratory study examines three countries: the United States, which plays a central role in both technological innovation and public discourse on activism, and Italy and Sweden, two member states of the European Union that, despite their geographical proximity and shared European political framework, exhibit significant differences in their approaches to social issues and in the acceptance and adoption of AI. These national differences in cultural orientation and technological adoption provide a relevant foundation for understanding how GAI activist messages may be received differently across contexts.

Sweden is characterized by high levels of societal trust, proactive governmental policies on AI, and strong openness toward innovation (AI Commission, 2024). Italy, by contrast, adopts a more cautious stance toward technology, with AI uptake still limited among both citizens and businesses. A significant portion of the population faces difficulties with basic digital skills, and the country records the lowest percentage of ICT graduates in the European Union (European Commission, 2024). These factors contribute to the slow integration of AI into everyday life. The adoption of AI technologies remains limited among Italian companies, reflecting broader societal skepticism and relatively low levels of digital literacy (Eunews, 2025). By contrast, the United States holds a distinctive position in the global AI landscape, characterized by technological leadership and the early, widespread adoption of AI applications (Microsoft, 2025). US consumers are highly exposed to AI-powered services and tend to feel comfortable with technological innovation. However, their perception of AI remains context-dependent, with more favorable attitudes emerging when applications are perceived to enhance efficiency and personalization (Pew Research Center, 2023). This comparison allows the study to explore how cultural factors influence the perception of messages created through GAI and intended to communicate meaningful brand values. It provides an important initial contribution to understanding whether GAI supports brands in conveying activist messages that resonate with audiences or, conversely, generates a sense of detachment and skepticism.

The research also investigates whether the reception of such messages varies according to the thematic focus of the campaign, such as social, political, or environmental issues, and how this may affect perceptions of authenticity and emotional engagement.

This line of inquiry offers significant contributions from both theoretical and managerial perspectives. From a theoretical standpoint, it deepens the current understanding of the relationship between GAI and value-driven communication in culturally diverse contexts. From a managerial perspective, it provides timely insights for brands aiming to engage in activist communication while preserving perceived authenticity and supports more informed decision-making when using AI in emotionally sensitive campaigns.

## 4. Results and discussions

### 4.1 Sample Description

This section presents a general overview of the socio-demographic characteristics and attitudinal dispositions of the participants involved in the study. These insights help contextualize the explorative analysis by highlighting potential underlying factors that may shape participants' evaluations of AI-generated brand activism. The preliminary results serve as a foundation for the deeper, culturally based insights explored through the thematic analysis.

Specifically, the Italian sample showed a higher average age (38 years) compared to the Swedish (29.5 years) and USA (29 years) participants. This age difference may have influenced the perspectives expressed, particularly in terms of ethical reflection maturity and exposure to long-term environmental and social narratives.

In terms of gender distribution, the Italian and Swedish samples were predominantly female (9F/4M and 8F/5M, respectively), whereas the U.S. sample skewed slightly male (7M/3F, with 2 unspecified genders).

After assessing the demographic characteristics, respondents were asked to report their attentiveness to social and environmental issues, as well as their general attitude toward AI. When evaluating environmental and social awareness, Italians reported the highest levels of both social (M = 5.85) and environmental attentiveness (M = 5.15). These results indicate a particularly strong sensitivity to issues related to social justice and environmental responsibility. The U.S. sample followed with slightly lower but comparable scores (Social M = 5.3, Environmental M = 5.0). Swedish respondents scored marginally lower (both around M = 4.9). Although slightly lower, these scores still exceed the midpoint of the scale, indicating that Swedish respondents demonstrate a considerable, though relatively less pronounced, attentiveness to social and environmental concerns.

When asked about their attitude toward AI, all three groups expressed a stance of cautious optimism. Among the Italian respondents, 7 described their attitude toward AI as "fairly favorable" and 3 as "very favorable." A similar pattern was observed among the Swedish participants, with 6 moderately and 4 strongly supportive. Among the U.S. participants, 10 expressed a "fairly favorable" attitude.

However, when it came to GAI in content creation, neutrality dominated: Italians (n = 8) and U.S. participants (n = 10) showed a majority of neutral positions, while Swedes displayed a balanced mix of neutrality (n = 6), positivity (n = 3), and criticism (n = 4). The observed differences across national samples, particularly in social and environmental sensitivity and considerations, and openness to AI, provide important cultural and perceptual lenses through which subsequent themes are interpreted.

### 4.2 Thematic analysis: an interpretation through cultural tightness-looseness

Five major themes emerged from the thematic analysis, offering insight into the ways GAI-driven activist messages are interpreted across cultural contexts.

To enrich the interpretation of the qualitative data, the thematic findings were mapped against the average tightness-looseness scores of each country. According to the scores from the present sample, Sweden (M = 4.2) represents the least tight cultural context, followed by Italy (M = 4.7), which occupies an intermediate position between the two nations. The United States, with an average score of 5.0, reflects the tightest cultural environment among the three nations in the sample. This comparison provides additional insight into how cultural expectations and normative clarity may help contextualize participants' responses to AI-driven activist communication.

When interpreting the results of the cultural tightness-looseness scale, some interesting variations emerge when compared to the general patterns outlined in Gelfand et al. (2011). While these comparisons should be made with due caution, they offer useful points of reflection. In the case of Sweden, a direct comparison is not possible, as the country was not included in the original cross-national dataset. Nevertheless, considering existing evidence from other Nordic countries included in their study, the relatively lower levels of perceived tightness observed in our Swedish sample may point to a slightly different pattern than initially assumed. For Italy, the findings appear broadly consistent with previous classifications that position the country as moderately tight. The United States presents an interesting case. Whereas prior studies have typically characterized it as one of the loosest cultures (e.g., Gelfand et al., 2011), our findings indicate a somewhat higher level of perceived tightness compared to Italy. This shift in the relative positioning between the two countries

may reflect changing cultural perceptions or context-specific factors influencing respondents' interpretation.

Overall, although our findings are not radically divergent from those of Gelfand et al. (2011), some variations in the relative ranking of countries are observable. These differences highlight the importance of considering both temporal and contextual influences when interpreting cross-cultural data and suggest that perceptions of cultural tightness-looseness may be more fluid than previously assumed. The following sections explore the main emerging themes.

*Theme #1: Authenticity and consistency in activist branding*

The first identified theme concerns how people perceive brands engaged in activism and highlights that perceived authenticity depends on the alignment between a brand's public messages and its concrete actions. Participants across all countries expressed distrust toward what they described as "performative" activism, indicating communication efforts that promote socially relevant causes without being backed by real, consistent actions. When evaluating AI-generated activist messages, respondents looked for specific evidence of consistency: for example, whether a brand that promotes gender equality also demonstrates inclusive hiring practices or shares progress on measurable diversity goals. Authenticity, in this sense, was judged not by the sophistication of the message but by whether the company "practiced what it preached" in visible, traceable ways.

Interestingly, the interpretative lens of authenticity varied across cultures. In Italy, authenticity was mainly defined in terms of alignment between declared values and actual behavior, especially on ethical and moral grounds. Participants underscored the necessity of value alignment: "If it supports a cause, I want to see consistency in its daily choices: how it produces, who it works with, how it treats people. (…) Most importantly, when it shows the results of what it says (completed projects, measurable impact, tangible change) only then do I feel there is sincere commitment and not just marketing" (IT2).

While the Swedish participants demonstrated a trend broadly aligned with that of the Italian respondents, nuanced distinctions were observed. In Sweden, participants judged brand activism not only by what companies claimed in their messages within a single market, but also by whether those claims were supported by consistent actions across different markets. For example, one respondent criticized Nike for changing its logo to support Pride in countries where such support is widely accepted, but not doing so in more conservative regions like the Middle East: "Nike, for example, changes their logo on social media in countries where Pride is accepted, but not in places like the Middle East" (SE3). This inconsistency led the participant to question the sincerity of the company's values. Rather than seeing the support as genuine, the respondent interpreted it as a calculated business move, tailored to local expectations rather than reflecting a true commitment to the cause.

U.S. participants appeared to adopt a more pragmatic approach to authenticity. They evaluated authenticity based on the alignment between a brand's core business and the cause it promotes, questioning whether the company's products or services had any meaningful connection to the issue raised by the campaign. As one participant noted: "I genuinely believe a brand if I see their message being aligned in its products. If their products have nothing to do with the cause, I have a hard time believing them. For instance, I would find it difficult to fully believe if a shoe company is trying to make a social statement because their line of business has nothing to do with it" (USA7).

The findings strengthen the results of Vredenburg et al. (2020) and Dwivedi & McDonald (2018) by showing that cultural background influences the type of alignment consumers expect between a brand's values, messages, and tangible practices.

Participants expected companies to act in ways that were visibly consistent with the values they publicly endorsed. Italian respondents, reflecting moderately tight cultural norms, emphasized the importance of sincerity and personal commitment behind a brand's advocacy. Rather than simply reacting to contradictions, they questioned whether a brand truly believed in the cause it promoted. Swedish participants, from the loosest cultural context of the study, were somewhat more flexible, yet still critical of brands that appeared to tailor their messages based on where they operated.

*Theme #2: The role of human agency in AI-driven messages*

Participants consistently indicated that human involvement is essential in creating activist messages. While AI was generally accepted as a helpful support tool, respondents believed it could not replace human empathy, real-life experience, and the sense of genuine concern that a human communicator brings when addressing these issues.

Respondents emphasized that human involvement remains indispensable in campaigns addressing morally or emotionally charged topics.

In Italy, this concern emerged with an affective emphasis: "I believe that a message created by generative AI can evoke emotion and convey empathy, but only if there is genuine human guidance and sensitivity behind it. AI can help find the right words, but authenticity comes from the intentions of those who use it. If a team that truly believes in the cause uses AI as a tool and not as a shortcut, then the engagement can be genuine. Otherwise, it risks coming across as cold or artificial" (IT1). Swedish respondents adopted a pragmatic stance: "It depends on what the model is trained on. Models nowadays are getting increasingly good at conveying more "human" sounding messages, most likely because the models are trained on materials that have empathetic or emotional content, or content that displays human behavior. In that sense, if the model is trained with content related to the activist cause, especially containing emotionally charged topics, I could see it producing content that people would respond and relate to (although it might of course still need editing)" (SE2). U.S. participants highlighted embodiment and lived values: "I think that AI is capable of making good reasoning when inclusion, diversity etc. topics are concerned - so I am pretty sure it would do a good job at supporting human creativity and even reducing bias or discrimination, if properly used" (USA5) and "Especially with such prevalent issues, it is important that human ideas and visions are at the forefront of such initiatives" (USA8).

These distinctions support prior observations that AI's credibility is often conditional on visible human oversight and authorship (Kirk & Givi, 2025). Across all three countries, respondents rejected the idea that AI could fully replace human input in activist messaging. Yet their reasons diverged in culturally meaningful ways. U.S. participants grounded their views in the value of authentic human representation. Italians emphasized the importance of emotional "credibility" and the need for messages to reflect a real sense of care and responsibility. In contrast, Swedish participants were open to the use of AI as a supporting tool but did not accept it as a full-fledged communicator. The relatively loose Swedish cultural context may allow for greater technological mediation, provided that human intention and oversight remain evident.

*Theme #3: Transparency and technological accountability*

Transparency was a non-negotiable condition for activist communication. Participants from all three countries expected brands to clearly disclose the use of GAI. Italian participants, in particular, saw openness about the creation process as a key factor in building trust: "Transparency about how the campaign was created makes a difference" (IT1). In Sweden, transparency was tied to informed consumer rights through clear labeling: "Be transparent in the making of campaigns, maybe if there's a stamp/certification that clarifies transparency?" (SE9). In the USA, participants stressed that knowing whether a campaign was created using AI affects how much they trust it. Disclosure was seen as essential to prevent misunderstandings and preserve brand credibility: "Discovering that an activist campaign was created using AI might raise doubts, especially if transparency is lacking… its credibility could decrease significantly" (US12).

This mirrors the growing demand for algorithmic transparency in the AI ethics literature (Brüns & Meißner, 2024) and reaffirms that perceived openness significantly shapes trust.

Tightness may help explain the different ways transparency was understood across countries. Swedish participants, representing the least tight group in the sample, viewed it more pragmatically, as a functional requirement for making informed consumer choices. They found the omission problematic, but not necessarily a dealbreaker. Italian participants, from a moderately tight cultural context, saw transparency as a matter of ethical respect. In the United States, which represents the tightest cultural context in this study, hidden AI involvement was perceived as manipulative, and transparency was framed as a non-negotiable principle tied to individual rights.

*Theme #4: The limits of AI-generated empathy*

Another recurring theme was the limited emotional and empathetic authenticity of AI. While some participants acknowledged that AI can trigger emotional reactions, they emphasized that genuine empathy comes from human involvement, particularly from people who understand the issue, believe in the cause, and take responsibility for the message. Italian respondents, for instance, highlighted that meaningful communication should be shaped by human values and guided by real-world experience rather than automated tools: "Using AI ethically and responsibly, for a brand running activist campaigns, means always starting from a vision and human values. Actions should be designed, guided, and overseen by people who deeply understand the cause and genuinely want to make a difference. AI can be a useful tool, but it should never replace critical thinking, empathy, and human responsibility" (IT2).

Swedish participants recognized that, with the right instructions, AI can produce messages that feel emotionally engaging, highlighting a practical, tool-based approach to communication: "With correct prompting the message can be emotional and empathetic enough, for sure." (SE8). U.S. participants were skeptical about emotional simulation: "(…) because I think that any campaign trying to capture people's hearts and draw concern has to be created by real people who would genuinely be concerned and actually be on the receiving end of that campaign. Otherwise, it's like asking a boy to empathize with a girl: they can to an extent, but will never be able to truly understand the other's feelings and experiences" (USA11).

Although some participants acknowledged that GAI can create emotionally engaging messages, they doubted its ability to express true empathy. Authentic emotion was seen as inherently human.

The results align with the findings of Garcia (2024) and Arango et al. (2023), showing that emotionally charged AI-generated content raises doubts about the message's sincerity and the brand's intentions. In this study, participants expressed skepticism when emotional and

ethical appeals appeared disconnected from human experience, reinforcing how cultural background can influence whether AI-driven empathy is seen as convincing or strongly artificial.

Notably, all participants expressed doubts about AI's capacity to convey genuine empathy, though with varying degrees of skepticism. U.S. and Italian respondents were more categorical, rejecting AI-generated emotional appeals. Swedish participants, consistent with a more flexible cultural outlook, were more open to the idea that AI could generate emotional content, provided its use was transparent, such as indicating that AI was involved, and limited to supporting rather than replacing authentic human voices and narratives.

*Theme #5: Context-specific appropriateness: environmental vs. social causes*

Participants drew a clear distinction between environmental and social issues in terms of AI's perceived suitability.

Italians highlighted the importance of lived experience in social issues "For me, there's a difference between topics: for environmental issues, AI use may be more acceptable, as it often involves data, forecasts, and technical messages. But when it comes to social issues like rights or inclusion, I believe it's essential that the message at least partly comes from real human experiences, not just generated ones" (IT1). Swedes viewed AI as a data-processing support for ecological causes: "Some AI content might evoke a good response on environmental causes but showing possible future scenarios, which could be an efficient form of communicating, but couldn't those scenarios be created by an artist instead? AI bots also use a lot of energy which makes it contradict environmental marketing, but I guess I could see the point of creating striking images to make a point. For social issues I find it more difficult to accept. Social issues revolve around how we think and act towards other humans and putting AI into that somehow removes the whole point of how we are all a part of the human experience. (…) It's a fine line to thread." (SE4). U.S. participants made a distinction between types of causes: they saw AI as suitable for environmental topics grounded in scientific facts and data visualization. However, when it came to social causes—such as those involving personal stories, discrimination, or the representation of marginalized groups—they believed that messages needed to come from people with direct, lived experience. In these cases, relying solely on AI risked producing messages that felt emotionally disconnected or lacked credibility: "For environmental topics, which are often supported by data and scientific evidence, AI can help structure clear, informative messages that raise awareness. However, when it comes to social causes involving lived experiences, identity, or justice, a purely AI-generated voice risks sounding detached or artificial" (USA4).

This theme underscores that participants did not perceive GAI as equally suitable across all activist domains and communications. Rather than being seen as a neutral tool, the acceptability of AI was shaped by the type of cause it supported and the cultural expectations surrounding that cause. In line with Spálová (2023), these perceptions reflect how AI's role in public discourse is contextually built and shaped by cultural values, norms, and the symbolic perception of the topic. Participants were more open to AI use in environmental messaging, often associated with data and efficiency, while social causes, which deal with human experience, vulnerability, or marginalization, were seen as requiring a human voice.

AI was deemed more acceptable for environmental messaging, especially when datadriven, and less appropriate for social justice topics, which require empathy, presence, and moral voice. U.S. and Italian participants were particularly vocal about the inadequacy of AI in representing complex human struggles. Swedish respondents, while similarly cautious, were more pragmatic, suggesting that AI's appropriateness depends on the campaign's objective and design.

For a clearer overview, the main themes are summarized in Table 1.

| Theme | Description | Key findings |
|---|---|---|
| **Authenticity and consistency in activist branding** | The theme focuses on how participants assess the credibility of a brand's activist communication based on the match between what a brand says and what it does. Participants paid close attention to whether companies show genuine support for causes through real actions, not just words. | Respondents from all countries expressed skepticism toward companies that adopt activist messaging without backing it up with consistent and actual behavior. Italians often evaluated credibility through ethical behavior and long-term commitment. Swedish participants were concerned with inconsistencies between external messaging and internal practices. U.S. participants focused more on how visible misalignment could damage brand reputation and reduce trust. |
| **The role of human agency in AI-driven messages** | The theme explores people's opinions about the importance of human involvement in creating activist messages. While many accepted AI as a tool, they insisted that only humans can share real experiences and connect emotionally with audiences. | Participants saw human involvement as essential when communicating about sensitive or emotional topics. Italians emphasized that only humans can fully understand and speak about social issues. Swedes were open to using AI, but only under human supervision. Participants from the USA highlighted the importance of human contribution to make messages feel sincere and grounded in lived experience. |
| **Transparency and technological accountability** | The theme addresses the expectation that brands clearly communicate when they use GAI in activist campaigns. Participants viewed honesty about AI use as a sign of respect and a way to build trust. | Across countries, participants believed brands should always reveal if AI was used in campaign development.<br>Italians linked transparency to a sense of responsibility and consumer trust. Swedish respondents supported clear labeling to allow people to make informed decisions.<br>U.S. participants felt that not |

| | | |
|---|---|---|
| | | disclosing AI use could be seen as a dishonest behavior, especially if the campaign dealt with serious social issues. |
| **The limits of AIgenerated empathy** | The theme looks at how participants viewed AI's ability to express emotions in activist communication. While AI might imitate emotional and empathetic language, many felt it lacks the human experience needed to express real empathy. | Italians believed that real empathy comes from people who understand a cause through personal involvement and real-life experiences. Swedes pointed out that AI can sometimes create emotional messages, but only when guided by people who understand the topic well. U.S. participants were more critical, saying AI lacks the capacity to understand emotions or lived struggles, making its messages feel artificial or disconnected to reality. |
| **Context-specific appropriateness: environmental vs. social causes** | The theme highlights how participants judged the use of AI based on the type of cause. AI was seen as more acceptable for environmental topics, which often involve data and analysis, but less suitable for social issues that require emotional sensitivity. | Italians said AI may help with environmental topics but cannot replace the human touch in social justice messages. Swedes accepted AI for technical and environmental communication but were hesitant about its use in messages involving human identity and relationships. U.S. participants consistently emphasized that campaigns dealing with inequality or lived experience must be led by people, not algorithms. |

**Table 1**: Findings from the thematic analysis (author's own elaboration).

## 5. Implications and final remarks

The present study contributes to the growing body of literature on branding and ethical communication by providing a cross-cultural perspective on how GAI is perceived when employed in brand activist messaging. Through thematic analysis of 38 qualitative responses from Italy, Sweden, and the United States, five thematic clusters emerged: authenticity and consistency, human agency in AI-driven messages, transparency and accountability, limited empathy, and contextual appropriateness of AI across causes. These themes collectively

reveal how audiences interpret AI-generated brand activist campaigns not only through a technological lens, but also within deeply human, moral, and cultural frames.

One key implication of the study is that people do not judge authenticity based solely on what the brand claims about itself. Instead, they assess whether the brand's use of AI in activist campaigns feels genuine and whether it meets their cultural expectations about sincerity, human involvement, and consistency between words and actions. Consumers from all three countries showed increasing sensitivity to inconsistencies between what a brand claims and how it behaves, particularly when activism is communicated via artificial systems. While Italian participants focused on whether brands acted consistently with the values they promoted, often questioning if AI use showed real commitment or just a marketing tactic, U.S. respondents evaluated whether the activist message was meaningfully connected to the brand's core business and products. Swedish participants, meanwhile, paid attention to whether brands applied the same activist messages across different markets or adapted them to fit local expectations, an inconsistency that affected how genuine they perceived the communication to be.

Another fundamental implication is that while GAI can simulate affective tone or creative output, respondents across cultures maintained that human presence, lived experience, and ethical deliberation are central to credible and emotionally resonant activism. This aligns with broader critiques of "technological solutionism" (Morozov, 2013), suggesting that efficiency or innovation alone cannot replace the depth of meaning, storytelling, and emotional understanding that human communicators bring. Brands that entirely rely on AI for sensitive or socially related messages risk creating content that feels impersonal and disconnected from their audiences. In discussing empathy, the responses challenge the capacity of AI to serve as a meaningful communicator of emotional narratives. While some participants acknowledged AI's ability to generate persuasive or affective content, the majority emphasized that real empathy requires human vulnerability, intentionality, and context-awareness. The emotional intelligence of activism must be grounded in experience. In this regard, GAI is seen as a tool that can enhance or support messages created by humans, but not replace them. For marketers, this suggests the importance of combining AI with human input, allowing AI to assist in content creation while people ensure that messages remain meaningful and anchored in real experiences.

Moreover, transparency emerged as a widely shared expectation, with respondents calling for clear disclosure of when and how AI is used in activist content generation. This concern extended beyond compliance with regulations and consumer rights; it also involved enabling individuals to trace the origin and intent of a message, thereby enhancing transparency in both source and purpose. Participants expressed a desire to know whether AI is involved, as this helps them better assess the credibility and intentions behind a campaign. From a managerial perspective, this suggests that brands should explicitly disclose the use of AI within their communication strategies, particularly when addressing politically or emotionally sensitive issues.

Lastly, the study underscored the importance of matching the type of cause to the communication tool. AI was seen as more suitable for environmental campaigns, where its strengths in data processing and forecasting offer clear advantages, and less appropriate for social justice issues, which require moral sensitivity, historical awareness, and human experience. The findings suggest that cause typology influences not only perceived appropriateness, but also emotional resonance and credibility. This has important implications for strategic segmentation and message design: while GAI may be effectively embraced in campaigns related to climate efficiency or sustainability, it should be applied more cautiously in domains that demand moral engagement and identity affirmation.

The debate around AI is no longer limited to its capabilities but extends to how it should be used in contexts where brand communication involves social values and moral dilemmas.

## Abstract

Negli ultimi anni i brand globali hanno intensificato l'adozione di strategie di brand activism, utilizzandole come strumento per esprimere il proprio impegno nei confronti di questioni sociali. Questo studio indaga come il framing linguistico influenzi l'engagement degli utenti nei confronti dei contenuti attivisti su Instagram, basandosi sulla teoria del framing (Entman, 1993) e sulle sue applicazioni nell'attivismo digitale (Wagner et al., 2017; Mendelson et al., 2024). Attraverso un'analisi del contenuto di 314 post pubblicati da MAC Cosmetics negli Stati Uniti, in India e in Messico tra il 2022 e il 2024, esploriamo la relazione tra esplicità del messaggio e interazione del pubblico. I post sono stati codificati secondo le quattro funzioni del framing di Entman - definizione del problema, diagnosi causale, valutazione morale e suggerimento di soluzioni - e analizzati in base all'engagement rate. I risultati indicano che i messaggi espliciti, in particolare quelli che identificano le cause dei problemi sociali, generano un engagement superiore rispetto ai messaggi non espliciti. Al contrario, i messaggi focalizzati sulle soluzioni tendono a ricevere un engagement minore. Lo studio evidenzia inoltre variazioni interculturali: il framing esplicito è più efficace in India, mentre ha un impatto minore in Messico e negli Stati Uniti. I risultati sottolineano il ruolo strategico del linguaggio nel brand activism e l'importanza della sensibilità culturale nella comunicazione globale. Combinando la teoria del framing con una prospettiva cross-culturale, lo studio offre spunti teorici e indicazioni pratiche per i brand che vogliono comunicare valori attivisti in modo efficace.

## 1. Introduzione

Il legame tra imprese e società è oggi al centro di trasformazioni profonde. In questo contesto, il brand activism - definito come "gli sforzi aziendali volti a promuovere, ostacolare o guidare riforme sociali, politiche, economiche e/o ambientali con l'obiettivo di migliorare la società" (Sarkar & Kotler, 2018; Cammarota et al., 2023) - si è affermato come un tema centrale nel dibattito accademico e manageriale. La crescente rilevanza del fenomeno emerge dal numero sempre maggiore di imprese che scelgono di assumere posizioni pubbliche su temi sociali. Giganti globali come Google, Facebook e Nike hanno lanciato campagne contro la discriminazione razziale sostenendo movimenti come "Black Lives Matter", mentre brand come Gucci e Stella Artois hanno affrontato il tema della disuguaglianza di genere, rendendo visibile il loro impegno sociale. (Shukla et al., 2025).

I profondi cambiamenti sociali e ambientali del XXI secolo hanno spinto le imprese ad adattarsi a scenari in continua evoluzione, assumendo talvolta un ruolo di leadership

nell'affrontare queste sfide (Cammarota et al., 2023). Tuttavia, questo orientamento non deriva sempre da un autentico risveglio etico. Spesso le aziende rispondono piuttosto alle crescenti aspettative dei consumatori, che richiedono prese di posizione chiare e pubbliche su temi critici come il razzismo (Grier & Crockett, 2024), le disuguaglianze e l'inclusione (Kipnis et al., 2021), riconoscendo nei brand una capacità d'azione talvolta percepita come più efficace di quella delle istituzioni (Bhagwat et al., 2020). Di conseguenza, le aziende sono sempre più chiamate a riflettere i valori dei propri clienti e a sostenere attivamente convinzioni condivise. Studi recenti confermano questa tendenza: ad esempio, Rimmer (2022) evidenzia che il 90% dei millennials preferirebbe acquistare da un brand impegnato nel supporto di una causa sociale (Shukla et al., 2025). In questo scenario, le aziende non possono più mantenere una posizione neutrale di fronte a questioni sociali polarizzanti, e l'attivismo diventa una componente fondamentale della comunicazione aziendale (Sarkar & Kotler, 2018; Vredenburg et al., 2020).

Le piattaforme social rappresentano un canale privilegiato per la diffusione di contenuti attivisti (Volpe et al., 2023; Vredenburg et al., 2020). Le campagne sui social media non comprendono solo immagini e video, ma anche contenuti testuali ricchi di significato, fondamentali per catturare l'attenzione e stimolare l'interazione degli utenti (Deng et al., 2021). Quando questi contenuti riguardano tematiche sensibili come diritti civili, giustizia sociale o cambiamenti climatici, le scelte linguistiche dei brand assumono un'importanza strategica, influenzando profondamente il modo in cui il pubblico interpreta e reagisce al messaggio (Gong et al., 2025).

Analizzare le modalità con cui i brand comunicano le proprie posizioni è dunque cruciale, poiché la forma e la struttura del messaggio incidono sulla percezione, sull'interpretazione e sulle risposte emotive del pubblico (Grappi et al., 2024). In questo contesto, la teoria del framing offre un quadro teorico efficace per valutare l'impatto comunicativo, mostrando come la selezione e l'enfasi di specifici contenuti possano orientare atteggiamenti e comportamenti. Studi empirici confermano tale dinamica: ad esempio, Florence et al. (2022) dimostrano, nel social marketing, che diverse strategie di framing – basate su guadagno o perdita – influenzano significativamente le scelte sostenibili e le risposte attitudinali. Più nello specifico, Xie, Wei e Chen (2024) evidenziano che, nell'ambito del brand activism, il modo in cui i messaggi vengono "incorniciati" - in particolare attraverso appelli basati sulla speranza o sulla frustrazione - può influenzare le reazioni emotive e le intenzioni d'acquisto dei consumatori. La teoria del framing, introdotta da Goffman (1974) e successivamente sviluppata da Entman (1993) nel campo dei media e della comunicazione, spiega come i messaggi selezionino, enfatizzino e organizzino determinati aspetti della realtà, guidando così l'interpretazione pubblica. Secondo Entman (1993), il framing implica quattro funzioni principali: definire un problema, diagnosticarne le cause, formulare giudizi morali e proporre soluzioni. Questo quadro teorico è stato applicato con successo in diversi ambiti, dalla pubblicità e comunicazione aziendale (Maher & Schmidt, 2025) alla responsabilità sociale d'impresa (Melchiades Soares, 2023), dalla comunicazione sanitaria (Lee et al., 2024) fino al brand activism (Zhou et al., 2023).

Nonostante l'attenzione crescente dedicata al tema, la ricerca presenta ancora alcune lacune riguardo al ruolo delle strategie linguistiche nel generare engagement dei consumatori. La maggior parte degli studi si è concentrata sull'uso del linguaggio come strumento per mitigare le reazioni negative (Gong et al., 2025) o sull'impatto di specifici elementi dei messaggi attivisti - come le parole trigger - nel generare risposte avverse (Pöyry & Laaksonen, 2022). Rimane però poco esplorato come la struttura linguistica dei messaggi attivisti sui social media influenzi l'engagement e come tali dinamiche varino in contesti culturali differenti.

Il presente studio mira a colmare tali lacune analizzando la comunicazione attivista di MAC Cosmetics, brand noto per la sua identità inclusiva, attraverso un confronto tra tre mercati culturalmente distinti: Stati Uniti, India e Messico. L'analisi si concentra sul contenuto testuale dei post attivisti, classificandone il framing in base al grado di esplicità linguistica (esplicito vs. non esplicito), al fine di indagare come tali strategie influenzino l'engagement degli utenti nei diversi contesti geografici e culturali.

Le domande di ricerca principali sono:

- RQ1: In che modo differenti strategie linguistiche (esplicite vs. non esplicite) influenzano l'engagement degli utenti con i messaggi di brand activism su Instagram?

- RQ2: L'efficacia di queste strategie linguistiche nel generare engagement varia in base al contesto culturale (Stati Uniti, India, Messico)?

Per rispondere a tali quesiti, è stata condotta un'analisi quantitativa di 314 post pubblicati da MAC Cosmetics tra il 2022 e il 2024 nei tre mercati di riferimento. I contenuti testuali sono stati codificati secondo le quattro funzioni del framing di Entman (1993) e successivamente classificati in base al livello di esplicità linguistica. I dati sono stati analizzati mediante t-test di Welch per il confronto delle medie tra gruppi e regressioni OLS per valutare l'impatto delle variabili linguistiche e culturali sull'engagement rate, seguendo le linee guida metodologiche di Hair et al. (2019).

Questo studio apporta tre principali contributi alla letteratura sul brand activism. In primo luogo, fornisce evidenze empiriche sul ruolo delle strategie linguistiche - esplicite e non esplicite - nell'influenzare l'engagement con i contenuti attivisti su Instagram. In secondo luogo, introduce una prospettiva comparativa di tipo crossculturale, analizzando le risposte dei consumatori in tre mercati distinti. Infine, integra la teoria del framing con un approccio linguistico-pragmatico, offrendo anche implicazioni manageriali utili alla costruzione di messaggi attivisti culturalmente sensibili in contesti globali.

## 2. Contesto Teorico

### 2.1 Il linguaggio come determinante dell'engagement dei consumatori

Il linguaggio impiegato nella comunicazione attivista dei brand riveste un ruolo centrale nel modellare le risposte dei consumatori, influenzandone in particolare la percezione di autenticità e il livello di engagement (Gong et al., 2025). Studi precedenti hanno evidenziato come i consumatori valutino il brand activism non solo in base ai temi trattati, ma anche secondo il modo in cui le aziende articolano i propri messaggi, tenendo conto del contesto socio-culturale del mercato di riferimento (Livas et al., 2023; Vredenburg et al., 2020; Mukherjee & Althuizen, 2020).

I messaggi formulati con un linguaggio chiaro, trasparente e orientato al problema sono generalmente percepiti come più autentici e affidabili, favorendo così la fiducia del pubblico e aumentando la ricettività (Cammarota et al., 2024). In questa prospettiva, definiamo linguaggio esplicito quei messaggi chiaramente allineati ai valori del brand e supportati da giustificazioni trasparenti. Questa definizione si avvicina al concetto di linguaggio razionalizzato proposto da Gong et al. (2025), ovvero una comunicazione finalizzata a giustificare il coinvolgimento del brand in questioni sociopolitiche; tuttavia, la nostra operazionalizzazione è più ampia. Il linguaggio esplicito, così concepito, comprende le giustificazioni razionalizzate ma pone anche l'accento sulla trasparenza comunicativa, sulla chiarezza morale e sull'allineamento ai valori in senso più generale.

Al contrario, definiamo linguaggio non esplicito la comunicazione del brand caratterizzata da sottospecificazione retorica, opacità strategica o struttura argomentativa incompleta, ad esempio con omissione della diagnosi causale o della valutazione morale. Questo costrutto si sovrappone parzialmente alla nozione di linguaggio evasivo di Gong et al. (2025), che indica una comunicazione finalizzata a oscurare o minimizzare l'impegno del brand nelle attività di Corporate Sociopolitical Activism (CSA). Sebbene concettualmente correlato, il termine non esplicito è qui utilizzato in senso più ampio, includendo tutti i messaggi sottospecificati, compresi quelli "evasivi".

La seguente tabella sintetizza le principali distinzioni tra questi due costrutti:

| **Tipo di linguaggio** | **Definizione operativa** |
|---|---|
| Linguaggio razionalizzato (Gong et al., 2025) | Comunicazione aziendale che tenta di razionalizzare l'impegno nel CSA. |
| Linguaggio evasivo (Gong et al., 2025) | Comunicazione aziendale che tenta di evitare il collegamento con il CSA. |
| Linguaggio esplicito (definito in questo studio) | Linguaggio chiaramente articolato, trasparente e allineato ai valori che include tutte e quattro le funzioni di framing proposte da Entman (1993). |
| Linguaggio non esplicito (definito in questo studio) | Comunicazione caratterizzata da bassa chiarezza e struttura retorica incompleta (ad esempio mancanza<br><br>della diagnosi causale o del framing della soluzione).<br><br>Mancano uno o più elementi di framing di Entman. |

**Tabella 1:** Confronto delle categorie linguistiche (Fonte: elaborazione dell'autore)

Basandosi sulla Signaling Theory (Spence, 1973; Connelly et al., 2011), i messaggi dei brand fungono da segnali strategici volti a ridurre l'asimmetria informativa e a comunicare l'intento dell'azienda. In questo contesto, i messaggi espliciti trasmettono un autentico impegno del brand verso una causa, incrementando la credibilità percepita e la fiducia da parte dei consumatori. Secondo l'Elaboration likelihood Model (ELM) (Petty & Cacioppo, 1986), questo tipo di linguaggio tende ad attivare la central route processing, portando il pubblico a valutare attentamente la qualità delle argomentazioni e la coerenza dei valori espressi. Messaggi chiari e coerenti rafforzano la percezione di allineamento tra brand e causa, aumentando l'autenticità percepita (Trimble & Rifon, 2006; Napoli et al., 2016). Al contrario, il linguaggio non esplicito, caratterizzato da mancanza di chiarezza e giustificazione, può generare scetticismo e ridurre la fiducia, alimentando percezioni di opportunismo (Vo et al., 2025). Tali messaggi tendono ad attivare la peripheral route processing, basandosi su segnali superficiali come immagini o appelli emotivi, risultando meno efficaci nel generare un engagement sostenibile nel tempo (Petty & Wegener, 1999).

Il quadro teorico trova ulteriore supporto in Mangiò et al. (2023), che introducono il concetto di social pathos come strategia retorica nella comunicazione dei brand "woke".

I loro risultati evidenziano che narrazioni emotivamente e moralmente cariche possono aumentare l'engagement, superando positivamente le aspettative del pubblico. Tuttavia, se tali messaggi risultano disallineati dai valori del brand o dal contesto, possono generare backlash o polarizzazione.

L'engagement - tipicamente misurato attraverso like, commenti e condivisioni - risulta positivamente correlato alla percezione di autenticità dei messaggi attivisti, soprattutto in contesti sociopolitici in cui la congruenza morale e la trasparenza comunicativa sono particolarmente valorizzate (Vredenburg et al., 2020; Mukherjee & Althuizen, 2020). Inoltre, studi recenti indicano che la percezione di autenticità media la relazione tra chiarezza del messaggio e comportamento (Kothari et al., 2025).

Sulla base di queste premesse teoriche, si propone la seguente ipotesi:

• H1: I post che utilizzano un linguaggio esplicito genereranno un engagement più elevato rispetto a quelli che impiegano un linguaggio non esplicito.

### 2.2 Chiarezza causale e framing: un fattore chiave dell'engagement

La teoria del framing fornisce un quadro concettuale utile per comprendere come i messaggi attivisti influenzino l'engagement attraverso specifiche strutture linguistiche. Tra le quattro funzioni principali delineate da Entman (1993) - definizione del problema, attribuzione causale, valutazione morale e suggerimento di soluzioni - quella causale è particolarmente rilevante per il brand activism, poiché aiuta il pubblico a comprendere perché un problema sociale è emerso e perché un brand prende posizione.

Nonostante la sua rilevanza, la dimensione causale è spesso trascurata nella comunicazione aziendale, la quale tende a concentrarsi sulla narrazione del posizionamento morale del brand o sulla proposta di soluzioni. Tuttavia, attribuire cause chiare a un problema sociale è fondamentale per costruire una narrazione coerente, capace di giustificare l'impegno dell'azienda agli occhi del pubblico. Evidenze empiriche recenti sottolineano l'importanza della chiarezza causale: Muraro et al. (2023) mostrano che, nel contesto del digital consumer activism, l'engagement degli utenti è sostenuto in modo più efficace da frame orientati alle cause, che enfatizzano motivi sistemici o morali alla base di un problema. Studi precedenti indicano inoltre che l'inclusione di spiegazioni causali aumenta sia la chiarezza che la rilevanza percepita del messaggio, favorendo un'elaborazione cognitiva più profonda da parte del pubblico (Wood & Eagly, 1981; Slater & Rouner, 2006). Questo elemento risulta particolarmente cruciale nel brand activism, dove gli stakeholder analizzano attentamente le narrative aziendali alla ricerca di giustificazioni coerenti e credibili (Vredenburg et al., 2020).

Il valore del framing causale trova ulteriore supporto nella Attribution Theory di Weiner (1985), secondo cui gli individui valutano il comportamento altrui sulla base delle cause percepite, utilizzando queste valutazioni per inferire motivazioni e sincerità. Applicata alla comunicazione aziendale, la teoria suggerisce che, quando le spiegazioni causali sono percepite come interne, stabili e controllabili, i consumatori tendono a interpretare la posizione del brand come autentica, generando un engagement positivo. Al contrario, messaggi attivisti vaghi o privi di chiarezza causale possono risultare opportunistici o superficiali, minando la fiducia e riducendo l'interazione del pubblico con il contenuto. Sulla base di queste premesse teoriche, formuliamo la seguente ipotesi:

• H2: I post che includono una spiegazione causale genereranno un engagement più elevato.

### 2.3 Contesto culturale come moderatore dell'efficacia dei messaggi attivisti

L'efficacia del linguaggio attivista può variare significativamente tra contesti culturali, in particolare rispetto alle aspettative di chiarezza comunicativa e allineamento morale. Secondo le dimensioni culturali di Hofstede, l'evitamento dell'incertezza (UA) indica il grado in cui gli individui si sentono minacciati da situazioni incerte (Hofstede, 2001). Basandosi su questo

modello, il Messico registra un alto livello di UA (82), indicando una preferenza per comunicazioni strutturate ed esplicite, mentre India (40) e Stati Uniti (46) sono generalmente considerate culture a basso UA, più tolleranti verso l'ambiguità.

Tuttavia, la sola considerazione dell'UA non è sufficiente a spiegare pienamente le risposte del pubblico ai messaggi attivisti. I quadri culturali sono complessi e multidimensionali, e le preferenze sui messaggi spesso riflettono logiche normative e relazionali più profonde. Ad esempio, sebbene l'India registri un basso livello di UA, è anche una società altamente collettivista (Hofstede, 2001; House et al., 2002) con un forte orientamento al gruppo (il cosiddetto "embeddedness", Schwartz, 1994; Schwartz, 2012) e marcata enfasi sull'integrità morale. In tali contesti, il pubblico può apprezzare un linguaggio chiaro ed esplicito non tanto per ridurre l'incertezza, quanto per valutare l'allineamento del brand con norme etiche condivise. Secondo questo quadro, l'efficacia di un messaggio dipende dalla sua congruenza con le aspettative morali radicate culturalmente, in particolare dal grado in cui la comunicazione riflette valori di responsabilità, legittimità e rispetto all'interno della cultura di riferimento. Quando il messaggio del brand è coerente con queste norme, si favorisce una connessione più forte con il pubblico, aumentando persuasione ed engagement. Al contrario, messaggi non allineati alle norme culturali risultano meno efficaci, indipendentemente dalla loro chiarezza.

Questo effetto moderatore può essere ulteriormente compreso attraverso l'Elaboration Likelihood Model (ELM) (Petty & Cacioppo, 1986), che distingue due vie per la persuasione: la central route, che implica un'elaborazione cognitiva attenta e approfondita del contenuto, e la peripheral route, basata su segnali superficiali. I messaggi percepiti come autentici, trasparenti e moralmente congruenti - cioè che mostrano un alto grado di allineamento morale-culturale - tendono a coinvolgere il pubblico attraverso la central route, generando un engagement più elevato. Al contrario, messaggi vaghi o culturalmente incongruenti stimolano principalmente l'elaborazione periferica, riducendone l'impatto. Ricerche recenti su autenticità del brand e wokewashing supportano questa interpretazione. Vredenburg et al. (2020), ad esempio, mostrano che i messaggi attivisti percepiti come moralmente sinceri e coerenti con i valori della comunità ottengono maggiore supporto e engagement da parte dei consumatori.

Nel complesso, questi quadri teorici suggeriscono che, sebbene l'evitamento dell'incertezza offra una prospettiva utile, è l'orientamento culturale più ampio - in termini di giustificazione morale, collettivismo e congruenza di valori - a spiegare perché i messaggi attivisti espliciti generano un engagement maggiore in paesi come l'India. Pertanto, si propone la seguente ipotesi:

- H3: Il contesto culturale modera l'effetto positivo del framing esplicito sull'engagement.

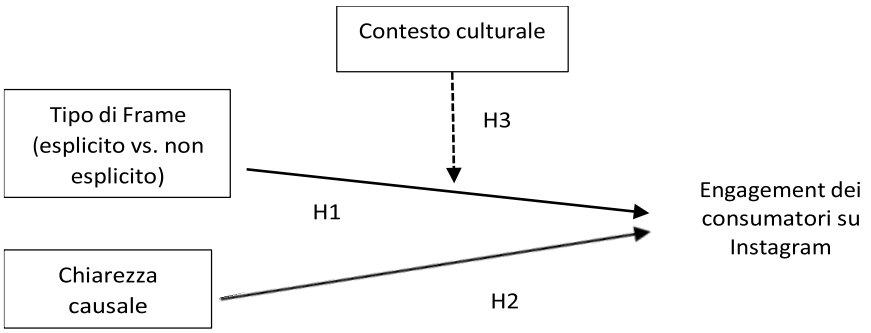

**Figura 1:** Modello concettuale e ipotesi (Fonte: elaborazione dell'autore)

## 3. Methodologia

### 3.1 Selezione del caso e contesto di ricerca

Seguendo l'approccio del caso singolo proposto da Yin (2017), lo studio seleziona MAC Cosmetics come caso teoricamente significativo per analizzare il ruolo del framing linguistico nel brand activism sull'engagement dei consumatori in culture differenti. Secondo Yin, un caso singolo è appropriato quando il caso è esemplare, rivelatore o teoricamente significativo - criteri che MAC soddisfa chiaramente.

MAC ha sviluppato un'identità attivista riconosciuta a livello globale, fondata su un impegno costante su temi quali inclusività di genere, diritti LGBTQ+ ed empowerment delle minoranze. La sola campagna Viva Glam ha raccolto oltre 500 milioni di dollari per iniziative legate all'HIV/AIDS e alla salute queer (MAC Cosmetics, 2024), dimostrando non solo un posizionamento simbolico, ma anche una legittimità attivista concretamente misurabile. Il brand è frequentemente citato nella letteratura accademica come esempio di brand activism intersezionale e inclusivo (Grier & Brumbaugh, 2013; Shukla et al., 2025). I temi trattati - visibilità, equità e rappresentazione - rientrano tra i domini più moralmente e politicamente sensibili del discorso contemporaneo sul brand. La loro rilevanza globale, unita al peso normativo che rivestono, li rende ideali per esaminare come i consumatori in culture diverse reagiscano non solo a cosa i brand comunicano, ma soprattutto a come lo comunicano. Ciò assume particolare importanza nel contesto delle crescenti aspettative dei consumatori riguardo alla sincerità del brand e al suo allineamento ai valori sociali (Vredenburg et al., 2020).

La ricerca si è focalizzata sulla comunicazione di MAC su Instagram in tre mercati culturalmente distinti - India, Messico e Stati Uniti - selezionati per la loro divergenza rispetto a dimensioni culturali chiave quali l'evitamento dell'incertezza, e l'individualismo-collettivismo (Hofstede, 2001; House et al., 2002). Gli account Instagram localizzati di MAC in questi paesi offrono contenuti attivisti comparabili, ma con variazioni stilistiche, consentendo un'analisi controllata di come le diverse strutture di framing - più che la rilevanza del tema trattato - influenzino l'engagement nei diversi contesti culturali.

### 3.2 Raccolta dati

Per investigare come il framing linguistico influenzi l'engagement degli utenti riguardo ai messaggi attivisti, è stata condotta un'analisi dei contenuti dei post pubblicati da MAC Cosmetics in tre Paesi culturalmente e geograficamente diversi: Stati Uniti, India e Messico.

I dati sono stati raccolti dagli account ufficiali Instagram di ciascun mercato in un arco temporale di due anni (gennaio 2022 - marzo 2024).

In totale, sono stati analizzati 314 post (Stati Uniti = 107; Messico = 103; India = 104). Il campione è stato limitato ai post che trattavano esplicitamente contenuti sociopolitici attivisti (ad esempio, diritti di genere, rappresentanza delle minoranze, salute pubblica, accesso all'istruzione). Sono stati esclusi i post puramente commerciali o incentrati sul prodotto. Ogni post è stato codificato da due ricercatori lungo più dimensioni derivanti dalle quattro funzioni del framing di Entman (1993): definizione del problema, diagnosi causale, valutazione morale e suggerimento di soluzioni, usando una classificazione binaria (presente/assente). Inoltre, ogni post è stato categorizzato in base alla "esplicità linguistica" (esplicito vs. non esplicito) seguendo un protocollo di codifica basato sul framing e guidato da Gong et al. (2025) e Vredenburg et al. (2020).

Per valutare la risposta del pubblico, è stato calcolato il tasso di engagement (ER) per ciascun post. Questa metrica è un proxy ampiamente utilizzato per misurare l'interazione del pubblico e l'efficacia dei contenuti sui social media (de Vries et al., 2012; Lou & Yuan, 2019), poiché controlla le dimensioni dell'account e consente confronti tra mercati.

### 3.3 Procedura di codifica

Per investigare la relazione tra framing linguistico e engagement dei consumatori, ogni post Instagram è stato codificato secondo una griglia strutturata che includeva caratteristiche retoriche e metriche di performance. Il dataset comprendeva variabili relative ai metadati del post, alla struttura del contenuto e all'interazione degli utenti. Ogni osservazione è stata identificata con un ID univoco e annotata con la data di pubblicazione e il link corrispondente su Instagram. Le metriche di engagement derivavano dal numero di like e commenti ricevuti da un post rispetto alla base di follower della pagina, permettendo di calcolare un tasso di engagement standardizzato. Questa metrica è stata calcolata come somma di like e commenti divisa per il numero totale di follower al momento della pubblicazione, moltiplicata per 100.

La componente testuale di ciascun post, sia nella didascalia sia nell'immagine associata, è stata preservata attraverso un estratto breve per facilitare l'interpretazione qualitativa. È stato quindi applicato uno schema di codifica deduttivo basato sulle quattro funzioni core del framing di Entman (1993). I post sono stati valutati per la presenza o assenza delle quattro funzioni proposte da Entman, codificando ogni funzione come variabile binaria.

Sulla base di questo framework, è stata introdotta una misura a doppio livello di esplicità del messaggio. Il primo livello consisteva in un indicatore binario, che distingueva i messaggi espliciti da quelli non espliciti. Il secondo livello misurava il grado di esplicità come variabile ordinale a quattro livelli - da 'nessuna' a 'alta' - in base al numero di elementi del framing chiaramente articolati. I post che includevano tutti e quattro gli elementi del framing sono stati classificati come espliciti, mentre i messaggi privi di tutti gli elementi sono stati considerati non espliciti. I casi intermedi, contenenti da uno a tre elementi, sono stati categorizzati come a media-bassa esplicità, con soglie determinate durante una fase pilota di codifica.

Ogni post è stato inoltre assegnato a una categoria tematica rappresentante il tema sociopolitico trattato (ad esempio, diritti LGBTQ+, equità di genere, salute mentale). Tali categorie sono state sviluppate in modo induttivo, partendo da un primo round di codifica aperta e definite successivamente tramite consenso tra i coder. Per garantire l'affidabilità del processo di codifica, due ricercatori hanno codificato indipendentemente l'intero dataset, testando l'affidabilità intercoder su un sottoinsieme casuale del 10%. I valori di

Krippendorff's alpha hanno superato la soglia standard di 0,80 per tutte le dimensioni chiave, indicativo di un alto livello di accordo. Eventuali discrepanze sono state risolte mediante revisione collaborativa. Quando necessario, i coder hanno incluso note osservazionali per documentare elementi contestuali, come riferimenti a notizie, collaborazioni o scelte visive rilevanti, a supporto dell'interpretazione durante la fase di analisi.

### 3.4 Costruzione delle variabili e strategia analitica

L'engagement degli utenti è stato operazionalizzato tramite il tasso di engagement (ER), calcolato come somma di like e commenti divisa per il numero di follower al momento della pubblicazione, moltiplicata per 100. Questa misura, ampiamente adottata nella ricerca sui social media (de Vries et al., 2012; Lou & Yuan, 2019), tiene conto delle differenze nella dimensione del pubblico tra i vari account nazionali. Data la sua asimmetria positiva, l'ER è stato log-trasformato per migliorare la normalità e successivamente winsorizzato al 5° e 95° percentile per ridurre l'influenza di valori estremi senza scartare osservazioni (Hair et al., 2019).

La principale variabile indipendente è il Tipo di Frame, codificata come 0 per i messaggi non espliciti e 1 per i messaggi espliciti, in base al livello di esplicità linguistica del post. Inoltre, è stata testata l'influenza di ciascuna delle quattro funzioni del framing di Entman (1993) - definizione del problema, diagnosi causale, valutazione morale e suggerimento di soluzioni - codificate come indicatori binary (presente/assente).

Per valutare gli effetti del framing sull'engagement, è stata adottata una strategia in due fasi. In primo luogo, sono stati condotti t-test di Welch per confrontare il log-ER medio tra le condizioni di framing, sia complessivamente sia per paese. Successivamente, è stata stimata una serie di regressioni OLS per prevedere il log-ER in base allo stile di framing, al contenuto retorico e alle interazioni con il paese, controllando per numero di follower, categoria del tema trattato e tempistica del post. Come verifica di robustezza, i modelli chiave sono stati replicati usando la regressione robusta di Huber, che minimizza l'influenza di eventuali outlier residui.

## 4. Resultati

Per testare le ipotesi dello studio, abbiamo innanzitutto confrontato i tassi medi di engagement tra i post che utilizzano un linguaggio esplicito rispetto a quelli non espliciti (H1). Come mostrato nella Tabella 2, la differenza non era statisticamente significativa nel campione complessivo (t = –0,428, p = .669; Cohen's d = –0,048), suggerendo che, in generale, il framing linguistico da solo non predice un engagement più elevato su tutti i post.

Tuttavia, controllando per i componenti retorici, l'analisi di regressione (vedi Tabella 2) ha rilevato che il framing esplicito predice significativamente un engagement più elevato (b = 0,042, p = .020), supportando H1. Tra le quattro funzioni del framing, solo la diagnosi causale ha mostrato un effetto positivo e significativo sull'engagement (b = 0,028, p = .001), in linea con H2. Al contrario, la raccomandazione di trattamento era negativamente associata all'engagement (b = –0,028, p = .031).

| **Confronto** | **t** | **p-value** | **Cohen's d** |
|---|---|---|---|
| Non esplicito vs. esplicito | - 0.428 | 0.669 | - 0.048 |

**Tabella 2:** Media di Engagement per Tipo di Framing (t-test di Welch)
(Fonte: elaborazione dell'autore)

| Predittore | Coef. | Std. Err. | Z |
|---|---|---|---|
| Tipologia di Frame | 0.042 | 0.018 | 2.33 |
| Causal Diagnosis | 0.028 | 0.008 | 3.33 |
| Treatment | - 0.028 | 0.013 | - 2.16 |

**Tabella 3:** Regressione Robusta Predittiva dell'Engagement (H1–H3)
(Fonte: elaborazione dell'autore)

Abbiamo quindi testato H3, che postula che il contesto culturale moderi l'effetto del framing esplicito. La Tabella 4 mostra che i livelli di engagement variano significativamente tra i paesi ($F = 43{,}93$, $p < .001$), con il Messico che mostra il tasso di engagement più alto ($M = 0{,}242$), seguito dall'India ($M = 0{,}122$) e dagli Stati Uniti ($M = 0{,}049$).

| Paese | Engagement medio |
|---|---|
| India | 0.122 |
| Messico | 0.242 |
| Stati Uniti | 0.049 |

**Tabella 4:** Media di Engagement per Paese (Fonte: elaborazione dell'autore)

Un modello di regressione includendo termini di interazione tra tipo di Frame e Paese (vedi Tabella 5) conferma che l'effetto del framing esplicito è più forte in India e negativo negli Stati Uniti e in Messico. Ciò fornisce supporto per H3.

| Termine | Coef. | p-value |
|---|---|---|
| Tipo di frame x Messico | - 0.058 | 0.001 |
| Tipo di frame x Stati Uniti | - 0.036 | 0.020 |
| (Baseline: effetto del tipo di frame in India) | 0.025 | 0.181 |

**Tabella 5:** Effetti di Interazione Frame × Paese (H4) (Fonte: elaborazione dell'autore)

Nel complesso, questi risultati suggeriscono che, sebbene il linguaggio esplicito generalmente favorisca l'engagement quando contestualizzato con chiarezza retorica (H1–H2), questo

effetto è moderato dal contesto nazionale (H3) e si riduce quando i post enfatizzano soluzioni.

## 5. Discussion and Conclusions

Questo studio ha analizzato come il framing linguistico nel brand activism, in particolare l'impiego di un linguaggio esplicito rispetto a uno non esplicito, influenzi l'engagement dei consumatori in mercati culturalmente eterogenei. Il lavoro si fonda sulla Framing Theory (Entman, 1993), sulla Signaling Theory (Spence, 1973; Connelly et al., 2011) e sulla Cultural Congruity Theory (Luna & Peracchio, 2001), con l'obiettivo di esaminare l'impatto delle strategie retoriche e delle funzioni del framing sull'interazione degli utenti con i post pubblicati da MAC Cosmetics su Instagram in India, Messico e Stati Uniti.

I risultati confermano empiricamente il ruolo centrale del framing nel modellare l'engagement dei consumatori con contenuti attivisti. In particolare, i post caratterizzati da un linguaggio esplicito hanno generato livelli di engagement significativamente più elevati rispetto a quelli che impiegano un linguaggio non esplicito. Tale evidenza è coerente con la letteratura che sottolinea come messaggi razionalizzati riducano l'ambiguità retorica, aumentino la percezione di sincerità e favoriscano una più profonda elaborazione del contenuto (Gong et al., 2025; Vredenburg et al., 2020). Alla luce dell'Elaboration Likelihood Model (Petty & Cacioppo, 1986), il linguaggio esplicito sembra attivare la central route processing, stimolando risposte più forti e consapevoli da parte degli utenti.

Oltre agli aspetti stilistici, l'analisi delle quattro funzioni del framing proposte da Entman evidenzia che l'attribuzione causale svolge un ruolo particolarmente rilevante nel favorire l'engagement. I post che esplicitano in modo chiaro le cause del problema affrontato mostrano una maggiore capacità di generare interazioni, in linea con la Attribution Theory (Weiner, 1985), secondo cui la presenza di cause percepite come interne, stabili e controllabili favorisce reazioni positive e riduce lo scetticismo. Al contrario, la proposta di soluzioni è risultata associata a una lieve ma significativa diminuzione dell'engagement. Sebbene tale risultato possa apparire controintuitivo, esso è coerente con gli studi di psicologia sociale sulla reattanza (Kim & Cameron, 2011) e sulla collective action fatigue (van Zomeren et al., 2008). In particolare, messaggi percepiti come eccessivamente prescrittivi possono indurre gli utenti a disimpegnarsi, soprattutto quando suscitano sensazioni di pressione morale o quando la soluzione appare imposta dall'alto, piuttosto che frutto di un processo partecipativo.

L'analisi cross-country evidenzia inoltre che l'effetto positivo del linguaggio esplicito varia in funzione del contesto culturale. L'efficacia del framing esplicito risulta significativamente più elevata in India rispetto a Messico e Stati Uniti, confermando l'ipotesi H3. Questo risultato contribuisce alla letteratura sulle contingenze culturali nella comunicazione attivista (Hofstede, 2001; Luna & Peracchio, 2001). Sebbene l'India presenti un basso livello di uncertainty avoidance, l'alto grado di collettivismo e le forti aspettative normative in materia di discorso morale possono spiegare la risposta favorevole a un linguaggio strutturato e trasparente. Al contrario, nei contesti più individualisti e maggiormente tolleranti all'ambiguità, come Messico e Stati Uniti, la forza persuasiva dei frame espliciti tende ad attenuarsi.

Nel complesso, i risultati sottolineano l'importanza di adattare la comunicazione attivista non solo alla causa sostenuta, ma anche al contesto culturale di riferimento. Il linguaggio non rappresenta un mero strumento espressivo: esso costituisce un segnale strategico capace di amplificare o ridurre la credibilità percepita dell'impegno del brand.

## 6. Contributi Teorici

Questo studio apporta diversi contributi teorici alla letteratura sul brand activism, sulla teoria del framing e sulla comunicazione di marketing interculturale.

In primo luogo, esaminando empiricamente l'effetto del framing linguistico sull'engagement degli utenti, estendiamo la ricerca precedente sul brand activism oltre la mera salienza dei temi e il posizionamento (Sarkar & Kotler, 2018; Vredenburg et al., 2020). In particolare, consideriamo come la forma di articolazione del messaggio, e nello specifico il grado di esplicità linguistica, influenzi la risposta dei consumatori. Mentre studi precedenti hanno enfatizzato la chiarezza della posizione del brand e l'allineamento alla causa (Bhagwat et al., 2020), i nostri risultati mostrano che non tutti i messaggi attivisti vengono elaborati nello stesso modo: il modo in cui una posizione viene comunicata rilevante tanto quanto la posizione stessa. In tal senso, dimostriamo che il framing linguistico incide significativamente sulle reazioni dei consumatori, indipendentemente dalla causa trattata. Questo risultato arricchisce l'intuizione di Gong et al. (2025), i quali si sono concentrati sul linguaggio reattivo in contesti di crisi (CSA), mostrando che il linguaggio esplicito incrementa l'engagement anche nell'attivismo volontario e non legato a crisi.

In secondo luogo, il lavoro contribuisce alla teoria del framing (Entman, 1993) introducendo uno schema di codifica strutturato e linguisticamente fondato per l'analisi della comunicazione attivista. Applicando le quattro funzioni del framing proposte da Entman, evidenziamo come l'attribuzione causale, spesso trascurata, svolga un ruolo cruciale nel generare engagement.

In terzo luogo, la ricerca connette le prospettive del framing e del signaling, proponendo che il linguaggio esplicito funzioni come segnale credibile di autenticità (Spence, 1973; Connelly et al., 2011). In questa prospettiva, il nostro studio fornisce un meccanismo teorico innovativo che collega la formulazione linguistica dei messaggi agli esiti di engagement dei consumatori, suggerendo che la trasparenza comunicativa riduce la percezione di opportunismo e rafforza la fiducia, considerata un antecedente chiave dell'engagement nei contesti attivisti.

Infine, lo studio contribuisce alla letteratura sull'adattamento culturale mostrando che l'impatto del framing esplicito varia a seconda dei contesti nazionali. Il confronto tra tre mercati caratterizzati da profili culturali distinti aggiunge profondità empirica alla Cultural Congruity Theory (Luna & Peracchio, 2001) e risponde alle richieste di ampliare l'analisi oltre i contesti WEIRD nel marketing internazionale (Henrich et al., 2010). I risultati suggeriscono che variabili culturali quali collettivismo, aspettative normative e tolleranza all'ambiguità influenzano significativamente il modo in cui i messaggi attivisti vengono decodificati dal pubblico.

Nel complesso, questi contributi offrono una comprensione teorica più articolata di come i brand possano comunicare in modo efficace attraverso un framing linguistico strategico, adattando il proprio discorso attivista a differenti contesti culturali.

## 7. Implicazioni manageriali

I risultati di questo studio offrono implicazioni operative significative per i brand manager, in particolare per coloro impegnati nella progettazione di campagne attiviste in contesti globali.

In primo luogo, i risultati mostrano che l'inquadramento linguistico rappresenta un elemento cruciale: i messaggi veicolati attraverso un linguaggio esplicito generano livelli più elevati di engagement, soprattutto quando includono spiegazioni causali chiare. Ne deriva che, nella

creazione di contenuti attivisti, i brand dovrebbero evitare formulazioni vaghe o meramente performative, privilegiando invece giustificazioni trasparenti e ben articolate. In tal modo si favorisce non solo la chiarezza comunicativa, ma anche la percezione di autenticità, un attributo sempre più rilevante nella comunicazione brand-cause.

In secondo luogo, l'analisi evidenzia che l'inquadramento problema-causa stimola l'engagement, mentre un'eccessiva enfasi sulle soluzioni tende a ridurlo. Ciò mette in discussione l'assunto manageriale secondo cui i messaggi orientati alla soluzione siano intrinsecamente costruttivi. Nei contesti attivisti, soluzioni percepite come prescrittive o semplificate possono generare affaticamento nel pubblico o attenuare la percezione di urgenza. I manager dovrebbero pertanto bilanciare l'enfasi sull'identificazione del problema con inviti alla riflessione e all'azione, piuttosto che affidarsi esclusivamente a indicazioni direttive.

In terzo luogo, i risultati della nostra analisi cross-culturale confermano che l'efficacia delle strategie di framing varia tra i diversi contesti nazionali. In particolare, il mercato indiano risponde in maniera più favorevole a messaggi espliciti, probabilmente in virtù di norme sociali che enfatizzano coerenza e giustificazione morale. Al contrario, in Messico e negli Stati Uniti tali effetti risultano attenuati. È dunque consigliabile che i marketer conducano analisi diagnostiche del pubblico a livello regionale e modulino di conseguenza il grado di esplicità linguistica, evitando approcci uniformi (one-size-fitsall) nel brand activism internazionale.

Infine, il framework metodologico adottato - che integra la teoria del framing con l'analisi dei social media - fornisce ai manager uno strumento diagnostico applicabile sia ex ante, per testare le campagne in fase di progettazione, sia ex post, per valutarne la performance. Griglie di codifica simili possono essere utilizzate per monitorare i contenuti, individuare debolezze linguistiche e ottimizzare l'engagement in mercati culturalmente eterogenei.

## Abstract

Front of Pack Nutritional Labeling (FOPL) is a key strategy to address rising global obesity and diet-related noncommunicable diseases. This study examines whether recent academic research aligns with the public health needs and policy development stages of different countries. Using a mixed approach we identified a disconnection: while nearly 30% of countries face high obesity rates and lack FOPL implementation, over 70% of research focuses on countries with established systems. This reveals a misalignment between research efforts and policy urgency. Our findings suggest the need for stronger coordination between researchers and policymakers to ensure that scientific evidence supports FOPL adoption where it is most needed.

*Keywords: Front-of-Pack Nutritional Labels; Obesity; Overweight; Policy-making; Food; Bibliometric analysis.*

### 1. Introduction

Global institutions are increasingly prioritizing the growing prevalence of obesity and overweight worldwide, as highlighted by the World Health Organization (WHO, 2025). Between 1990 and 2022, obesity rates among children and adolescents aged 5–19 rose from 2% to 8%, while adult obesity more than doubled, from 7% to 16%. Once considered an issue limited to high-income countries, obesity is now widespread in many middle-income nations, which report some of the highest prevalence rates. This global trend poses a major public health challenge, fueling the rise of noncommunicable diseases and placing mounting pressure on healthcare systems (WHO, 2024); a key factor contributing to this issue is malnutrition, which includes not only deficiencies but also excesses and imbalances in nutrient intake. In response, a range of stakeholders—from individuals to policymakers and industry players—have introduced various countermeasures. Among these, Front-of-Pack Nutritional Labeling (FOPL) has emerged as a prominent strategy to inform consumers about the nutritional quality of food products (Mazzù et al., 2023). FOPL systems vary by country: directive formats like Nutri-Score are voluntarily used in several European nations, Warning Labels are prevalent in South America, and non-directive models such as Italy's NutrInform Battery offer alternative approaches.

While FOPLs are widely acknowledged as effective and necessary, their implementation differs significantly across countries in terms of "policy maturity" (van der Bende and Lissner, 2019; European Commission, 2020), resulting in a fragmented regulatory landscape.

Consequently, research efforts—both in focus and intensity—do not always align with the various stages of the policy lifecycle. Scholarly output tends to surge during moments of public debate or uncertainty, such as during the selection of an FOPL system or in later stages assessing its impact.

Despite a robust body of literature evaluating FOPL effectiveness, there remains a limited understanding of countries' underlying needs in relation to FOPL, especially when viewed through the lens of public health challenges and policy development stages. This paper therefore (i) explores the alignment between these needs and recent FOPL research (2018–2023), focusing on research intensity, quality, and geographic distribution, and (ii) highlights a disconnect, showing that research efforts are not always concentrated where they are most urgently needed.

## 2. Metodologia

This study adopts a mixed-method approach rooted in public policy analysis, integrating three key components: (i) a systematic review of the literature on Front-of-Pack Labels (FOPLs), (ii) an initial assessment of the policymaking landscape related to FOPLs across various countries, and (iii) a comparative analysis of country-level health indicators related to obesity. The policy cycle framework is employed to trace the evolution of FOPL initiatives through the different stages of the policymaking process. To support the conceptual framework and uncover cross-national patterns, relevant academic literature on FOPLs, policy development, and nutrition governance was thoroughly examined.

### 2.1 Systematic Literature Review and Research focus

The study began with a Systematic Literature Review conducted in accordance with PRISMA guidelines. In the initial phase, a search was carried out using the query ("= Front AND Pack AND Nutr*") across the Scopus and Web of Science databases, restricted to peer-reviewed articles published between 2020 and 2024. This search yielded 1,316 records. Following the removal of duplicates and dataset cleaning, a relevance screening was performed based on journal quality, using the Scimago Journal Rank (SJR) as a reference. Only articles published in top-quartile (Q1) journals were retained, narrowing the pool to 1,161 papers. This subset was further refined to 238 articles by selecting only those with an SJR above the median value within each main thematic area.

In the third stage, a detailed manual screening was conducted to ensure the inclusion of high-quality studies with clear thematic relevance. Articles that did not explicitly address Front-of-Pack Labeling (FOPL) or deviated substantially from the core topic were excluded, resulting in a curated dataset of 150 articles. Finally, a full-text analysis was carried out, during which specific information from each article was systematically recorded in a dedicated review file. At this stage, additional exclusions were made due to content misalignment with the study's objectives—issues not evident during the abstract screening—yielding a final dataset of 105 articles, 91 of which were directly associated with individual countries.

### 2.2 Policy lifecycle stages

Policy life cycle frameworks offer a valuable lens for examining the progression of public policy development and implementation. Drawing on established literature (Robinson and Eller, 2010), this study identifies a series of stages beginning with the "absence" of policy discourse, followed by "agenda setting," "problem identification," and "policy formulation," which encompasses both "drafting a proposal" and initiating the "legislative process." The final stages involve "adoption" (either voluntary or mandatory) and "monitoring, adjustment, and evaluation" to assess and refine policy effectiveness.

In the context of Front-of-Pack Labeling (FOPL), the "problem identification" phase typically entails recognizing critical public health issues—such as rising obesity and overweight rates—and their links to poor dietary habits. The subsequent "agenda-setting" stage reflects increasing interest in FOPL as a policy response to nutrition-related diseases. The "policy formulation" stage is particularly pivotal, involving the assessment of alternative policy options. This includes drafting a proposal and proceeding through the legislative process, where the policy undergoes debate, approval, and legal ratification.

The "adoption" stage—whether voluntary or mandatory—depends heavily on political and institutional commitment. Once adopted, FOPL systems enter the "implementation" phase, which may encounter obstacles such as limited consumer engagement or "label fatigue" (Pfister and Pozas, 2023). This leads to the final phase of "monitoring, adjustment, and evaluation", aimed at measuring the policy's outcomes and improving its performance over time.

To determine each country's position within the policy lifecycle, we analyzed data from 197 countries using the WHO GIFNA (2025) dataset. This encompasses all 193 United Nations member states, as well as additional entities including Vatican City, French Polynesia, Kosovo, and Palestine. Countries were categorized into nine macro-regions: (1) North America, (2) Central America and the Caribbean, (3) South America, (4) Europe – EU27, (5) Europe – non-EU27, (6) Africa, (7) Middle East, (8) Asia (excluding the Middle East), and (9) Oceania. Table 1 presents an overview of FOPL policymaking status across these regions.

For analytical clarity, countries were grouped into three overarching policy lifecycle phases: (i) "Pre-adoption", (ii) "Voluntary adoption, monitoring, and adjustment" and (iii) "Mandatory adoption and monitoring". The findings reveal that most countries (74.62%) remain in the early, pre-adoption stages, while only 6.60% have progressed to mandatory adoption.

| Macro-Region | Countries in the macro-region | Countries in before voluntary adoption stages | Countries in voluntary adoption, monitoring and adj. stages | Countries in mandatory adoption and monitoring stages |
|---|---|---|---|---|
| | Number | Number | Number | Number |
| North America | 3 | 2 | 0 | 1 |
| Central America and the Caribbean | 20 | 20 | 0 | 0 |
| South America | 12 | 3 | 1 | 8 |
| Europe – EU 27 | 27 | 13 | 14 | 0 |
| Europe, Non EU 27 | 19 | 13 | 6 | 0 |
| Africa | 54 | 54 | 0 | 0 |
| Middle East | 16 | 9 | 5 | 2 |
| Asia (excl. Middle-East) | 31 | 20 | 9 | 2 |
| Oceania | 15 | 13 | 2 | 0 |
| Total | 197 | 147 | 37 | 13 |
| *Percentage on the total* | *100%* | *74.62%* | *18.78%* | *6.60%* |

**Table 1:** Status of policy lifecycle by macro-region

### 2.3 Obesity-related health indicators

To evaluate the severity of obesity-related challenges across countries, we identified a set of key indicators. Specifically, the analysis included: (a) Body Mass Index (BMI), a widely used screening measure that estimates body fat based on height-to-weight ratio (with definitions from the Cleveland Clinic, 2025, and data primarily sourced from WorldData, 2025); (b) the prevalence of obesity and overweight within the total population, expressed as a percentage; (c) the incidence of noncommunicable diseases (NCDs), measured by the proportion of total deaths attributable to these conditions (data mainly retrieved from the World Bank, 2025); and (d) relevant covariates highlighted in the literature, including education level, income or purchasing power, age, and gender (Cooper et al., 2021; Egnell et al., 2018; Pettigrew et al., 2017), with data primarily obtained from WorldData (2025) and Numbeo (2025)

Of the complete dataset, 59 countries—representing approximately 30% of the total sample—had comprehensive data available across all selected indicators (see Table 2).

| Macro-Region | Countries in the macro-region<br>Number | Indicators available<br>Average number (out of 16) |
|---|---|---|
| North America | 3 | 16.0 |
| Central America and the Caribbean | 20 | 14.1 |
| South America | 12 | 15.4 |
| Europe – EU 27 | 27 | 15.9 |
| Europe, Non EU 27 | 19 | 13.0 |
| Africa | 54 | 12.6 |
| Middle East | 16 | 15.3 |
| Asia (excl. Middle-East) | 31 | 14.7 |
| Oceania | 15 | 13.1 |

**Table 2:** Number of countries and data availability by macro-region

## 3. Results

Using the dataset described above, we clustered countries based on two primary criteria: (i) the status of Front-of-Pack Label (FOPL) policy adoption—specifically, whether a FOPL system is currently implemented in the market—and (ii) key obesity-related health indicators, namely average Body Mass Index (BMI) and the proportion of deaths attributable to noncommunicable diseases (NCDs). BMI functions as an input indicator, reflecting potential health risks, while NCD-related mortality serves as an output indicator, capturing the consequences of such risks (e.g., Riquelme et al., 2021; García-Witulski, 2025).

From the original dataset, 184 countries were retained, with 13 excluded due to incomplete data. Countries were categorized according to standard adult BMI classifications (CDC, 2025): those with an average BMI above 30 were classified as "obese," those between 25 and 29.9 as "overweight," and those below 25 as having a "healthy weight". Notably, no country in the dataset reported an average BMI below 18.5, which would indicate an underweight population.
For NCD-related mortality, the median value across countries was calculated and used as a threshold to divide the sample into two groups: those with a "higher incidence of NCD-related deaths" and those with a "lower incidence." By combining these health classifications with the presence or absence of FOPL policies, we identified 12 distinct country clusters (see Table 3).

| BMI Level | NCD incidence | Policy status | | Total |
|---|---|---|---|---|
| | | Early | In place | |
| BMI>30 | | 9 (4.9%) | 2 (1.1%) | 11 (6.0%) |
| | Higher NCD | 5 (2.7%) | 1 (0.55%) | 6 (3.3%) |
| | Lower NCD | 4 (2.2%) | 1 (0.55%) | 5 (2.7%) |
| BMI: 25-29.9 | | 84 (45.7%) | 41 (22.3%) | 125 (67.9%) |
| | Higher NCD | 49 (26.6%) | 29 (15.8%) | 78 (42.4%) |
| | Lower NCD | 35 (19.0%) | 12 (6.5%) | 47 (25.5%) |
| BMI <25 | | 42 (22.8%) | 6 (3.3%) | 48 (26.1%) |
| | Higher NCD | 3 (1.6%) | 4 (2.2%) | 7 (3.8%) |
| | Lower NCD | 39 (21.2%) | 2 (1.1%) | 41 (22.3%) |
| Total | | 135 (73.4%) | 49 (26.6%) | 184 (100.0%) |

**Table 3:** Country clustering by typology: incidence by segment

Clusters comprising countries where the average population falls into the "obese" or "overweight" categories—combined with a high incidence of NCD-related mortality—are of analytical interest. These groupings reflect nations facing acute public health challenges. Notably, 54 countries (29.3% of the sample) fall within this category while remaining in the early, pre-adoption phases of FOPL policy development. This represents a significant opportunity for targeted research and institutional action. While some of these countries have initiated limited legislative or drafting activities, they have not yet advanced to the voluntary or mandatory implementation stages. Others show minimal policy engagement, with little to no regulatory or legislative initiatives underway. These countries are typically lower-income or developing nations, where FOPL has not yet emerged as a governmental or institutional priority. A further 39 countries (21.2% of the sample) also fall into the "BMI > 30" or "BMI 25–29.9" range but report lower rates of NCD-related mortality. This discrepancy may be explained by several factors, including younger population demographics, delayed onset of NCDs, better access to basic healthcare, variation in leading causes of mortality, or potential underreporting and data quality limitations. Despite lower current mortality rates, these countries present a latent risk of future health deterioration and thus represent a strategic target for early-stage preventive policies such as FOPL implementation. In contrast, 16.3% of the sample consists of countries with similarly high BMI and overweight prevalence, but with active FOPL policy engagement. These nations have typically adopted voluntary labeling schemes, indicating broad industry participation, heightened consumer awareness, and institutional readiness to transition toward mandatory regulation. Such countries, often more economically developed, tend to implement multi-

phase FOPL strategies and demonstrate a clear commitment to nutrition policy as a core public health priority.

### 3.1 Advances in research and its link to supporting policy development

Each article selected through the literature review was examined to determine its geographical focus. A value of "one" was assigned to a country whenever it was explicitly addressed in the study—whether through experimental research, policy evaluation, or other analytical methods. This process yielded a total of 188 entries. Of these, 174 were associated with 50 specific countries, while the remaining 14 referred either to broader continental regions or lacked a defined national focus, instead contributing to the conceptual or theoretical development of FOPL. The findings reveal a marked concentration of research activity in specific geographic areas, suggesting an uneven global distribution of scholarly attention (see Table 4).

| Macro-Region | Policy status | | Total |
|---|---|---|---|
| | Early | In place | |
| North America | 24 | 6 | 30 |
| Central America and the Caribbean | - | - | - |
| South America | 2 | 29 | 31 |
| Europe – EU 27 | 9 | 52 | 62 |
| Europe, Non EU 27 | - | 16 | 16 |
| Africa | 8 | - | 8 |
| Middle East | - | - | - |
| Asia (excl. Middle-East) | 3 | 17 | 20 |
| Oceania | | 8 | 8 |
| Total | 46 | 128 | 174 |

**Table 4:** Research by macro-region and by policy status

Major countries focus of the research are displayed in Figure 1.

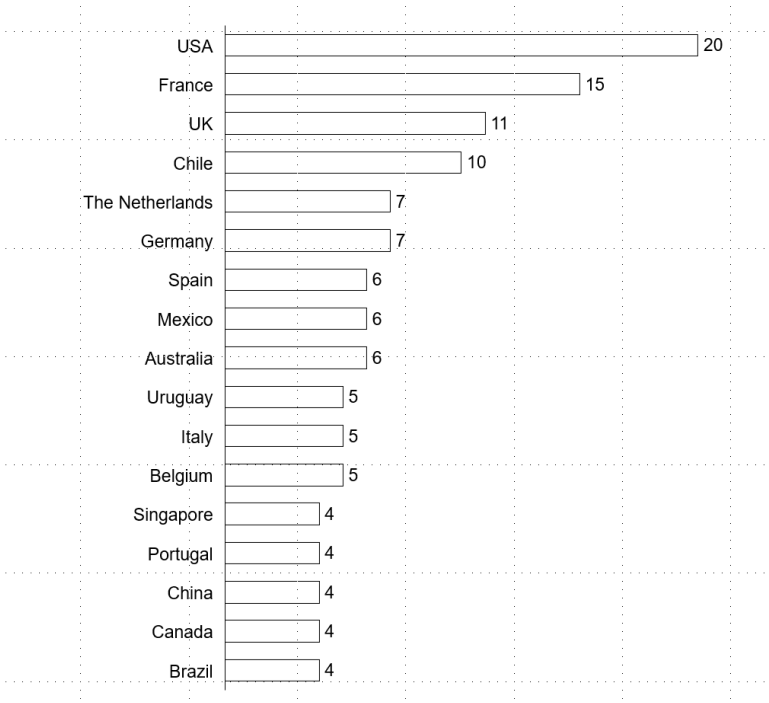

**Figure 1:** Country focus of advances in research

In this respect, authors affiliated with institutions of 12 different countries were active in top journals (Figure 2).

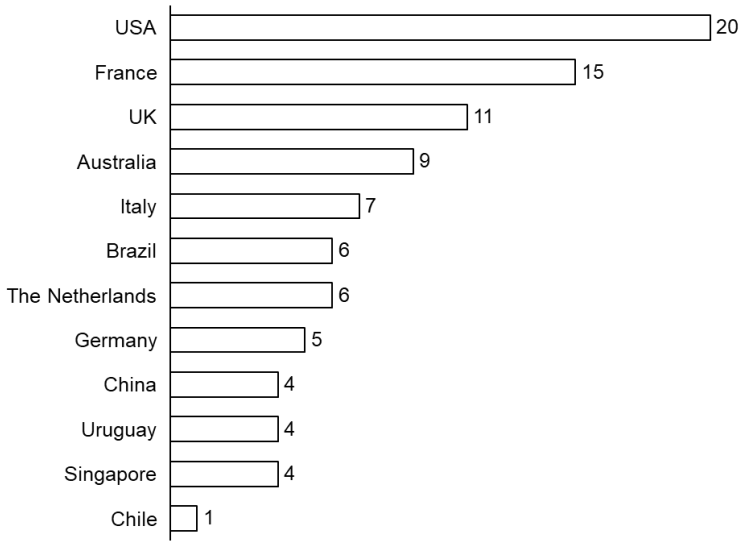

**Figure 2.** Authorship by country of affiliation of the main author

Authors affiliated with institutions in the United States and China—together responsible for 24 publications (26.0%)—were predominantly associated with studies examining countries

that remain in the early stages of FOPL policy development. A second, more substantial group includes 57 papers (62.0%) focusing on countries that were early adopters of voluntary FOPL systems, such as France, Italy, Germany, the Netherlands, Singapore, the United Kingdom, and Australia. A third cluster comprises 11 studies (12.0%) centered on countries where FOPL policies have already been implemented and where institutional efforts are now directed toward evaluating their real-world impact. This latter group primarily includes Chile, Uruguay, and Brazil.

Notably, a significant share of recent scholarly output in high-ranking journals (73.6%) has concentrated on countries with existing FOPL policies. These studies explore a broad range of issues, including assessments of policy effectiveness, comparative analyses of labeling schemes, and the development of new conceptual or applied frameworks (see Table 5).

| BMI Level | NCD incidence | Paper by Policy status Number, percentage | | Total |
|---|---|---|---|---|
| | | Early | In place | |
| BMI >30 | | 0 (0.0%) | 0 (0.0%) | 0 (0.0%) |
| | Higher NCD | 0 (0.0%) | 0 (0.0%) | 0 (0.0%) |
| | Lower NCD | 0 (0.0%) | 0 (0.0%) | 0 (0.0%) |
| BMI: 25-29.9 | | 37 (21.3%) | 106 (60.9%) | 143 (82.2%) |
| | Higher NCD | 33 (19.0%) | 82 (47.1%) | 115 (66.1%) |
| | Lower NCD | 4 (2.3%) | 24 (13.8%) | 28 (16.1%) |
| BMI < 25 | | 9 (5.2%) | 22 (12.6%) | 31 (17.8%) |
| | Higher NCD | 2 (1.1 %) | 20 (11.5%) | 22 (12.6%) |
| | Lower NCD | 7 (4.0%) | 2 (1.1%) | 9 (5.2%) |
| Total | | 46 (26.4%) | 128 (73.6%) | 174 (100.0%) |

**Table 5:** Incidence of research by country clustering – Number of paper and distribution by cluster

In the United States, research on Front-of-Pack Labeling (FOPL) can be organized into several distinct micro-clusters. The first cluster explores the impact of various labeling formats—such as warning labels (Hughner and Dumitrescu, 2024), stop sign symbols (Rybak et al., 2024), and Traffic Light systems (Meng and Chan, 2022 —with a particular focus on their ability to influence healthier and more sustainable food choices. A second cluster is more policy-oriented, examining how FOPL initiatives are positioned as tools to promote healthier eating behaviors and curb the prevalence of noncommunicable diseases (NCDs). A third body of literature evaluates the behavioral outcomes of nutritional labeling interventions, including studies like those by Downs and Demmler (2020), which assess how such measures affect consumer decision-making and encourage shifts toward alternative or healthier food options. Lastly, several studies focus on the Nutrition Facts Panel, analyzing its effectiveness and influence within the broader framework of front-of-pack and back-of-pack labeling strategies.

In France, most studies focus on the application of the Nutri-Score system, reflecting a highly mature phase of research on this specific labeling scheme. This is evidenced by large-scale field experiments conducted in retail settings (Dubois et al., 2021) as well as investigations within broader communication and media contexts (Courbet et al., 2024; Hémar-Nicolas et al., 2024). Overall, the literature has progressed beyond initial evaluations of Nutri-Score's potential benefits, moving toward more advanced analyses of its practical effectiveness and contextual relevance.

In the United Kingdom, research has largely concentrated on the practical application of Traffic Light labeling systems. Several studies have investigated their influence on consumer behavior with respect to specific nutrients (Mauri et al., 2021), either in isolation or when combined with additional visual cues such as green labels (Macdiarmid et al., 2021). Other studies have explored how complementary strategies—such as shelf placement and product allocation in retail environments—can enhance the effectiveness of Traffic Light labels in promoting healthier purchasing decisions (Grandi et al., 2021; Harastani et al., 2020).

In Chile, the research landscape on Front-of-Pack Labeling (FOPL) has reached a mature stage, with a predominant focus on the country's implementation of warning labels. Much of the literature adopts a distinctly economic perspective, analyzing the effects of FOPLs on outcomes such as prices, real wages, and employment (Paraje et al., 2021; Alé-Chilet et al., 2022; Pachali et al., 2023). Complementing this, a second stream of research adopts a broader policy-oriented lens (Araya et al., 2022). These studies examine the influence of various stakeholders—particularly food industry actors—in shaping or resisting FOPL policy development and implementation (Mialon et al., 2020), as well as the health impacts of FOPLs on vulnerable populations, including children and adolescents (Fretes et al., 2025).

In the Netherlands, research has underscored the positive role of Front-of-Pack Labels (FOPLs) in encouraging healthier eating behaviors. Notable labeling schemes studied include the national Dutch Choices logo (van der Bend et al., 2020) and the Traffic Light system. Additionally, recent work (Maesen et al., 2022) demonstrates a measurable impact of FOPL implementation on product sales.

In contrast, the body of FOPL research specific to Germany remains limited. One key study examined the influence of the Nutri-Score label on individuals' dietary planning (Hau and Lange, 2024), while most other research involving Germany appears within broader cross-country comparisons.

In Spain, the literature has primarily focused on the role of FOPLs in preventing health-related conditions, with Nutri-Score being the most frequently analyzed scheme. Studies have explored its relevance in the context of gluten-free product consumption (De las Heras-Delgado et al., 2021), the association between low nutritional scores and mortality risk (Gómez-Donoso et al., 2021), and its implications for renal function (Montero-Salazar et al., 2022). One particularly noteworthy contribution investigates how FOPLs moderate the relationship between brand attitude and purchase intention (Medina-Molina et al., 2021).

In Mexico, FOPL research carries strong policy relevance. Several studies explore divergent stakeholder perspectives on FOPL adoption (Durán et al., 2022), while others assess the effectiveness of labeling in reducing the consumption of ultra-processed foods (Cruz-Casarrubias et al., 2021) or position FOPLs as part of a broader set of tools to address obesity and noncommunicable diseases (Rivera et al., 2024).

In Australia, nearly all studies focus on the Health Star Rating (HSR), the country's voluntary FOPL system. Research approaches the HSR from both nutritional and applied perspectives. Nutritionally, studies investigate how components such as whole grains are factored into the HSR algorithm (Byron et al., 2024). From an applied standpoint, scholars have examined its integration into digital retail environments like online supermarkets (Maganja et al., 2023), as well as its broader implications for public health policy (Sainsbury et al., 2020).

In Uruguay, research centers on maximizing the effectiveness of warning labels. This includes examining the role of supportive communication campaigns (Ares et al., 2021) and the strategic placement of labels on specific product categories, such as white bread

(Antúnez et al., 2020) and sugar-reduced desserts marketed to children (Velázquez et al., 2023).

In Italy, studies predominantly benchmark the effectiveness of various FOPL schemes in terms of consumer comprehension, preference, and influence on dietary behavior (Hasni et al., 2024). Additional research explores how FOPLs interact with contextual factors, such as environmental cues (Mazzù et al., 2025) or product-specific considerations, as in the case of olive oil (Mazzù et al., 2024).

A significant portion of the literature has adopted a cross-country perspective. For instance, some studies evaluate technical developments such as the updated Nutri-Score algorithm (Merz et al., 2024), or the integration of environmental indicators using Traffic Light color schemes (Neumayr and Moosauer, 2021). Others compare the effectiveness of various labels based on consumers' objective understanding and interpretation (Egnell et al., 2020). Another cluster of cross-national research focuses on policy-related dimensions, aiming to assess the effectiveness of nutritional labeling implementation in specific regions (Barlow et al., 2021; Pettigrew et al., 2023). Within the Americas, several reviews have examined the impact of labeling policies across different national contexts (Crosbie et al., 2023), and have proposed conceptual frameworks to better understand the relationship between food environments and consumer food choices (Constantinides et al., 2021).

## 4. Discussion and conclusions

This study represents an initial attempt to examine the recent evolution of scientific research on Front-of-Pack Labeling (FOPL) and to compare it with the current state of policymaking across countries. The objective is to encourage critical reflection on whether research efforts are effectively aligned with the specific needs of different country clusters and the various stages of the policy lifecycle.

The research makes several key contributions. First, it offers preliminary insights into the alignment between scientific output and policymaking stages, highlighting how certain phases of policy development tend to attract greater attention from high-quality research, particularly in regions where the urgency of FOPL implementation is highest. Second, it underscores the disparities in research focus relative to consumer health priorities and policy maturity. While a significant portion of academic work concentrates on evaluating existing FOPL models or proposing context-specific innovations, these efforts are not always synchronized with countries' most pressing policy needs. Findings reveal an uneven distribution of research intensity and quality, as well as thematic fragmentation. This often stems from differences in national regulatory approaches and institutional research priorities. Comparative studies—spanning various phases of the policy lifecycle—constitute a major share of the literature and typically assess the effectiveness of FOPL schemes in influencing consumer behavior, public health outcomes, and industry practices. However, a persistent misalignment exists between the timing of research outputs, the public health conditions in specific countries, and the evolving demands of policy. While policymakers require timely, actionable insights to inform decisions, academic research may operate on different timelines and pursue broader theoretical goals, thereby limiting its immediate policy relevance. These observations point to the need for improved coordination between academic researchers and institutional stakeholders. Strengthening this collaboration could help ensure that scientific findings more effectively inform regulatory decisions and contribute to enhancing population health in context-specific ways.

The study is not without limitations. It focuses primarily on publicly available data on obesity-related health metrics and includes only peer-reviewed articles published in top-tier journals, as ranked by Scimago. Future research could broaden the scope to include additional data

sources, a wider range of publication types, and a longer time span, potentially revealing shifts in research priorities or the emergence of long-term trends. Furthermore, it would be valuable to investigate the extent to which institutional funding frameworks shape research agendas and geographic focus.

In summary, global institutions should place greater emphasis on encouraging—and, where appropriate, subsidizing—research in countries with the greatest need for intervention, particularly those with high rates of obesity and noncommunicable diseases. A more cross-disciplinary and targeted research approach would support the effective integration of FOPL into national legislation, ultimately contributing to improved health outcomes at the global level.

## Abstract

This research explores how Generative AI (GenAI) in social media content (SMC) creation affects consumer perceptions in the luxury fashion industry. Based on the cue utilization theory, signaling theory, and self-concept theory, the study proposes a conceptual model to shed some light on better understanding the relationships among how AI-generated SMC may backfire on customers' willingness to pay more. The main contribution consists in introducing the country-of-origin (COO) image as a key factor in shaping customers' responses: the research proposes a framework in which the negative impact of AI is reduced when the brand is associated with a favorable country image, such as Italy. By integrating COO into the debate on AI-generated branded content, this research offers a new perspective on how cultural brand signals interact with technological innovation, providing both theoretical and practical contributions for marketers operating in the luxury fashion sector.

*Keywords: AI-generated content; brand authenticity; self-congruity, country-of-origin; luxury brands*

## 1. Introduction

Once defined by exclusivity, rarity, and tradition, luxury has undergone a radical transformation (Kumar et al., 2020). Digital innovation is the main driver of this shift, which is transforming how luxury companies engage with their customers (Creevey et al., 2021).

One of the latest innovations that is affecting the way luxury brands communicate is the use of generative artificial intelligence (GenAI) to automate the creation of social media content (SMC) (Dwivedi et al., 2023).

However, in the luxury sector, wherein a brand "has a prestigious image within the market built on qualities such as artisanship, craftsmanship, or service quality" (Ko et al. 2019), the use of GenAI for creating social media and advertising campaigns raises important questions regarding authenticity perceptions and sense of exclusivity and uniqueness. For instance, can a message created by an algorithm evoke the same sense of craftsmanship, creativity, and emotional depth that defines luxury fashion? Or does GenAI risk undermining the creation of a relationship between brands and customers by altering the way people see luxury brands? What role does the COO play in guiding AI-driven communications to ensure they reflect a brand's value and avoid unintended consequences?

Since a luxury brand's positioning is strongly linked to its country-of-origin (COO), the COO's image is an important factor that shapes customers' brand evaluations, perceptions, and purchasing behavior (Adina et al., 2015). In this context, the connection to a country renowned for craftsmanship and exclusivity, such as Italy, can help ground AI-generated messages in a more tangible and credible narrative. By evoking cultural associations of artisanal excellence, attention to detail, and timeless style, the COO serves as an anchor that enhances the authenticity of brand communications shaped by generative AI. This connection not only strengthens the emotional resonance of the message but also mitigates the risk of skepticism toward GenAI (Magnusson et al., 2019), strengthening the customer's belief in the brand's authenticity, quality, and values and consequently the willingness to pay.

To fill this gap, the present study proposes a conceptual model to investigate how AI-generated content in luxury fashion SMC creation affects consumers' perceptions of authenticity, self-congruity, and willingness to pay more. This study adds to the literature by integrating COO image into the debate on AI-generated content, highlighting how such symbolic cues shape consumer responses towards luxury brands.

## 2. Theoretical Background

We draw on three well-established theories in the fields of marketing: cue utilization theory (Jacoby and Haddock, 1971; Olson, 1972; Olson and Jacoby, 1972), signaling theory (Erdem and Swait, 1998; Erdem et al., 2006; Erdem and Swait, 2016), and self-concept theory (Sirgy, 1982; Sirgy et al., 1997), to explain how AI-generated content may influence brand authenticity perceptions, self-congruity, and ultimately consumers' willingness to pay.

Drawing on cue utilization theory (Jacoby et al., 1971), consumers may assess SMC quality based on extrinsic cues (Javeed et al., 2022), such as COO and AI disclosure, especially in high-involvement contexts like luxury fashion. As explained by signaling theory, these cues act as signals that can shape customers' perceptions (Javeed et al., 2022). In this sense, using GenAI for creating SMC may weaken the customer's perceived authenticity. In such cases, extrinsic cues like a strong COO image may serve as compensatory signals, mitigating the possible negative effects of GenAI on authenticity perceptions. Finally, according to self-concept theory (Sirgy, 1982), consumer responses are shaped by the alignment between brand signals and their self-image, which affects self-congruity and downstream behavioural responses such as willingness to pay more. Drawing from these theories, Figure 1 shows a conceptual framework of the factors that may affect how customers respond to AI-generated content in the luxury fashion context and forms the basis of the following research hypotheses.

Recent research that analyzes customers' responses to AI-generated advertising and social media campaigns found mainly negative results. Indeed, AI-generated advertisements have negatively impacted the credibility and attitude towards advertising (Baek, 2024) and brands (Sands, 2025). Similarly, including an AI disclosure label on an advertisement has been shown to decrease trust and customer attitudes towards the advertisement itself, especially when used to generate intangible attributes (Grigsby et al., 2025). However, while the majority of previous studies have focused on cognitive responses, behavioral outcomes, such as willingness to pay more, have been largely unexplored (Ali et al., 2025). Defined as "a consumer's readiness or inclination to pay a higher price for a product or service" (Zeithaml, 1988), the willingness to pay more is especially relevant in contexts like luxury fashion, where exclusivity is key.

While consumers may not always discern whether content is human or AI-generated, their behavioral responses tend to turn negative when the use of GenAI is explicitly disclosed (To et al., 2025). This suggests that adopting GenAI in content creation may undermine brand

authenticity and exclusivity that justify premium pricing in the luxury sector (Hung et al., 2011; To et al., 2025). In this vein, the following hypothesis is proposed:

H1. GenAI adoption for social media content creation (vs Human) will negatively impact willingness to pay more

To explain the relationship between AI-generated content creation and customers' behavioral responses, previous studies have revealed that brand authenticity and self-congruity may play a role. Nevertheless, they found mixed results. Brand authenticity, defined as the extent to which a brand is perceived as genuine, of high quality, and craftsmanship-related by its customers (Alexander, 2009), leads to favorable brand outcomes, such as trust, positive attitudes, and behavioral responses. In the context of AI-generated content creation, on the one hand, it has emerged that the use of GenAI in social media strategies may lead to a reduction of the perceived authenticity as it diminishes the credibility of a post and, in turn, the attitudes towards and the engagement with brands (Brüns and Meißner, 2024). Similarly, using AI-generated content seems to lower the customers' perception of the brand's authenticity and their brand responses, especially in the luxury context, since customers perceived a violation of their expectations of identity benefits, such as exclusivity and aspirational values (To et al., 2025). On the other hand, by allowing brands to personalize their marketing strategies, AI-generated content seems to enhance the customers' perception of authenticity because brands can create consistent narratives and customized experiences (Ali et al., 2025). Another organismic response that has to be considered to understand the underlying mechanisms between GenAI and consumer behavioral response is self-congruity, namely, a psychological concept reflecting the consumer's self-identity alignment with how they perceive a brand. When consumers perceive a brand as authentic, they tend to identify with the brand, develop emotional ties with it, and be more willing to buy and pay more for that brand (Fatma and Khan, 2024). In the context of AI-generated content, it seems that the negative impact of GenAI on brand authenticity may also backfire on the authentic alignment with consumers' self-concepts, as AI-generated content lacks the emotional nuance and cultural sensitivity that are characteristics of human-generated content (Ali et al., 2025). Nevertheless, GenAI's capability to create content tailored to consumers' preferences and values could promote deeper resonance and alignment, reinforcing customers' self-concepts and enhancing self-congruity (Dwivedi, 2024). In this vein, the following hypothesis is proposed:

H2. The effect of GenAI adoption for creating social media content (vs Human) on willingness to pay will be sequentially mediated by brand authenticity and self-congruity. The negative effect of GenAI adoption on willingness to pay more is driven by a) lower perceived authenticity, which leads to b) lower self-congruity.

When a brand originates from a country strongly associated with values such as artisanal quality and heritage, such as Italy in the fashion sector, the COO acts as a contextual anchor that enhances perceived authenticity. This aligns with the cue congruence framework (Magnusson et al., 2011), suggesting that consistency between different brand signals (e.g., origin and communication style) can reduce cognitive dissonance. Moreover, drawing on the signaling theory (Erdem & Swait, 1998), we argue that a strong COO image may amplify the overall perceived trustworthiness and authenticity of the message, even when the message is AI-generated. Thus, the COO can help restore coherence between message and brand identity, especially in high-involvement categories such as luxury fashion.

Brands linked to high-image COO, such as Italy, are typically expected to embody authenticity, craftsmanship, and tradition (Cheah et al., 2016; Cappelli et al., 2019). In line with this, a strong COO image generally enhances brand authenticity (Siew et al., 2018) and, therefore, can serve as a buffer that mitigates the potentially negative effects of AI-generated

content on brand authenticity and self-congruity. Therefore, the following hypotheses are presented:

H3. Perceived country image positively affects brand authenticity

H4. GenAI adoption for creating social media content and the COO effect will interact to influence brand authenticity and self-congruity. When social media content is generated by GenAI, a brand with a high-country image is expected to generate (a) higher brand authenticity and (b) higher self-congruity compared to a brand with a low country image.

H5. The interaction between GenAI adoption for creating social media content and the COO effect will positively influence customers' willingness to pay more through brand authenticity and self-congruity.

Consumers tend to associate luxury brands with uniqueness, human craftsmanship, and emotional depth (Han & Kim, 2020), which raises their expectations for authenticity and personal relevance. When GenAI generates a SMC, it may conflict with these expectations, creating a stronger sense of incongruity than mainstream brands, which are less bound by such symbolic values. Consequently, the negative effect of AI-generated content on brand authenticity and self-congruity is expected to be stronger for luxury brands than for mainstream brands, due to the perceived misalignment between the artificial origin of the content and the emotional and symbolic meanings traditionally associated with luxury (Jacob et al., 2020). Consequently, the following hypotheses are proposed:

H6. GenAI adoption for creating social media content, COO effect, and brand luxury will interact to influence brand authenticity and self-congruity. When social media content is generated by GenAI, a luxury brand is expected to generate (a) lower brand authenticity and (b) lower self-congruity compared to mainstream brands.

H7. The interaction between GenAI adoption, COO image, and brand luxury will influence customers' willingness to pay more through brand authenticity and self-congruity.

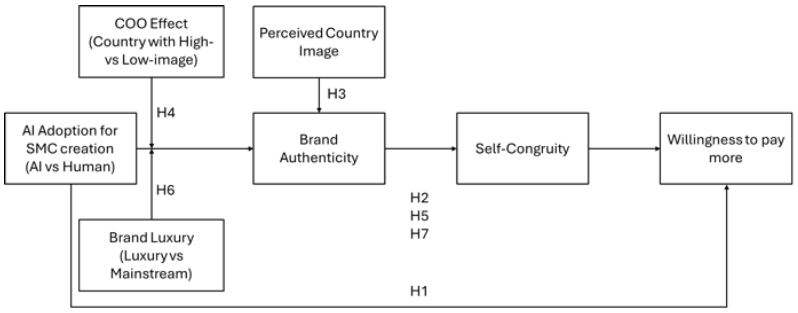

**Figure 1:** Proposed Conceptual Framework

## 3. Conclusion

This paper contributes to the literature by conceptualizing how AI-generated content interacts with symbolic cues, proposing a theoretical framework that links generative AI adoption for SMC creation to key consumer outcomes. Drawing on cue utilization theory,

signaling theory, and self-concept theory, the framework articulates the mechanisms through which GenAI may undermine or reinforce brand meaning, depending on contextual factors such as the brand's COO image and luxury positioning. Specifically, the framework proposes that GenAI adoption may negatively affect willingness to pay by reducing perceived brand authenticity and self-congruity, and that strong extrinsic cues, such as COO image, may attenuate these effects. Furthermore, the framework theorizes that this consumer response may be particularly pronounced in the case of luxury brands, positioning brand luxury as a boundary condition.

By integrating COO image into the debate on AI-driven brand communications, this framework emphasizes the role of cultural heritage and national symbolism in buffering the AI aversion that seems to characterize customers' response to AI-generated advertising.

The proposed framework offers several directions for future research. Scholars may empirically examine how different dimensions of COO image (e.g., functional vs. symbolic) or varying types of AI content (e.g., text, image, video) influence consumer behavioral responses. Additional boundary conditions, such as consumer involvement, AI literacy, or conspicuous consumption tendencies, could also enrich the theoretical understanding of GenAI's impact on brand-consumer relationships.

From a managerial perspective, the study provides guidance for luxury brand manager aiming to balance innovation with preserving symbolic brand values. By leveraging signals based on extrinsic cues, such as a strong COO image, brands may reduce the risks associated with GenAI adoption and maintain perceived authenticity in their social media activities.

## Abstract

I prodotti agroalimentari biologici sono percepiti dai consumatori nazionali ed internazionali come prodotti di grande qualità organolettica e soprattutto di beneficio per la salute, in quanto permettono di evitare i pericolosi rischi per la salute, provenienti dall'utilizzo di pesticidi e sostanze chimiche dannose. I prodotti agroalimentari biologici sono sottoposti ad un processo di certificazione biologica, con controlli periodici, dal campo di coltivazione al prodotto finale, secondo normative e standard nazionali e internazionali. Esistono diverse competizioni nazionali ed internazionali, per i differenti prodotti biologici, che premiano questi ultimi in relazione alla qualità delle caratteristiche organolettiche del prodotto o per l'eccellenza del packaging di prodotto. Con questo contributo, relativo ad una ricerca in fieri, si intende contribuire alla letteratura di Marketing Internazionale, approfondendo le strategie di marketing nei mercati esteri, applicate dalle imprese di olio extra vergine di oliva (EVO) certificato biologico (Dominici A. et al., 2025) che hanno partecipato a qualche competizione ed ottenuto un premio internazionale, analizzando come le imprese di questo settore valorizzano questi premi per crescere nei mercati internazionali e verificando, inoltre, i legami tra le strategie di marketing internazionali attuate in seguito all'ottenimento dei premi e le performance ottenute nella crescita delle quote di mercato nei Paesi esteri.

## 1. Introduzione

I prodotti agroalimentari biologici sono percepiti dai consumatori nazionali ed internazionali come prodotti di grande qualità organolettica (Wojciechowska Solis J. et al, 2025; Muñoz-Pant S.C., 2025; Udgam Mishra and Park Thaichon, 2025; Jakubowska D. et al., 2024; Carzedda M., 2021; Sánchez V.M et al., 2021; Kushwah S., 2019) e soprattutto di beneficio per la salute, in quanto permettono di evitare i numerosi rischi per la salute, provenienti dall'utilizzo di pesticidi e sostanze chimiche dannose (Winter C.K. and Davis S.F., 2006). I prodotti agroalimentari biologici sono sottoposti ad un processo di certificazione biologica, con controlli periodici, dal campo di coltivazione al prodotto finale. La qualità garantita dalla certificazione di prodotto biologico, secondo gli standard dell'IFOAM (International Federation of Organic Agriculture Movements) e/o la normativa nazionale, comunitaria e internazionale vigente, rappresenta un elemento fondamentale per incrementare e trasmettere la fiducia (Morosan E. 2025; Nguyen N.T., 2025, Ayyub S. et al., 2021) nei consumatori a livello mondiale, soprattutto per un segmento di consumatori attenti alla salute e alla sostenibilità ambientale. Infatti, i prodotti agroalimentari biologici sono il risultato di processi di coltivazione che non usano pesticidi e che rispettano numerose procedure, nonché apposite normative per controllare il territorio circostante il luogo di coltivazione, in modo da evitare ogni tipo di contaminazione del prodotto biologico.

La domanda mondiale del mercato di prodotti agroalimentari biologici è oramai in forte ascesa e anche nel mercato italiano si evidenzia una crescita della domanda di prodotti agroalimentari biologici. Il valore del biologico è stimato in circa 6,5 miliardi nel mercato italiano con una crescita di circa il 5,7% rispetto all'anno precedente e un'incidenza del 4% sul totale fatturato nazionale dell'agroalimentare (SANA, Nomisma 2025) e con un valore export dei prodotti agroalimentari biologici pari a circa 3,9 miliardi (pari a più della metà del totale del fatturato dei prodotti biologici) e una percentuale del 6% sul fatturato nazionale dell'agroalimentare. Nel corso dell'ultimo anno il consumo dei prodotti agroalimentari biologici è aumentato sia nel mercato nazionale sia in quello estero. Si evidenzia che i consumi del 2024, riportati da uno studio realizzato da Nomisma e AssoBio, confermano una tendenza in crescita, non solo mondiale (IFOAM & FIBL 2025), ma anche nazionale, portando l'Italia al 4° posto nella classifica mondiale, tra i paesi che valorizzano maggiormente la produzione biologica. Gli acquisti consapevoli dei consumatori italiani evidenziano anche che il 93% della popolazione, nella fascia di età 18-65 anni, include consapevolmente almeno un prodotto a marchio biologico nel carrello della spesa, rispetto al 50% della popolazione nel 2012. Si ritiene, inoltre, importante evidenziare che dal 2024 l'Italia si è dotata di un Piano d'Azione Nazionale per la produzione biologica (PANBio 2024-26), in attuazione di quanto previsto dalla normativa nazionale (Legge del 9 marzo 2022 n. 23), al fine di garantire la tutela, lo sviluppo e la competitività della produzione agricola con metodo biologico, la realizzazione di un marchio per i prodotti italiani biologici finalizzato a rinvigorire il mercato, facendo leva sull'attenzione che il consumatore rivolge ai prodotti Made in Italy, la valorizzazione delle filiere locali e l'impiego di risorse per promuovere la ricerca specializzata per il biologico (ISMEA, 2024). Dall'analisi del settore, emerge anche un importante fattore di cambiamento da parte dei consumatori italiani ed esteri (Pant S.C. et al., 2024), che si sta riscontrando, dopo la pandemia da Covid-19 (Murmura F., Musso F. et al. 2024), con riguardo alla consapevolezza dell'importanza di un'alimentazione sana (Mainolfi G., et al. 2025), ponendo una maggiore attenzione verso i prodotti alimentari biologici e in particolare verso l'olio Extra Vergine d'Oliva (EVO) Biologico, che sempre più è percepito come un prodotto fondamentale per la salute umana, anche per effetto della divulgazione di numerosi studi scientifici. Dunque, la letteratura di Marketing, che ha studiato il comportamento di acquisto del consumatore verso i prodotti agroalimentari biologici, sopra riportata, negli anni passati si è chiesta e ancora oggi si sta chiedendo come aumentare l'impatto e la fiducia, che comunque stanno evolvendo (Wojciechowska Solis J. et al, 2025; Muñoz- Pant S.C., 2024; Udgam Mishra and Park Thaichon, 2025; Jakubowska D. et al., 2024), tra i consumatori di prodotti biologici nazionali ed esteri. Nel frattempo, dai dati secondari evidenziati nei numerosi rapporti statistici di settore citati, si conferma proprio che oramai la domanda di prodotti agroalimentari biologici si sta evolvendo e sta diventando sempre più consapevole del valore qualitativo di un prodotto agroalimentare biologico certificato. Invece, è evidente che, per diversi elementi legati al momento di acquisto (prezzo, fiducia, posizionamento nella distribuzione, comunicazione realizzata, formazione del consumatore, etc), non vi sia ancora una situazione omogenea e di piena domanda né in Italia, né in Europa e tanto meno nel resto del mondo verso i prodotti biologici agroalimentari. Pertanto, essendoci ancora molta strada da percorrere per incrementare la domanda dei mercati nazionale ed internazionali, le imprese italiane ed estere di prodotti agroalimentari biologici devono continuare a migliorare le loro strategie di marketing per poter conquistare quote di mercato nei diversi mercati nazionali ed internazionali.

Nelle strategie di marketing internazionale (Alon I. et al., 2022) sicuramente è indispensabile saper comunicare e promuovere la qualità dei propri prodotti biologici ai consumatori esteri e rappresenta una sfida notevole riuscire a conquistare la loro fiducia nei mercati internazionali (Abitabile C., 2015), che scontano una minore conoscenza della reputazione e della serietà dei singoli brand stranieri e dei loro prodotti biologici, ma anche delle certificazioni di produzione biologica, che le stesse imprese riportano sull'etichetta dei propri

packaging. I prodotti agroalimentari biologici, inoltre, sono da anni riconosciuti e premiati, attraverso competizioni nazionali ed internazionali (Rebufa C. et al., 2021)nelle diverse tipologie del settore agroalimentare, facilitando anche la maggiore conoscenza e la consapevolezza dei consumatori.

Dunque, in questo contributo si intende delineare un progetto di ricerca avviato per approfondire non solo la situazione del settore dei prodotti agroalimentari biologici, ma comprendere "se" e "come" le imprese italiane ed estere del settore riescono a migliorare la crescita commerciale e reputazionale nei mercati internazionali, attraverso una strategia promozionale di partecipazione alle competizioni internazionali di prodotto biologico certificato e di comunicazione della stessa partecipazione, con o senza l'ottenimento del relativo Premio. Tali competizioni di prodotti biologici agroalimentari certificati, nelle diverse tipologie presenti in Italia e nel mondo, attraverso giurie composte da cosiddetti "panel" di esperti valutatori di prodotto, verificano in primis le caratteristiche e la qualità intrinseca del prodotto biologico certificato e del rispettivo packaging, valutando, in quest'ultimo caso, la conformità alle norme di confezionamento, la chiarezza e la completezza delle informazioni riportate sull'etichetta, il design dell'involucro e della bottiglia. Tra le diverse competizioni per i Premi nazionali e internazionali attualmente riconosciute, il presente progetto ha voluto avviare un percorso di ricerca e osservazione delle imprese di prodotti biologici agroalimentari, previo accordo con un'impresa pugliese che gestisce uno dei principali premi internazionali (premio BIOL), analizzando le strategie di marketing internazionale e i relativi risultati o performance nei mercati nazionali ed internazionali, riscontrati dalle imprese nazionali ed estere, partecipanti a questa competizione nel settore dell'olio extra vergine di oliva (EVO) certificato biologico (Carzedda M. et al., 2021).

Il presente contributo, pertanto, intende contribuire alla letteratura di marketing internazionale, partendo dallo studio delle strategie di marketing internazionale delle imprese di produzione di olio EVO certificato biologico, che partecipano e ottengono un premio internazionale per la qualità dei loro prodotti biologici e per il loro packaging e avviando uno studio sui legami esistenti tra i risultati di crescita delle imprese agroalimentari nei mercati internazionali e le loro strategie di marketing mix internazionali, connesse alla partecipazione e all'ottenimento dei rispettivi premi nelle competizioni internazionali dei prodotti agroalimentari certificati biologici.

## 2. Metodologia

Al fine di poter studiare nel dettaglio le strategie di marketing internazionale delle imprese di produzione di olio EVO certificato biologico e i legami con la partecipazione e l'ottenimento dei relativi premi, si è elaborato un questionario di 24 domande da sottoporre, in una survey online, alle imprese italiane ed estere che hanno partecipato alle competizioni e ottenuto o meno un premio internazionale per la qualità dei loro prodotti di olio EVO certificato biologico e per il loro packaging, in modo da verificare i legami con la conseguente crescita o meno nei mercati esteri in cui l'impresa è presente e valorizza tale partecipazione con l'ottenimento del rispettivo premio. Le imprese non sono state selezionate, ma hanno deciso in maniera spontanea, al momento dell'iscrizione alla competizione, se accogliere l'invito alla compilazione del questionario ricevuto da parte dell'Organizzazione del Premio Internazionale BIOL per l'edizione 2025. Al momento, su un campione di circa trecento imprese che negli ultimi anni partecipano in media alla competizione del Premio BIOL, hanno già risposto al questionario oltre un centinaio, con una percentuale di circa l'ottanta per cento di imprese italiane, di diverse regioni d'Italia e con differenti dimensioni aziendali, e per il venti per cento di imprese estere.

Inoltre, tra queste si individueranno alcune imprese italiane, di diverse regioni, ed estere, che daranno la loro disponibilità per un'intervista semi strutturata in profondità per approfondire

come applicano tali strategie di marketing nei mercati esteri e come valorizzano nei mercati esteri la partecipazione e l'ottenimento di un premio internazionale di qualità.

## 3. Risultati Attesi, Limiti E Futuri Sviluppi

Attraverso un'analisi dei dati, al momento in corso, ci si attende di verificare quali strategie di marketing internazionale sono state attuate dalle imprese di olio EVO certificato biologico che hanno partecipato e ottenuto un premio nazionale e internazionale, quali sono i legami tra l'ottenimento del Premio, la valorizzazione dello stesso premio attraverso le strategie di marketing internazionale (premium price, distribuzione, partecipazione a fiere internazionali e comunicazione digitale) e le performance ottenute nella crescita delle quote di mercato nei Paesi esteri dopo l'implementazione delle suindicate strategie di marketing. Al momento si ritiene esiguo il numero di risposte ottenute per una generalizzazione statistica ed infatti si ritiene di continuare la presente ricerca attraverso la stabilizzazione del presente progetto in un Osservatorio delle imprese di prodotti agroalimentari certificati biologici, in modo da poter approfondire maggiormente i legami tra la partecipazione e l'ottenimento dei premi di qualità, le strategie di marketing internazionali e le performance conseguite nei rispettivi mercati esteri. Infine, si ritiene anche di poter confrontare quanto realizzato in Italia nel settore dell'olio EVO certificato biologico con altri prodotti agroalimentari biologici di uno o due Paesi Europei, in modo da realizzare un'analisi comparativa di imprese differenti per prodotti e mercati di origine.

# Do Dedicated Measures of Ecological Country Image Outperform Conventional Country Image Scales? A Predictive Validity Perspective

Chiara Scrimieri[1], *, Alberto Pastore[1], and Adamantios Diamantopoulos[2]

## Abstract

Recent research has been arguing in favor of using dedicated (i.e., domain-specific) measures of a country's ecological/environmental/green image in studies of sustainable consumer behavior. However, there is no empirical evidence confirming that such dedicated measures outperform conventional country image scales in terms of predicting consumer responses. This study (Ntotal = 926) compares the predictive validity of Lala et al.'s (2008) environmental/social country image (ESCI) measure with Roth and Romeo's (1992) product-country image scale (PCI) on (a) consumer perceptions of product sustainability, and (b) purchase probability. The results across two distinct product categories, two types of sustainability labels, and four different product origins offer clear evidence in favor of the PCI scale and call into question the need for developing fine-grained measures specifically capturing environmental/social aspects of country image.

*Keywords: environmental/ecological country image, product-country image, perceived product sustainability, purchase probability*

## 1. Introduzione

In recent years, the importance of sustainability in terms of economic, social, and environmental dimensions (Elkington 1997) has been increasing: more and more consumers seek sustainable products (e.g., McKinsey & Company and NielsenIQ 2023), firms are often implementing sustainability programs (e.g., Leonidou et al. 2013), and governments around the world pursue sustainable development (e.g., United Nations 2015). As a result of these developments, there has been growing research interest as to the role of country-of-origin (COO)[1] in the context of sustainable consumption, not least because there are marked differences between countries in terms of demand and supply for sustainable products, eco-certification policies, and the attention paid to environmental and social issues (e.g., Li et al. 2018). Such inter-country differences may "lead buyers concerned with sustainability to favour (vs. avoid) purchasing products that come from countries projecting favourable (vs.

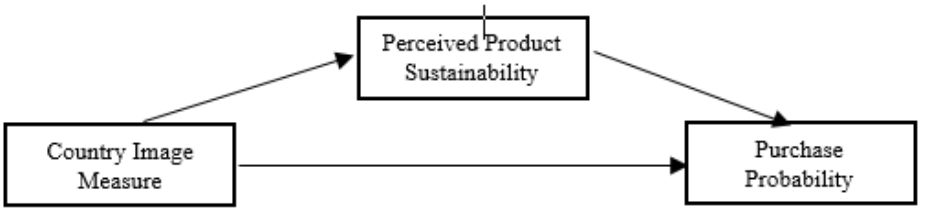
[1] COO has been conceptualized either as brand origin (BO), namely "*the country which a consumer associates with a product or brand as being its source, regardless of where the product is actually produced*" (Jaffe and Nebenzahl 2006, p. 29) ) or as country of manufacture (COM), namely "*the country in which the product is manufactured or assembled*" (Hamzaoui-Essoussi and Merunka 2007, p. 412). BO and COM can be the same or different; the latter case is exemplified by bi-national or hybrid products (e.g., Insch and McBride 2004).

unfavourable) images related to environmental and social commitment" (Dekhili et al. 2021, p. 665).

Broadly speaking, three distinct research streams characterize the literature linking COO to sustainable consumption. The first stream seeks to determine the relative importance of COO and sustainability cues (e.g., eco-labels) as attributes in consumer decision making and typically employs conjoint analysis as its methodology (e.g., Brand and Rausch 2021). The second stream focuses on how COO together with sustainability cues (typically eco-labels) influences consumer responses in terms of product evaluations, attitudes, and intended/actual behavior (e.g., Tran and Paparoidamis 2020). The third stream consists of methodological efforts seeking to develop "dedicated" scales of ecological/environmental/green country image (e.g., Garcia-de-Frutos and Ortega-Egea 2015). Such efforts reflect researchers' concerns that "conventional" country image measures (see Roth and Diamantopoulos 2009 for a review) "completely exclude environmentally and socially related dimensions" (Dekhili and Achabou 2015, p.91); this exclusion (presumably) limits their applicability to the study of sustainable consumer behavior and calls for the use of scales specifically and explicitly focusing on environmental/social aspect of a country's image.

Surprisingly, however, there is no empirical evidence demonstrating that dedicated measures of a country's ecological/environmental image are indeed superior to standard/conventional country image scales when it comes to explaining/predicting sustainable consumer behavior: it is merely assumed that the former will outperform the latter. In this paper, we question this assumption by undertaking a systematic comparison of the predictive ability of Lala et al.'s (2008) dimensions of environmental/social country image (ESCI) versus Roth and Romeo's (1992) product-country image (PCI) scale. The ESCI is the first measure to focus explicitly on sustainability issues at a country level and is frequently cited in subsequent similar scale development efforts (e.g., Thogersen and Pedersen 2021); on the other hand, the PCI is probably the most established and widely used country image scale in COO research. [2]

## 2. Metodology



### 2.1 Model and Data

To compare the predictive validity of the ESCI and PCI scales, we use the model in Figure 1 which includes two important consumer outcomes used in COO and sustainability research, namely (a) consumer perceptions of the focal product's sustainability (scale adapted from Gershoff and Frels 2015), and (b) their likelihood of buying the product (scale adapted from Juster 1966; 0% = would definitely not buy, 100% = would definitely buy). We also use product involvement (Mittal and Lee 1988), age, income, gender, and social desirability (Steenkamp et al., 2010) as control variables.[3]

[2] The Roth and Romeo (1992) paper – in which the PCI scale is proposed – has attracted more than 2,400 citations (Google Scholar, May 2025).

[3] Controlling for social desirability is important in the current context, given the well-known "attitude-behavior" gap repeatedly noted in studies of sustainable purchasing behavior (e.g., Wiederhold and Martinez 2018).

We apply this model under two different conditions: in the first condition, only the product origin (i.e. the COO) is disclosed to consumers; in the second condition, a sustainability label is also shown on the product package, in addition to COO information. Using fictitious brands as stimuli to avoid confounding effects related to brand equity (Dimofte et al. 2008), we estimate the model in two very different product categories (chocolate and microwaves), employing different product origins (chocolate: Denmark and Bulgaria), and different sustainability labels (chocolate: Fairtrade; microwaves: Energy Star). We collected the data on the Prolific platform with an online questionnaire created on Qualtrics (NTotal = 926, approx. 50% male, all Italian citizens); received £9.00/hour (approx. €10.53/hour) in compensation. Table 1 provides an overview of the data structure.

*Note:* Product Involvement, Age, Income, Gender, and Social Desirability included as control variables.

**Figure 1:** Estimated Model

| **Product Origin** | **No Label** | **Sustainability Label** | **Product category** |
|---|---|---|---|
| Denmark | N = 116 | N = 105 | Chocolate |
| Bulgaria | N = 112 | N = 114 | |
| Germany | N = 129 | N = 115 | Microwaves |
| Türkiye | N = 123 | N = 112 | |

**Table 1:** Data Overview

## 2.2 Analysis and Results

We used Model 4 of the PROCESS routine (Hayes 2022) to estimate the model parameters in Figure 1 and obtain the relevant coefficients of determination (i.e., R2 values) for the two criterion variables (perceived product sustainability and purchase probability); a comparison of the magnitudes of the R2 values when ESCI and PCI are respectively used as independent variables enables an assessment of their relative predictive ability.[4] Tables 3 and 4 show the relevant results.

[4] Prior to estimation, we checked the reliability of the ESCI and PCI scales in all eight data cells in Table 1; both scales proved to be highly reliable (Cronbach's $\alpha > 0.70$).

| Country Image Scale | Denmark | | Bulgaria | | Germany | | Türkiye | |
|---|---|---|---|---|---|---|---|---|
| | **PPS** | **PP** | **PPS** | **PP** | **PPS** | **PP** | **PPS** | **PP** |
| ESCI | 0.298 | 0.436 | 0.208 | 0.395 | 0.120 | 0.312 | 0.209 | 0.268 |
| PCI | 0.349 | 0.538 | 0.238 | 0.461 | 0.116 | 0.337 | 0.241 | 0.380 |

**Table 2:** $R^2$ Values: ESCI vs. PCI (No Sustainability Label)

| Country Image Scale | Denmark | | Bulgaria | | Germany | | Türkiye | |
|---|---|---|---|---|---|---|---|---|
| | **PPS** | **PP** | **PPS** | **PP** | **PPS** | **PP** | **PPS** | **PP** |
| ESCI | 0.461 | 0.457 | 0.042 | 0.219 | 0.190 | 0.242 | 0.332 | 0.294 |
| PCI | 0.508 | 0.460 | 0.080 | 0.291 | 0.119 | 0.286 | 0.235 | 0.304 |

Note: PPS = Perceived Product Sustainability, PP= Purchase Probability

**Table 3:** $R^2$ Values: ESCI vs. PCI (Sustainability Label)

Focusing initially on product sustainability perceptions, with few exceptions, the PCI scale outperforms the ESCI scale in terms of explanatory power; its R2 values consistently exceed those of the ESCI scale in five out of eight comparisons in Tables 2 and 3; only when the COO is Germany or Türkiye (with a sustainability label) is the opposite the case. The superiority of the PCI scale is even more evident when purchase probability is the dependent variable. Here, the PCI scale outperforms the ESCI scale across all eight comparisons and the magnitude of the difference in R2 values is even more pronounced, particularly when no sustainability label is present (see Denmark and Türkiye in Table 1).

## 3. Discussion and Conclusions

Overall, our results cannot but cast doubt on the utility of using dedicated/domain-specific scales capturing environmental/social aspects of country image in sustainability research. Although we only scrutinized the predictive validity of the Lala et al. (2008) measure, we failed to reveal any marginal benefit over Roth and Romeo's (1992) "traditional" country image measure (at least from a predictive validity perspective). These findings are quite surprising, particularly with respect to the prediction of perceived product sustainability. Intuitively, given the explicit focus of the ESCI measure on sustainability issues, one would expect that it would consistently explain more variance in sustainability perceptions than the broader/more general PCI scale; however, this did not turn out to be the case.

Regarding purchase probability, the performance of the ESCI measure was even more disappointing as there was not a single instance where it outperformed the PCI scale – even in cases where the product carried a sustainability label. The difference in R2 values were often substantial (up to 11.2%) and always in favor of the PCI scale. A potential explanation is that the ESCI measure has – by definition – a narrower scope than the PCI scale as its conceptual domain focuses only on sustainability issues. As a result, its influence on purchase probability has to be mainly channeled through perceptions of product sustainability and it

is difficult to conceptually identify other/additional pathways (captured by the direct effect in Figure 1) that would boost that influence. However, purchase probability does not only depend on consumers' assessments of product sustainability but also on other evaluative judgments, such as quality and reliability; and a more general country image measure – such as the PCI scale – is better able to impact such judgments above and beyond its influence on sustainability perceptions.

Of course, whether other scales focusing on ecological/environmental/social dimensions of a country's image (e.g., Garcia-de-Frutos 2015; Thogersen and Pedersen 2021; Lee et al. 2024) are likely to perform better is an empirical question that only future research can answer. Given our findings, we strongly advise researchers to examine the performance of these scales versus conventional country image scales before the latter are dismissed as being inappropriate for use in sustainability research.

## Abstract

In the current global context, firms are increasingly expected to integrate ethical, sustainable, and human-centered principles in their strategy. Humane Entrepreneurship (HumEnt), which encompasses entrepreneurial (EO), sustainability (SO), and human resource orientations (HRO), offers a framework to align business performance with broader social goals. This study investigates the relationship between HumEnt and international performance, with a specific focus on the mediating role of brand reputation. Using primary data from 228 Italian firms, we examine whether different levels of HumEnt are associated with variations in international performance and whether these differences are explained by firms' international reputation. The analysis applies a mediation framework to assess both direct and indirect effects. The results indicate that the influence of HumEnt on international performance is mediated significantly by brand reputation. The direct effect of HumEnt on performance is not statistically significant, suggesting that brand reputation is the primary channel through which HumEnt contributes to international outcomes. These findings contribute to the literature on HumEnt by providing empirical evidence on its strategic relevance in international business. For practitioners, the study underlines the importance of fostering brand credibility through ethical and sustainable practices as a tool to enhance competitiveness in international markets. The results support the view that purpose-driven strategies can generate value beyond the domestic context, reinforcing the role of reputation in translating humane values into measurable international performance.

*Keywords: Humane Entrepreneurship, Humane Entrepreneurial Orientation, International Performance, International Competitiveness, Brand Reputation*

## 1. Introduzione

The ongoing transformation of the global business environment, driven by intensifying climate crises, widening social inequalities, and the depletion of natural resources, is compelling firms to reassess their strategic priorities and social responsibilities (Parente et al., 2021; Zhao et al., 2024). Businesses are increasingly expected not only to generate profit but also to act as agents of positive change by addressing complex societal and environmental challenges (Ghauri et al., 2021). This evolution in expectations has given rise to alternative business models that embed ethical commitments, stakeholder well-being, and sustainable value creation into their core operations.

Among these, Humane Entrepreneurship (HumEnt) has emerged as a framework integrating economic dynamism with a strong focus on human, social, and environmental capital (Kim et al., 2018; Parente et al., 2018). HumEnt is defined by three strategic orientations: Entrepreneurial Orientation (EO), Sustainability Orientation (SO), and Human Resource Orientation (HRO) (Parente et al., 2021). EO encourages proactiveness and calculated risk-taking, essential for navigating dynamic global markets (Covin & Lumpkin, 2011). SO aligns firms with growing demands for responsible business conduct, enabling long-term resilience and stakeholder alignment (Kuckertz & Wagner, 2010; Muñoz & Dimov, 2015). HRO refers to inclusive, people-centered practices that enhance employee engagement, creativity, and organizational learning (Kim et al., 2018; Vesci et al., 2023).

By placing these orientations at the heart of firm strategy, HumEnt enables organizations to build strategic flexibility, social legitimacy, and a deep-rooted alignment with global institutional expectations, which are key drivers of international competitiveness and performance (George et al., 2023; Zahra, 2021). Firms that internalize the principles of HumEnt may develop a distinct ethical identity that resonates with stakeholders across diverse markets, allowing them to differentiate themselves from competitors through purpose-driven value propositions (Chakrabarty & Wang, 2012; Henderson, 2021).

However, despite its growing theoretical appeal, the relationship between HumEnt and international performance remains unexplored. Existing studies have primarily focused on domestic outcomes of sustainability and ethical practices (Mayer, 2021; Muñoz et al., 2018), leaving a significant gap in understanding how purpose-driven strategies translate into superior performance in global markets. In particular, the role of intangible assets, such as brand reputation, in mediating this relationship has received limited empirical and theoretical attention.

Brand reputation, understood as stakeholders' collective perception of a firm's integrity, values, and social impact, is increasingly recognized as a critical determinant of global success (Hall Jr. & Lee, 2014). As international consumers, investors, and partners become more attuned to issues of transparency, fairness, and sustainability, a strong ethical reputation can serve as a powerful mechanism for building trust and overcoming the liabilities of foreignness (Chabowski et al., 2023). Firms that embody the tenets of HumEnt, through demonstrable commitments to human development, environmental stewardship, and inclusive innovation, are more likely to cultivate this reputational capital (Aspelund, 2017). In turn, this can enhance their ability to achieve growth and access new markets (El Tarabishy et al., 2022).

Moreover, recent research suggests that ethical and sustainability-driven firms tend to be more innovative, resilient, and socially embedded. These traits are strongly associated with long-term international performance (El Tarabishy et al., 2022; Xin et al., 2023). Bae et al. (2018), for instance, argue that HumEnt can stimulate inclusive innovation that strengthens global performance by addressing underserved needs across borders.

In light of this, the present study investigates how HumEnt contributes to a firm's international success and whether this relationship is shaped by reputational factors. Accordingly, we propose the following hypotheses (see Figure 1):

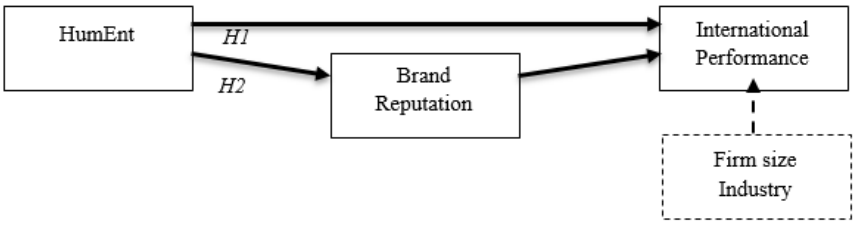

**Figure 1:** Conceptual Framework

H1: Firms with a strong HumEnt orientation are more likely to achieve superior international performance.

H2: Brand reputation mediates the relationship between HumEnt orientation and international performance.

## 2. Methodology

The study draws on primary data collected within the framework of the PRIN project, funded by the Italian Ministry of University and Research. A structured questionnaire was administered via email between December 2024 and February 2025 to a heterogeneous sample of Italian firms. The sample encompassed companies recognized as Best Places to Work 2023, EMAS-certified firms, B-Corporations, businesses listed on the Italian Stock Exchange, Euronext Growth firms, and innovative SMEs. This purposive sampling strategy enabled broad coverage across various organizational forms and industries within the Italian entrepreneurial ecosystem. After excluding incomplete submissions, the final dataset comprised 228 fully completed surveys, with 50% of the sample consisting of exporting firms.

The survey instrument was designed to capture multiple dimensions of international business performance. Specifically, the indicators were adapted from Donbesuur et al. (2020), while constructs related to HumEnt were operationalized based on Vesci et al. (2024). Brand reputation was assessed through a self-reported measure, capturing respondents' perceptions of how their company is viewed in the market. All these variables were measured using 7-point Likert scales, as detailed in Table 1.

The analytical approach was structured into three sequential phases to uncover latent firm typologies and examine their impact on international performance outcomes.

First, a cluster analysis was conducted to detect naturally occurring profiles within the sample, based on the standardized values of HumEnt variables. This step facilitated the identification of meaningful behavioral profiles among the firms.

In the second phase, regression models were employed to assess the predictive influence of cluster membership on international performance outcomes. These models allowed for the examination of how distinct firm profiles are associated with variations in international performance, accounting for potential covariates.

Finally, a mediation analysis was conducted to test the presence of indirect effects. This analysis aimed to explore whether specific mechanisms mediated the relationship between cluster profiles and international performance, thereby offering a deeper understanding of the underlying dynamics.

| Variable Name | Description | Unit |
|---|---|---|

| | | |
|---|---|---|
| *HumEnt* | | Likert Scale (1-7) |
| • EO | 3 items (innovation, competitiveness, aggressiveness) (Covin & Slevin, 1989) | |
| • SO | 2 items (social sustainability, environmental sustainability) (Muñoz & Dimov, 2015) | |
| • HRO | 4 items (empathy, no discrimination, employee development, participation) (Kim et al., 2018) | |
| *International Performance* | 6 items (international market share, sales volumes, sales growth, profitability, overall international performance, overall results achieved) (Donbesuur et al., 2020) | Likert Scale (1-7) |
| *Brand Reputation* | Self-reported measure | Likert Scale (1-7) |
| *Firm Size* | Firm size class (Micro, Small, Medium, Large) | Categorical (1-4) |
| *Industry* | Sector of the firm (Manufacturing, Services, Commerce, Construction) | Categorical (1-4) |

**Table 1:** Key variables description

## 3.Preliminary Findings

The analytical process began with a Confirmatory Factor Analysis (CFA) to validate the measurement model of HumEnt, which integrates EO, SO, and HRO. Standardized factor loadings were satisfactory across constructs, with all exceeding the 0.50 threshold. Significant positive covariances among the latent constructs further supported their theoretical interrelatedness. Factor scores for each HumEnt dimension were then extracted and standardized to perform k-means cluster analysis. Although the elbow and silhouette methods suggested differing optimal cluster numbers (3 and 2, respectively), theoretical interpretability favored a three-cluster solution. These clusters were labeled as "Low HumEnt", characterized by below-average scores across EO, SO, and HRO; "In Transitions", exhibiting moderate EO and slightly positive SO and HRO; and "High HumEnt" displaying above-average scores on all dimensions (see Table 2). The average silhouette width of 0.323 indicated a reasonable clustering solution.

| **Cluster** | **EO** | **SO** | **HRO** |
|---|---|---|---|
| *Low HumEnt* | -0.52 | -1.24 | -0.99 |
| *In Transition* | -0.72 | 0.14 | 0.19 |
| *High HumEnt* | 1.14 | 0.74 | 0.52 |

**Table 2:** Cluster Profiles (mean standardized scores)

Multiple linear regression analyses, controlling for firm size and industry, were conducted using a composite indicator of international performance as the dependent variable (see Table 3). Consistent with H1, results revealed that firms in the "High HumEnt" cluster significantly outperformed the "Low HumEnt" cluster in composite international performance ($\beta = 0.714$, $p < 0.05$). The "In Transition" cluster did not differ significantly from the "Low HumEnt" group ($\beta = 0.252$, $p > 0.05$). These results held for multiple international performance indicators, notably sales growth ($\beta = 0.865$, $p > 0.05$) and overall results achieved ($\beta = 0.738$, $p > 0.05$). Industry effects showed that firms in the Service sector consistently had lower international performance. All these results suggest that organizations embracing a strong human-centric approach tend to achieve superior outcomes in international markets.

Building on this, to test H2, we conducted a causal mediation analysis controlling for firm size and industry. "High HumEnt" firms showed significantly higher brand reputation than

"Low HumEnt" firms (β = 1.198, p < 0.01), with "In Transition" firms also reporting higher reputation (β = 0.766, p < 0.05). When both cluster membership and brand reputation were included in predicting international performance, brand reputation emerged as a strong positive predictor (β = 0.421, p < 0.001), while the direct effect of the "High HumEnt" cluster on performance became non-significant (β = 0.200, p > 0.05).

| Variable | Model 1 (Direct Effect) | Model 2 (Mediation) |
|---|---|---|
| Intercept | 3.724*** | 2.052*** |
| "In Transition" (Cluster 1) | 0.252 | -0.059 |
| High HumEnt" (Cluster 3) | 0.714* | 0.200 |
| Brand Reputation | - | 0.421*** |
| Size (Small) | -0.142 | -0.376 |
| Size (Medium) | 0.362 | 0.087 |
| Size (Large) | 0.826 | 0.726 |
| Industry (Services) | -0.922** | -0.749** |
| Industry (Commerce) | -0.714 | -0.818 |
| *Goodness of Fit Indices* | | |
| R-squared | 0.185 | 0.355 |
| Adjusted R-squared | 0.137 | 0.311 |

Significance levels: ***p < 0.001, ** p < 0.01, *p < 0.05

**Table 3:** Results of model estimation for the composite index of International Performance

Formal mediation tests confirmed a significant Average Casual Mediation Effect (ACME) for composite international performance (ACME = 0.326, 95% CI: 0.038, 0.700, p < 0.05), with a non-significant Average Direct Effect (ADE), indicating full mediation. This mediation pattern persisted across individual performance items, suggesting the central role of brand reputation in translating HumEnt into international success.

## 4. Discussion, Limitations, and Future Research

The current preliminary study offers evidence that HumEnt, defined by the integration of EO, SO, and HRO (Parente et al., 2018), enhances international business performance. Firms demonstrating high commitment to these principles significantly outperformed others. However, a closer analysis of this relationship reveals that this advantage is primarily explained by brand reputation. Our mediation analysis shows that the performance benefit of HumEnt is fully channeled via enhanced reputational capital, suggesting that brand reputation plays a key, though not necessarily exclusive, role in this dynamic. In essence, ethical and human-centered strategies must be visible and credible to international stakeholders to yield tangible results.

The research aims to contribute to both theory and practice. From a managerial standpoint, adopting HumEnt practices is not enough. Firms must also cultivate and communicate a strong brand identity rooted in these values. Theoretically, this study underlines the role of brand reputation as a central mechanism linking ethical orientations to global competitiveness.

Nonetheless, the study's cross-sectional design limits causal interpretations, and reliance on self-reported measures introduces potential bias. Additionally, the focus on Italian firms may constrain generalizability. Future research should therefore adopt longitudinal and cross-cultural approaches to explore how the HumEnt-reputation-international links evolve over time and across institutional contexts. Examining additional mediators, such as innovation

capabilities or stakeholder engagement, could further deepen our understanding of how HumEnt strategies translate into sustainable competitive advantage in global markets.

# Track 2
# Consumer Behavior

Coordinators: Alessandro Maria Peluso & Rebecca Pera

I ricercatori di consumer behavior studiano come gli individui, i gruppi o le organizzazioni scelgono, acquistano, consumano e dispongono di beni, servizi, esperienze ed idee, al fine di soddisfare i propri bisogni e obiettivi. In questa sezione, vengono dunque analizzati sia gli atteggiamenti che i comportamenti degli individui nell'ambito delle proprie scelte di acquisto e consumo. Avvalendosi del supporto di teorie e metodi provenienti da diversi ambiti scientifici (es. psicologia, sociologia, statistica, antropologia, neuroscienze, economia, information technology), lo studio del consumer behavior fornisce ai ricercatori e ai manager una grande varietà di approcci e strumenti di analisi (ad esempio, sia metodologie quantitative che qualitative), finalizzati a ottenere una solida base di conoscenze e insight su numerosi aspetti che sono centrali per la formulazione delle strategie di marketing. Tra questi, possono ad esempio essere menzionati i seguenti:

- Qual è l'impatto delle variabili ambientali, storiche e culturali sui comportamenti di consumo;
- Qual è il ruolo dei fattori sociali (es. gruppi, comunità, famiglie) nell'interpretazione o previsione dei comportamenti di consumo;
- Quali sono i processi psicologici attraverso cui i consumatori pensano, ragionano, percepiscono le informazioni, ricordano, formano preferenze e scelgono;
- Quali sono le emozioni che intervengono nei processi decisionali che riguardano l'acquisto e il consumo;
- Quali sono le diverse fasi seguite dagli individui nei vari processi di acquisto e consumo;
- Qual è il ruolo delle variabili di marketing (es. prodotto, marca, prezzo, spazi commerciali, etc.) nell'influenzare il comportamento del consumatore.

Consumer behavior research explores how individuals, groups, and organizations select, buy, use, and dispose of products, services, and ideas. It examines attitudes and behaviors in consumption decisions, using theories and methods from fields such as psychology, sociology, anthropology, neuroscience, and economics. The goal is to provide insights that support effective marketing strategies.

Core themes include the influence of cultural and environmental factors, the role of social groups, key psychological and emotional processes in decision-making, the stages of purchasing and consumption, and the impact of marketing variables such as product, brand, price, and retail settings.

# Please, Mind the Gap! Dal Dire al Fare Sostenibile

## Abstract

In un contesto in cui la sostenibilità è al centro delle agende politiche, economiche e aziendali, il comportamento dei consumatori rappresenta una leva fondamentale per promuovere modelli di consumo più responsabili. Tuttavia, il divario tra intenzioni dichiarate e comportamenti effettivi – noto come say–do gap – continua a ostacolare la transizione verso scelte realmente sostenibili. Questo studio propone un'analisi integrata dei comportamenti di consumo e di acquisto in Italia, basata su dati dichiarativi e comportamentali raccolti tramite il Consumer Panel Service di NielsenIQ. L'analisi di oltre 9.600 famiglie ha permesso di identificare sei cluster con differenti profili sociodemografici, attitudinali e di acquisto, evidenziando sia segmenti coerenti tra intenzioni e comportamenti, sia gruppi più contraddittori. Il contributo si inserisce in un più ampio progetto di ricerca finalizzato a monitorare nel tempo l'evoluzione del consumo sostenibile e a fornire strumenti pratici per ridurre il divario tra intenzione e azione. Le evidenze emerse offrono implicazioni rilevanti per le strategie di marketing volte alla promozione di modelli di consumo più consapevoli, inclusivi e stabili nel tempo.

## 1. Introduzione

Negli ultimi decenni, la sostenibilità ha conquistato un posto di primo piano nelle agende politiche, economiche e sociali a livello globale, passando da tema marginale legato all'ambiente a fondamento imprescindibile dello sviluppo del ventunesimo secolo (Schaefer & Crane, 2005; Portney, 2015; Ferrero-Ferrero et al., 2023). Se inizialmente il concetto si legava prevalentemente alla scarsità di risorse naturali (Kuhlman & Farrington, 2010), oggi si riconosce in modo sempre più condiviso la sua triplice natura che integra le dimensioni ambientale, sociale ed economica (Purvis et al., 2018), evolvendosi rispetto a quanto sostenuto dall'accademia negli anni '80.

Tuttavia, nonostante gli sforzi delle Nazioni Unite, formalizzati attraverso gli Obiettivi di Sviluppo Sostenibile (SDGs) (Whittingham et al., 2023), i progressi attuati restano ancora insufficienti (United Nations, 2023). È in questo scenario che i comportamenti della domanda assumono un'importanza strategica: è infatti nelle scelte quotidiane delle persone che si giocano molte delle possibilità reali di cambiamento. Come sottolineato da Sheth et al. (2011), il modo in cui i cittadini orientano le proprie decisioni d'acquisto può diventare una delle leve più potenti – e allo stesso tempo più complesse – per avvicinare l'economia globale a modelli più sostenibili.

Sebbene i consumatori dichiarino una crescente attenzione ai temi etici e ambientali, e ricerchino brand in linea con i propri valori (Anuradha et al., 2023), le scelte sostenibili restano ancora minoritarie, soprattutto in presenza di barriere percettive come prezzi elevati o prestazioni percepite inferiori rispetto a prodotti considerati meno o non proprio sostenibili (Olson, 2013). A complicare ulteriormente il quadro contribuisce l'evidenza che molte decisioni di acquisto avvengono direttamente nel punto vendita (Inman et al., 2009), in un contesto dominato da stimoli sensoriali, eccesso di informazioni, euristiche e scorciatoie cognitive, nonché dinamiche impulsive non sempre consapevoli. Proprio per questo motivo, le aziende hanno iniziato a sperimentare strategie di marketing pensate per influenzare responsabilmente il comportamento d'acquisto, agendo direttamente sull'architettura delle scelte attraverso leve di marketing come il posizionamento di prezzo (Bedek 2011; Ingenbleek, 2015; Hecht et al., 2020), la gestione dell'assortimento e il category management (Hecht et al., 2020), le private label (Ngobo, 2011; Gielens et al., 2021) e l'intensità promozionale (Bedek, 2011). Grazie ai diversi interventi nei punti vendita, mirati al miglioramento del comportamento dei consumatori (Wansink, 2017), lo shopper marketing diventa un terreno fertile su cui le imprese, sia industriali che commerciali, possono agire per stimolare scelte più sostenibili.

In questo scenario, infatti, lo shopper marketing – inteso come l'insieme di strumenti, tattiche e azioni volte a influenzare il comportamento del consumatore durante il path-to-purchase (Shankar, 2011) – assume una nuova e profonda valenza sociale volta a spingere le scelte di acquisto verso prodotti che hanno un impatto positivo sia sulle persone che sul pianeta. Se orientato verso obiettivi di benessere collettivo, lo shopper marketing può dunque contribuire a promuovere scelte consapevoli e sostenibili, trasformando il punto vendita in un vero e proprio luogo di creazione di valore sociale (Yoder et al., 2021; Bellini, 2023). Tutto ciò depone a favore della centralità dei retailer nelle attività promosse a sostegno della sostenibilità lungo tutto il percorso d'acquisto (Yoder et al., 2021). Per essere efficace, questo approccio richiede un cambio di paradigma: occorre integrare i principi dell'economia comportamentale, della psicologia cognitiva e delle neuroscienze nelle logiche di marketing tradizionale, così da interpretare con maggiore precisione le dinamiche decisionali dei consumatori. Solo così è possibile comprendere come le scelte vengano realmente prese nei contesti di acquisto e intervenire in modo mirato sulla loro attivazione e consolidamento.

Tuttavia, le scelte sostenibili non sono facili da compiere né, soprattutto, da mantenere stabilmente nel tempo, poiché richiedono uno sforzo cognitivo significativo che sfugge spesso al controllo consapevole e si arrende di fronte a una forza di volontà che, per definizione, non è inesauribile (Bellini et al., 2025). In queste condizioni, diventano centrali gli strumenti dell'economia comportamentale, che permettono di intercettare i meccanismi mentali impliciti alla base delle decisioni e di orientarli verso scelte in grado di migliorare il benessere individuale e collettivo. Le scelte sostenibili, inoltre, si configurano spesso come "intertemporali" (Thaler & Sunstein, 2008), ovvero richiedono un sacrificio immediato nel presente (es. in termini di tempo, prezzo o comodità) a fronte di benefici futuri e collettivi, spesso meno tangibili e quindi difficili da percepire, da valutare e misurare nell'immediato o comunque nel breve periodo. Tale asimmetria percettiva riduce la forza di volontà degli individui (Bellini et al., 2025) e compromette la stabilità delle scelte sostenibili nel tempo, minando l'efficacia delle intenzioni dichiarate e aprendo la strada a un diffuso disallineamento comportamentale. Un elemento chiave per comprendere l'inefficacia delle sole dichiarazioni di intenti è rappresentato dal cosiddetto "say–do gap", ovvero il divario tra ciò che i consumatori affermano di voler fare (intenzioni) e ciò che realmente fanno (comportamenti). Questo fenomeno, ampiamente documentato in letteratura (Sheeran & Webb, 2016; Bellini et al., 2025), rivela che anche i soggetti con forte consapevolezza ambientale e sociale non necessariamente traducono tali convinzioni in scelte di acquisto coerenti. Le cause sono molteplici: dalla presenza di barriere cognitive e motivazionali (Shah & Oppenheimer, 2008;

Bellini et al., 2025), alla mancanza di incentivi immediati (Thaler & Sunstein, 2008), fino a ostacoli di tipo strutturale come prezzi elevati (Olson, 2013) o scarsa o inadeguata visibilità dei prodotti sostenibili nel punto vendita (Inman et al., 2009).

All'interno di quello che viene definito da Bellini (2023) come "conscious shopping", ossia consumo responsabile, il say–do gap rappresenta non solo una sfida per la ricerca accademica, ma anche un ostacolo concreto per tutte quelle imprese che intendono promuovere comportamenti sostenibili attraverso le leve dello shopper marketing. È quindi fondamentale individuare strategie capaci di colmare questa distanza tra intenzione e comportamento, trasformando il dichiarato in abitudini stabili e coerenti di consumo sostenibile. In questa prospettiva, il ruolo dei retailer si rivela particolarmente rilevante nel riavvicinare il "dire" al "fare": grazie alla loro capacità di incidere sul contesto decisionale, possono intervenire direttamente nel punto vendita per facilitare scelte più sostenibili, agendo su leve di marketing, cognitive e ambientali che incoraggino comportamenti virtuosi senza richiedere uno sforzo deliberativo eccessivo. È proprio in questo contesto che si inserisce il concetto di nudging, inteso come insieme di interventi "leggeri e gentili" e non prescrittivi sull'architettura delle scelte è in grado di orientare i comportamenti in modo prevedibile senza imporre vincoli né modificare significativamente gli incentivi economici (Thaler & Sunstein, 2008)[5]. Le leve del nudging si rivelano particolarmente efficaci nel guidare le decisioni degli individui poiché fanno leva sulle componenti emotive, più reattive in situazioni in cui la forza di volontà si affievolisce di fronte all'incertezza del risultato e alla difficoltà di quantificare il ritorno personale (Thaler & Sunstein, 2008). Esso agisce, infatti, su automatismi cognitivi, componenti emotive e risposte affettive, riducendo lo sforzo deliberativo e facilitando decisioni virtuose (Bargh et al., 2001; Shah & Oppenheimer, 2018; Caraban et al., 2019; Wozniak et al., 2024). L'efficacia del nudging nel promuovere comportamenti sostenibili è ampiamente documentata in letteratura (Lehner et al., 2016; Mont et al., 2014; Trewern et al., 2021; Mirbabaie et al., 2022; Amiri et al., 2024). In particolare, queste "spinte gentili" si sono dimostrate cruciali nel colmare il persistente gap tra intenzioni e comportamenti (Sheeran & Webb, 2016; Bergram et al., 2022; Bellini et al., 2025), contribuendo a trasformare scelte episodiche e azioni isolate in abitudini consolidate e socialmente desiderabili. Tali obiettivi dovrebbero trovare rispondenza nelle strategie delle imprese, sia commerciali che industriali, promuovendo nudges lungo tutto il customer journey.

In questo contesto teorico e operativo, il presente lavoro si propone di misurare il fenomeno del "say-do-gap" in ambito di sostenibilità attraverso un'analisi empirica basata sui dati del Consumer Panel Service di NielsenIQ (di seguito CPS) che integrano dati autodichiarati e comportamentali.

Comprendere la complessità e l'eterogeneità della domanda è una condizione necessaria per avviare una riflessione concreta sulla direzione verso la quale devono orientarsi le strategie di marketing delle imprese affinché possano portare un contributo fattivo e concreto in ambito di sostenibilità. L'analisi, aggiornata al 2025, introduce una nuova segmentazione supportata da una base dati ampliata e aggiornata, offrendo evidenze quantitative utili per comprendere con maggiore precisione le dinamiche che caratterizzano il divario tra intenzione e azione.

## 2. Background teorico

Il crescente interesse dei consumatori verso la sostenibilità ha aperto nuove sfide per la comprensione e la promozione di comportamenti di acquisto allineati ai principi della responsabilità ambientale e sociale. Tuttavia, numerosi studi hanno evidenziato l'esistenza di

[5] Definizione di nudge di Thaler & Sunstein, 2008: "nudge is any aspect of the choice architecture that alters people's behavior in a predictable way without forbidding any options or significantly changing their economic incentives".

un persistente divario tra ciò che i consumatori dichiarano di voler fare e ciò che effettivamente fanno nel contesto reale di consumo: il cosiddetto say–do gap (Sheeran & Webb, 2016; Carrington et al., 2010; White et al., 2019; Munro et al., 2023). Questo fenomeno, particolarmente rilevante nei comportamenti di acquisto di beni di largo consumo, riflette una distanza tra la sensibilità espressa dai consumatori e le azioni concrete ed effettivamente compiute nel momento della scelta d'acquisto (Yamoah & Acquaye, 2019). Le ragioni alla base di questo gap sono molteplici e, come evidenziato da Munro et al. (2023) in una recente analisi sistematica sul say–do gap della spesa alimentare sostenibile nel contesto del supermercato, coinvolgono una serie di fattori che vanno ben oltre l'individuo. Questi includono barriere cognitive, motivazionali e strutturali, come la percezione di prezzi più elevati, la disponibilità limitata di alternative sostenibili, la scarsa visibilità o promozione dei prodotti in-store (Yamoah & Acquaye, 2019), la mancanza di fiducia nelle etichette e nei retailer (Munro et al., 2023), nonché la difficoltà di valutare i benefici ambientali e sociali nell'immediato o comunque nel breve periodo (Shah & Oppenheimer, 2008; Olson, 2013; Frank & Brock, 2018; Lehner, 2015; Munro et al., 2023). Inoltre, il comportamento d'acquisto sostenibile è spesso descritto come una scelta intertemporale (Thaler & Sunstein, 2008), in cui i costi percepiti si manifestano immediatamente (in termini di tempo, denaro o sforzo cognitivo), mentre i benefici sono collettivi, diluiti nel tempo e spesso difficili da quantificare (Bellini, 2023). Questo disallineamento tra costi immediati e benefici differiti indebolisce la determinazione individuale e può tradursi in compromessi pratici o divergenze tra intenzioni dichiarate e comportamenti effettivi (Ferrero-Ferrero et al., 2023). Secondo la Theory of Planned Behavior (Ajzen, 1991), l'intenzione di compiere un'azione è influenzata da attitudini, norme soggettive e percezione di controllo; tuttavia, numerosi studi evidenziano come l'intenzione, da sola, non sia sufficiente a determinare comportamenti coerenti, soprattutto in situazioni ad alto carico cognitivo o basso supporto ambientale (Carrington et al., 2010; White et al., 2019). Di conseguenza, anche i consumatori più motivati, consapevoli e informati possono incontrare ostacoli significativi che compromettono l'attuazione concreta delle loro intenzioni di acquisto sostenibile (Munro et al., 2023). Come sottolineato da Carrington et al. (2010; 2014), il passaggio dall'intenzione all'azione è tutt'altro che lineare: esso si rivela particolarmente critico proprio nel punto vendita, dove prevalgono abitudini consolidate, dinamiche impulsive e considerazioni legate a prezzo, convenienza o gusti individuali e non (Sarti et al., 2018). In tale contesto, in cui si realizzano gran parte delle scelte di consumo (Inman et al., 2009), l'organizzazione dell'offerta e dell'assortimento, la comunicazione visiva, l'impiego di etichette affidabili e di supporti visivi in-store capaci di guidare il consumatore verso scelte più sostenibili rappresentano leve determinanti per orientare le scelte del consumatore (Frank & Brock, 2018; Lehner, 2015). Attribuire il fallimento comportamentale esclusivamente all'individuo risulta quindi riduttivo. Il contributo di Munro et al. (2023) invita a superare la tradizionale prospettiva microcentrica, proponendo un cambio di paradigma verso una visione sistemica ispirata al macromarketing. Il punto vendita non è, dunque, considerato solo come luogo decisionale, ma come un ecosistema complesso in cui molteplici attori — dai produttori ai retailer, fino alle istituzioni regolatrici — interagiscono e si influenzano reciprocamente, contribuendo in modo decisivo a determinare le condizioni che facilitano o ostacolano il consumo sostenibile. Questa visione evidenzia l'importanza di progettare ambienti, politiche e pratiche commerciali capaci di attivare meccanismi di feedback positivi, stimolando un processo evolutivo nelle abitudini di consumo e nelle capacità decisionali del consumatore. È in questo ambiente che le strategie di shopper marketing possono giocare un ruolo cruciale nel facilitare scelte più sostenibili (Shankar, 2011; Yoder et al., 2021; Bellini, 2023). Agendo su leve quali il posizionamento dei prodotti, la gestione dell'assortimento, l'uso delle private label o l'intensità e la frequenza delle attività promozionali (Bedek, 2011; Ingenbleek, 2015; Gielens et al., 2021), le imprese possono influenzare concretamente il comportamento degli

acquirenti, soprattutto quando tali azioni sono integrate in un'architettura delle scelte favorevole (Wansink, 2017; Bellini et al., 2025).

In questa prospettiva, il retailer può assumere il ruolo di nudger, configurando il punto vendita in modo da rendere le scelte sostenibili più semplici, immediatamente identificabili e desiderabili, orientando i comportamenti attraverso modifiche contestuali che preservano la libertà di scelta del consumatore (Thaler & Sunstein, 2008; Bellini et al., 2025). Secondo la definizione originaria proposta da Thaler e Sunstein (2008) il nudge fa riferimento a qualsiasi aspetto dell'architettura delle scelte che modifica il comportamento delle persone in modo prevedibile, senza proibire alcuna opzione o alterare in modo significativo gli incentivi economici. La sua efficacia nel promuovere comportamenti sostenibili è ampiamente documentata in letteratura (Lehner et al., 2016; Mont et al., 2014; Trewern et al., 2021; Mirbabaie et al., 2022; Amiri et al., 2024). Nello specifico, le leve del nudging si sono dimostrate particolarmente efficaci nel promuovere comportamenti sostenibili, grazie alla loro capacità di agire su automatismi cognitivi, risposte emotive e affettive, riducendo lo sforzo deliberativo e semplificando il processo decisionale (Thaler & Sunstein, 2008; Bargh et al., 2001; Shah & Oppenheimer, 2018). Tali interventi risultano particolarmente utili nelle decisioni intertemporali, in cui i costi sono percepiti come immediati e i benefici come futuri e diffusi. La letteratura evidenzia come le "spinte gentili" siano più efficaci delle strategie persuasive tradizionali nel colmare il say–do gap, contribuendo alla costruzione di abitudini più sostenibili lungo l'intero customer journey (Lehner et al., 2016; Bergram et al., 2022; Bellini et al., 2025). L'impiego di spinte gentili e non intrusive — come la disposizione dei prodotti, la visibilità immediata dell'offerta sostenibile, la chiarezza informativa e l'introduzione di opzioni predefinite — consente di orientare le scelte dei consumatori senza comprometterne l'autonomia decisionale. Tali strategie si collocano all'interno dello shopper marketing sostenibile e offrono una risposta operativa al say–do gap, in particolare nei contesti in cui il processo decisionale è complesso o il coinvolgimento motivazionale è ridotto (Bellini et al., 2025; Lehner, 2015).

A fronte della complessità che caratterizza il say–do gap, emerge la necessità di comprendere più a fondo l'eterogeneità dei consumatori in relazione ai comportamenti sostenibili. Differenziare tra soggetti motivati ma incostanti, individui che adottano pratiche sostenibili per abitudine o convenienza, e consumatori poco coinvolti consente di restituire una lettura più realistica delle scelte di acquisto e di sviluppare strategie di marketing più mirate. Integrare dimensioni attitudinali e comportamentali rappresenta, in questo senso, un passaggio fondamentale per valutare l'efficacia delle iniziative promosse dal retail e per progettare interventi specifici per ciascun profilo di clientela.

## 3. Obiettivi della ricerca

Questo studio si propone di indagare in profondità il comportamento dei consumatori italiani rispetto alla sostenibilità, con l'obiettivo di comprendere come le intenzioni dichiarate si traducano – o meno – in scelte di acquisto effettive. In un contesto in cui il consumo sostenibile rappresenta una leva strategica per il cambiamento, ma è ostacolato da barriere cognitive, economiche e contestuali, il lavoro mira a fornire una lettura integrata e aggiornata del fenomeno. Lo scopo dello studio è quello di mappare la popolazione italiana in base alla coerenza tra atteggiamenti dichiarati e comportamenti reali di acquisto sostenibile, attraverso l'analisi congiunta di dati attitudinali e comportamentali, al fine di identificare cluster distinti di consumatori e supportare lo sviluppo di strategie di marketing e policy più efficaci nel colmare il divario tra il "dire" e il "fare".

## 4. Metodologia

L'indagine sulla sostenibilità rappresenta una sfida metodologica di notevole complessità, in quanto presuppone l'identificazione preliminare di criteri e parametri in grado di definire in maniera operativa cosa possa essere considerato "sostenibile", tanto dal punto di vista della domanda quanto da quello delle imprese. Si tratta di un ambito in continua evoluzione, caratterizzato da una cornice normativa ancora in via di consolidamento e da un lessico non ancora pienamente condiviso. Al fine di costruire un approccio metodologico rigoroso e fondato su evidenze oggettive, ci siamo avvalsi dei database forniti da NielsenIQ (NIQ), in particolare del Consumer Panel Service, che ci ha consentito di accedere a informazioni statisticamente significative in merito ai comportamenti di consumo sostenibile.

I consumatori sono stati profilati secondo una triplice dimensione: sociodemografica, attitudinale e comportamentale. Il Consumer Panel di NIQ costituisce uno strumento particolarmente utile per raccogliere sia dati dichiarativi, tramite syndicated survey, sia dati comportamentali concreti relativi agli acquisti di prodotti sostenibili raccolti tramite il servizio Homescan di NielsenIQ. Homescan è un consumer panel attivo in oltre 25 Paesi, composto da oltre 13.000 famiglie solamente in Italia, selezionate secondo criteri rappresentativi della popolazione nazionale. Le famiglie partecipanti registrano sistematicamente gli acquisti effettuati nei canali del largo consumo, sia fisici sia online, utilizzando un'app mobile o uno scanner domestico fornito da NielsenIQ. Ogni registrazione include informazioni dettagliate relative al prodotto acquistato — marca, formato, prezzo, punto vendita, eventuali promozioni — consentendo così un'analisi approfondita dei comportamenti di acquisto. I partecipanti al panel sono incentivati tramite un sistema di raccolta punti, convertibili in premi o buoni regalo, che contribuisce a garantire continuità e affidabilità nella registrazione dei dati. I dati comportamentali sono stati classificati secondo la tassonomia del database Immagino, sviluppato da NielsenIQ in collaborazione con GS1 Italy. Il panel raccoglie periodicamente informazioni sulle caratteristiche sociodemografiche e sul comportamento d'acquisto reale. Le indagini, condotte in modalità single source, permettono di ottenere dati coerenti e integrati: le famiglie che rispondono ai questionari sono infatti le stesse che registrano i propri acquisti, permettendo così una segmentazione accurata e affidabile. Ai fini dell'analisi, la segmentazione è stata condotta secondo due misure principali:

- la dimensione del "dire", ovvero ciò che i consumatori dichiarano di fare in termini di sostenibilità, rilevata attraverso un set strutturato di domande che esplorano l'atteggiamento verso ambiti quali il benessere individuale, sociale e ambientale;

- la dimensione del "fare", che si riferisce al comportamento effettivo di acquisto, misurato sulla base della quota di prodotti sostenibili presenti nel carrello, espressa in termini di value share, secondo attributi riconducibili alla tre anime della sostenibilità.

Tale approccio consente un'analisi integrata tra atteggiamenti e comportamenti, permettendo di delineare con maggiore precisione i profili dei consumatori in relazione alla sostenibilità.

## 5. Risultati e Discussione

Al fine di rispondere agli obiettivi di ricerca, la raccolta delle dichiarazioni autoriferite dei consumatori, - e quindi relative alla dimensione del say - è stata condotta tramite un questionario CAWI (Computer-Assisted Web Interviewing), strutturato esclusivamente con domande chiuse basate su una scala Likert a 5 punti. Il questionario è stato somministrato a un campione di 13.148 individui rappresentativi della popolazione italiana, e completato da 9.643 rispondenti, con un tasso di risposta pari al 74%. La somministrazione è avvenuta nel periodo compreso tra il 7 e il 15 febbraio 2025. L'obiettivo principale dello strumento era quello di indagare il profilo di sostenibilità dei partecipanti. In particolare, sono stati rilevati

comportamenti sostenibili generali — quali, a titolo puramente esemplificativo e non esaustivo, l'acquisto di prodotti in formato ricaricabile (refill), l'utilizzo di elettrodomestici a pieno carico, la pratica di docce brevi e la riduzione del consumo di carne — nonché atteggiamenti specifici legati alle tre dimensioni della sostenibilità precedentemente individuate. Ai fini della segmentazione dei consumatori italiani, sono state identificate come domande discriminanti quelle relative all'importanza attribuita alla sostenibilità e alla disponibilità a pagare un sovrapprezzo per prodotti sostenibili. Le restanti domande del questionario sono state utilizzate per descrivere i profili dei cluster emersi dall'analisi.

Per quanto riguarda la rilevazione dei comportamenti effettivi di consumo – e quindi relative alla dimensione del do -, è stato impiegato il servizio Homescan. Ai fini della segmentazione dei consumatori italiani per la dimensione del fare, è stata misurata la value share di prodotti con claim (Figura 1) che fanno riferimento alla tre anime della sostenibilità individuate - il Good For Me, il Good For Planet e il Good For Society.

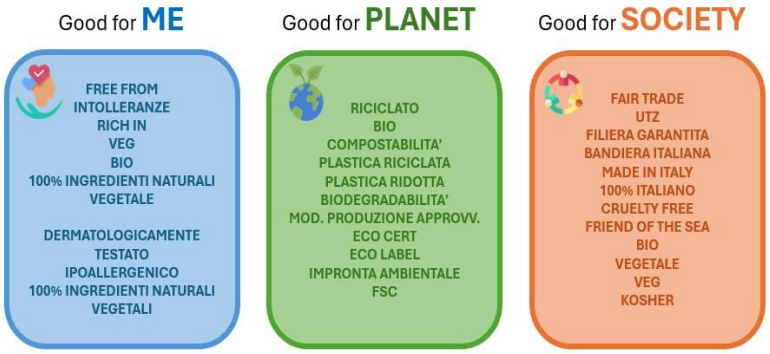

**Figura 1:** I claim considerati per l'analisi

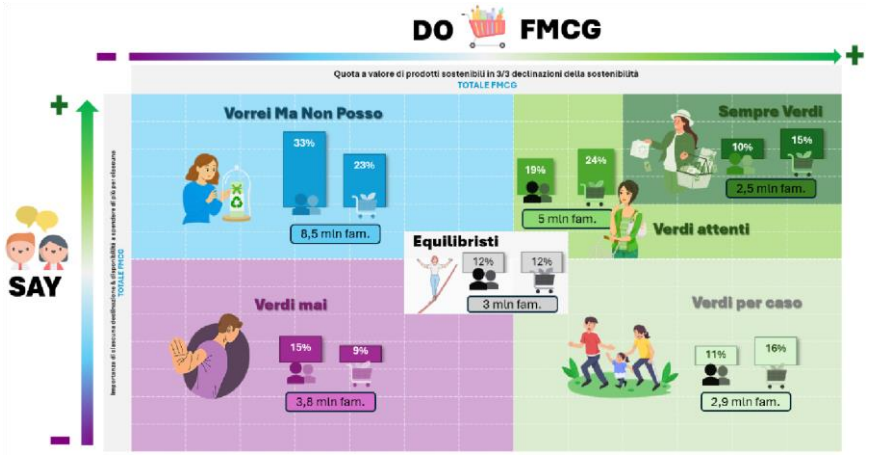
## 5.1 La segmentazione in cluster

L'interrogazione del Consumer Panel riguardo alla dimensione del "dire" (atteggiamento verso la sostenibilità e intenzioni di acquisto di prodotti sostenibili) e del "fare" (acquisto effettivo di prodotti sostenibili), ha portato all'identificazione di sei cluster di acquirenti (Figura 2).



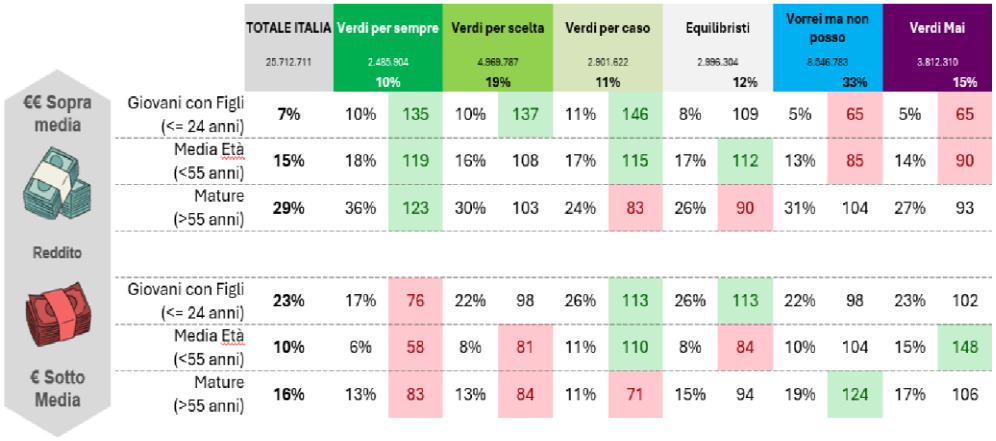


**Figura 2:** I sei cluster di acquirenti
(Fonte: Elaborazione degli autori basata sui basata sui dati NIQ)

La parte destra della matrice rappresenta tre gruppi — "Sempre Verdi", "Verdi Attenti" e "Verdi Per Caso" — accomunati da una significativa incidenza di acquisti sostenibili, seppur con livelli di consapevolezza differenti. In particolare, i "Sempre Verdi" e i "Verdi Attenti" si distinguono per una scelta deliberata e intenzionale di prodotti sostenibili, mentre i "Verdi Per Caso" sembrano manifestare comportamenti coerenti con la sostenibilità in modo non intenzionale, probabilmente influenzati da fattori contestuali piuttosto che da una reale motivazione valoriale. È interessante comprendere cosa stimoli questo comportamento che potremmo definire "inconscio". I due cluster situati nella parte sinistra della matrice ("Vorrei Ma Non Posso" e "Verdi Mai") acquistano di rado prodotti sostenibili ma per ragioni eterogenee. I "Verdi Mai" mostrano un disinteresse consapevole e deliberato verso la sostenibilità, che si riflette in un contributo marginale alla spesa sostenibile. I "Vorrei Ma Non Posso", invece, pur dichiarandosi sensibili ai temi ambientali e sociali, non traducono tali intenzioni in comportamenti coerenti nel punto vendita, suggerendo la presenza di barriere esterne o interne che meritano un'ulteriore indagine. Infine, il cluster degli "Equilibristi" occupa una posizione intermedia, caratterizzata da una relativa coerenza tra intenzioni e comportamenti, ma priva di una chiara direzione valoriale. Questo gruppo appare sostanzialmente allineato alla media nazionale, senza manifestare un orientamento deciso né verso la sostenibilità né verso il suo rifiuto.

## 5.2 Il profilo sociodemografico e di consumo dei cluster

I dati sociodemografici, comportamentali e di acquisto raccolti tramite il Consumer Panel offrono una base solida per comprendere le motivazioni che caratterizzano i diversi profili di sostenibilità individuati. L'analisi di questi dati consente non solo di delineare con precisione le caratteristiche distintive di ciascun cluster, ma anche di trarre indicazioni operative utili per le aziende interessate a sviluppare strategie di shopper marketing orientate a promuovere scelte di consumo più consapevoli all'interno del punto vendita. L'analisi si è basata sull'impiego di indici, in cui il valore 100 rappresenta la media nazionale: scostamenti al di sopra o al di sotto di tale soglia indicano, rispettivamente, una maggiore o minore incidenza del fenomeno osservato rispetto al totale della popolazione, consentendo un confronto immediato e intuitivo tra i diversi segmenti di consumatori.

| | TOTALE ITALIA 25.712.711 | Verdi per sempre 2.485.804 10% | | Verdi per scelta 4.969.787 19% | | Verdi per caso 2.901.622 11% | | Equilibristi 2.896.304 12% | | Vorrei ma non posso 8.546.783 33% | | Verdi Mai 3.812.310 15% | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Giovani con Figli (<= 24 anni) | 7% | 10% | 135 | 10% | 137 | 11% | 146 | 8% | 109 | 5% | 65 | 5% | 65 |
| Media Età (<55 anni) | 15% | 18% | 119 | 16% | 108 | 17% | 115 | 17% | 112 | 13% | 85 | 14% | 90 |

**Figura 3:** I sei cluster di acquirenti
(Fonte: Elaborazione degli autori basata sui dati NIQ)

- I Sempre Verdi rappresentano il profilo ideale del consumatore sostenibile: rappresentano circa 2,5 milioni di famiglie italiane, pari al 10% della popolazione, e acquistano in modo consapevole e convinto, contribuendo al 15% del fatturato generato dai prodotti «green». Questo segmento presenta elevate disponibilità economiche ed è caratterizzato da un orientamento marcato verso la qualità, la precisione e l'attenzione ai dettagli, privilegiando prodotti premium, naturali e salutari. Nei punti vendita si informano con attenzione sull'offerta, dedicando tempo alla lettura delle informazioni presenti sui packaging. La loro sensibilità verso la sostenibilità è a 360°: adottano comportamenti responsabili in ogni ambito della vita quotidiana. Utilizzano più della media il canale online per individuare prodotti adatti alle loro esigenze e, una volta trovati i punti vendita che rispecchiano i loro valori, diventano clienti fedeli e difficilmente li abbandonano. Distribuzione e industria dovrebbero cooperare sinergicamente allestendo in-store experience e corner tematici dedicati alla sostenibilità, con l'obiettivo di intensificare il coinvolgimento di questi consumatori e consolidare il loro legame valoriale con il punto vendita.

- I Verdi Attenti sono un target simile ai Sempre Verdi, ma con caratteristiche distintive: circa 5 milioni di famiglie italiane, pari al 19% della popolazione, che mostrano attenzione alla sostenibilità, sebbene con un approccio più orientato alla qualità del prodotto. Rappresentano la quota più alta della spesa sostenibile (24%), un dato in parte giustificato anche dalla presenza di bambini nelle famiglie. A differenza dei "Sempre Verdi", preferiscono marche note e affidabili, privilegiando la sicurezza rispetto all'esplorazione o alla curiosità verso nuovi prodotti. Anche per loro il prezzo non è un fattore determinante nelle scelte d'acquisto, ma rispetto ai primi le promozioni hanno un impatto leggermente superiore. Per loro si suggerisce di valorizzare in assortimento linee certificate (B Corp, Fair Trade, ecc.) mediante badge distintivi e strategie di shelf marketing.

- I Verdi Per Caso costituiscono un target contraddittorio: circa 2,9 milioni di famiglie italiane, pari all'11% della popolazione, che pur dichiarando una bassa sensibilità verso la sostenibilità contribuiscono al 16% della spesa sostenibile. Si tratta in prevalenza di famiglie con figli, appartenenti sia a fasce di reddito elevate che più basse. Per questi consumatori il prezzo rappresenta un fattore determinante: sono disposti a cambiare marca per approfittare di promozioni. La spesa, per loro, è vissuta come un dovere noioso ma inevitabile, più che come un momento di scelta o scoperta. In punto vendita l'esplorazione autonoma degli

scaffali risulta minima, con decisioni di acquisto guidate da abitudini consolidate e dall'insegna di riferimento. Alla luce di tali caratteristiche, si rende opportuno sfruttare il patrimonio distributivo delle imprese come leva di nudging: attraverso la progettazione strategica del layout e l'inserimento discreto di referenze sostenibili in posizioni privilegiate all'interno dell'assortimento, è possibile orientare in modo indolore le scelte di questo cluster verso prodotti che favoriscono la sostenibilità, senza incidere sul loro desiderio di rapidità e semplicità nell'esperienza di acquisto.

- Gli Equilibristi rappresentano un target intermedio, 12% della popolazione che genera il 12% della spesa sostenibile: rispetto al totale Italia sono allineati alla media, sia per comportamenti d'acquisto che per sensibilità verso la sostenibilità. Il prezzo è un elemento centrale nelle loro decisioni: ma ad esempio, pur non scegliendo un punto vendita in base alle promozioni, queste possono influenzare la scelta dei singoli prodotti. Sono consumatori pragmatici, attenti al risparmio ma facilmente influenzabili dagli acquisti d'impulso. Non si informano in modo approfondito e raramente leggono le informazioni riportate sulle confezioni. Tuttavia, mostrano una forte attenzione alla salute fisica: nei loro carrelli compaiono infatti prodotti per il benessere e articoli dedicati agli sportivi, come integratori e alimenti funzionali. Poiché gli Equilibristi rappresentano un bacino di clientela potenzialmente recettivo, risulta strategico implementare interventi di carattere informativo e di attivazione "soft". In termini di informazione, è opportuno privilegiare messaggi chiari e sintetici (es. badge ambientali immediatamente riconoscibili) unitamente a supporti digitali in-store che illustrino in modo rapido il valore aggiunto dei prodotti eco-friendly. Sul versante dell'attivazione, il cross-selling tra referenze legate al benessere fisico e alternative sostenibili e l'introduzione di promozioni mirate su assortimenti green possono stimolare l'acquisto per impulso, spingendo gradualmente questo segmento verso scelte maggiormente eco-consapevoli.

- I Vorrei Ma Non Posso rappresentano un importante segnale d'allarme: circa 8,5 milioni di famiglie italiane, pari al 33% della popolazione, che pur dichiarandosi sensibili ai temi ambientali, in punto vendita non acquistano prodotti sostenibili. Si tratta principalmente di famiglie mature con reddito contenuto. Pur affermando che il prezzo non è un fattore decisivo, sono molto sensibili agli aumenti di costo. Questi consumatori consultano assiduamente volantini cartacei e digitali e distribuiscono gli acquisti tra più insegne per massimizzare le opportunità promozionali; amano esplorare l'assortimento, ma continuano a privilegiare brand consolidati. Acquistano principalmente alcolici. Per intervenire efficacemente su questo cluster, è imprescindibile una sinergia strutturata tra distribuzione e industria: occorre promuovere un dialogo condiviso finalizzato a rendere accessibili opzioni sostenibili anche a fasce di reddito più basse, mediante iniziative di "democratizzazione" del prodotto green. Ciò può tradursi, ad esempio, nella creazione di linee a marchio del distributore a basso prezzo, co-progettate con le realtà industriali, e in campagne di comunicazione congiunte che stimolino la consapevolezza dei consumatori circa il valore e l'impatto delle scelte sostenibili, ponendo le basi per un cambio culturale nell'interpretazione della sostenibilità come bene collettivo.

- I Verdi Mai sono un target distante dai valori della sostenibilità: circa 3,8 milioni di famiglie italiane, pari al 15% della popolazione, che contribuiscono solo per il 9% alla spesa sostenibile. Si tratta principalmente di nuclei a basso reddito, con abitudini di consumo orientate al risparmio. Acquistano con maggiore frequenza nei discount rispetto ai restanti cluster, e tra i prodotti più presenti nei loro carrelli rispetto alla media figurano bevande gassate e alcolici. Il prezzo è il driver principale nelle loro scelte d'acquisto, mentre la marca ha un peso trascurabile, le promozioni invece catturano il loro interesse e possono influenzare le scelte. Il loro processo decisionale è rapido, con scarsa attenzione alle informazioni riportate sulle confezioni e ridotta disponibilità a dedicare tempo alla fase di

selezione dei prodotti. Per promuovere l'inclusione di questo cluster nel percorso verso comportamenti più sostenibili, è indispensabile partire da interventi informativi di base che riducano le barriere cognitive e percettive all'ingresso nel mondo "green". A tal fine, si possono sviluppare campagne in-store e digitali focalizzate sulla comunicazione semplificata dei benefici ambientali, affiancando a ogni offerta promozionale una componente educativa che renda la sostenibilità un vantaggio tangibile e immediatamente comprensibile.

L'analisi condotta attraverso il Consumer Panel ci permette di identificare i canali di acquisto preferiti per ogni target (Tabella 1), così come i negozi che frequentano abitualmente per fare la spesa (Tabella 2). Tale evidenza apre una riflessione sulla centralità dei luoghi di acquisto nel determinare i comportamenti d'acquisto: in che misura, infatti, il profilo del consumatore dipende dalle strategie implementate dai distributori nei punti di vendita?

| | **Online** | **Ipermercati** | **Supermercati** | **Prossimità** | **Specialisti drug** | **Discount** |

**Tabella 1:** I luoghi d'acquisto dei cluster (Fonte: Elaborazione degli autori basata sui dati NIQ)

Prendendo in esame diciotto insegne operanti sul territorio nazionale (Tabella 2), emerge chiaramente come alcuni operatori distributivi risultino maggiormente attrattivi per specifici segmenti di consumatori. Nel presente caso, l'attenzione è rivolta al cluster dei "*Verdi per Caso*" e all'insegna B. Come precedentemente evidenziato, i "*Verdi per Caso*" – famiglie sia ad alto che a basso reddito di giovane e media età, caratterizzate da una scarsa dichiarata sensibilità verso la sostenibilità ma da atteggiamenti d'acquisto "virtuosi" in punto vendita – rappresentano un segmento di grande interesse per comprendere i meccanismi che inducono consumatori poco motivati verso il "green" a scegliere comunque referenze con claim legati alla sostenibilità. In particolare, si ipotizza che la familiarità con un assortimento integrato, in cui prodotti sostenibili convivono accanto a referenze tradizionali, unitamente all'applicazione di tecniche di nudging – quali l'allocazione di spazi espositivi privilegiati, l'uso di promozioni mirate e politiche di pricing strategico – giochino un ruolo determinante nell'attivazione di comportamenti d'acquisto inconsapevoli. Questo approccio suggerisce che il semplice posizionamento e la comunicazione visiva selettiva possano veicolare una "spinta gentile" verso l'opzione sostenibile, convertendo l'esposizione ripetuta in un acquisto "per abitudine" piuttosto che in una scelta deliberata.

**Tabella 2:** I retailer preferiti dei cluster (Fonte: Elaborazione degli autori basata sui dati NIQ)

Al contrario, il canale discount, invece, ha un'incidenza superiore alla media per i cluster "*Vorrei Ma Non Posso*" e "*Verdi Mai*" (Tabella 1). In questi punti vendita, caratterizzati da un'offerta fortemente orientata al prezzo e alla velocità di turnover, le referenze sostenibili faticano a emergere in un assortimento che privilegia esclusivamente articoli a basso costo e (pochi) brand consolidati per il risparmio immediato. Di conseguenza, le famiglie "*Vorrei Ma Non Posso*" – pur dichiarando una sensibilità verso le tematiche ambientali – non incontrano prodotti "green" sufficientemente visibili o competitivi in termini di prezzo, alimentando la percezione, seppur apparente, che il discount non sia un contesto idoneo per realizzare scelte sostenibili. Allo stesso modo, i "*Verdi Mai*", che già mostrano una propensione minima al consumo sostenibile, vedono confermata la lontananza da questo mondo: la comunicazione in-store, basata esclusivamente su promozioni e sconti generalizzati, non introduce alcuna narrazione sul valore ambientale che possa stimolare anche solo curiosità. La carenza di un patrimonio distributivo sostenibile e la scarsità di spazi espositivi riservati a linee "green" consolidano quindi un circolo vizioso in cui questi cluster rimangono esclusi dal mercato della sostenibilità, nonostante la loro potenziale volontà di aderire a comportamenti di acquisto più responsabili.

## 6. Conclusioni

Il presente studio ha permesso di esplorare in profondità il comportamento dei consumatori italiani in relazione alla sostenibilità, mettendo in luce la complessità del rapporto tra ciò che viene dichiarato (say) e ciò che viene effettivamente fatto (do). Questo disallineamento, noto come say–do gap, rappresenta una delle principali sfide per chi si occupa di marketing sostenibile e per le politiche pubbliche orientate al cambiamento dei modelli di consumo.

L'analisi ha evidenziato come la sostenibilità non sia più un tema di nicchia, ma un elemento che attraversa trasversalmente le scelte di consumo, pur con intensità e consapevolezze differenti. La segmentazione in sei cluster ha permesso di restituire una fotografia articolata della popolazione italiana, in cui coesistono consumatori fortemente orientati alla sostenibilità, soggetti ambivalenti e profili ancora distanti da questi valori. Questi cluster possono essere assunti dalle imprese come target specifici di strategie mirate alla promozione e/o al consolidamento di comportamenti sostenibili.

Un target senz'altro molto interessante per le imprese è costituito dall'ampio segmento di individui "Vorrei Ma Non Posso" che, pur dichiarando attenzione ai temi ambientali e sociali, non riesce a tradurre tali intenzioni in comportamenti coerenti. Si tratta di un target ad alto potenziale, già ricettivo, che se raggiunto con adeguate strategie di marketing, volte a favorire l'accessibilità all'offerta sostenibile, può facilmente migrare nei "Sempre Verdi".

Ugualmente interessante è il cluster dei "Verdi Per Caso", la cui esistenza conferma il potere che hanno le imprese di influenzare e orientare i comportamenti di acquisto e di consumo. La presenza dei "Verdi Per Caso" suggerisce che esistono margini di intervento anche su consumatori apparentemente disinteressati, i cui comportamenti possono essere orientati positivamente attraverso leve di shopper marketing.

Allo stesso modo, l'eterogeneità tra retailers in relazione alla presenza di questo cluster evidenzia che alcune leve di retailing mix sono più efficaci di altre in termini di capacità di "spingere gentilmente" acquisti sostenibili.

Un ulteriore aspetto senz'altro distintivo del presente lavoro risiede nella metodologia. L'adozione di un approccio integrato, che combina dati dichiarativi e comportamentali, consente di comprendere in modo oggettivo le dinamiche del consumo sostenibile e di trarre indicazioni utili per orientare in modo concreto ed efficace le strategie e le azioni operative delle imprese. L'utilizzo di fonti oggettive e rappresentative, quali il Consumer Panel di

NielsenIQ, ha permesso di superare i limiti delle sole indagini di opinione, offrendo una base solida per l'elaborazione di strategie mirate.

Pur offrendo risultati significativi, il presente lavoro presenta alcune limitazioni. Lo studio costituisce infatti la fase iniziale di un progetto più ampio, che prevede l'integrazione dell'analisi condotta tramite il Consumer Panel Service (CPS) di NielsenIQ con i dati del Retail Measurement Service (RMS), al fine di valutare l'impatto di variabili chiave legate alle insegne distributive. Tra queste, si considereranno indicatori come l'ampiezza del patrimonio distributivo, la presenza più o meno marcata della marca del distributore, il posizionamento di prezzo e l'intensità promozionale. Inoltre, la ripetizione annuale dell'indagine consentirà non solo di monitorare l'evoluzione dei comportamenti nel tempo, ma anche di affinare un linguaggio condiviso tra i partner del progetto, utile alla redazione dei bilanci di sostenibilità in linea con le nuove normative europee. Infine, l'osservazione longitudinale della domanda permetterà di distinguere tra tendenze strutturali e fenomeni ciclici, offrendo indicazioni strategiche preziose per imprese e istituzioni impegnate nella promozione di modelli di consumo più sostenibili.

## Abstract

In 2024, the Italian wine sector generated €14 billion in revenue, representing approximately 10% of the national agri-food industry (ISMEA, 2025). Despite its economic significance, the sector is experiencing a marked decline in both production and number of enterprises. This trend coincides with a significant shift in consumer preferences, particularly among younger generations. While existing literature has addressed individual factors such as price, health, sustainability, and product knowledge (Russo, 2025; Savelli & Travasi, 2024; Casalegno et al., 2019), a comprehensive framework that integrates these dimensions remains lacking. This study explores the factors influencing wine consumption among Italian Generation Z, aiming to understand how the wine sector might align with the values and behaviors of a demographic increasingly distant from traditional consumption models. Employing a mixed-method approach, the research includes a critical literature review, qualitative insights from two focus groups, and a quantitative survey distributed to Gen Z respondents. Findings indicate that emotional value serves as a key mediating variable between wine perception and consumption behavior. Specifically, wine positive perceptions related to social interaction, status, sustainability, health, and knowledge significantly enhance emotional value, which in turn increases the likelihood of wine consumption. Conversely, wine price perception and concerns about drinking-driving showed no significant effect. These results suggest that Gen Z's relationship with wine is nuanced and emotionally driven, challenging prevailing assumptions of disinterest. The study contributes to both academic debate and industry practice, offering strategic insights for revitalizing the Italian wine sector.

*Keyword: wine, Gen Z, Italy, emotional value*

## 1.Introduction

The Italian wine market is not just an economic powerhouse, it's a key part of the nation's cultural identity, symbolizing tradition, territory, and excellence. Yet today, this market risks being undervalued, precisely at a time when it should be revitalized with greater vigor, especially among younger generations.

Our study explores how Italian Gen Z - born between 1995 and 2012 - relates to wine, how they perceive it, what images and meanings they associate with it, and what keeps them far from wine or could potentially draw them closer.

The development of the conceptual model adopted in this study stems from a critical review of the existing literature, which tends to address variables related to youth wine consumption

in isolation, overlooking the role of emotional dimensions in mediating behavior. Indeed, there is a lack of structured models that integrate rational drivers with more subjective and symbolic elements, such as each individual's "sentiment" toward wine. Results on one hand, help to gain a deeper understanding of Gen z attitudes and behaviours related to wine; on the other they offer valuable insights for businesses in the sector, which now face the challenge of having to speak through a new language to the Gen Z, without compromising the authenticity of the product. If the Gen Z is disinterested about wine, the risk is not just a market crisis, for Italy it would represent a loss of a vital part of the cultural heritage.

## 2. The Italian Wine Market and Gen Z

In 2024, the Italian wine sector generated €14 billion in revenue, representing approximately 10% of the national agri-food industry (ISMEA, 2025). That year, wine production saw a drop of 23.2% from the previous year. Consumption also remained below pre-pandemic levels, influenced by economic uncertainty and evolving consumer preferences (Statista, 2024). Cultural factors continue to shape wine consumption in Italy. The Enpaia–Censis Report (2024) underscores wine's symbolic value across generations, despite inflation and financial constraints. Gen Z is a heterogeneous cohort marked by rapid adaptability, digital fluency, and growing economic power, with a purchasing capacity exceeding $44 billion (Kahawandala and Peter, 2020). Unlike previous generations, Gen Z does not associate wine with luxury or prestige. According to Taylor et al. (2018), social status was once a motivating factor in wine consumption, but recent research (Russo, 2025) shows that wine choices among university students are now driven by personal experiences, price sensitivity, and peer influence rather than branding or packaging. Studies by Casalegno et al. (2019) and Savelli & Travasi (2024) show that Gen Z consumers value environmentally friendly production and short supply chains, though they often lack a clear understanding about sustainability certifications, labeling, and online information sources. This knowledge gap partly stems from the wine sector's historical failure to communicate effectively with younger audiences (Wilson et al., 2018). There is also growing interest in wines with reduced alcohol and carbohydrate content, particularly among health-conscious consumers (Ghvanidze et al., 2017).

Nonetheless, financial limitations and limited product knowledge hinder Gen Z willingness to pay premium prices for sustainable options (Savelli & Travasi, 2024).

Casalegno et al. (2019) report that young consumers are more likely to base their wine purchases on a cost-benefit analysis, emphasizing affordable yet value-aligned choices. However, targeted communication strategies may increase price tolerance. Chikumbi et al. (2020) found that transparent messaging about additive-free wines aligned with environmental values can boost consumers' readiness to pay a premium.

According to IWSR (2024) and Earl (2024), Gen Z is increasingly reducing alcohol intake in favor of physical and mental well-being. Wine is often preferred over spirits for its perceived healthfulness, but lower-alcohol options are especially favored. Russo (2025) and Spence (2020) found that drinking typically occurs during social gatherings, meals, or celebrations, with minimal association to solitary or nightlife contexts supporting its relational dimension. Supermarkets and restaurants are the primary points of purchase, further indicating wine's integration into casual, communal life.

Finally, as noted by Master of Wine Andrea Leonardi (as cited in Sottile, 2024), Gen Z may not yet find wine particularly satisfying, but their engagement could grow if wines are tailored to their evolving preferences. Success in reaching this demographic, requires not the imposition of tradition, but attentive listening and alignment with Gen Z actual new values.

## 3. Methodology

The research adopts a mixed-method approach both qualitative and quantitative. Two focus groups are conducted to explore the relationship between Gen Z and wine consumption. This qualitative investigation provides significant insights which, combined with the prior analysis of scientific literature, serve as a solid foundation for the development a quantitative three-level mediation model as follows (see figure 1):

- Causal factors: conspicuous consumption (Russo, 2025; Thach, 2022; Casalegno et al., 2019; Taylor et al., 2018;), perception of wine as a means of socialization (Russo, 2025; Spence, 2020; Casalegno et al., 2019; Taylor et al., 2018), perception of wine pricing (Russo, 2025; Spence, 2024; Savelli e Travasi, 2024; Hulkower, 2020; Casalegno et al., 2019; D'Amico et al., 2016), perception of wine as healthy (Savelli e Travasi, 2024; Earl, 2024; Thach, 2022; Ghvanidze et al., 2017; Samoggia, 2016), concerns about driving after drinking (Reports from Ministry of Health), perception of wine sustainability (Earl, 2024; Savelli e Travasi, 2024; D'Amico et al., 2016), and wine-related knowledge (Savelli e Travasi, 2024; Casalegno et al., 2019);
- Intermediate variable: emotional value (sentiment) attributed to wine;
- Behavioral outcome: actual wine consumption.

In light of the literature review, there is a clear need to consider certain individual variables that may moderate the relationships between the causal factors and the behavioral outcome. Specifically, five sociodemographic moderators were identified: gender, age, geographic area of origin, level of education and employment. In addition, several general attitudes were included: general health-oriented attitude, sustainability orientation, subjective risk sensitivity related to driving and conspicuous attitude/symbolic consumption disposition.

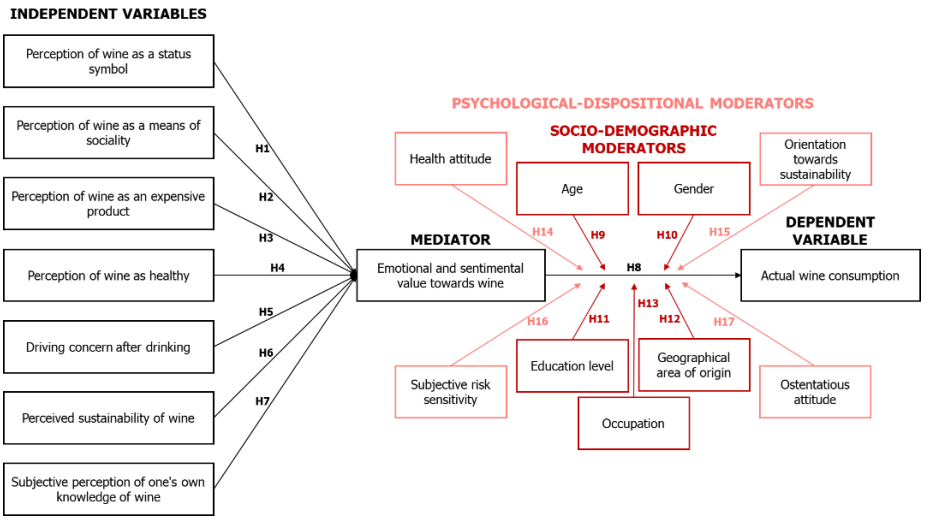

**Figure 1:** The Research Quantitative Model

A questionnaire was distributed using Qualtrics platform. Sampling followed a non-probabilistic, convenience-based approach, focusing on the Italian population belonging to Gen Z (over 18 years of age). A total of 337 valid responses were collected.

## 4. Results

Findings highlight the complexity and depth of the relationship between Gen Z and wine. The mediation analysis reveales the crucial role of emotional value as a bridge between

perception and behavior. Wine perceptions related to status, socialization, sustainability, health, and knowledge were found to positively influence emotional value, which in turn significantly increases the likelihood of consumption. This suggests that, for Gen Z, wine is not just a product but a cultural, symbolic, and relational experience, capable of generating deep emotional connections – in line with recent literature and Censis data (2024), which recognize wine as a cultural asset that conveys identity and social meaning. In contrast, price perception and concerns about driving do not significantly impact emotional value. This may be explained by the idea that strong emotional engagement with wine reduces sensitivity to cost. Furthermore, internalized social responsibility can weaken symbolic attachment to the product.

Overall, our study distinguishes between functional barriers (e.g., cost, legal risk) that affect feasibility, and emotional drivers (e.g., values, identity, sentiment) that shape deep motivation.

The model confirms emotional value as a significant mediator between perceptions and behavior. In cases of full mediation (e.g., sustainability, status), emotional value is the only pathway through which perception affects behavior. In partial mediation (e.g., socialization, health, knowledge), both direct and mediated effects coexist.

Ultimately, the model positions emotional value as the core psychological mechanism translating perception into consumption action. Moderation analysis found only one significant effect: risk sensitivity alters the relationship between emotional value and actual consumption suggesting that even emotionally engaged youth may limit intake if they are highly risk-averse. This aligns with increasing regulatory and cultural focus on road safety and responsible drinking.

## 5. Conclusions

To attract Gen Z, wine companies must move beyond traditional approaches and reposition wine as a cultural and emotional experience, not just a commodity. Many young consumers lack wine knowledge or emotional attachment, making it crucial to emphasize storytelling, symbolism, and authenticity.

A targeted communication strategy should also reflect the diversity within Gen Z considering that young consumers seek brands that are genuine and value-driven. Companies should use short-form, visually engaging formats and adopt a familiar language that resonates with younger audiences.

Promoting wine as a sustainable and health-conscious choice can strengthen its emotional appeal. This can be achieved through low-alcohol or organic options and by transparently sharing environmental efforts. However, the low-alcohol wine segment lags behind other categories like beer and needs both product and branding innovation to feel aspirational rather than inferior.

Wine education could be another key driver, it should begin early, ideally in schools. Many young people, feel uncertain about choosing or tasting wine. Brands should offer simple, interactive learning experiences to boost confidence and engagement. Wine must also adapt to Gen Z's preference for experiences over products. Sensory events, social media–friendly formats, and short urban wine tourism can make wine more accessible and memorable.

Finally, to overcome perceptions of wine as elitist, producers should explore more inclusive formats and informal narratives - without compromising perceived quality. While tradition (like corks and glass) still matters, modern packaging can convey elegance and trust when paired with thoughtful design. Personalized labels and direct sales can also strengthen brand

connection. Since Gen Z embraces digital retail, but when buying wine many still prefer physical interaction, e-commerce should evolve into a more immersive, guided experience, while direct-to-consumer channels remain key in building lasting relationships.

Public policy should also support innovation and sustainability—from digital transformation and supply chain integration to wine tourism and circular economy initiatives. Encouraging youth involvement in the sector through start-up incentives and training programs can help bridge the generational gap.

As already mentioned, rather than adopting moralistic or punitive approaches, public efforts should protect and promote wine's cultural, territorial, and ecological value, helping to define it as a product that connects history, community, and identity. In fact, focus groups revealed a strong "Italian" perception of wine among young people, who prefer national labels and view wine as deeply rooted in tradition.

# Navigating Ethical and Functional Tensions in Food Delivery: Insights from Italian Consumers

Matteo Corciolani

Università di Pisa, Italy

matteo.corciolani@unipi.it

## Abstract

Food delivery platforms (FDPs) have become increasingly integrated into consumers' daily routines, offering speed and convenience while raising concerns about ethics and sustainability. This study examines the tensions between functional and moral considerations in platform use, with a focus on the role of local delivery platforms (LDPs). Drawing on a mixed-methods approach, the research combines qualitative insights from two student focus groups with quantitative evidence from a representative survey of 1,946 Italian consumers, 800 of whom regularly use FDPs. Findings confirm the dominance of convenience-driven motives, while also highlighting a clear valueaction gap: although many consumers express concerns about rider conditions and environmental impact, these concerns rarely influence their behavior. LDPs, despite aligning with consumer values around locality and fairness, remain marginal due to low visibility and perceived inefficiency. The study examines the theoretical implications of consumer ethics and platform engagement, outlining practical strategies for both platform operators and policymakers to reconcile efficiency with emerging moral expectations.

*Keywords: Food Delivery Platforms; Online Food Ordering; Local Food Consumption; Ethical Consumption.*

## 1. Introduction

The rapid expansion of food delivery platforms (FDPs) has reshaped food consumption practices, embedding new routines into consumers' daily lives. These platforms offer unprecedented convenience and variety, yet raise critical questions about labor conditions, environmental impact, and the role of local alternatives. In this context, understanding how consumers navigate the interplay between functional benefits and ethical concerns is becoming increasingly relevant, particularly considering growing interest in sustainable and locally sourced food consumption. This study examines consumer attitudes, motivations, and tensions surrounding the use of food delivery services, with a focus on the perceived differences between national and local platforms. More specifically, it aims to uncover the underlying values and behaviors that shape delivery choices in Italy through a mixed-methods approach, including two focus groups and a representative survey of around 2000 Italian consumers, 800 of whom regularly use food delivery platforms.

## 2. Literature Review

In recent years, food consumption patterns have undergone significant changes due to the rise of digital technologies and the increasing use of online platforms and apps (Kaur et al.,

2021). Traditional activities such as product comparison and supplier selection are now often performed through digital intermediaries (Cochoy et al., 2020), with the COVID-19 pandemic accelerating this digital transition (Francioni et al., 2022; Jun et al., 2022).

Digital platforms have become key players in the distribution system, redefining relationships among producers, retailers, and consumers (Wichmann et al., 2022). At the same time, consumers are increasingly empowered, showing interest in ethical, sustainable, local, and authentic products (Reich et al., 2018). Therefore, a tension has emerged between the expansion of global platforms—often criticized for their environmental and social impact—and the growing demand for ethical and sustainable alternatives (Chocoy et al., 2020).

The food delivery sector exemplifies this shift. Since the first online order in 1994, platforms like Just Eat, Glovo, and Deliveroo have offered a fully integrated experience (Shankar et al., 2022), leveraging technologies such as GPS tracking, flexible payments, and feedback systems (Farah et al., 2021). User experience is crucial to customer loyalty, with key factors in convenience, speed, and interface quality (Leung et al., 2023).

Research identifies both functional and symbolic motivations behind FDP usage: convenience, time-saving, variety, and promotional access (Teo et al., 2024; Zhao et al., 2023). The Technology Acceptance Model and the Theory of Planned Behavior highlight the importance of perceived usefulness, trust, and personal attitude (Francioni et al., 2022).

Meanwhile, critics focus on social and environmental issues: rider working conditions, urban emissions, and potential food waste (Sharma et al., 2021; Siragusa et al., 2022). Local delivery platforms (LDPs) have thus emerged as a counter-model, promoting ethical labor, shorter supply chains, and community engagement (Bongianni, 2022). Yet, their adoption remains limited due to visibility, operational constraints, and perceived inefficiency (Teo et al., 2024). Despite expressing sustainable and ethical values, consumers often prioritize convenience, cost, and habit (Zepeda & Li, 2006), revealing a value-action gap. LDPs appear more appealing to specific consumer segments—educated, environmentally aware urban dwellers—suggesting the need for strategic positioning and increased visibility to realize their full potential.

## 3. Methodology

This study adopted a mixed-methods approach to explore consumer perspectives on FDPs and LDPs, combining qualitative insights from focus groups with quantitative data from a large-scale survey. The qualitative phase consisted of two focus groups conducted between May and June 2024, involving 11 university students aged 21 to 27. Following a semi-structured discussion guide, each session was moderated by two academic researchers with expertise in marketing and consumer behavior. The first group included six university students (four males and two females), mostly living away from home in urban areas. The second group involved five students (two males and three females) residing with their families or independently in smaller towns. The discussions aimed to investigate both practical usage patterns and symbolic meanings associated with delivery services, whether for prepared meals or online grocery shopping. Participants engaged actively, offering a nuanced perspective on the motivations, barriers, and ethical dilemmas surrounding the use of food delivery services.

The quantitative phase involved an online survey administered with the support of a professional market research firm. The survey targeted a representative sample of 1946 Italian consumers, ensuring demographic diversity across age, gender, geographic region, and socio-economic background. The questionnaire aimed to quantify key behaviors and

attitudes identified in the qualitative phase, providing robust insights into the current state and potential evolution of food delivery consumption across the Italian population.

## 4. Findings

### 4.1 Focus Groups

Participants in the two focus groups widely recognized convenience as the primary reason for using delivery platforms—for both prepared meals and online groceries— especially during periods of intense study or socializing. However, some also reported guilt when ordering under poor weather conditions or expressed concerns about the riders' working conditions.

Geographic context emerged as a key determinant in service availability. While urban participants had access to multiple platforms, those from smaller towns relied on informal or non-digital services. This uneven access significantly shaped usage patterns.

Price sensitivity and service efficiency were frequently discussed. Several students reported frustration over missing items, high delivery fees, or service delays, particularly during weekends. These experiences influenced the perceived reliability of specific platforms.

Food waste was another contested topic: while some viewed delivery as a way to avoid leftovers, others believed it led to increased waste, especially when food was not consumed promptly. This suggests that the delivery's environmental impact is not uniformly perceived and varies depending on personal habits and food types.

A distinction was made between delivery and dining out. Many considered delivery a substitute for home-cooked meals, rather than a replacement for restaurant experiences. However, for some, ordering in had become an alternative to going out, reflecting social and economic priorities.

Riders' working conditions also received attention. Students showed awareness of differences between casual and full-time riders, raising concerns about labor protection and fairness. Nevertheless, ethical considerations are rarely translated into concrete behavior changes. Indeed, attitudes toward LDPs remained largely indifferent. Despite acknowledging the moral and territorial values promoted by these platforms, most participants do not differentiate them from mainstream services like Glovo or Just Eat. This suggests a disconnect between declared values and actual consumption practices, highlighting functional dominance over ethical criteria in delivery choices.

### 4.2 Survey

Eight hundred consumers currently use food delivery platforms, representing approximately 40% of the sample, indicating that less than half of Italians utilize these channels for food purchases. Platforms account for a small share of total food purchases, at slightly more than 3%, and are outnumbered mainly by supermarkets (41.1%), local shops (27.9%), and hypermarkets (16.6%). Therefore, although the penetration of this channel reaches 40% of the population, its economic impact remains marginal.

Focusing on platform users, 21.9% use them to purchase fresh food once a week or more, 38.1% less than once a week but at least once a month, and the rest of the sample uses them even less frequently. The frequency of purchase of ready-to-eat food is even lower.

The most important motives for using food delivery platforms are "convenience" (27.2%), getting unusual or tricky food (17.2%), lack of time for cooking (14.1%), and special social

occasions (14.1%). Most occasions (around 75%) where Italian consumers obtain food from platforms are for a collective gathering, such as with friends, family, and the like.

Respondents declare that the most important criteria they employ to select their preferred platform are food quality and typology, straightforward indication of delivery time and delivery fees, the variety of restaurants available, and the platform's usability (website or app).

At least one-third employ the app or website of individual restaurants or shops, even if not exclusively.

Platform users believe that platforms can save people time and are intuitive and easy to use; however, they are not always economically convenient. Moreover, they believe that they exploit riders, which is a significant issue, and would prefer to rely on local suppliers for both products and delivery services. Platforms are also considered highly impactful. Ultimately, many choose to prepare their food or dine at a more authentic and satisfactory restaurant.

In perspective, platform users request more respect for riders and lower delivery fees, which are the most frequently cited expectations. These are followed by other requests, such as an increasing share of local products in the platforms' assortments, a wider variety of foods and suppliers, shorter delivery times, and a need to reduce the environmental impact of the entire delivery process.

## 5. Discussion

This study provides a multi-layered understanding of how Italian consumers interact with food delivery platforms, illuminating both their practical behaviors and the value tensions inherent in these practices. Findings from both the focus groups and the survey confirm what much of the literature has anticipated: functional motives—primarily convenience, time-saving, and platform usability—continue to dominate the rationale behind FDP usage (Francioni et al., 2022; Teo et al., 2024). In particular, a clear valueaction gap emerges: although participants express concern over rider exploitation and environmental impact—issues widely discussed in the literature (Sharma et al., 2021; Siragusa et al., 2022)—these concerns rarely translate into actual behavior change.

In line with prior studies (Zepeda & Li, 2006), ethical and sustainability considerations are recognized but subordinated to convenience and habit. This is particularly visible in the widespread indifference toward LDPs, which—despite their potential to promote sustainable, community-based food consumption—still struggle to gain traction due to low visibility and perceived inefficiency (Bongianni, 2022; Teo et al., 2024).

The practical implications of these findings are twofold. For platform operators, improving delivery affordability and transparency—especially regarding rider treatment—may enhance consumer trust and loyalty. Integrating more local products and vendors could also increase differentiation and appeal, particularly among environmentally conscious users. Policymakers and local institutions can support and promote LDPs by fostering digital infrastructure, enhancing communication efforts, and promoting ethical certifications, thereby highlighting their social and territorial value.

Ultimately, the future success of food delivery will depend on striking a balance between efficiency and ethics. Platforms that meet consumers' functional needs while addressing their latent moral concerns may be best positioned to thrive as the market matures.

# Reconstructing the Digital Funnel: A SEM-Based Perspective on Consumer Pathways and Service Expectations

Ernesto D'avanzo

Department of Economics and Management, University of Trento, Italy

ernesto.davanzo@unitn.it

## Abstract

In the realm of e-commerce, aligning digital funnel design with buyer expectations is critical for guiding consumers from awareness to purchase and beyond. This paper synthesizes insights from a buyer's expectation survey and structural equation modelling (SEM) of online consumer behaviour to propose a redesigned digital funnel. Drawing on an online buyer survey of desired e-commerce services and a SEM-validated model of choice mechanisms, the paper maps key digital services to appropriate funnel stages (Awareness, Consideration, Decision, and Post-purchase Loyalty). The proposed funnel highlights how heuristic-driven services – such as intuitive search and filtering by category/brand/price – in the consideration stage, and context-driven features (e.g., shopping by occasion) combine to drive deal-seeking behaviours, ultimately influencing purchase decisions. We integrate recent research on customer decision journeys and digital service design to ensure each funnel stage is supported by features that meet buyer needs while improving conversion. The findings indicate a significant gap between seller offerings and buyer expectations in current funnels, and demonstrate how our SEM-informed funnel can contribute to bridge this gap. We discuss theoretical and practical implications for e-commerce managers to enhance user experience, increase trust, and cultivate loyalty by deploying the right features at the right stage of the customer journey. All claims are supported with evidence from literature and foundational works in marketing and information systems.

*Keywords: digital marketing funnel; structural equation modeling (SEM); consumer decision-making; e-commerce experience; user journey personalization*

## 1. Introduction

E-commerce customer journeys are often conceptualized as a «digital funnel», guiding users from initial awareness through consideration to purchase and post-purchase engagement. This funnel metaphor – rooted in classic consumer decision models (e.g., the AIDA hierarchy) – delineates stages where marketers must attract attention, foster interest, drive decisions, and ultimately secure loyalty. Designing an effective digital funnel is critical: it provides a clear, efficient path that simplifies decision-making, minimizes drop-offs, and enhances satisfaction. Yet, many e-commerce funnels fall short of buyer expectations. Studies reveal a persistent gap between the services online sellers offer and what consumers actually desire or use when shopping online (D'Avanzo & Kufflik, 2013). Bridging this gap is essential for improving conversion rates and customer experience.

Prior research by D'Avanzo and Colaiori (2023) identified that e-commerce websites often lack non-compensatory decision aids that consumers value. For example, buyers may expect robust search and filtering options, informative reviews, and personalized recommendations, but sellers do not always provide these features or fail to implement them in line with buyer needs. The result is an "expectation gap" that can lead to user frustration and lost sales. Moreover, the traditional linear funnel is being challenged by contemporary customer journey models that emphasize ongoing engagement and a «loyalty loop» beyond the initial purchase. Customers now interact with firms across myriad touchpoints and may re-enter the funnel through post-purchase interactions, reviews, or social media advocacy (Lemon & Verhoef, 2016). These developments call for a redesign of the «digital funnel» that not only reflects stages of buyer decision-making, but also integrates features proven to influence consumer behaviour at each stage.

Against this backdrop, the present study aims to synthesize two complementary and mutual perspectives – buyer expectations across the funnel stages and SEM-validated consumer behaviours – into a unified, redesigned digital funnel model. The first perspective comes from a survey-based study of e-commerce buyers which revisited the digital funnel from the buyer's point of view. It identified which online services (e.g., site search, product recommendations, reviews) buyers deem most valuable at different stages of their journey and highlighted mismatches between what buyers want and what sellers commonly offer. The second perspective is through a structural equation modelling (SEM) to discover which e-commerce website features significantly drive consumer choices. The SEM analysis proposes a subset of eight non-compensatory choice mechanisms (e.g., filtering by brand, price, occasion, etc.) out of dozens of possible services, and grouped these into latent factors, or constructs, that predict online purchase intent. The SEM model highlights how three constructs of shopping behaviours interrelate: one capturing «product-filtering heuristics» (by category, brand, price), another capturing «goal-oriented filters» (by recipient or occasion), and a third capturing «deal-seeking actions» (viewing sale items, new arrivals, top-sellers). These data-driven insights offer a valuable lens on which site features truly influence consumer decisions.

Research problem and contribution: building on these prior works, we address the problem of how to integrate buyer expectations with empirically validated consumer behaviours in order to redesign the digital funnel.

We ask:

- RQ1: which e-commerce services should be present at each stage of the funnel to meet buyers' expectations?

- RQ2: how do these services correspond to behaviours that significantly drive online purchase decisions?

By answering these questions, our study contributes a synthesized funnel model that is both «buyer-centric» and «behaviourally validated». In contrast to generic funnel models, our proposed model is grounded in empirical evidence, trying to ensure theoretical rigor and practical relevance too.

It extends traditional funnels by explicitly mapping specific digital services (e.g., search filters, reviews, payment options) to funnel stages, guided by what buyers expect and what actually impacts their choices as per SEM findings.

We also incorporate post-purchase and loyalty stages, reflecting modern understandings of the customer journey as an ongoing cycle rather than a terminal funnel.

The remainder of the paper is organized as follows. First, we review the theoretical framework underpinning digital funnels, buyer decision-making, and relevant online services, drawing on marketing and IS literature. Next, we outline our methodology for synthesizing the two key points of view. We then present results and the discussion in the form of a redesigned funnel, including a detailed comparison of services identified in the buyer survey vs. the SEM model, where we interpret the findings in light of theory and prior research, and derive implications, even if at its early stage. Managerial implications are then outlined, providing guidance for practitioners on implementing the recommended funnel design. Finally, we conclude with a summary of contributions and suggestions for future research.

## 2. Theoretical Framework

### 2.1 Digital funnel and customer journey concepts

The notion of a «sales funnel» or «marketing funnel» has long been used to describe the stages of consumer decision-making, from initial awareness to purchase (and in extended models, post-purchase engagement). The concept originates from early marketing frameworks like the AIDA model (Awareness–Interest–Desire–Action) proposed over a century ago, which conceptualized a narrowing process where many prospects at the top eventually convert into a smaller number of buyers at the bottom. Modern interpretations of the funnel incorporate more nuanced stages and recognize post-purchase behaviours.

For instance, Gabbott and Hogg (1998) delineated pre-encounter, encounter, and post-encounter phases in service interactions. In e-commerce contexts, the encounter phase can be further refined into an exploratory stage (as the customer acquaints themselves with the website and offerings), a choosing/consideration stage (active product search and evaluation), and a purchase stage (transaction completion).

More recent literature on customer experience emphasizes that the journey does not end at purchase; rather, post-purchase phases like consumption, loyalty, and advocacy are crucial to firm success (Lemon & Verhoef, 2016). Loyalty loop models (Court et al., 2009) reconceptualize the funnel as a continuous cycle where satisfied customers re-enter the loop via repeat purchases or influence others via advocacy. This evolving view underlines the importance of including post-purchase services (e.g., support, personalized follow-ups) in funnel design.

### 2.2 Buyer decision-making and information processing online

A stream of research in marketing and information systems has examined how consumers gather information and make decisions online. A key distinction is between compensatory and non-compensatory decision strategies (Arana & León, 2009). In compensatory strategies, consumers evaluate trade-offs, allowing a high value on one attribute to compensate for a low value on another. In contrast, non-compensatory strategies (i.e, heuristics) involve simplified decision rules where consumers set cut-off criteria and eliminate options that don't meet the thresholds, without extensive trade-offs. Online shopping environments often encourage heuristic approaches due to information overload and the abundance of choices. Gigerenzer and Goldstein's (1996) work on bounded rationality argues that simple heuristics can be remarkably effective, enabling «fast and frugal» decisions with limited cognitive effort. E-commerce websites implement these heuristics as interactive tools: for example, filtering by category or price is a non-compensatory strategy that helps «narrow choices», quickly, without comparing every product detail. Such features reduce cognitive load and decision complexity, which is beneficial given that too many options or too much information can overwhelm consumers.

Studies on information overload in e-commerce demonstrate that presenting information in an organized, filtered manner helps consumers cope with extensive choice. When consumers encounter excessive product information, or complex interfaces, they often experience increased decision stress and reduced satisfaction, a phenomenon exacerbated when site design does not aid efficient scanning and filtering (Kusi et al. 2022). Conversely, if consumers feel inundated with unstructured information, their satisfaction and confidence drop. Furner and Zinko (2017) specifically explored the role of online reviews in this context. They showed that more extensive information in product reviews boosts trust and purchase intention up to a point, but beyond an optimal level it leads to diminishing returns and even declines in trust if information load becomes excessive. Notably, they found web interfaces can handle higher information loads better than mobile interfaces, implying that effective web design (with sorting, filtering, etc.) can mitigate overload. These findings underscore the importance of well-designed informational services – such as filtering options, concise yet thorough product descriptions, and user reviews – at the consideration stage of the funnel. They need to provide enough information to inform decisions and build trust, but not so much as to overwhelm.

### 2.3 Critical e-commerce services across the funnel

Prior work has identified various website features that facilitate different stages of the buyer's journey. During the Awareness or exploratory stage, consumers benefit from tools that orient them to the product space and pique interest. A shopping guide or clear categorization of products can introduce the range of offerings and help users navigate intuitively. According to D'Avanzo & Colaiori (2023), a shopping guide on the homepage (e.g., category overviews or gift guides) serves as a valuable starting point that frames the site's offerings and directs users to relevant sections. In addition, showcasing new arrivals or best-selling products on the landing page can attract user attention – these features leverage social proof and novelty to raise awareness of popular or latest items. Indeed, consumers highly appreciate seeing "What's new" or top sellers as it helps them discover trends or desirable options with minimal effort (see Figure 1). However, many sellers underutilize these: only about 29% of e-commerce sites offered a top sellers feature, despite ~68% of consumers expecting it. Similarly, highlighting discounted products (sale items) early can draw in deal-seekers; around 80% of consumers in one study wanted a products on sale filter, yet fewer than 20% of sites provided it.

In the Consideration stage, where users actively search and evaluate options, numerous online services come into play. A functional search engine is paramount – buyers overwhelmingly expect the ability to quickly find specific products via search. In fact, the availability of a good search function streamlines decision-making and saves time.

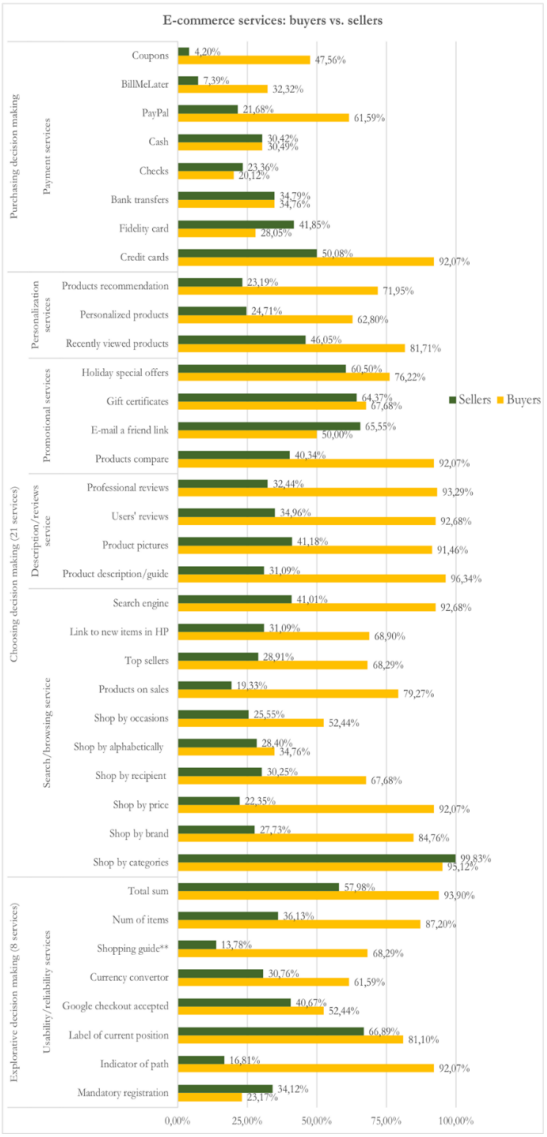

**Figure 1:** The figure shows, at the same time, the 37 services that were analyzed by D'Avanzo and Colaiori (2023). In yellow are represented the buyer's expectation (what buyer want) in terms of utility of the service, while in green are reported the percentages of e-commerce sites (sellers) that offer those services. For each service, it is possible to note the possible gap between what is offered (by the 594 e-commerce analysed) and how much the same services are expected by buyers (sample of 165 interviewees).

Almost all e-commerce websites provide basic search, and it's considered a standard feature (93% of sites in a 594-website survey had it). But the mere presence of search is not enough (only 41% of seller offer this service); its effectiveness (accuracy, ease of use) is crucial. Research shows that search algorithms and recommendation quality significantly influence purchase intention. Alongside search, navigation by categories is another key service. Organizing products into «logical categories» or hierarchies (and allowing shop by category) simplifies exploration, helping users systematically browse areas of interest. This feature was among the most frequent services provided by sellers and also highly expected by buyers, aligning both sides. Beyond category, more granular filters like shop by brand and shop by price are vital in consideration phases. These allow buyers to narrow down options according to their preferences or budget constraints, implementing a heuristic elimination of unsuitable

options. Buyers place great importance on brand and price filters – they were identified as highly expected tools for evaluating choices (by brand is expected by 85% of buyers, while by price by 92% of them, even if both of them have low spread among sellers). The SEM analysis introduced in the following indeed confirms that filtering by brand, price, and category form a significant construct influencing online consumer behaviour. This factor (named F1 in the following SEM model) essentially captures a consumer's heuristic attitude of «I want to see only items from certain brands, within my price range, or in a specific category» which streamlines the decision process.

Another set of tools in Consideration is contextual filters, such as shopping by recipient (e.g., gifts for men, women, children) or by occasion (e.g., holiday, back-to-school). These services address the situation-specific intent behind a purchase. While not all consumers shop by occasion, a substantial segment finds it useful: about 52% of buyers expected such filters, yet only ~25% of sellers offered them. The SEM analysis introduced in the following highlights the importance of these context-based mechanisms: shop by recipient and shop by occasion clustered into a construct (F7 in the SEM model), representing the consumer's goal-oriented intention (e.g., buying for a specific purpose or person). This factor significantly drives the selection of certain products, confirming that when sites allow filtering by context, it aligns with how many consumers approach shopping (especially for gifts or events).

Crucially, the consideration stage is also where product information and social proof shape decisions. Consumers demand comprehensive product descriptions (expected by 96% of buyers) and images (92% expected) to evaluate quality and fit-for-need. High-quality product pictures are indispensable; they set expectations and build confidence in the product's appearance. Visual presentation can often make or break a sale in e-commerce due to the inability to physically inspect items. Additionally, user reviews and professional reviews (expert opinions) become highly influential at this stage (see Fig. 1). They provide social proof, reduce uncertainty, and help buyers compare options. In fact, user-generated ratings and reviews have been found to be a "main component of purchase decisions" online. Furner & Zinko (2017) showed that well-curated reviews increase trust in the product and the platform. Accordingly, buyers in the survey rated reviews as critical features in the funnel's consideration phase. Many sellers have implemented review systems, but they are not as widely provided as buyers would like, as can be noticed looking at the gap on the corresponding bars of Fig. 1. Taken together, the literature and empirical evidence suggest that to support the consideration stage, an e-commerce site should integrate robust search and navigation, filtering heuristics for efficient sorting, and rich informational content (detailed descriptions, images, and reviews) to facilitate informed, confident decision-making.

Moving to the decision stage (the intent-to-purchase and purchase action phase), the focus shifts to transaction facilitation and reassurance. At this point, the user has selected a product and is ready to buy, so the site's job is to make checkout smooth and build final trust. One key service is displaying the total sum (cart total) and any cost details (taxes, shipping) clearly before checkout. Buyers expect transparency in pricing; showing the running total of their cart helps them manage their budget and avoid surprises. Total sum was among the most expected features during the intent stage, expected by about 94% of buyers. Another useful feature is an indicator of path or checkout progress bar. Clearly indicating the steps to completion (shipping, payment, confirmation, etc.) guides users and reduces anxiety by showing how close they are to finishing the purchase. This contributes to user satisfaction and prevents navigation confusion in the crucial final stage.

Trust is paramount at the decision stage, so offering secure and convenient payment options is critical. Acceptance of major credit cards is standard and expected – it signals reliability and meets consumers' usual payment habits. Beyond that, providing alternative payment

methods like PayPal can significantly enhance perceived security and convenience. PayPal, for instance, is trusted by many buyers for its fraud protections and ease of use; buyers value having it available and, in the survey, identified PayPal as a highly desired option during the purchasing stage. The presence of Buy Now, Pay Later services (e.g., the referenced "BillMeLater") can also influence purchase completion by reducing immediate financial burden – although the first study noted these may be less universally expected, some buyers appreciate the flexibility.

Additionally, incentives like coupons or discounts can be decisive at this stage. A timely coupon code or an automatically applied discount can motivate on-the-fence customers to complete the purchase. Consumers often look for coupon fields or promotions at checkout, and the expectation of finding a deal can increase conversions (the notion of getting a better price provides the final nudge). Coupons were among the services highly desired by buyers but not frequently offered by sellers, representing a missed opportunity to boost conversion rates.

Finally, Post-purchase and Loyalty stages involve services that encourage repeat engagement and turn purchasers into returning customers or advocates. After a purchase, features like "recently viewed products" or "related items" on the confirmation page or in account history can re-engage customers, reminding them of items they considered and potentially sparking a new purchase. The first study emphasizes that showing recently viewed items post-purchase can nurture the relationship and set the stage for the next buying cycle. In the longer term, personalized recommendations become crucial in the loyalty phase. Tailored product suggestions (via recommender systems leveraging prior purchase and browsing data) help create a one-to-one feel, enhancing customer satisfaction and loyalty. Personalized recommendation systems that integrate real-time user behavior—such as browsing and click histories—can significantly enhance accuracy, satisfaction, and loyalty in e-commerce contexts (Barzegar Nozari et al., 2024). This implies that effective personalization can drive incremental sales and deepen engagement. Buyers in the survey study also indicated they expect personalization in the loyalty stage – e.g., personalized product offers or emails catering to their preferences. Other loyalty-stage services include loyalty programs or fidelity cards, although interestingly the first study noted that a "fidelity card" was not highly expected during initial buying phases (likely because loyalty programs become relevant after trust in the platform is established).

### 2.4 Summary of gaps and theoretical implications

The literature and prior empirical findings collectively highlight that while numerous digital services can support the customer journey, not all are equally valued by consumers or effective in practice. Foundational works stress the role of website quality and features in fostering satisfaction and loyalty. For example, Bilgihan & Bujisic (2015) showed that well-designed website features are essential for building online customer relationships and influence purchase decisions. Easy navigation, convenient interfaces, and informative content lead to positive user experiences and competitive advantage for online retailers. From an IS perspective, factors like information quality (completeness, relevance of content) have been empirically linked to customer satisfaction (Chang, & Yang, 2010; Sehgal & Malik, 2024). Customers actively evaluate the information on websites – including price info and reviews from other buyers – and poor information quality can cause dissatisfaction and lost sales. Thus, there is a theoretical rationale for aligning funnel design with information-rich, user-centric features.

Based on the above rationale (i.e., buyer expectations and a body of knowledge), D'Avanzo & Colaiori proposed a new digital funnel that is based on the buyers' expectations. The contribution of their work is an attempt to map e-commerce services, identified though a

buyers' survey, on an extended version of a digital funnel made by 8 levels, as shown in the Figure 2.

However, implementing every possible service is neither practical nor necessary. The real challenge is to identify which services matter most at each stage, according to both consumer expectations and actual impact on behaviour. The expectation – offering gaps identified (e.g., high desire for coupons vs. low availability, desire for occasion-based shopping vs. low support) suggest specific areas for improvement, a job already tried by D'Avanzo & Colaiori (2023). Meanwhile, the SEM findings proposed in the following provide data-driven filters to prioritize features that significantly shape choices (like brand/price filters, context filters, and highlighting deals). By integrating these perspectives, our theoretical stance is that an optimized digital funnel is one that:

1. meets consumer expectations by providing the services they find most useful at each decision stage, thereby reducing friction and building trust;

2. leverages proven behaviours by emphasizing features that consumers actually use to make decisions (as validated by statistical models), thus efficiently guiding them toward purchase.

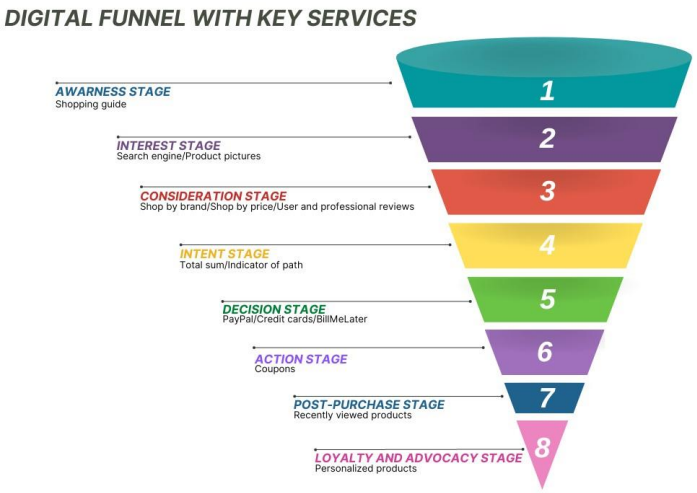

**Figura 2:** Graphical representation of a revisited digital funnel, incorporating 8 levels with their corresponding services. The figure is reproduced from the work of D'Avanzo and Colaiori (2023), courtesy of the authors.

In the next section, we describe how we combined the findings introduced above to develop such a funnel.

## 3. Methodology

Our research integrates findings from two complementary point of views to design a new digital funnel model. We leverage existing empirical results – one from a buyer survey study by D'Avanzo and Colaiori (2023) and another from a structural equation modelling (SEM) applied to their survey data – and connect them through conceptual mapping. This approach is akin to a meta-synthesis, or integrative framework development, common in conceptual research in marketing and IS.

### 3.1 Data sources

As mentioned above the dataset employed comes from D'Avanzo & Colaiori, 2023, which examined buyers' expectations of e-commerce website services across funnel stages. In their study, the authors based their funnel model on an extensive survey of online consumers (n = 165) using a 37-item questionnaire (5-point Likert scales) addressing various website features. Respondents were asked how useful/expected certain services were in their online shopping experience. The sample covered a broad demographic (both genders, ages spanning <21 to 50+) to capture diverse buyer perspectives. Additionally, they analyzed the prevalence of services on 594 e-commerce websites, identifying 68 distinct service variants and noting their frequency of implementation by sellers. These services were categorized following Gabbott & Hogg's (1998) phases (pre-encounter, encounter subdivided into exploratory/choosing, and post-encounter), as can be seen looking at left side of Figure 1.

The survey results were then used to pinpoint gaps between «buyer expectations» (which services were rated highly by consumers) and «seller offerings» (which services were infrequently available on sites). The key outputs of this first study that we utilize are:

a) a rank of services by how «highly expected» they are from the buyer's perspective;

b) identification of services that are both highly expected by buyers yet not common on sellers' websites;

c) a proposed eight-stage funnel model mapping specific services to each stage of the buying journey (their Figure 2).

We extracted qualitative insights from this paper – including direct statistics (e.g. «90% of consumers expect X, but only 30% of sites offer it») and the conceptual placement of services in funnel stages – to inform our funnel design.

After that we carried out a SEM analysis of e-commerce decision mechanisms identified through the survey. Using SEM, that is the novelty represented by our approach, we developed a full measurement model, where multiple observed items (questions about specific mechanisms) load onto latent factors representing broader decision-making constructs. Through model refinement (dropping non-significant items – services/filters - and improving fit indices), we arrived at a final SEM model (Figure 3) comprising three latent factors (labeled F1, F7, F4) and eight observed variables (the specific services). The model fit was excellent (CFI ≈ 0.993, RMSEA ≈ 0.019). Each factor/construct corresponds to a cluster of related services:

- F1: shopping heuristics by category, brand, price. These were all significant with F1, indicating consumers who tend to filter by brand also consistently filter by price and categories, suggesting a propensity for classical product filtering.

- F7: Goal-oriented heuristics by recipient and occasion. This construct reflects a consumer's intention to buy with a specific aim or context (e.g. a gift for someone or for a particular event). High scores on F7 mean the user frequently uses those contextual filters.

- F4: Deal-seeking and novelty-seeking behaviours. These items correspond to shop by products on sale, shop by top sellers, and links to new items on the home page respectively. F4 thus represents a tendency to focus on promotions, popular items, or new arrivals (composite «offers» factor).

The SEM's structural model then examined relationships among these factors. It found that F1 and F7 are significantly correlated, and both have causal influences on F4 (standardized coefficients: F1 → F4 = 0.31, F7 → F4 = 0.78, both $p < 0.05$).

In other words, consumers who rely on basic filters and those who shop by context both tend to engage with sale/top-seller/new-item features; together, F1 and F7 explain about 80% of the variance in the deal-seeking factor F4 ($R^2 = 0.801$).

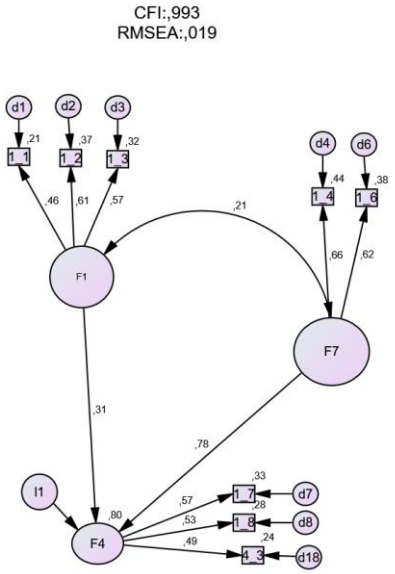

**Figure 3:** The figure shows the SEM model comprising the three latent factors (labelled F1, F7, F4) and eight observed variables (the specific services). The structural model (causal relations) explains F4 on the basis of F1 and F7. The model fits properly and the explanatory (independent) variables F1 and F7 are significant ($p<0,05$). This means that if we know the value of F1 and F7, we could predict the value of F4,
according to the relation: F4=0,31F1+0,78F7

This suggests that highlighting deals or popular items (F4 behaviors) is particularly effective for customers who are filtering by preferences or shopping for specific occasions – a valuable insight for funnel design.

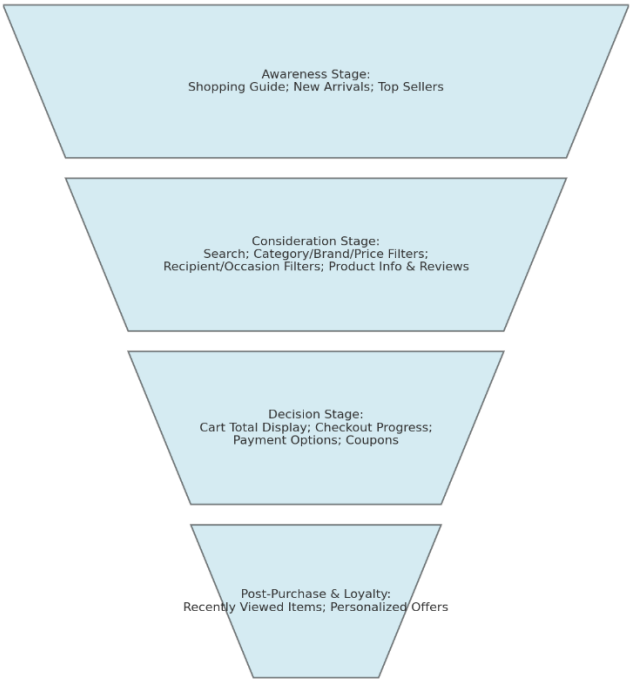
For our purposes, the critical outputs from the SEM study are the eight specific services validated as significant and their association with decision-making constructs. These eight services are: category filtering, brand filtering, price filtering, recipient-based filtering, occasion-based filtering, viewing sale items, viewing top-sellers, and viewing new arrivals. We treat these as the "SEM-validated" behaviours that our funnel model should incorporate at appropriate stages.

| SEM model | | |
|---|---|---|
| **Model Code** | **Variable (choice mechanism)** | **Construct** |
| 1_1 | *Shop by categories* | **F1** |
| 1_2 | *Shop by brand* | |
| 1_3 | *Shop by price* | |
| 1_4 | *Shop by recipient (e.g. products for children; women, etc…)* | **F7** |
| 1_6 | *Shop by occasions* | |
| 1_7 | *Shop by products on sale* | **F4** |
| 1_8 | *Shop by top sellers* | |
| 4_3 | *Links to new items on home page* | |

**Table 1:** Table report all variables/services as for the measurement model. F1 is composed for questions 1-1, 1-2 and 1-3, F7 composed for questions 1-4 and 1-6, and F4 is composed for questions 1-7, 1-8 and 4-3.
The meaning of each variable/question is also reported.

### 3.2 Integrative approach

We combined the above sources through the following steps:



*1. Stage definition alignment* - We first reconciled the stages used in the buyer survey's funnel model with common funnel terminology and the SEM study's focus. The buyer survey by D'Avanzo and Colaiori 2023, based on the same buyers' questionnaire we have employed, defined eight stages (Awareness, Interest, Consideration, Intent, Decision, Action, Post-Purchase, Loyalty/Advocacy) and mapped certain services to each.

For simplicity and coherence with widely used stages, we consolidated these into a slightly broader set: Awareness (including initial exploration/interest), Consideration, Decision (including intent/action of purchase), and Post-Purchase (including loyalty). This consolidation was also necessary because the SEM study primarily dealt with the «choosing» phase (overlapping our Consideration stage) and did not explicitly cover pre-awareness or post-purchase. Thus, our redesigned funnel uses four principal stages, ensuring that at least the classic trio (Awareness, Consideration, Decision) mentioned in the research question are covered, along with the post-purchase loyalty stage. We will, however, discuss sub-stage nuances (like "Interest" as part of Awareness, or "Intent/Action" within Decision) as needed.

*2. Mapping buyer-expected services to stages* – Based on the funnel designed by D'Avanzo and Colaiori, we listed the key services expected by buyers at each stage. For example, in the Awareness stage, buyers emphasized a shopping guide and easy initial exploration; in Consideration stage, they valued search, filters (by category/brand/price), and reviews; in the Decision stage, they wanted clear cost total, progress indicators, and trusted payment options, plus incentives like coupons; in Post-Purchase, they expected things like recently

viewed items, and in Loyalty, personalized recommendations. We documented these stage-service mappings and noted which of those services had notable expectation-offer gaps.

**Figure 4:** Redesigned digital funnel mapping buyer-expected services and SEM-validated behaviors to the stages of the online customer journey. Each funnel stage lists the critical website features or services that cater to user needs at that phase, based on buyer surveys and validated consumer

choice mechanisms.

*3. Incorporating SEM-validated services* - Next, we took the eight SEM-confirmed services and assigned them to the funnel stage where they look more logically belong to. For instance, category/brand/price filters clearly fit in the Consideration stage (when users are narrowing choices), recipient/occasion filters also fit in Consideration (particularly if the user's goal is defined at search time), and viewing sale items, top sellers, new items typically occur during product browsing – which could be late Awareness or early Consideration, depending on site design. We considered that Top sellers and New items on home page are often homepage features (Awareness stage), whereas Products on sale might be a filter or separate page used during product search (Consideration stage). However, since the SEM grouped these three together and tied them as outcomes of earlier filtering behaviours, we treated them as bridging Awareness/Consideration stages. In our integrated funnel, we decided to place Highlighting new arrivals and top-sellers as an Awareness-stage tactic (to draw interest), and Filter by sale/discounts as a Consideration-stage feature for deal-seekers.

*4. Reconciling differences and filling gaps* - Some expected services from the buyer survey did not appear in the SEM model (likely because that model was confined to the choosing phase and heuristic filters). Notably, search engine and user/pro reviews were not in the final SEM model. Search engine was actually tested but removed from the SEM due to not fitting well (it had a high expected importance but perhaps low variance since nearly all use it). We kept

site search as a crucial feature in our funnel's Consideration stage due to its obvious utility, supported by abundant literature (e.g., the link between easy search and conversion). Reviews, while not a heuristic filter per se, are information sources that strongly affect Consideration (as shown by Furner & Zinko and others), so we included user reviews and expert reviews as part of the Consideration stage in our model to preserve the buyer's perspective. Conversely, the SEM study identified shop by recipient and shop by occasion as significant, whereas the buyer survey's top-level funnel discussion did not explicitly highlight these in their stage descriptions (they were mentioned in the gap analysis though). We therefore made sure to add contextual filters (occasion/recipient) to our Consideration stage, as a distinct element separate from generic category filters.

For stages outside of SEM's focus (Awareness and Post-Purchase), we relied primarily on the buyer survey and supporting literature. SEM provided little direct insight on, say, loyalty programs or post-purchase behaviour, so features like personalized recommendations, order tracking, etc., were brought in from the buyer expectations study and prior research (e.g. importance of personalization for retention). We recognize this as a limitation – our funnel's latter stages are grounded more on descriptive expectations than on SEM validation – but it is necessary for completeness.

*5. Conceptual model construction* - With the above mapping in place, we constructed a conceptual model of the redesigned funnel. This is illustrated in Figure 4, which we created to visualize the funnel stages and the key services at each stage. The figure uses a classic funnel shape with segments labelled as Awareness, Consideration, Decision, and Post-Purchase & Loyalty, and lists inside each segment the main services or features assigned to that stage. Each listed service is either drawn from the buyer expectation analysis (with literature backing) or from the SEM's statistically validated set. We ensured that all eight SEM services appear in the figure at their appropriate positions, and that all major buyer-desired services are also present.

*6. Comparative analysis* - Finally, to address the requirement for a detailed comparison of services from the two points of view, we performed a crosswalk analysis. We tabulated each service of interest (see Table 2) and indicated whether it was (a) highly expected by buyers, (b) frequently offered by sellers, and (c) included as significant in the SEM model. This allowed us to discuss in the Results Section which services are "unanimously supported" (expected by buyers and confirmed by SEM) versus those that are "expected but under-leveraged" (desired by buyers but not emphasized in current practice or model) or "emerging behaviours" (highlighted by SEM even if not top-of-mind for buyers). For example, filter by brand/price falls in the first category (buyers want it and SEM confirms it influences decisions), while site search is expected by buyers (and universally offered by sellers) but didn't factor into the SEM (likely due to ubiquity). Shop by occasion is an interesting case of the third category – SEM shows it's impactful, and a majority of consumers do expect it, but it wasn't among the very top features listed by buyers perhaps because not all need it for every purchase. We integrate these observations into the Results narrative.

The overall methodological approach is qualitative in the integration but rooted in quantitative findings from the source studies. By triangulating between the buyer survey evidence, the SEM statistical evidence, and prior literature, we aim to build a funnel model as more robust as possible and evidence-based. In order to maintain rigor, we linked our model back to established concepts (e.g. heuristics, information overload, customer journey theories).

## 4. Results and discussion

Redesigned digital funnel model - Based on our synthesis, we propose a redesigned digital funnel that aligns buyer expectations with SEM-validated behaviors. Figure 4 presents a

visual representation of this funnel, encompassing four main stages – Awareness, Consideration, Decision, and Post-Purchase/Loyalty – with the key e-commerce services mapped to each stage.

At a high level, the redesigned funnel ensures that as the customer moves from the top (Awareness) to the bottom (Decision and beyond), they are continually supported by relevant site features. The model emphasizes a buyer-centric flow: starting from engaging the user with introductory guides and popular item highlights, through efficient search and filtering during Consideration, through a seamless and transparent checkout process, and finally into relationship-building features post-purchase. Below, we detail each stage of the funnel, highlighting how services from the twofold approach is integrated and comparing what buyers expect versus what is proven to influence behavior.

### 4.1. Awareness stage (initial exploration)

At the top of the funnel, the goal is to attract and orient potential customers. Our model incorporates a shopping guide as a prominent service in this stage. This could be a section on the homepage that introduces product categories or provides curated suggestions (e.g. Shop the gift guide or find the right product in 3 steps). The buyer survey indicated that a shopping guide is highly appreciated as a starting point for exploration. It serves to acquaint newcomers with the website's offerings and structure, thereby reducing the entry barrier for those who aren't sure where to begin. In practice, however, few e-commerce sites explicitly offer a guided shopping feature – this was identified as a gap, with buyers desiring guidance that sellers often don't provide. Additionally, the Awareness stage in our funnel features "New Arrivals" and "Top Sellers" showcases. These correspond to two of the SEM-validated items: links to new items on the home page and shop by top sellers. We position them in Awareness because they typically appear on the main entry pages to grab attention. For instance, a carousel of new arrivals keeps the content fresh and can intrigue repeat visitors, while a list of top-selling products leverages social proof (popularity) to draw interest. The inclusion of these features is strongly supported by the SEM study – they were part of factor F4 and were significantly driven by user predispositions (F1 and F7). Interestingly, while the buyer survey did not highlight new items or top sellers as top-of-mind expectations in their funnel description, the quantitative data suggests a majority of consumers do appreciate these (as evidenced by ~70% wanting top-seller lists). In fact, these features implicitly address a buyer's desire to simplify choice: a top-seller list says "these are tried-and-true favorites" and a new-arrivals list says "here's something novel you might not know about" – both cater to exploratory browsing. By including them, our funnel ensures that the awareness stage is not just about passive awareness (ads or external traffic) but an active on-site engagement where the website immediately presents useful entry points aligned with common buyer heuristics (trending or new items). From the perspective of buyer expectations vs. current offerings, we note a significant discrepancy: although consumers want these awareness features, only a minority of sites implement them effectively. For example, as mentioned earlier, top sellers and on sale sections were present in only ~29% and ~20% of surveyed websites, despite high consumer interest. Our results underscore the recommendation that e-commerce managers should integrate such features on their landing pages to meet user expectations and leverage user behaviour patterns. Not only do they attract attention, but SEM evidence suggests they play a role later in decision-making by connecting with how users filter and decide.

### 4.2. Consideration stage (active search & evaluation)

This is the most feature-rich stage in our redesigned funnel, reflecting the variety of tools consumers use to make informed choices. When a potential buyer has engaged with the site and moves into actively looking for products, the funnel must support efficient discovery,

comparison, and evaluation. At the core of this stage are the search and filtering services. Our model prominently includes the search engine as a carryover from the buyer expectations study – nearly all buyers expect to be able to search for specific items or keywords. While "search" did not show up in the final SEM model (likely because almost everyone uses search to some extent, making it less of a differentiating factor), it remains a sine qua non for e-commerce. The search bar typically sits atop any page; in funnel terms, it transitions the user from passive browsing (awareness) to goal-driven consideration. By typing a query, the consumer signals an intention, and the site's subsequent responsibility is to deliver relevant results or guidance (which may involve further filtering). Modern search implementations often go hand-in-hand with filtering options on the results page, which leads to the next set of services. Our funnel incorporates product filtering by various criteria: category, brand, price, and also occasion/recipient. The first three (category, brand, price) correspond to SEM factor F1 – they are confirmed to be a cluster of heuristics many users employ. Buyers themselves highly value these: shop by category was one of the most frequent and expected services, and shop by brand and price were explicitly noted as useful at the consideration stage in the buyer survey's funnel description. By providing these filters, a site allows the shopper to narrow down an overwhelming product list to a manageable set that meets basic criteria (e.g., showing only smartphones by a preferred brand under $300). The effect is twofold: (1) it reduces information overload, as suggested by information systems research – users see a curated subset rather than all 10,000 items, thus feeling less overwhelmed; and (2) it aligns with the natural decision strategies (non-compensatory elimination) that many consumers use. The SEM data showed that consumers who use one of these filters often use the others, indicating a segment of users who heavily rely on filtering to make decisions. For such users, if a site lacked robust filtering, it would likely lead to frustration and exit – hence including all three is important to meet expectations and keep those users engaged. It's worth noting that almost all e-commerce sites do have category browsing (as a fundamental navigation), but some smaller or poorly designed sites might have limited brand or price filter options. Our results strongly encourage implementing these standard filters and making them prominent in the UI (e.g., sidebar filters or filter menus on search results pages). The inclusion of occasion/recipient filters in our funnel is a direct adoption of SEM factor F7's insights. While not universally needed for every shopping session, these filters can be extremely powerful in scenarios where the buyer's need is defined by context (gift shopping, event shopping). In the survey, about half to two-thirds of respondents appreciated these filters, yet they were underprovided by sellers. The SEM confirms that those who do use these context filters form a coherent behavioural segment, and more importantly, their usage links to a higher propensity to engage with deals (F4). In practice, adding an occasion filter (like letting users filter "show me products for Birthday/Christmas/Wedding" etc.) or recipient (filter by "for kids/for him/for her") is a way of personalizing the browsing experience without needing detailed personal data – it taps into the situational variables of the purchase. Our funnel recommends including these as advanced search options or separate curated categories (many sites now have seasonal or gift sections, which is analogous to this). To illustrate, consider a user who comes with a vague goal: "I need a gift for my 10-year-old nephew's birthday." If the site offers a "shop by age" or "for kids" recipient filter, the user can quickly narrow down to relevant items. Without it, the user might resort to random searching or give up. Adopting this service directly addresses a known expectation gap: e.g., ~68% expect shop by recipient but only ~30% of sites offer it. Our model thus explicitly features it in the consideration toolkit, suggesting its broader implementation. Next, our funnel ensures rich product information is available in the consideration stage to facilitate evaluation. This includes product descriptions and product pictures, which the buyer survey found to be among the highest expected elements from an e-commerce site. Although not explicitly an interactive "service" like search or filter, we treat comprehensive product info as a service the site provides to help

decision-making. The importance of detailed, quality product content is well-documented: it aligns with consumers' need for information to reduce uncertainty (a principle from the Elaboration Likelihood Model, for instance, where high-involvement purchases require central-route information processing). In the survey, product description ranked at the very top of expected features (with virtually all respondents rating it highly). Naturally, most sellers do provide descriptions and images; the challenge is ensuring quality and completeness. Some sites skimp on content (leading to cognitive dissonance or lack of trust). Our results reinforce that investing in thorough, clear, and accurate product information is crucial, as it directly correlates with buyer satisfaction and willingness to proceed. This is echoed by Sehgal & Malik (2024), who found that information quality on websites positively influences customer satisfaction and loyalty. Similarly, multiple studies cited in the theoretical framework (e.g., Chang, & Yang, 2010; Chen & Schwartz 2006) indicate that when consumers find consistent, relevant, and transparent information (including pricing, specs, etc.), they are more likely to trust the site and make a purchase. Finally, user reviews and professional reviews - i.e., social proof mechanisms – are integrated into the Consideration stage of our model. In the buyer survey's funnel, these were highlighted as critical in the consideration phase, providing social and expert validation to aid decisions. They were also among the services that buyers expect but that are not universally available or easy to find on all sites (some sellers hide reviews or lack expert content). The literature supports their impact: for example, Furner & Zinko (2017) showed that reading online product reviews can directly increase purchase intention, up until the point of information overload. Tan et al. (2018) explicitly note that customer reviews are a main component of online purchase decisions. Professional reviews (e.g. editorial content, buying guides) add an authoritative assessment that some consumers find reassuring. While these review features were not part of the SEM model (likely because they are evaluative rather than choice-narrowing tools), we include them because they fulfill a different but complementary role in decision-making: building trust and confidence. In our funnel, after a user has narrowed down options via filters, they should have access to reviews to compare those final few options on qualitative merits. By incorporating user and expert reviews, the funnel addresses buyers' desire for validation of their choice from both peer experiences and expert opinions. In summary, our Consideration stage is packed with features, and for good reason: this is where the user's initial interest is converted into a firm intention to buy a specific item. The synergy of services here – search + filters (to find the candidate products), detailed info + images (to evaluate each candidate), and reviews (to verify quality and satisfaction) – creates an environment conducive to making an informed and confident purchase decision. The interplay between these features and the SEM constructs is notable. For instance, a user high on F1 (filtering by brand/price) will appreciate those filter options and then likely look at product pages (with images/descriptions) and might also check reviews; a user high on F7 (shopping by occasion) might navigate via that path, then similarly use product info and reviews to finalize. Both types (F1 and F7) are predicted to respond to sale/top-seller prompts (F4) – which is why even in Consideration, it's useful to allow sorting by "discount" or highlight if a filtered item is on sale (thus combining heuristic with deal-seeking triggers). We ensure our funnel doesn't isolate these elements, but allows them to work in tandem (e.g. filters can be applied simultaneously, search results can be sorted by popularity or discount, etc., and all product pages show reviews).

### 4.3. Decision Stage (Purchase & Checkout)

Once the user has selected a product (or products, if adding multiple to cart), they enter the Decision stage – essentially the checkout process and the moments right before the final conversion. The redesigned funnel focuses on transparency, convenience, and assurance at this stage, to encourage completion of the purchase. The first element is the Total Sum Display (Cart Summary). As soon as the user proceeds to checkout or views their shopping

cart, the site should prominently display the total cost including any shipping, taxes, or discounts. Buyers expect this clarity; the survey listed total sum as a highly expected feature because it helps users manage their budget and avoid unexpected charges. By showing the aggregated price, the site empowers users to make a final confirmation that the purchase is within their comfort zone. Our funnel incorporates this at the intent/decision crossover point – essentially bridging consideration to decision. Literature on checkout usability also emphasizes that cost transparency reduces cart abandonment, a finding echoed in practitioners' guides and academic studies alike (Chang & Chen, 2008; Kukar-Kinney et al., 2016). Thus, this simple feature can have a significant impact on whether the user clicks Place Order. Next is the indicator of ath (Checkout Progress Indicator). The buyer study noted that a clear indicator of where the user is in the process (e.g. "Step 2 of 3 – Payment Information") is beneficial. We have included this in our funnel as it contributes to usability and stress reduction. Knowing the steps remaining (and that it's not an endless form) keeps users from feeling lost or impatient. Progress indicators are essential in checkout design, as they provide clear feedback and reduce user anxiety—a feature shown to improve conversion rates by up to 35% in modern usability studies evaluating over 130 e-commerce sites (Baymard Institute, 2024). In our model, this fits squarely in the Decision stage. It wasn't part of the SEM (since it's not relevant to product choice, but rather to checkout experience), but its importance is validated by the buyer expectations and UX best practices. The payment options offered are another cornerstone of the Decision stage. Our model explicitly lists PayPal, Credit Cards, and similar alternatives (like BillMeLater as cited in the study, which is akin to modern BNPL services). Buyers view multiple payment methods as a trust signal and a convenience factor. The survey data showed PayPal was highly desired in the purchasing stage, and credit card acceptance of course a basic necessity. PayPal's influence is notable – its brand carries trust due to buyer protection, so including it can increase conversion rates (as also suggested by an increase in consumer comfort). Our funnel thus insists that providing trusted third-party payment options (PayPal, Apple Pay, etc.) alongside standard credit/debit processing is part of an optimal design. This aligns with foundational e-commerce trust literature: Pavlou (2003) noted that perceived security of payment methods positively affects online purchase intention. From the SEM perspective, payment methods were outside the scope (post-choice), but in bridging expectation to action, they are crucial. We also include mention of Buy Now Pay Later (BNPL) or deferred payment (the study's "BillMeLater") as a nice-to-have, recognizing that not all buyers expect it upfront. While the survey found it was less expected compared to PayPal or cards (likely because it's more niche), offering it can tip the scales for certain customers who might hesitate due to budget – thus in our integrated model, it is a feature that could increase the likelihood of completing the purchase for those on the fence. Another component of the Decision stage is the presence of Coupons or Discount Codes. We incorporate coupons as a lever in the Action sub-stage (which the first study distinguished as a separate "Action stage" after Decision, but we merge it here for simplicity). The availability (and communication) of a coupon or promotion can spur immediate action. For example, if during checkout the site highlights "Enter coupon code – members have a 10% off coupon available", it might encourage the user to use it and thus finalize the purchase (feeling they got a deal). The buyer survey specifically pointed out that coupons motivate action and were among the highly expected but less offered features. Many retail sites do use coupons in marketing campaigns, but anecdotally, users often search externally for coupons if they see a coupon code box (and if they don't find one, some might abandon the cart). One managerial takeaway (which we detail later) is that companies should either provide accessible coupons or remove the field to avoid "coupon scrounging" exits. In our funnel design, we assume the positive scenario: the business strategically uses coupons (or automatic discounts) to increase conversion at this final step, thereby aligning with consumer expectation for deals. In synergy with SEM findings, recall that factor F4 (deal-seeking) indicates many consumers respond strongly to sales – a coupon at checkout is

effectively a personalized sale for that user. So even though coupons weren't in the SEM model explicitly, the concept of deal-orientation was (via "shop by sale"), and this is an execution of that concept at point of purchase.

By implementing the above features, the Decision stage in our funnel is geared towards minimizing abandonment and maximizing trust. The buyer knows what they are paying (total sum), sees that the process is straightforward (path indicator), feels secure (recognized payment brands), and might even feel they got a special deal (coupon) – all of which increase the likelihood of completing the order.

### 4.4. Post-purchase & loyalty stage

The funnel does not end at the transaction. Post-purchase, the focus shifts to maintaining engagement and building a long-term relationship (loyalty and advocacy). Our redesigned funnel incorporates two key services here: recently viewed products and personalized recommendations (personalized products/offers).

Recently viewed products is a feature that many e-commerce sites implement on product pages or the homepage for returning users, but it can also be shown on the order confirmation page or in the user's account dashboard after purchase. The idea is to remind customers of their browsing history ("You recently looked at…") which can prompt them to continue shopping or consider items they left behind. The buyer survey highlights this in the Post-purchase stage, noting that showing recently viewed items helps nurture the relationship and set the stage for the next purchase. This aligns with the concept of the loyalty loop: even immediately after buying, planting the seed for a future purchase (especially if the user was undecided between a few items) can shorten the interval to the next conversion. Our model thus includes recently viewed items as a gentle re-engagement tool.

Personalized products/offers fall into the loyalty/advocacy stage. This refers to providing tailored recommendations based on the user's purchase history or preferences – for example, sending a follow-up email with "You might also like these accessories for your recent purchase" or showing a customized section on the homepage like "Recommended for You." The buyer study's loyalty stage explicitly mentions personalized suggestions as crucial for creating a one-to-one relationship and incentivizing future purchases. This is strongly supported by literature in both marketing and IS. Recommender systems research (e.g., Schafer et al. 2001) shows personalization increases perceived relevance, satisfaction, and can significantly boost repeat sales. In essence, personalization operationalizes the retention part of the funnel by continuing the conversation with the customer. Our funnel model underscores that after the initial purchase, engaging the customer with personalized content (product recommendations, exclusive deals, loyalty rewards, etc.) is necessary to foster loyalty and possibly turn the customer into an advocate (someone who will recommend the platform or share reviews – linking back to the beginning of the cycle where their advocacy contributes to awareness for others).

Other post-purchase services, though not explicitly depicted in Figure 1, can complement these, such as efficient customer service or easy returns (which build trust and satisfaction, indirectly affecting loyalty). The focus of our model remains on those identified by the buyer perspective study, so we stick to recently viewed and personalized offers as representative features. Implementing these ensures that the funnel is not a "one-and-done" pipeline, but rather feeds into a cyclical journey – satisfied customers see value even after the transaction, increasing the likelihood of re-entry at the Awareness stage in the future (albeit with the benefit of data-driven personalization).

Table 1 (below) summarizes the comparison of key services across the two source studies and our funnel model:

| Service | Buyer Expectation (Survey) | Seller Offering Frequency | SEM Validation | Included in Redesigned Funnel |
|---|---|---|---|---|
| Site search | Very high (essential) | ~96% of sites have it | Not in final model (removed) | Yes – Consideration |
| Category navigation/filter | Very high (essential) | ~96% of sites | Yes – Factor F1 | Yes – Consideration |
| Filter by brand | High | Common (exact % not given, but many) | Yes – Factor F1 | Yes – Consideration |
| Filter by price | High | ~20% sites (only) offer shop-by-price | Yes – Factor F1 | Yes – Consideration |
| Filter by recipient | Moderate (~65% expect) | ~25% of sites | Yes – Factor F7 | Yes – Consideration |
| Filter by occasion | Moderate (~50% expect) | ~25% of sites | Yes – Factor F7 | Yes – Consideration |
| On sale (discount filter) | Very high (~80% expect) | ~20% of sites | Yes – Part of F4 | Yes – Consideration (as sort/filter option) |
| Top sellers showcase | High (~65% expect) | ~25% of sites | Yes – Part of F4 | Yes – Awareness (homepage feature) |
| "New items" showcase | (Implied moderate, not explicitly polled) | Uncommon (observed qualitatively) | Yes – Part of F4 | Yes – Awareness (homepage feature) |
| Shopping guide (overview) | High (for exploration) | Rare (gap) | N/A (outside SEM scope) | Yes – Awareness |
| Product descriptions | Very high (top expected) | Nearly all sites (quality varies) | N/A (standard content) | Yes – Consideration (all products) |
| Product images | Very high (top expected) | Nearly all sites (quality varies) | N/A | Yes – Consideration (all products) |
| User reviews | High (crucial in consider) | ~25% of sites (provided by few) | N/A (not a heuristic mechanism) | Yes – Consideration |
| Professional reviews | Moderate-High (helpful) | Few sites (gap) | N/A | Yes – Consideration |
| Total price display | High (expected in cart) | Most sites (some hide until late) | N/A | Yes – Decision (cart/checkout) |
| Checkout step indicator | Moderate (improves UX) | Some sites (not universal) | N/A | Yes – Decision |
| PayPal payment | High (boosts trust) | Many sites (but not all) | N/A | Yes – Decision |
| Credit card payment | Very high (standard) | Almost all sites | N/A | Yes – Decision |
| "Bill Me Later" / BNPL | Low-Moderate (niche) | Few sites (was niche) | N/A | Yes – Decision (optional) |
| Coupons/discount codes | High (motivator) | Some sites (often not upfront) | N/A | Yes – Decision (action incentive) |
| Recently viewed items | Moderate (post-purchase helpful) | Some sites (common feature) | N/A | Yes – Post-Purchase |
| Personalized recomm. | High (loyalty builder) | Some sites (increasingly common) | N/A (if outside initial purchase) | Yes – Post-Purchase/Loyalty |

**Table 1:** Comparison of key e-commerce services across buyer expectations (survey data), seller offerings, SEM behavioral validation, and inclusion in our redesigned funnel (Fig. 4)

The table shows broad agreement on many features (especially filtering and basic info) between buyer expectations and SEM results, while highlighting areas of discrepancy (e.g., search and reviews highly desired by buyers but not captured by SEM; contextual filters and deal showcases strongly validated by SEM but not universally offered by sellers). Our redesigned funnel encompasses all listed features to maximize alignment with what consumers want and what they use.

From the above comparison and our funnel, a coherent picture emerges: to redesign the funnel effectively, an e-commerce site should proactively provide the services that buyers expect at each stage, especially those that have demonstrated impact on user behaviour. The synergy between buyer expectations and SEM findings is generally positive – features that buyer vocally want (like filters by price or showing deals) indeed have measurable effects on shopping patterns and outcomes. Where there were mismatches or gaps (like lacking reviews or contextual options), those present opportunities for improvement. Our results affirm that a funnel rich in decision-support tools (heuristics to narrow choices and information to evaluate them) will likely both satisfy customers and increase conversion effectiveness.

The redesigned funnel (as depicted in Figure 1 and detailed above) represents a blueprint for aligning e-commerce design with consumer expectations and proven behaviours. It is not merely a theoretical construct; it is grounded in concrete data: the voice of the customer and statistical modelling of their actions. In the next section, we discuss the implications of this model, how it relates to existing theory, and what it suggests for practitioners and future research.

## 5. Implications

One of the central issues highlighted by prior research (D'Avanzo & Kuflik, 2013) was the gap between what online buyers expect and what sellers deliver. Our results demonstrate that this gap can be systematically addressed by focusing on specific services at each funnel stage. The integration of buyer survey data (expectations) with SEM data (behavioural performance of features) provides evidence-based direction on where to intervene. For instance, at the consideration stage, buyers' desire for robust filtering and review features was met with patchy implementation by sellers; simultaneously, our SEM analysis confirms that when such features are used, they significantly shape the purchase path (improving likelihood of finding suitable products and engaging with promotions). The redesigned funnel, by including those features, effectively shows how to bridge that gap.

### 5.1. Theoretical implications

Theoretically, findings this support the argument that customer-centric design of information systems (in this case, e-commerce websites) can enhance decision outcomes and satisfaction (Grange & Benbasat, 2010). When an IS (website) aligns with users' mental models and preferences (e.g., providing a filter for the criterion the user cares about, or a review for the exact information they seek), it reduces the cognitive effort required (cognitive fit theory) and increases perceived usefulness, leading to higher adoption and success (Goodhue & Thompson, 1995; Todd & Benbasat, 1999). Our funnel's emphasis on non-compensatory tools (filters) aligns with Gigerenzer's notion of environmental structure: these tools work because they complement how consumers naturally eliminate options under information overload. By reducing overload and increasing relevant information (through reviews and clear descriptions), the funnel likely improves decision quality (the degree to which the chosen product fits the buyer's needs) and decision efficiency (the time/effort spent).

In fact, a key theoretical contribution of our work is highlighting the role of heuristic decision-making aids in each stage of the digital funnel. Traditional marketing funnels did not explicitly account for these micro-decision processes; they were high-level stages. Our model, informed by SEM findings, embeds heuristics (like shop by brand or shop by occasion) into the funnel. This acknowledges that at the consideration stage, consumers often do not perform full compensatory analysis of every alternative; instead, they heavily rely on heuristics to shortlist options. By designing the funnel around these heuristics (making them features of the website), we essentially institutionalize heuristics in the shopping process.

This has implications for the debate on consumer rationality in digital environments. Researchers like Hauser, Urban & Weinberg (1993) suggested that decision support systems can increase the utility of choices by enabling rational comparison. But more recent perspectives (Simonson, 2015) argue that too much choice and information leads consumers to fall back on simpler decision rules. Our findings support the latter: features that allow simple rules ("show me X under $Y") are highly valued and effective, whereas features enabling complex trade-off (like comparison matrices or long spec lists) were not highlighted by consumers. This is a heuristic-driven journey rather than an exhaustive search, consistent with theories of bounded rationality.

SEM structural model result that F1 and F7 (basic and contextual filters) drive F4 (deal-seeking with sales/top-sellers) has an interesting interpretation in funnel terms. It implies that consumers who engage deeply in consideration (using various filters) are also more likely to respond to promotional stimuli (sales, popular items). This suggests a nuanced journey: an engaged shopper might narrow their choices (consideration) and then make a final decision not purely on product attributes but on promotional factors (e.g., choosing the one that's on sale or a top seller among their narrowed set). In our funnel, we accommodate this by ensuring that promotional info (sales flags, etc.) is visible during consideration. The broader theoretical implication is that the boundaries between funnel stages are porous. Awareness and Consideration can loop – a sale banner might send a user back to consider a different product they hadn't thought of, or a top-seller list might bring awareness of a new option in the middle of deliberation. This resonates with the "messy middle" model proposed by some Google researchers (2020), where consumers oscillate between exploration and evaluation, influenced by triggers like promotions. Our funnel remains stage-structured, but by embedding these cross-stage features (e.g., showing deals during search), it acknowledges that real consumer behaviour is not strictly linear.

Rethinking funnel metrics. A subtle theoretical implication is the need to refine how we evaluate funnel performance. A funnel is typically measured by conversion rates at each stage (e.g., X% of aware become interested, Y% of interested actually buy). If we embed various features, we might also measure micro-conversions: e.g., what percentage use a filter? what percentage read reviews? These micro-conversions could be proxies for engagement quality. Our funnel suggests that higher usage of these critical features likely correlates with better outcomes (since they indicate the site is serving the user's needs). Future research could test if, for example, a site that gets 80% of users to use the search/filter tools sees higher overall conversion than a site where only 30% use them (maybe due to poor design). This interplay of feature usage and stage progression is an interesting area bridging IS (feature adoption) and marketing (funnel conversion). The SEM's $R^2$ of 0.80 for how filters drive deal engagement is an example of quantifying such relationships.

Alignment with foundational theories. Our funnel is a concrete instantiation of principles from both marketing and IS theory. From marketing, the hierarchy of effects model posited that cognitive (awareness), affective (interest, desire), and conative (action) stages lead to

purchase. Our funnel provides the tools to facilitate each step cognitively: awareness via guides/visuals, interest via relevant search results, desire via persuasive information (reviews, images), action via easy checkout. It supplements that with loyalty loops, aligning with relationship marketing theory that retention is as important as acquisition. From IS, the funnel embodies ideas from the Technology Acceptance Model (TAM) in an indirect way – by increasing perceived usefulness of the site, via helpful features, and perceived ease of use, via intuitive navigation and reduced effort, users are more likely to use the site and complete transactions (akin to "intention to use" leading to "usage behaviour"). Each added service, if well implemented, can boost these perceptions. For example, a filter by price can eases use for a budget-conscious user (ease of finding the right range), and a strong review system boosts perceived usefulness (site provides valuable info to make decisions). Thus, our funnel could serve as a framework for evaluating an e-commerce system's user-centric effectiveness.

### 5.2. Managerial implications

Our findings yield a number of actionable insights for e-commerce managers, digital marketers, and web platform designers seeking to optimize the online funnel.

*Stage-specific value* - Managers should ensure that each stage of the customer journey is supported by features that address the user's immediate needs and mindset. For the Awareness stage, this means investing in a strong landing page experience – include a shopping guide or clear category navigation for first-time visitors and use the homepage to showcase new and popular products. The presence of Top sellers" or Trending now sections can quickly engage users by leveraging social proof (i.e., people tend to trust popular items). Likewise, highlighting "New Arrivals" taps into curiosity. Currently, many sites underutilize this prime real estate; by populating it with content that buyers find useful (rather than just generic ads), managers can increase initial engagement. Consider metrics like bounce rate – a well-designed awareness stage with these features should reduce bounce rates as visitors find something that catches their interest immediately.

*Robust filtering and search tools* - The Consideration stage is where a website can really differentiate itself. Managers should implement robust search functionality with intelligent autocomplete and relevant results, as well as an array of filtering options (category, brand, price, rating, etc.). These should be easily accessible (e.g., visible filters on the sidebar or top of search results) and fast (use AJAX to update results without full page reloads, for instance). Our research shows that consumers actively use these tools to cope with product variety. If cost is a concern, managers can phase implementation: perhaps start with essential filters (category, price) and add more (brand, occasion) as they gather data on usage. However, given that shop by price and shop by brand were both highly expected and proven useful, those should be priority features.

*Information-rich product pages* - It may seem basic, but managers must not neglect the fundamentals of product page content. Our research reinforces that buyer expects thorough product descriptions, multiple high-quality images, and easy access to reviews. Managers should audit their product pages: are the descriptions detailed and helpful (not just marketing fluff, but concrete specs and usage info)? Are the images clear, zoomable, and do they show different angles or usage scenarios? Are customer reviews displayed prominently, and can users sort or filter them (e.g., see most recent, or see reviews with images)? These elements build trust. If internal resources are limited for content creation, consider leveraging manufacturers' descriptions or user-generated content (encourage buyers to leave reviews or photos). For instance, after purchase, sending an automated email asking for a review can steadily increase the volume of reviews over time. Many platform providers (like Amazon, Bazaarvoice) can facilitate review collection. The managerial takeaway is that investing in content quality correlates with conversion and reduced return rates (because customers have

clearer expectations, as Chang & Chen (2008) noted regarding detailed product info reducing returns). Our findings on the importance of information quality should suggest managers to allocate budget to content (copywriters, photographers, UX writers for guides, etc.), not just to advertising. It's more cost-effective to convert the traffic you already have by giving them the info they need than to spend more on acquiring new traffic that might bounce due to poor information

To sum up, managers should view the funnel not just as a marketing concept but as a framework for site functionality deployment. Each funnel stage suggests a checklist of features – our redesigned funnel could serve as that checklist. Those who systematically ensure each item is checked (and executed well) could likely outperform competitors who neglect parts of the funnel.

## 6. Conclusions and future work

In this study, we set out to synthesize buyer expectations with SEM-validated consumer behaviours into a redesigned digital funnel for e-commerce. By drawing on a buyer-centric survey study and a structural equation modelling analysis of online shopping mechanisms, we proposed a comprehensive funnel model that maps specific digital services to the appropriate stage of the buyer's journey. The contribution of the paper is twofold, to both theory and practice.

*Integrated funnel framework* – The proposed funnel model explicitly aligns what buyers want at each stage with what data shows they use. This goes beyond traditional funnel depictions by identifying concrete features (search filters, reviews, etc.) at each stage, thus operationalizing the funnel concept for digital channels. It contributes to marketing theory by refining the concept of the consideration stage to include heuristic decision aids, and extends the funnel into post-purchase loyalty with personalization features, reflecting modern customer journey thinking.

*Confirmation of non-Compensatory strategy importance* - Findings reinforce that non-compensatory decision strategies (like filtering by criteria) are not only preferred by consumers but have measurable impact on their purchase behaviour. This validates and extends prior work on heuristics in online choice (e.g., Haubl & Trifts, 2000; Gbadamosi et al., 2017) by showing how these strategies can be embedded in site design and how they correlate with outcomes (as evidenced by the SEM links to deal-seeking). It highlights that e-commerce systems should be designed to accommodate bounded rationality, which is a contribution to information systems design literature

*Enhanced customer journey rigor* - We situated our funnel in the context of Lemon & Verhoef's (2016) customer experience framework and Court et al.'s (2009) loyalty loop, while also referencing classic concepts like AIDA and TAM. This interdisciplinary approach (i.e., marketing + IS) strengthens the scholarly contribution, suggesting that optimal e-commerce design benefits from both disciplines. We showed how features influence psychological outcomes like trust (drawing on Furner & Zinko (2017) for reviews' effect on trust) and satisfaction (citing Sehgal & Malik (2024) on website features and satisfaction), thereby linking funnel stages to customer mindset changes.

*Conceptualization of a data-driven funnel* - Finally, by basing a funnel model on SEM results (something rarely done, as funnels are often drawn from intuition or qualitative observation), we show a novel approach to funnel conceptualization – one that is data-driven and statistically validated. This could inspire future research to apply similar methods (e.g., use PLS-SEM or path modelling on journey touchpoints) to refine other models like the B2B buying funnel or omnichannel customer journeys.

*Limitations*– The paper presents a lot of limitations. First of all, our synthesis relied on a twofold approach that analyzed only a few factors; while these were comprehensive, there may be other factors (e.g., emotional branding, social media influence) that lie outside their scope and thus ours. Additionally, our funnel model is generic for e-commerce retail – different verticals (fashion vs. electronics) or cultural markets might have nuances (for example, in some markets cash-on-delivery is a crucial payment option to list as expected). We focused on universal elements, but managers should adapt the model to their context as needed.

*Future work* - Future research could extend this work by empirically testing the performance of the redesigned funnel. For instance, a field experiment could implement several of the recommended features on an e-commerce site and measure the before/after impact on funnel metrics. Another avenue is to explore personalization within the funnel – e.g., dynamic funnels where the site adapts to user type (a novice gets a shopping guide, an experienced user gets straight to deals). The interplay of AI-driven personalization and funnel stages is ripe for exploration: does a personalized homepage (Awareness stage) significantly improve downstream conversion? Our model would predict yes, if done in line with user expectations.

## Abstract

This research explores how the aesthetic framing of luxury products (specifically, inner vs. outer aesthetics) affects sustainable consumption, measured through the length of product usage (LPU). Across six experiments and a large-scale field study on social media content, we demonstrate that emphasizing inner aesthetics (e.g., craftsmanship and heritage) increases LPU compared to outer aesthetics (e.g., beauty and recognizability), through the mediating role of perceived authenticity. The effect is especially pronounced for consumers with lower conspicuous consumption orientation. These findings have important implications for sustainable marketing and luxury branding strategies: they suggest that luxury brands can actively shape more responsible consumption behaviours by leveraging communication choices that evoke heritage and craftsmanship rather than focusing solely on visual appeal. In doing so, brands can align sustainability goals with core luxury values.

*Keywords: luxury consumption, luxury aesthetics, sustainable consumption, authenticity, product durability*

## 1. Introduction

Luxury brands are increasingly integrating sustainability into their practices, signalling a shift in how exclusivity and responsibility can coexist. Companies such as Chanel, Gucci, and Cartier now use recycled materials or ethically sourced components, responding to consumer expectations and regulatory pressures. In parallel, academic research has begun to examine how luxury and sustainability may be reconciled (Amatulli et al. 2017). A growing stream of studies suggests that luxury goods can be inherently sustainable because of their superior quality and durability, which lead to longer product lifecycles and reduced waste (De Angelis, Amatulli, and Zaretti, 2020). This line of reasoning has led some scholars to propose that luxury brands should explicitly emphasize durability in their communications, positioning long-lasting products as a sustainable choice (Sun, Bellezza, and Paharia, 2021). While this productcentred perspective has merit, it overlooks the role of consumer perceptions and experiences in driving sustainable behaviour. Specifically, we argue that beyond material characteristics, consumers' aesthetic experience of luxury goods may influence how long they intend to use them.

Aesthetics are central to the luxury value proposition, yet prior literature has often treated this dimension as unidimensional. We propose a novel distinction between outer aesthetics (i.e., beauty, recognizability, and shapes) and inner aesthetics (i.e., craftsmanship and cultural

heritage). Outer aesthetics are typically visible and tied to social signalling, while inner aesthetics reflect intangible elements that connect the product to tradition and artisanal value. We argue that this aesthetic dichotomy has significant implications for sustainability, particularly in influencing the length of product usage (LPU), defined as how long consumers plan to or actually use a product. This research adopts a consumer-based perspective on sustainable luxury, shifting attention from physical product attributes to experiential and symbolic meanings. We suggest that products framed through inner aesthetics are perceived as more authentic, which fosters longer product use.

To test our hypotheses, we conducted six preregistered experiments and a large-scale field study using text analysis on over 22 million social media comments. Results consistently show that when brands highlight inner (vs. outer) aesthetics, consumers report both higher intended and actual LPU. This effect is explained by perceived authenticity, which mediates the relationship between aesthetic framing and product usage. Moreover, the effect is stronger for consumers with lower conspicuous consumption orientation, who are less driven by status signalling and more by personal relevance.

In summary, this research contributes to a more nuanced understanding of sustainable luxury. Rather than focusing solely on material durability, we show that the way a product is presented, especially in terms of aesthetic storytelling, can meaningfully influence sustainable behaviour. By leveraging inner aesthetics in communication, luxury brands can encourage consumers to keep and use products longer, thereby aligning sustainability goals with brand heritage and authenticity.

## 2. Theoretical Background

Historically, luxury and sustainability were seen as incompatible due to the perceived tension between luxury's values of personal pleasure, exclusivity, and status, and sustainability's emphasis on moderation and environmental ethics (Athwal et al., 2019). Scholars suggested that luxury consumers may not prioritize sustainability when purchasing luxury goods, often viewing environmental concerns as secondary to status signalling (Kapferer and Michaut-Denizeau, 2017). However, recent research has argued that luxury and sustainability can coexist, driven by characteristics intrinsic to luxury goods, such as their durability (Amatulli et al., 2017). Luxury products typically last longer than mass-market alternatives due to higher quality materials and craftsmanship, making them inherently more sustainable by reducing waste and encouraging long-term usage. As Sun, Bellezza, and Paharia (2021) noted, the consumption of fewer high-end goods can promote sustainability.

Despite these insights, sustainable luxury is not only about material durability. We argue that it also involves consumers' aesthetic experiences with luxury products. Aesthetics has been identified as a significant driver of consumer choice (Townsend, 2017), particularly in the context of luxury goods, where it plays a dual role in both functional and symbolic dimensions (Fuchs et al., 2013). Previous studies have often regarded luxury aesthetics as a single concept, but we propose a distinction between outer aesthetics (i.e., beauty, recognizability, and shapes) and inner aesthetics (i.e., craftsmanship and cultural heritage). Inner aesthetics are more closely linked to sustainable consumption, both environmentally and socially. From an environmental perspective, products made through traditional craftsmanship methods, like "Made in Italy" goods, are often rare and use fewer natural resources (Kapferer and Michaut, 2015). Socially, they contribute to the preservation of local craftsmanship and the development of communities. In contrast, outer aesthetics are frequently associated with conspicuous consumption, where products serve as social signals rather than lasting investments, potentially undermining sustainable intentions (Podoshen and Andrzejewski, 2012). Building on these arguments, we hypothesize that: H1: Highlighting inner (vs. outer) aesthetics increases LPU.

We further propose that this effect is mediated by perceived authenticity, defined as the extent to which a product is seen as genuine, responsible, and true to its heritage (Morhart et al., 2015). Previous research has identified authenticity as a key value in luxury consumption and a potential bridge to sustainability, especially when tied to craftsmanship and heritage (Septianto et al., 2020). Formally:

H2: Inner (vs. outer) aesthetics increase perceived authenticity, which enhances LPU. Lastly, we expect that consumers' conspicuous consumption orientation (CCO) moderates this effect. For consumers less driven by status signalling, inner aesthetics should have a stronger impact on perceived authenticity and, consequently, on LPU (Han et al., 2010).

H3: The positive effect of inner (vs. outer) aesthetics on authenticity is stronger among consumers with low CCO.

## 3. Methodology And Results

We conducted one field and six pre-registered experimental studies to test our hypotheses.

Study 1: main effect on LPU. The sample consisted of 153 Prolific participants (50% females; Mage = 29.70, SD = 9.38) who were randomly assigned to one of the two conditions (luxury aesthetics: inner vs. outer) in a between-subjects design. As expected, the inner aesthetics condition generated higher LPU than the outer aesthetics (Minner = 5.68, SD = 1.76 vs. Mouter = 4.68, SD = 2.03, $F(1, 151) = 10.37$, $p = .002$).

Study 2: main effect on actual LPU. The sample consisted of 296 Prolific participants (45% females; Mage = 41.54, SD = 13.60). Participants first read a description of a luxury product emphasizing either inner or outer aesthetics. They were then asked to recall and describe an item they personally owned that matched the assigned aesthetic characteristics. Finally, they reported when they had purchased the product, allowing us to measure actual LPU. The inner aesthetics condition generated higher actual LPU than the outer aesthetics (Minner = 4.68, SD = 2.07 vs. Mouter = 3.91, SD = 2.08, $F(1, 294) = 4.54$, $p = .002$), as well as higher planned LPU (Minner = 6.42, SD = 1.28 vs. Mouter = 6.07, SD = 1.48, $F(1, 294) = 10.13$, $p = .03$).

Study 3: field study. In December 2023, we identified the 100 most-followed luxury brand accounts using platforms such as SocialBlade. From these accounts, we extracted all posts published between 2019 and 2023, collecting data on post captions, engagement metrics (likes and comments), and media type (image, sidecar, or video). We also scraped all user comments associated with each post. The final dataset included 181,595 posts and over 22 million comments.

To quantify aesthetic characteristics and user references to LPU, we applied a dictionary-based text analysis approach. Since no pre-existing dictionaries were available, we developed custom lexicons for inner aesthetics (e.g., handmade, heritage), outer aesthetics (e.g., stylish, charm), and LPU (e.g., durable, lasting). Two independent coders refined the dictionaries based on construct definitions and author input, resulting in 64 inner, 212 outer, and 33 LPU terms. We then estimated OLS regression models predicting LPU (calculated through the comments) from inner and outer aesthetic cues (calculated through the post captions). In the baseline model, inner aesthetics significantly increased LPU ($b = 0.019$, $p < .001$), while outer aesthetics had no effect. This result held when controlling for brand fixed effects and various

postlevel covariates and linguistic controls (see Table 1). Overall, inner aesthetics predicted more LPU-related engagement from users, supporting our experimental results.

| DV | **Length of product usage** | | | | | |
|---|---|---|---|---|---|---|
| N | 181,595 | | | | | |
| | **Model 1** | | **Model 2** | | **Model 3** | |
| | *b* | *Robust SE* | *b* | *Robust SE* | *b* | *Robust SE* |
| Inner | .019** | .004 | .016** | .003 | .016** | .003 |
| Outer | .002 | .002 | .001 | .002 | .001 | .002 |
| Brand FE | | | Included | | Included | |
| Time FE | | | | | Included | |
| Likes Count | | | | | .000 | .001 |
| Comments Count | | | | | -.001 | .000 |

* $p < .05$, ** $p < .01$.

**Table 1:** Regression Analysis Results.

Study 4: mediation effect. The sample consisted of 152 Prolific participants (61% females; Mage = 32.30, SD = 11). The inner aesthetics condition generated higher LPU than the outer aesthetics (Minner = 5.57, SD = 1.67 vs. Mouter = 4.57, SD = 2.07, F(1, 150) = 10.99, p =.001). Then, we found a significant indirect effect confirming the mediating role of authenticity (b = .30, SE = .14, 95% CI: .089, .623).

Study 5a: main effect with authenticity cue. The sample consisted of 123 Prolific participants (50% females; Mage = 29.78, SD = 10.43) who were randomly assigned to one of two conditions (luxury aesthetics: inner vs. outer with authenticity cue). As predicted, the LPU did not differ between the inner aesthetics condition and the outer aesthetics condition featuring the authenticity cue (Minner = 5.35, SD = 1.84 vs. Mouter+authenticity = 5.34, SD = 1.76, F(1, 121) = 0.001, ns). This study further supports the authenticity effect by showing that making it salient eliminates the LPU difference between inner and outer aesthetics.

Study 5b: main effect with authenticity cue. The sample consisted of 184 Prolific participants (50% females; Mage = 32.51, SD = 10.89) who were randomly assigned to one of two conditions who were randomly assigned to one of two conditions (luxury aesthetics: outer vs. outer with authenticity cue). As expected, the LPU was higher when the product description included the authenticity cue (Mouter = 4.54, SD = 1.99 vs. Mouter+authenticity = 5.19, SD = 1.81, F(1, 182) = 5.362, p = .02), giving additional support to our authenticity account.

Study 6: moderation effect. The sample consisted of 199 Prolific participants (49% females; Mage = 32.34, SD = 10.28). We measure CCO using a 12-item scale (from Chaudhuri, Mazumdar, and Ghoshal, 2011; $\alpha = .90$). Results showed a significant index of moderated mediation (b = -.20, SE = .09, 95% CI: -.394, -.028), indicating that the indirect impact of aesthetics on LPU via authenticity varied by CCO levels. Specifically, the mediation effect was stronger for individuals low in CCO and weaker for those high in CCO. When CCO was high, the indirect effect was significant but relatively small (b = .27, SE = .15, 95% CI:

.018, .588). At medium levels of CCO, the effect increased in magnitude (b = .56, SE = .14, 95% CI: .314, .853), and it was strongest when CCO was low (b = .82, SE = .21, 95% CI: .427, 1.256).

## 4. Contributions and Implications

This research offers two key theoretical contributions. First, it adds to the literature on sustainable luxury (e.g., Amatulli et al., 2017; Sun et al., 2021) by shifting the focus from product-based attributes to the consumer's aesthetic experience. We show that highlighting inner (vs. outer) aesthetics leads to longer product usage, offering a novel experiential driver of sustainable behaviour. Second, we contribute to the literature on authenticity in marketing (e.g., Morhart et al., 2015) by identifying perceived authenticity as the psychological mechanism through which aesthetic framing influences sustainable consumption. By introducing the distinction between inner and outer aesthetics, we also advance the understanding of how symbolic and design-related elements affect consumer behaviour in the luxury context.

From a managerial perspective, this research provides clear guidance for luxury brands seeking to promote sustainability. Our findings suggest that marketing communications should emphasize inner aesthetics to increase the perceived authenticity and longevity of luxury products. This approach is particularly effective among consumers with lower levels of conspicuous consumption orientation, for whom authenticity resonates more than status signalling. Moreover, our large-scale social media analysis provides a practical tool for assessing the aesthetic framing of brand content, helping managers design narratives that nudge consumers toward longer product use. For instance, saying "Our summer collection is a crafted work of artistry" should enhance LPU more than saying "Our summer collection is the state-of-the-art of glamor".

## Abstract

Le sfide ambientali e i mutamenti climatici che caratterizzano l'attuale scenario globale richiedono urgenti cambiamenti nei comportamenti individuali e collettivi, con una maggiore attenzione alla sostenibilità. Tra le strategie più innovative volte alla promozione di pratiche e abitudini sostenibili, la gamification è emersa come un approccio efficace, in grado di favorire motivazione e coinvolgimento. Nonostante l'interesse crescente sia da parte di studiosi che di professionisti, la letteratura sul tema appare ancora frammentata e necessita di maggiori approfondimenti basati su dati e ricerche empiriche. Muovendo dal framework teorico della Teoria dell'Autodeterminazione, il presente contributo intende colmare questo gap attraverso un'indagine netnografica incentrata sull'analisi di greenApes, azienda italiana che nasce con l'obiettivo di promuovere comportamenti sostenibili attraverso la gamification. Dopo aver introdotto il tema e presentato un breve inquadramento teorico, il paper descrive la metodologia e i risultati dell'indagine, evidenziandone le principali implicazioni, sia teoriche che pratiche.

*Keywords: Gamification, Sostenibilità, Autodeterminazione, Netnografia; greenApes.*

## 1. Introduzione

Le sfide ambientali e i mutamenti climatici che caratterizzano l'attuale scenario globale richiedono urgenti cambiamenti nei comportamenti individuali e collettivi, con una maggiore attenzione alla sostenibilità. Tra studiosi, istituzioni e professionisti di vari ambiti, è, ormai, consolidata l'idea che variazioni negli stili di vita, come la riduzione della produzione dei rifiuti e scelte di consumo più attente e responsabili, possano determinare benefici per l'ambiente e favorire la sostenibilità nelle sue dimensioni, ambientale, sociale ed economica (Crittenden et al., 2011).

Tra le strategie più innovative volte alla promozione di comportamenti e abitudini sostenibili, la gamification è emersa come un approccio efficace (Douglas e Brauer, 2021): essa è in grado di favorire motivazione e partecipazione e rendere le attività più coinvolgenti e attraenti attraverso l'applicazione di elementi tipici del gioco, come sfide, ricompense e punteggi, all'interno di contesti non ludici (Deterding et al., 2011). Nonostante l'interesse crescente da parte di studiosi e professionisti (Lim et al., 2025; Whittaker et al., 2021), la letteratura sul tema della gamification per la sostenibilità appare ancora frammentata e necessita di maggiori approfondimenti basati su dati e ricerche empiriche. Il presente contributo intende colmare questa lacuna attraverso una ricerca netnografica incentrata sull'analisi di greenApes, impresa italiana la cui missione è promuovere comportamenti sostenibili attraverso un'applicazione

basata su elementi di gioco. Nella prospettiva del presente lavoro, la sostenibilità è intesa nella sua triplice accezione, ossia ambientale, sociale ed economica: per i suoi meccanismi di funzionamento, l'app sviluppata da greenApes valorizza tutte e tre le dimensioni, promovendo comportamenti finalizzati alla salvaguardia ambientale, a un utilizzo responsabile delle risorse e al benessere della società, sia a livello locale che internazionale.

La restante parte del presente contributo è strutturata nel modo seguente: dopo un breve excursus teorico, il lavoro descrive la metodologia utilizzata per la selezione del caso, la raccolta e l'analisi dei dati. Successivamente, il lavoro presenta i risultati dell'indagine e si conclude evidenziando le implicazioni e le conclusioni del progetto di ricerca.

## 2. Background teorico

Tra gli approcci teorici più utilizzati e consolidati per analizzare il fenomeno della gamification, la Teoria dell'Autodeterminazione (Ryan and Deci, 2017, 2000) occupa una posizione di rilievo. Secondo questa teoria, motivazione e benessere individuali sono connessi alla soddisfazione di tre bisogni psicologici fondamentali: autonomia, competenza e relazione. L'autonomia riguarda il bisogno di ciascun individuo di sentirsi libero di scegliere e di agire autonomamente, senza imposizioni esterne; la competenza si riferisce al senso di efficacia e padronanza nel raggiungimento di determinati obiettivi; mentre la relazione fa riferimento al bisogno di connessione con altri individui e al senso di appartenenza a una dimensione sociale più ampia.

Nella prospettiva della Teoria dell'Autodeterminazione, la motivazione individuale può spaziare tra forme più controllate ed estrinseche (basate su ricompense, premi o sanzioni) a forme più autonome e intrinseche, fondate sull'interesse personale e su forme di interiorizzazione valoriale. L'applicazione della teoria all'ambito della gamification ha delle implicazioni interessanti, in particolar modo per ciò che riguarda la possibilità di transizione tra forme di motivazione estrinseca a forme di motivazione intrinseca, attraverso la valorizzazione dei bisogni di autonomia, competenza e relazione. Si inserisce, in questo ambito, il concetto di meaningful gamification proposto da Nicholson (2015): l'autore distingue la gamification basata su premi e gratificazioni esterne (reward-based gamification) dalla gamification significativa (meaningul gamification), fortemente integrata con il contesto della vita reale e volta a promuovere coinvolgimento, apprendimento e riflessione.

## 3. Metodologia

L'obiettivo di questa ricerca è esplorare le potenzialità della gamification nella promozione di comportamenti e pratiche sostenibili.

A partire dall'obiettivo cognitivo, sono state formulate due domande di ricerca (DR):

- DR1) Come può la gamification supportare i bisogni fondamentali di autonomia, competenza e relazione individuati dalla Teoria dell'Autodeterminazione e come ciò può influenzare il coinvolgimento degli utenti in pratiche sostenibili?
- DR2) Come può la gamification promuovere la motivazione intrinseca e favorire l'adozione di comportamenti sostenibili duraturi e stabili nel tempo?

Dal punto di vista metodologico, la ricerca ha previsto l'applicazione di una netnografia, un approccio qualitativo che traspone e adatta le tradizionali tecniche di ricerca etnografica allo studio di comunità e comunicazioni online (Kozinets, 2010). La scelta del caso di studio [6]è

[6] La scelta del caso è avvenuta nel rispetto dei previsti dalla letteratura sulla netnografia (Kozinets, 2010), ossia: rilevanza rispetto agli obiettivi e alle domande della ricerca; attività e presenza di comunicazioni frequenti e aggiornate quotidianamente; interattività e ricchezza informativa. La rilevanza dell'app è testimoniata da una

ricaduta su greenApes, azienda italiana con sede a Campi Bisenzio (Firenze), fondata nel 2012 e certificata B Corp a partire dal 2016.

L'app sviluppata da greenApes, scaricabile gratuitamente da Internet, consente agli utenti di tracciare le proprie azioni sostenibili e di trasformare i propri comportamenti virtuosi in punti virtuali, chiamati TWIN. Una volta raccolti, i TWIN possono essere utilizzati per sostenere iniziative ambientali e sociali promosse da associazioni, ONG e partner di greenApes. La raccolta dei TWIN permette, inoltre, agli utenti di sbloccare premi messi a disposizione dai partner dell'azienda, che consistono in sconti o promozioni per l'acquisto di prodotti e servizi sostenibili. All'interno dell'app è, inoltre, presente uno spazio condiviso, chiamato La Giungla, dove tutti gli iscritti possono incontrarsi virtualmente, scambiarsi informazioni, condividere consigli, suggerimenti e riflessioni sulle proprie pratiche sostenibili.

Oltre alla versione gratuita dell'applicazione, greenApes stabilisce collaborazioni e partnerships con altre aziende, interessate a sviluppare una versione customizzata dell'app per promuovere la sostenibilità tra i propri clienti e/o dipendenti e rafforzare la propria awareness come brand sostenibile ed eco-friendly.

La ricerca netnografica ha previsto, inizialmente, una fase preliminare di lurking[7] volta ad acquisire familiarità con la community e con le sue dinamiche di funzionamento. A questa fase ha fatto seguito un'osservazione partecipante, durante la quale i ricercatori, dopo aver palesato la propria presenza sia agli admin che agli utenti, hanno utilizzato quotidianamente l'app, partecipando attivamente alle sue attività, cimentandosi nelle sfide e interagendo con la comunità.

La raccolta delle informazioni è avvenuta integrando fonti diverse, come i documenti ufficiali dell'azienda disponibili sul sito web, l'analisi dei profili social di greenApes, i post e i commenti rilasciati dagli utenti all'interno dell'app, nonché le note sul campo derivanti dall'osservazione partecipante e contenenti le riflessioni emerse durante il lavoro di ricerca. Tutte le informazioni raccolte sono state analizzate combinando un processo di coding e analisi ermeneutica.

All'osservazione partecipante è stata affiancata la realizzazione di interviste in profondità, rivolte sia a rappresentati di greenApes che agli utenti, volte ad approfondire gli aspetti motivazionali e triangolare le informazioni raccolte attraverso l'osservazione, coerentemente con quanto previsto dal protocollo di ricerca netnografica.

## 4. Risultati preliminari

In questo paragrafo, sono riportati i risultati della ricerca, basati sulle informazioni raccolte e analizzate attraverso il framework teorico della Teoria dell'Autodeterminazione (Ryan and Deci 2017; 2000).

In riferimento alla DR1, dalle evidenze dell'indagine emerge che l'app greenApes promuove i bisogni di autonomia, competenza e relazione identificati da Ryan and Deci. Per quanto riguarda la dimensione dell'autonomia, l'app consente agli utenti di stabilire il livello e, soprattutto, le forme di partecipazione alle attività. Le sfide proposte sono volte a stimolare la creatività e l'interpretazione personale da parte degli utenti, piuttosto che l'esecuzione di compiti meccanici e ripetitivi. Aggiornate periodicamente nei contenuti, le sfide muovono da

serie di riconoscimenti internazionali ottenuti da greenApes per l'attività svolta, come il premio *B Corp Best for The World* nella categoria *Governance and Changemaker* nel 2019 e nella categoria *Governance* nel 2021.

[7] Il *lurking* consiste in un'osservazione nascosta e può rivelarsi una strategia molto utile in una fase esplorativa della ricerca, consentendo al ricercatore di acquisire informazioni sulla comunità e sulle sue dinamiche di funzionamento. Sulla base delle informazioni raccolte in fase di lurking, infatti, il ricercatore potrà valutare la migliore strategia di accesso alla comunità che sta studiando.

un tema generale (per esempio il problema dello smaltimento della plastica, oppure il riciclo dei giocattoli) e richiedono agli utenti di interpretare il tema stesso in modo personale, scrivendo commenti, scattando foto, effettuando ricerche e approfondimenti.

La partecipazione alle attività di greenApes valorizza anche la dimensione della competenza: per il superamento delle sfide, agli utenti è richiesto di ricercare informazioni su argomenti connessi alla sostenibilità. L'acquisizione di conoscenza è successivamente testata attraverso il superamento di quiz e sondaggi. L'app premia, inoltre, la realizzazione di comportamenti virtuosi (come l'attività fisica e le pratiche di consumo sostenibili) documentati dagli utenti attraverso la condivisione di post e foto. L'impegno di ciascun utente e i progressi raggiunti determinano il conseguimento di badge e "livelli" crescenti, visibili all'interno dei profili individuali e utili a evidenziare i miglioramenti in termini di conoscenze e competenze raggiunte.

L'app, infine, valorizza la dimensione della relazione attraverso la presenza dello spazio comunitario, La Giungla, che rappresenta uno dei principali elementi distintivi di greenApes, grazie al quale gli utenti possono confrontarsi quotidianamente, condividere esperienze, informazioni e buone pratiche. Il meccanismo dei TWIN e delle donazioni contribuisce a rafforzare il senso di comunità e appartenenza: ogni volta che un obiettivo di supporto a una campagna viene raggiunto, gli utenti festeggiano il traguardo come un successo collettivo, un segnale tangibile della forza e della coesione della comunità. Attraverso il focus su attività ludiche, ma strettamente ancorate al contesto della vita quotidiana e volte a favorire riflessione, coinvolgimento e apprendimento, greenApes promuove in modo originale la meaningful gamification teorizzata da Nicholson (2015).

Dal punto di vista motivazionale, l'app combina efficacemente elementi estrinseci, (come premi, sconti, ricompense) ed elementi intrinseci, che fanno leva su competenza, autonomia e relazione. I risultati della ricerca mettono in evidenza che la motivazione degli utenti di greenApes non è, infatti, riconducibile unicamente a dimensioni intrinseche o estrinseche, ma piuttosto a una combinazione dinamica di entrambi i tipi di motivazione. Premi e ricompense rappresentano una leva iniziale fondamentale per suscitare interesse, curiosità ed attivare la partecipazione, mentre, nel tempo, fattori legati alla soddisfazione dei bisogni individuati dalla Teoria dell'Autodeterminazione acquisiscono maggiore importanza. Questa combinazione di elementi intrinseci ed estrinseci suggerisce che la gamification per la sostenibilità opera attraverso un continuum motivazionale in cui le due dimensioni si rafforzano reciprocamente, favorendo il mantenimento dei comportamenti sostenibili nel lungo periodo e l'interiorizzazione di pratiche virtuose come parte della propria identità quotidiana (DR2).

## 5. Conclusioni

La presente ricerca suggerisce interessanti implicazioni dal punto di vista teorico e pratico. Innanzitutto, essa contribuisce a consolidare la validità della Teoria dell'Autodeterminazione nello studio della gamification per la promozione della sostenibilità. Lo studio arricchisce, inoltre, la letteratura sul tema della meaningful gamification, evidenziando come la dicotomia tra motivazione intrinseca e motivazione estrinseca possa essere superata. GreenApes, infatti, integra elementi reward-based (sconti, premi, badge) con meccanismi orientati alla soddisfazione dei bisogni di autonomia, competenza e relazione. Da questa integrazione deriva una forma ibrida di meaningful gamification, in cui i premi e le gratificazioni esterne non sono fine a sé stessi, ma risultano incorporati in pratiche quotidiane di sostenibilità e in dinamiche comunitarie di supporto reciproco.

La ricerca offre altresì indicazioni pratiche per tutte le organizzazioni, le istituzioni e le imprese interessate a sviluppare piattaforme gamificate per la promozione della sostenibilità,

mettendo in evidenza strategie e tecniche operative per favorire autonomia, competenza e relazione. La dimensione dell'autonomia può essere valorizzata preferendo sfide creative e personalizzabili, piuttosto che compiti rigidi e meccanici; la competenza può essere promossa consentendo agli utenti di acquisire conoscenze e rendendo visibili i progressi raggiunti attraverso badge e livelli. Infine, il bisogno di relazione è connesso all' integrazione di una dimensione comunitaria che favorisca condivisione e confronto tra gli utenti coinvolti.

In conclusione, lo studio conferma che la gamification, se progettata in modo equilibrato tra motivazioni intrinseche ed estrinseche, può rappresentare uno strumento efficace per incentivare l'adozione di comportamenti sostenibili nella vita quotidiana e favorire il mantenimento degli stessi nel tempo.

# All You Need Is... AI? Investigating Relationships Between Frequent Users and GenAI

Mihaela Giannelli[1], Antonella Cammarota[2], Ludovica Serafini[1],*, and Giovanni Baldi[2]
[1] University of Salento, Lecce (LE), Italy
[2] International University of Monaco, Montecarlo, Monaco

*Corresponce: ludovicaserafini96@gmail.com

## Abstract

Generative AI (GenAI) tools are becoming deeply embedded in consumers' daily lives. This study investigates whether and how frequent users form relationships with these technologies. Using a qualitative approach based on 13 in-depth interviews, the research identifies four distinct relational patterns, shaped by users' perceptions of GenAI's competence and warmth. These perceptions influence the role GenAI plays in both purchase-related and more personal decisions. The study contributes to the emerging literature on consumer behavior and GenAI dynamics and offers early insights for research and practice.

*Keywords: Generative AI; Consumer-Brand Relationship; Companionship; Feelings.*

## 1. Introduction

OpenAI's ChatGPT didn't just launch: it exploded. One million users in five days (Davison et al., 2024), and, by February 2025, 400 million people were using it weekly. Two months later, that number had doubled, with over 800 million users: about 10% of the world's population. In a few days, GenAI had become part of everyday life (Badalyan, 2025; Agizza, 2025). However, ChatGPT is just one of several GenAI tools that are reshaping various sectors of society, as well as models of production and consumption (Chan & Choi, 2025; Nasr & El-Deeb, 2025), with enormous potential to impact consumer behavior (Cillo & Rubera, 2025; Dwivedi et al., 2023). GenAI has the potential to transform consumer-AI interactions by making them more human-like, leading to both promising opportunities and critical concerns (Wen & Laporte, 2024). In this context, the term consumers (hereafter users) refers to individuals engaging with GenAI technologies (Hermann & Puntoni, 2024).

Particularly emblematic cases involve consumers who even report feelings and relational bonds with GenAI tools. One example, reported by Kashmir (2025) in a New York Times article, describes Ayrin, a 28-year-old woman in a romantic relationship with Leo: a good listener, a stress-reliever, an empathic study partner. However, Leo is, in fact, a fictional construct, a "perfect boyfriend" prompt generated through ChatGPT. Ayrin's case may seem isolated, yet it could instead signal the emergence of a broader system of consumer–AI relational dynamics that remains largely unexplored (Chen et al., 2025; De Freitas et al., 2024). While consumers' tendency to create relationships with non-human entities such as brands (MacInnis & Folkes, 2017), robots (Ho et al., 2018), or other technologies (Singh, 2021) is widely documented, scholars have urged the need to examine how consumers engage with GenAI tools (Cillo & Rubera, 2025; Paul et al., 2023), as academic research continues to lag behind the developments unfolding in practice (Chen et al., 2025). Thus, the aim of this

research is to explore the relationships consumers develop with GenAI tools by addressing the following research question: What types of relationships may emerge between consumers and GenAI?

## 2. Theoretical Background

GenAI and Consumers: New Paradigms. It is reasonable to expect that GenAI tools will profoundly transform consumer attitudes and behaviors (Chan & Choi, 2025). GenAI offers consumers a natural and human-like form of communication (Baird & Maruping, 2021), operating in real time and with a high degree of personalization (Mogaji & Jain, 2024). GenAI tools can interpret inputs and respond with coherent, articulate, and timely content (Wen & Laporte, 2024). The extreme ease of use, the speed of responses, and the broad accessibility have led consumers to increasingly rely on GenAI. This growing dependency can be understood in terms of usage frequency and the level of trust consumers place in GenAI (Paul et al., 2023). In this perspective, Kumar et al. (2024) highlight that consumers may also move beyond purchase-related requests and use ChatGPT for more personal and intimate purposes (Edsall et al., 2023). Thus, the existing literature suggests, on the one hand, that GenAI, with its disruptive power in individuals' lives, may generate risks and detrimental effects (Hermann & Puntoni, 2024). On the other hand, the increasing frequency of use and the ways in which consumers engage with GenAI call for a timely investigation of how this phenomenon is evolving, as it appears to be giving rise to new attitudes and new forms of consumer–brand relationships (Alabed et al., 2024; Chan & Choi, 2025).

From Brands to Consumer-GenAI relationships. According to existing research, consumers form deep, symbolic, and evolving bonds with brands, traditionally constructed as social actors with voice, meaning, and personality, yet lacking autonomy (Batra, 2019; Kirby & Kent, 2010; Kohli et al., 2005). These consumer–brand relationships (hereafter, CBR), mirroring real relationships in many ways (Alvarez & Fournier, 2016), are embedded in broader sociocultural networks (Fournier & Alvarez, 2019) and tightly linked to how people construct their identities (Holt, 1997). At their core, they are co-created: a dynamic interplay between the parties, each shaping the other over time (Fournier, 1998; Hinde, 1978).

However, with the emergence of GenAI branded products, the nature of relationships becomes more complex. Due to their characteristics, GenAI tools can redefine the relational dynamics (Kumar et al., 2024; Paul et al., 2023). To explore how consumers relate to non-human agents, Fournier and Alvarez (2012) introduced the Brands as Intentional Agents Framework, which centers on two key socio-cognitive dimensions: warmth, that is the friendliness, benevolence, and moral intent perceived by the consumer toward the brand, and competence, that is, how consumers perceive the entity's intelligence, capabilities, and effectiveness. These dimensions are foundational for understanding CBR (Fiske et al., 2007), as they explain how and why a consumer begins to develop trust, cooperation, and relationships with a non-human agent. Studies have shown that relationships are deep and significant in the context of AI (Alabed et al., 2024), due to tools' anthropomorphic features such as having a name, a voice, constant presence, and empathy. Given these bonds with AI-based tools, consumer relationships can shape everyday life, for better (Vernuccio et al., 2023) or worse (Monteverde et al., 2025). It is therefore plausible that relational dynamics may also emerge with GenAI tools, especially given their rapid advancement and widespread use (Chen et al., 2025; De Freitas et al., 2025). Yet, the limited anthropomorphic cues and lack of emotional or personality traits (Alabed et al., 2024) suggest that these relationships may follow fundamentally different logics.

## 3. Methodology

Given the exploratory aim of this study, we employed a qualitative design based on in-depth, semi-structured interviews to capture consumers' attitudes, emotions, and perceptions toward GenAI tools (Creswell, 2009). Thirteen informants with varied demographic and socio-cultural background were recruited through purposive sampling and a self-selection form circulated via social media, targeting frequent GenAI users likely to provide rich, experience-based insights (Roulston & Martinez, 2015). Interviews were conducted between March and May 2025, either in person or via MS-Teams. Data were analyzed using inductive thematic analysis to identify recurring themes across the dataset (Braun & Clarke, 2006).

## 4. Preliminary findings

The analysis revealed four distinct relational patterns in frequent users' interactions with AI varying alongside the competence/warmth dimensions. For each pattern, we explore the key themes that emerged, the relational posture adopted toward AI, recurring metaphors, and underlying tensions.

High Competence/High Warmth. Informants in this cluster describe a relationship with AI that is deeply integrated into daily routines and emotionally rich. AI is not confined to a specific context but spans across domains, supporting everything from productivity to playful ideation. The relationships are characterized by enthusiasm and curiosity, reflecting a daily usage pattern that conceptualizes AI as a cognitive and emotional partner, as an extension of the self, imbued with trust and companionship. From a relational standpoint, users adopt a quasi-social stance, referring to AI as a "second self" or a "non-judgmental friend", highlighting openness and dependence on its presence. Users rhetorically refer to AI as a "moral compass", an "illicit affair", or a "sparring partner", conveying emotional comfort and intellectual stimulation. In some cases, AI even replaces human connection, offering more psychological relief than close others. Yet, beneath this closeness lies a web of tensions. The relationship is marked by a constant negotiation between autonomy and dependence, as well as anthropomorphization and rational detachment. While AI is warmly embraced as a partner in everyday sense-making, this cluster reflects a coexistence of integration and hesitation.

High Competence/Low Warmth. Informants within this cluster engage with AI through a pragmatic, critically detached lens. AI is integrated into professional lives and daily workflows but is never trusted. Outputs are constantly reviewed and adapted to preserve users' authorship. The relationship remains firmly instrumental, as AI is a means to an end rather than a partner. Relationally, users adopt a position of control, casting themselves as instructors and AI as an "apprentice," "student," or "assistant" requiring constant oversight. Humanizing metaphors are rejected, as AI is likened to a machine or a servant, that is efficient but subordinate. Emotionally, the tone is marked by restraint and ambivalence. While AI is appreciated as a productivity-enhancer, its use also evokes guilt, especially when it invades creative or authorial tasks. Fears of cognitive deskilling are recurrent, alongside ethical unease about AI's growing role in professional contexts. Tensions emerge around autonomy vs. efficiency and originality vs. standardization. Although users value AI's competence, trust is conditional and continuously negotiated. This cluster reflects a posture of guarded pragmatism: AI is a powerful tool, but one whose use must be carefully bounded to protect expertise, authenticity, and creative agency.

Low Competence/High Warmth. Informants within this cluster relate to AI with emotional openness and imaginative engagement, despite limited technical competence. While they frame AI as external to their world, they interact with it daily, often in reflective and exploratory contexts. The relationship is marked by a hybrid script: AI is not a peer or

authority but a symbolic extension of the user's imaginative space. Users adopt a posture of ironic curiosity, approaching AI as a non-threatening interlocutor, useful for narrative play and speculative thinking, though never fully trusted as a co-creator. Metaphors reinforce this playful detachment: AI is a "playground", a "serious toy", or a "benign intruder". Emotionally, this cluster is rich in curiosity and delight, tempered by underlying unease. Irony operates as both a mode of enjoyment and a shield against deeper concerns. While joking, users express anxiety about AI's subtle influence and lack of control. Tensions emerge between immersion vs. distance, irony vs. concern, and between critical awareness vs. thrill of experimentation. AI is simultaneously welcomed and resisted. In sum, AI is approached with cautious playfulness: emotionally warm and cognitively detached.

Low Competence/Low Warmth. Informants within this cluster relate to AI with marked skepticism, limited technical engagement, and emotional detachment. Their use of AI is strictly functional, driven by necessity rather than interest or trust. They reject any relational framing, refusing to humanize or emotionally invest in the system, which they describe as "cold" and "impersonal". Prevailing relational postures are defensive and supervisory, as users act like monitors rather than collaborators, interacting with AI under strict control. They are reluctant participants, motivated by the fear of professional obsolescence, while remaining ideologically critical. Metaphors reinforce this guarded stance, as AI is seen as a "surveillance device" or a "tightrope", evoking imbalance and systemic critique. Emotionally, the cluster is dominated by distrust and resignation. Users are concerned about loss of privacy and intellectual agency, as well as institutional double binds that both demand and forbid AI use. The few moments of relief are framed as acts of survival. Tensions abound: ethics vs. efficiency, exclusion vs. participation, resistance vs. dependency. Users feel caught between a cautious present and a future they fear may normalize what they resist. A final tension emerges between individual agency and systemic expectation, promoting a sense of detachment from dominant enthusiastic narratives. In sum, these users exhibit a posture of cold vigilance: AI is a watched object, engaged reluctantly and distanced affectively.

## 5. Conclusions

This study contributes to consumer behavior and consumer-AI interaction research (Minina Jeunemaître et al., 2025; Paul et al., 2023) by proposing a preliminary taxonomy of consumer-AI relationships based on perceived competence and warmth. Through inductive thematic analysis of 13 in-depth interviews, four relational clusters were identified, each marked by distinct emotional, cognitive, and relational patterns. Contrary to the claims of Alabed et al. (2024), who argue that GenAI lacks anthropomorphic features and thus inhibits the formation of relationships, our findings demonstrate that consumers are, in fact, establishing meaningful and relational bonds with these tools. Thus, rather than treating GenAI as a tool, many users engage with it as a relational and symbolic actor. Warmth emerged as the primary driver of emotional proximity and anthropomorphization: high-warmth users, regardless of competence, assign social roles to AI (e.g., companion, confidant, creative partner), fostering affective engagement, especially when paired with high competence. In contrast, low-warmth users adopt a distanced, instrumental stance, emphasizing control and rejecting anthropomorphization. Competence shapes strategic engagement: high-competence users integrate AI deliberately, using it either as a collaborator or as a task optimizer while maintaining authorship. Importantly, users don't just use AI, they narrativize it. Recurring metaphors (e.g., "mirror," "moral compass") reveal how symbolic framings guide expectations, shape attitudes, and influence emotional investment. These constructions have significant implications for understanding consumer experience and for informing GenAI adoption, design, and marketing. By introducing a competence-warmth taxonomy of consumer-AI relationships (Alvarez & Fournier, 2016), this study shifts the focus from purely instrumental adoption to the emotional and symbolic dimensions of GenAI use.

When AI is seen as a mirror, friend, or partner, interactions become effectively charged. When seen as a tool or threat, engagement remains pragmatic and detached. Future work should track how these stances evolve over time, what could be the positive or negative effects of leveraging relationships of this sort, and how the metaphors through which consumers narrate AI are structured and related to. These findings can inform the design and implementation of AI agents across digital and physical contexts. Recognizing variations in relational postures allow for more effective segmentation and interaction design. High-warmth users respond to cues of creativity and collaboration; low-warmth users prioritize transparency and control. Tailoring design and communication to these dynamics can foster trust, enhance engagement, and reduce both resistance and over-reliance.

## Abstract

Armed conflict, mass displacement, and climate-driven disasters have turned crisis into a routine backdrop for qualitative marketing research when both parties share a traumatic reality. Standard guides, however, still assume a detached interviewer and a uniquely vulnerable respondent. The study addresses this methodological gap with TICMI – the trauma-informed, co-constructed market interview framework. It draws on 76 post-Russian-invasion interviews with Ukrainian refugees across the EU and North America and marketing faculty who continued teaching under missile threat. Integrating trauma-informed care, co-creative interviewing, and an expanded consumer-vulnerability lens that recognizes interviewer distress, the framework sets out practical safeguards across pre-, during-, and post-interview stages. Pause-and-ground cues, language-flexible scripts, shared notepads, and reflexive self-checks helped maintain rapport and analytic depth even amid crisis settings. TICMI provides a clear, field-tested protocol for collecting ethical, high-quality insights in war, disaster, and other high-stress contexts, emphasizing the need to include trauma literacy into marketing-methods training.

*Keywords: crisis research contexts; shared traumatic reality; trauma-informed care; qualitative marketing methods; TICMI.*

### 1. Introduction

War, displacement, pandemics, and climate disasters have made crisis the routine backdrop for qualitative marketing research, where an interviewer and participant share the traumatic reality (Baum, 2013). Yet, field manuals still assume a neutral moderator and a uniquely vulnerable respondent (Durrant et al., 2010). Early cautions about re-victimizing consumers (Hill, 1995) and recent calls for trauma-informed interviews (Crosby et al., 2022) center almost wholly on participant safety. Psychology, however, shows that continual exposure to others' suffering can trigger vicarious trauma in researchers (Smith et al., 2021). Marketing scholarship largely ignores this risk, as the word "trauma" appears in only 0.4% of Psychology & Marketing articles (Farrell et al. 2024).

This study, therefore, asks how an in-depth market interview can remain ethical and analytically rich when both an interviewer and a participant share the same prolonged traumatic reality. Specifically: RQ1: Which trauma-informed adaptations keep business-

centered conversations flowing naturally? RQ2: How can interviewers' well-being be protected so that data quality is not distorted by unaddressed vicarious trauma?

The answer lies in the trauma-informed, co-constructed market interview framework. Drawing on 76 interviews after Russia's 2022 invasion of Ukraine with refugees in Europe and North America and with faculty teaching under missile threat, TICMI fuses the "4 Rs" of trauma-informed care with co-creative interviewing (Belk 2006) and extends consumer-vulnerability theory to consider also the researcher (Baker, Gentry & Rittenburg 2005). The result is a protocol that preserves rapport and data quality while safeguarding both parties.

## 2. Method

### 2.1. Research context

Russia's full-scale invasion of Ukraine (February 2022) displaced 6.9 million people abroad and 3.7 million internally; more than 12 million now require humanitarian aid (UNHCR, 2025). One in five Ukrainian universities has suffered damage or destruction (Carter 2024). Interviews, therefore, unfolded amid rolling blackouts, air-raid alerts, and persistent uncertainty—a textbook case of shared traumatic reality.

### 2.2. Participants and interviewers

Two trauma-exposed cohorts were purposefully sampled – the first comprised 32 displaced Ukrainians living in Europe and North America, and the second consisted of 66 heads of marketing departments or program coordinators at Ukrainian universities, many working from relocated or damaged campuses. Three Ukrainian marketing scholars moderated all sessions: one recently displaced to Western Europe, and two remained in Kyiv and Lviv under daily missile alerts. Their dual role as researchers and war-affected citizens made systematic self-monitoring critical.

### 2.3. Data collection

Participants first completed a short online survey that included informed consent and contact options. Follow-up interviews were semi-structured in Ukrainian via Zoom, Viber, WhatsApp, or Telegram—whichever platform minimized blackout and time-zone risk. Conversations paused for sirens or connection loss. Respondents could shift to audio-only, live text, or asynchronous voice notes and skip questions. Refugees received a closing thank-you, while faculty additionally joined a collaborative log that generated follow-up surveys and member-checking meetings.

2.4. Data analysis. Audio files were auto-transcribed (Turboscribe.ai) and manually verified. Reflexive thematic analysis progressed through familiarization, open coding, theme building, and iterative review. Three coders independently annotated an initial tranche, achieving substantial agreement. Researchers' reflexive notes were woven into the analysis to trace how shared trauma shaped questioning, prompting, and interpretation.

## 3. Results

### 3.1. Linguistic and paralinguistic signals of shared trauma

Instead of analyzing what refugees said, the study examined how they said it—the lexical choices, paralinguistic cues, and conversational moves that revealed distress and ultimately shaped the TICMI protocol. Four recurring patterns emerged, each illustrated below with a Ukrainian quotation followed by an English rendering.

*1. Emotional leakage and metacommentary.* Participants routinely named their own affect or commented on the interview as it unfolded: "усі плачуть" / "everyone is crying," "мені так боляче" / "it hurts to talk," "я постійно боюся" / "I am constantly afraid." Because fear and pain surfaced mid-sentence, these moments offered moderators natural pause points for the pause → ground → skip routine.

*2. Code-switching as an affective buffer.* Spontaneous shifts into English, Italian, or other non-native languages softened emotion ("sorry for that," "keep smiling," "piano-piano") and created momentary distance from painful detail. Allowing multilingual expression and mirroring it only when invited proved more stabilizing than insisting on a single language.

*3. Disclaimers, hedges, and safety checks.* Parenthetical queries such as "ти записуєш?" / "are you recording?" or «ти мені віриш?» / "do you believe me?" signaled exposure anxiety. Interviewers who echoed these concerns, saying, "I'm recording only for myself, not to miss important ideas," re-established safety and encouraged fuller disclosure.

*4. Humor and hyperbole masking distress.* Gallows humor, like "це, конечно, прикол" / "it's kind of a joke," "это цирк" / "it's ridiculous," and exaggerated anecdotes about bureaucratic absurdities or cultural peculiarities often preceded sudden topic shifts or brief silences. Recognizing laughter as a stress regulator, moderators acknowledged the joke, offered a brief grounding pause, and then probed the feelings beneath.

### 3.2. Translating patterns into the TICMI protocol

These speech cues directly informed TICMI's design: 15-minute micro-checks begin with "How does the conversation feel?", language flexibility is formalized, on-the-spot confidentiality reassurances are scripted, and a "humor flag" reminds interviewers that laughter may signal peak anxiety. Together, the adaptations translate conversational nuance into concrete safeguards, letting market researchers collect rigorous data while protecting both sides of the interview (see Table 1).

## 4. Discussion

### 4.1. Theoretical and practical contributions

TICMI operationalizes trauma-informed care's "4 Rs," but adds co-creative mechanics that re-center participant agency without abandoning commercial objectives. TICMI addresses analytic bias, often overlooked in consumer research, by extending vulnerability theory to include interviewer distress. Brands commissioning fieldwork in conflict zones can deploy TICMI with minimal delay. Evidence of richer transcripts and lower dropouts suggests better ROI on insight budgets.

### 4.2. Limitations and future research

The sample is culturally and geopolitically specific, so further studies should test TICMI in disaster relief or pandemic wards.

## 5. Conclusion

Crisis contexts demand that marketing researchers replace the myth of neutrality with a praxis that safeguards both interlocutors. TICMI offers a rigorously tested, practitioner-friendly roadmap. Including trauma awareness and co-constructive reflexivity into research-methods curricula will help ensure that marketing insight remains humane and trustworthy, even in crisis settings.

## Abstract

This study explores the phenomenon of prompt perseverance, a form of persistent engagement in which users continue interacting with generative AI tools despite inefficiencies, diminishing returns, or recurring frustration. Drawing from 8,934 user-generated comments on Reddit and Facebook, the research adopts an inductive qualitative content analysis approach to investigate the emotional, behavioral, and psychological mechanisms underlying this emerging form of digital behavior. Findings reveal four core themes: (1) emotional bonding with the AI, (2) illusion of incremental mastery, (3) productive procrastination, and (4) algorithmic hope. Users anthropomorphize AI agents, develop affective attachments, and sustain interaction not merely for utility but for symbolic and emotional reasons. The study advances the concept of prompt perseverance as a ritualized and meaning-laden behavior, offering new insights into human–AI interaction that challenge traditional models of rational tool use and continuance. Theoretically, the paper contributes to experiential consumption, digital coping, and symbolic engagement literatures. Methodologically, it illustrates the value of user-generated trace data in capturing affective and irrational digital practices. Practically, the findings suggest that AI developers and marketers should account for emotional and symbolic user dynamics, which may drive engagement independently of functional performance. This work opens new avenues for understanding how individuals relate to emerging technologies and highlights the importance of psychological investment in shaping the long-term adoption and usage of AI platforms.

*Keywords: Prompt Perseverance, Generative AI, Consumer behaviour, Human–AI Interaction, Symbolic consumption, Qualitative Content Analysis.*

## 1. Introduction

Generative AI tools have become integral to the daily workflows of millions of users, supporting tasks from idea generation to content creation and problem solving (Zhao et al., 2023). Tools such as ChatGPT, Claude, and Grok offer sophisticated interaction experiences, prompting users to engage in extended prompting behavior across multiple iterations (Sun et al., 2024). Yet, despite growing concerns over efficiency and result quality, many users remain deeply engaged with these systems, even when outcomes are suboptimal. This raises a fundamental behavioral and psychological question: why do users persist in prompting AI systems even when it seems irrational to do so?

While existing studies have explored satisfaction, continuance intention, and perceived usefulness in digital tool usage (Venkatesh et al., 2003), less attention has been paid to emotionally charged and effort-intensive behaviors that emerge in generative AI contexts

(Kumar et al., 2021). This study seeks to address this gap by exploring the phenomenon of prompt perseverance, a behavioral pattern in which users persistently prompt generative AI tools despite low utility returns. Unlike traditional technology continuance, prompt perseverance appears to be driven by symbolic, emotional, and ritualistic dynamics that merit closer investigation.

The relevance of this inquiry extends beyond performance metrics, tapping into the experiential dimensions of digital consumption (Holbrook & Hirschman, 1982) and affective user–platform relations (Nass & Moon, 2000). Through the qualitative analysis of 8,934 user-generated comments on Reddit and Facebook, this study identifies four key mechanisms underlying prompt perseverance: Emotional Bonding, Illusion of Incremental Mastery, Productive Procrastination, and Algorithmic Hope. These mechanisms illuminate how consumers form para-social attachments, internalize AI skill development, and displace goal-oriented work through prolonged interaction.

By uncovering the deeper motivational and emotional underpinnings of AI engagement, this paper contributes to the growing literature on human–AI interaction, affective computing, and consumer behavior in digital environments. It also introduces prompt perseverance as a conceptually novel form of digitally mediated persistence, with implications for platform design, user psychology, and the symbolic consumption of intelligent tools.

## 2. Theoretical Background: Understanding Prompt Perseverance Beyond Rational Use

Digital engagement literature has long studied user continuance behavior, often through models such as the Technology Acceptance Model (Venkatesh & Davis, 2000), which emphasize rational appraisals like perceived usefulness and ease of use. However, recent scholarship increasingly recognizes the emotional, symbolic, and identity-based dimensions of technology use, especially in contexts involving AI (Holbrook & Hirschman, 1982; Nass & Moon, 2000). As users interact more extensively with generative AI, their engagement transcends efficiency-seeking to encompass emotional investment, ritualistic behavior, and exploratory persistence. In affective computing and human–AI interaction research, para-social relationships with intelligent agents have been documented, highlighting how anthropomorphized systems evoke social and emotional responses (Christodoulides et al., 2021). Similarly, behavioral economics literature offers insights through concepts like the illusion of control (Langer, 1975) and the sunk cost fallacy, explaining how individuals overestimate their agency and remain committed to inefficient systems due to prior investment. While some studies have explored prompt optimization strategies (Tafesse & Wood, 2024), few have unpacked the irrational perseverance that emerges during repeated prompting cycles. Our study contributes by synthesizing insights from consumer psychology, cognitive bias theory, and affective digital engagement to theorize prompt perseverance as a unique form of irrational commitment, embedded in emotional bonding, cognitive distortion, and symbolic gratification.

## 3. Methodology

This study adopts an exploratory qualitative approach to examine the emotional, behavioral, and psychological dimensions of persistent user engagement with generative AI tools (Snelson, 2016). The dataset consists of 8,934 user-generated comments collected manually from Reddit (5,478 comments) and Facebook (3,456 comments), where users discussed their experiences with tools like ChatGPT, Claude, and Grok. Threads and posts were selected based on relevance, interaction richness, and comment volume, allowing access to naturally occurring digital trace material (Graham & Stough, 2025).

Reddit offered detailed narratives and peer interactions, while Facebook contributed broader user perspectives. All data were anonymized and processed ethically, in line with internet research guidelines (Markham & Buchanan, 2015; Micu et al., 2017). No private content was accessed.

Following Schreier (2012) and Mayring (2021), we applied inductive qualitative content analysis. Initial open coding identified descriptive labels, which were then organized through axial coding into higher-order themes. This process surfaced recurring motivations and engagement patterns such as emotional bonding, cognitive biases, and future expectations. Two researchers independently coded the data; discrepancies were resolved with a third reviewer to ensure triangulation and reliability.

Saturation was reached when no new themes emerged. A coding log was maintained, and representative quotes were selected for each theme. This interpretive approach aligns with prior studies exploring symbolic and affective dimensions in user–platform interaction (Rossolatos, 2019; Christodoulides et al., 2021). The analysis led to the conceptualization of prompt perseverance, a behavioral pattern characterized by irrational persistence in AI prompting despite diminishing returns.

## 4. Findings

The analysis identified four core themes that explain prompt perseverance—users' persistent engagement with generative AI tools despite diminishing returns. These themes reflect deeper emotional, behavioral, and cognitive processes and are visually synthesized in Figure 1.

### 4.1 Emotional Bonding with the AI

Users often described ChatGPT using relational metaphors, attributing human-like traits such as loyalty or companionship. This para-social framing triggered emotions of guilt when switching models, e.g., "I feel like I'm about to betray my best friend." Such expressions echo emotional brand attachment (Thomson et al., 2005) and anthropomorphism literature (Nass & Moon, 2000; Arora et al., 2025), illustrating how affective ties reduce users' likelihood of abandoning the tool. This reinforces the experiential consumption logic (Holbrook & Hirschman, 1982), where symbolic meaning overrides instrumental performance.

### 4.2 Illusion of Incremental Mastery

Users frequently blamed themselves, not the AI, for poor results, believing that success required more skilled prompting: "I just haven't asked the right way yet." This reflects an illusion of control (Langer, 1975) and gamified learning logic, where near-success reinforces engagement. In line with Tafesse and Wood (2024), the act of refining prompts becomes a self-reinforcing behavior framed as skill development, supporting a mastery narrative that sustains prolonged use.

### 4.3 Productive Procrastination

Participants acknowledged excessive prompting even when it delayed task completion. Yet, they justified it as cognitively engaging: "At least I felt like I was doing something." This mirrors structured procrastination (Steel, 2007) and symbolic productivity (Holbrook & Hirschman, 1982), where user effort is emotionally validated even without functional gain. It also echoes cognitive offloading (Risko & Gilbert, 2016), although here, the tool prolongs rather than reduces cognitive labor.

### 4.4 Algorithmic Hope

Users expressed future-oriented optimism about the tool's evolution—"I know it'll catch up"—despite present dissatisfaction. This algorithmic hope reflects a form of technological optimism, where users maintain engagement based on expected improvements rather than current performance. Such optimism has been noted in innovation and adoption literature, where belief in progress drives continued use (Dwivedi et al., 2021). It also resonates with the sunk cost fallacy, where individuals persist with a tool due to the time and effort already invested (Arkes & Blumer, 1985).

Emotional loyalty and imagined future gains create a symbolic justification for ongoing engagement, independent of current effectiveness. This future-oriented logic aligns with prior work in consumer behavior, where anticipated utility and emotional commitment can outweigh functional dissatisfaction (Oliver, 1999; Holbrook & Hirschman, 1982). In this sense, prompt perseverance emerges not only as habitual use but as an affective and imaginative act, where users project improvement onto the tool and internalize hope as a reason to stay.

Figure 1 illustrates these interrelated dynamics. Rather than viewing prompt perseverance as purely rational or utilitarian, our model highlights its emotional, symbolic, and psychological underpinnings.

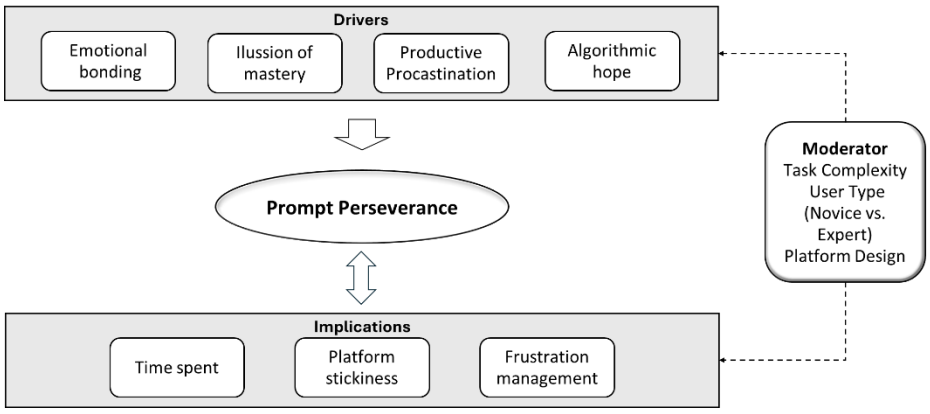

**Figure1:** Conceptual model of prompt perseverance (Source: our elaborations)

## 5. Discussion and Conclusion

This study conceptualizes prompt perseverance as a psychologically rich and affect-driven phenomenon emerging from users' sustained interaction with generative AI. By examining naturally occurring digital conversations, we reveal that persistent prompting behavior is not solely the result of task-oriented dissatisfaction or usability flaws. Instead, it is fueled by emotional bonding, perceived skill development, symbolic productivity, and future-oriented optimism.

Our findings challenge linear continuance models that equate satisfaction with use. Rather than discontinuing after inefficiency or error, users construct alternative narratives that reframe AI engagement as loyalty, mastery, or cognitive play. These behaviors echo consumer–brand relationships and ritualized consumption but are here directed at a non-human, dynamic system. Prompt perseverance thus represents a novel form of symbolic

interaction with technology, one that blends emotional commitment, behavioral inertia, and imagined utility.

Beyond theoretical contributions, these insights carry significant implications for the design and deployment of generative AI systems. Failing to consider the emotional and symbolic dimensions of user interaction may result in tools that frustrate, alienate, or exhaust users through prolonged and inefficient engagement loops. Our findings suggest that platform designers should not only optimize for accuracy and speed but also anticipate the affective journeys users undergo. Features such as emotionally intelligent feedback, guided prompting systems, or playful interruption mechanisms could help align user expectations with actual tool performance, supporting more sustainable and satisfying engagement. By responding to users' symbolic and emotional investments, AI platforms can cultivate trust and long-term loyalty, rather than reliance built on false mastery or sunk-cost dynamics.

From a marketing perspective, understanding prompt perseverance can help brands design emotionally resonant AI interfaces that foster deeper consumer engagement. Marketers integrating generative AI into service touchpoints (e.g., virtual assistants, co-creation tools) should consider how emotional attachment, gamified learning curves, and future-facing optimism shape continued interaction, loyalty, and user advocacy.

In sum, generative AI is not only a productivity tool but a relational and symbolic actor within users' cognitive and emotional lives. Our model offers a framework for understanding these emerging dynamics and invites future research on how digital persistence evolves in human–AI interaction.

# Consumers and Sustainable Fashion: A Systematic Literature Review (2020–2024)

Chiara Marinelli

DEAMS Department, University of Trieste

chiara.marinelli@deams.units.it

## Abstract

The fashion industry remains a major driver of environmental harm and social inequality. Since 2020, disruptions such as the Covid-19 pandemic, geopolitical tensions and emerging sustainability issues have significantly reshaped how consumers engage with fashion, fueling public debate, increasing industry focus and attracting academic interest in sustainable fashion consumption. However, research produced during this timespan is often fragmented, employing diverse methods and perspectives. This systematic literature review aims to synthesise studies published between 2020 and 2024 on consumer positions toward sustainable fashion. Key recent trends include the dominance of survey-based studies adopting quantitative approaches, a geographical focus on Asia and Europe and an increasing variety of adopted theoretical approaches. Moreover, main recent topics of interest emerge through content analysis, such as the importance of adequate communication, the role of digital channels, interest in sociodemographic trends and a deeper, evolving understanding of the attitude-behaviour gap. Overall, the study aims to offer timely guidance for future research and concrete targeted strategies for a more sustainable fashion system.

*Keywords: sustainable fashion, consumers, attitude-behaviour gap, systematic literature review, sustainable consumption, circular economy*

## 1. Introduction

The escalating climate crisis and increasing regulatory and societal pressures for sustainability have placed responsible sustainability practices at the forefront of global economic and political agendas. Among the industries most in need for a sustainable transition, the fashion industry stands out for its environmental and social impact, mainly driven by fast fashion practices (Brandão & da Costa, 2021;Niinimäki et al., 2020). In this context, consumers play a crucial role in driving sustainable practices in the fashion industry. Nevertheless, several studies report a persistent gap between pro-sustainability attitudes and actual behaviour, commonly referred to as the "attitude–behaviour gap" (Fani et al., 2023). In addition, the scenario has grown increasingly complex due to major global and industry-specific disruptions. Between 2020 and 2024, events such as the Covid-19 pandemic, rising sustainability concerns and key policy measures like the European Strategy for Sustainable and Circular Textiles (EC, 2022) have reshaped both industry agendas and consumer practices. These changes call for a renewed assessment of how consumers engage with sustainable fashion. This systematic literature review responds to that need by analysing 171 peer-reviewed studies published between 2020 and 2024 across management, economics and

related fields. The review maps the current state of research, highlighting dominant themes and literature trends. On these bases, the paper aims at offering a structured synthesis to support academic inquiry and inform effective sustainability strategies in the fashion sector.

## 2. Theoretical Background

Fashion ranks among the most polluting industries globally, contributing an estimated 1.2 billion tons of $CO_2$ emissions and experiencing a fourfold increase in consumption over two decades, mainly driven by fast fashion trends (EC, 2022; Niinimaki et al., 2020).

Despite its increasing popularity, the sustainable fashion concept remains elusive due to the proliferation of overlapping definitions and labels (Busalim et al., 2022). While no unique definition exists, sustainable fashion broadly refers to clothing that is produced, used and disposed of with minimal environmental and social harm. Moreover, the concept has been progressively expanding to encompass a wide range of processes and practices, including eco-friendly, ethical and circular business models such as donation, second-hand, rental up to recycling and upcycling (Schiaroli et al., 2024). Although market data show rising consumer interest, the global share of sustainable fashion remains relatively low, below 6% (Statista, 2025). This sheds light on the complexity of consumer behaviour, influenced by individual and contextual factors, making changes difficult to predict or generalise.

## 3. Methodology

This study employs a systematic literature review methodology to analyse recent academic work on sustainable fashion consumption, identify key research trends and synthesise consumer-focused insights (Tranfield et al., 2003).

Data sources included Scopus and Web of Science, chosen for their coverage of high-impact journals in business, management and economics. The query string can be seen in Table 1.

| |
|---|
| (("sustainable" OR "circular" OR "eco friendly" OR "slow" OR "eco-friendly" OR "green" OR "ethical" OR "organic" OR "reused" OR "secondhand" OR "second hand" OR "second-hand" OR "recycled") AND ("fashion" OR "garment" OR "cloth" OR "textile" OR "apparel" OR "T&A")) AND (("consumer" OR "customer" OR "buyer" OR "purchaser" OR "client") AND ("perception" OR "attitude" OR "opinion" OR "view" OR "belief" OR "preference" OR "perspective" OR "evaluation" OR "judgement" OR "assessment" OR "intention" OR "behaviour" OR "purchase intention" OR "purchase behaviour")) |

**Table 1:** Search string and screening criteria

The inclusion and exclusion criteria for the literature review were designed to ensure both relevance and academic quality. To be included, studies had to be published in the years from 2020 to 2024 (included) and focus specifically on sustainable fashion, with all its synonymous terms, while also addressing consumer-related constructs such as attitudes, perceptions, intentions or behaviours. Only peer-reviewed journal articles were considered, while non-peer-reviewed content was excluded. Furthermore, only articles written in English were included. Additionally, to ensure thematic alignment with the fields of interest, eligible studies needed to be indexed under Business, Management, Accounting, Economics, Econometrics or Finance. Finally, all included studies had to be published in journals listed in the ABS Academic Journal Guide, regardless of the ranking level.

## 4. Results

The screening process followed PRISMA guidelines (Page et al., 2021), moving from 1,072 studies initially retrieved to 772 abstracts screened. After reviewing 250 articles full-text, 167 were then included in the final article sample. These were systematically coded for bibliometric data, research methods, theoretical approaches, consumer-related variables and key findings. These studies explored a range of consumer practices, including second-hand purchasing, fashion rental, slow fashion engagement and broader sustainable practices across the fashion value chain. First of all, a clear upward trend in scholarly attention was observed over the review period. Starting with 22 publications in 2020, the selected academic output reaches its apex in 2024 with 45 studies.

From a theoretical standpoint, the Theory of Planned Behaviour emerged as the most frequently used framework (30 articles), followed by the Theory of Reasoned Action (11 articles). While we attest an increasing theoretical diversification with respect to previous reviews, 40 studies either lacked a clear theoretical foundation or only loosely referenced existing theories. In terms of methodology, the vast majority (137 studies) relied on quantitative approaches. Only a small number employed mixed methods (8 studies) or experimental designs (3 articles). Geographically, empirical research was most commonly conducted in India (30 studies), followed by the United States (24), with China and Italy each contributing 10 studies. Regarding publication venues, the most frequent outlets were the Journal of Fashion Marketing and Management (30 articles), Journal of Retailing and Consumer Services (15), Journal of Cleaner Production and Journal of Global Fashion Marketing (13 articles each). Moreover, a preliminary qualitative content analysis of the final sample of articles lets some recent topics worth of attention to emerge.

First, the persistence-although with refined understanding- of the attitude–behaviour gap, which remains a major challenge (Brandão & da Costa, 2021; Cairns, 2022). This misalignment is increasingly understood as a product of complex psychological, contextual and social factors. Scholars highlight values and environmental awareness alone are insufficient motivators unless supported by enabling conditions, e.g. social acceptance, product availability and emotional alignment. Studies are thus moving toward more flexible and context-sensitive behavioural models.

Second, sociodemographic variables—particularly age and gender—continue to attract researchers' interest (Cairns et al., 2022; Tewari et al., 2022). Many studies focus on younger generations or female categories, who are often seen as the most promising demographic for advancing sustainable fashion. Yet, their behaviour frequently reflects ambivalence: while ideologically aligned with sustainability, they often struggle with inconsistent actions, driven by emotional tensions and fashion-related concerns (Fani et al., 2023). However, practical concerns—such as hygiene and aesthetics—can still override sustainable intentions, suggesting the need for nuanced, segment-specific strategies.

Third, marketing communication and media are increasingly influential in shaping perceptions and behaviours (Grappi et al., 2024; Tewari et al., 2022). Digital platforms serve as powerful tools for promoting sustainability narratives, especially when messages are engaging, compelling and conveyed by credible communicators. However, potential consumer scepticism highlights the importance of communication authenticity and consistency. This shows choices of tone, platform and framing are as the message content.

Fourth, technological innovation is emerging as a key enabler of sustainable fashion consumption. Tools such as blockchain, digital product passports and virtual try-ons support transparency, traceability and consumer empowerment (Lou & Xu, 2024; Won et al., 2024). Additionally, platform-based models like peer-to-peer marketplaces and rental services are

gaining popularity, especially among younger, digitally native consumers. However, access and adoption can vary significantly across demographics due to differing levels of digital literacy, trust and platform usability.

## 5. Discussion and Conclusion

Collectively, these findings reflect a dynamically evolving field in which consumer engagement with sustainable fashion is shaped by a complex mix of psychological and social factors and technological tools. Theoretically, the study refines understanding of the attitude–behaviour gap, highlighting its complexity beyond limited awareness or external barriers. Recent studies show that emotional, cognitive, symbolic, and contextual factors interact in shaping inconsistent consumer actions, calling for more nuanced, multidimensional behavioural models that account for identity and affective influences (Brandão & da Costa, 2021; Fani et al., 2023). Second, the review identifies emerging theoretical gaps and underexplored areas in the literature, including constructs like emotional gratification, platform trust and perceived uniqueness. While academic interest is growing, the field still needs stronger conceptual clarity and theoretical depth to advance beyond practical insights and better reflect evolving consumption behaviours.

Practically, the findings offer valuable direction for fashion industry professionals. First, addressing the attitude–behaviour gap requires more than informational campaigns. Consumers need emotional, social and stylistic reinforcements that align sustainability with their personal identity. Third, the rising importance of digital and platform-based models—such as second-hand marketplaces and rental services—underscores the potential of alternative business models. These are especially relevant for younger, digitally native consumers, but their success depends on usability, trust and community engagement (Tewari et al., 2022). Companies should invest in trustworthy, accessible, and engaging digital experiences to encourage sustainable practices (Grappi et al., 2024).

In conclusion, this review synthesises recent academic work on sustainable fashion and suggests that, while sustainability is becoming more prominent, it is rarely sufficient on its own to drive substantial consumer engagement. Weaknesses of the study include potential selection bias, limited timespan of analysis and selection limitations.

Future research should explore longitudinal and cross-cultural dynamics, evaluate emerging digital tools like AI and blockchain, and test the proposed typology in real-world contexts. Mixed-methods and interdisciplinary approaches will be key to capturing the full complexity of sustainable fashion consumption in a fast-changing industry landscape.

## Abstract

As the global population ages, understanding how older adults engage with Artificial Intelligence (AI) becomes increasingly critical. This study investigates the adoption of AI among Digital Seniors—older individuals who actively use digital technologies—through the lens of Life Course Theory (LCT). Using a systematic literature review following PRISMA 2020 guidelines, 205 peer-reviewed articles from 2016 to 2025 were analyzed to explore how biographical trajectories, social relationships, cultural context, and key life transitions influence AI adoption. Findings reveal that the decision to adopt AI is shaped not only by technical features but by a complex interplay of past experiences, social support, self-efficacy, and timing within the life course. The four pillars of LCT—Location in Time and Place, Linked Lives, Human Agency, and Timing of Lives—offer a theory-informed framework to interpret these dynamics. This study contributes to the growing literature on aging and digital inclusion, offering insights for designing more inclusive and age-responsive AI systems.

*Keywords: Digital seniors, Elderly Consumers, Artificial Intelligence, Life Course Theory.*

## 1. Introduction

Population aging is reshaping global societies, with over 2.1 billion individuals expected to be over 60 by 2050 (UN DESA, 2024). Older adults now play a growing economic and digital role, accelerated by the COVID-19 pandemic, which boosted their tech engagement while also exposing internal digital divides (Katey & Chivers, 2025).

The emergence of Digital Seniors—older individuals who actively and confidently use technology—reflects this shift (Quan-Haase & Wellman, 2016). Their digital practices span social interaction, telehealth, finance, and learning, often supported by intergenerational ties (Lei et al., 2024). These seniors are not merely adapting to technology but reshaping its use, challenging ageist assumptions and promoting digital inclusion (Ren et al., 2025).

However, despite the rise of Artificial Intelligence (AI) in everyday services, there is limited understanding of how seniors perceive and adopt these tools (Pejić Bach et al., 2023). To bridge this gap, we adopt Life Course Theory (Giele & Elder, 1998), which interprets aging

through social roles, agency, and timing, offering a nuanced lens to explore seniors' engagement with AI.

## 2. Theoretical background and research question

### 2.1 Elderly consumers and Digital seniors

Today's elderly aldults form a dynamic consumer segment, often viewing retirement as a phase of renewal and active engagement (Guido, 2014; Schau et al., 2009). Many embrace digital tools that are perceived as useful and empowering, integrating them into everyday life (Chen & Chan, 2013). Digital Seniors use technology not only for basic tasks, but also for learning, socializing, and managing health, often with support from younger relatives (Lei et al., 2024; Quan-Haase & Wellman, 2016).

Yet adoption remains uneven: while some adapt with confidence, others encounter psychological or usability barriers, especially with more complex AI applications (Charness & Boot, 2016). Designing inclusive technologies requires attention to both functional and emotional dimensions of aging.

### 2.2 Life Course Theory (LCT)

Life Course Theory (Giele & Elder, 1998) provides a nuanced perspective for understanding how older adults adopt emerging technologies. Rather than viewing adoption as a matter of access or skill, LCT emphasizes how personal histories, social interactions, and cultural contexts shape technological behaviors across time.

The first dimension, Location in Time and Place, refers to the historical, institutional, and cultural environments that influence digital orientation. Older adults' technology use often reflects accumulated experiences with education, work, and innovation systems (Elder, 2018; Liu et al., 2025).

The second dimension, Linked Lives, captures how relationships—especially intergenerational ones—shape digital behavior. Family members often act as intermediaries, helping seniors navigate AI systems and reinforcing digital confidence (Chu et al., 2022).

Human Agency highlights the importance of perceived autonomy and goal-directedness. Seniors are more inclined to adopt AI when it aligns with their personal values and when they feel competent and in control (Bandura, 2018; Chen & Chan, 2013).

Finally, Timing of Lives stresses that adoption varies depending on when in the life course the technology is introduced. Key transitions such as retirement or caregiving often act as catalysts, reshaping technology's meaning and relevance (Moschis, 2019).

### 2.3 Research question development

Guided by Life Course Theory, this study explores how older adults' interactions with AI technologies are shaped by biographical context, social relationships, self-perception, and transitional life events. These dynamics influence not only access, but also how technology is evaluated, trusted, and integrated. This conceptual framing leads to the following research question:

RQ. How do life course dynamics influence the decision of older adults to adopt or resist AI technologies?

## 3. Methodology

This study conducted a systematic literature review following PRISMA 2020 guidelines (Page et al., 2021), aiming to explore how Life Course Theory (LCT) helps interpret AI adoption among Digital Seniors. As shown in Figure 1, the review process ensured methodological rigor and transparency.

The search was carried out in the Scopus database, focusing on peer-reviewed literature in business, social sciences, and technology. Articles published in English between January 2016 and March 2025 were considered. The query combined three conceptual domains—older adults, consumer behavior, and artificial intelligence—using the expression: TITLE-ABS-KEY (senior) AND TITLE-ABS-KEY (consumer) AND TITLE-ABS-KEY (Artificial Intelligence), with filters applied to subject areas (Business, Management, Social Sciences, Economics) and language of English.

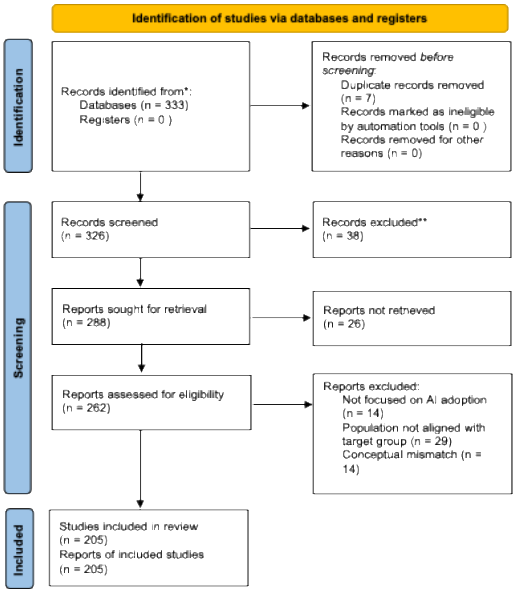

**Figure 1**: PRISMA flow diagram

From the 333 records retrieved, 205 studies were ultimately included after removing duplicates and applying eligibility criteria. Selected works addressed individuals aged 60 or more, focused on AI-related topics (adoption, use, or perception), and were published in peer-reviewed journals. Both conceptual and empirical contributions were retained; grey literature and unrelated studies were excluded. For each article, relevant information—authors, methods, theoretical frameworks, and findings—was extracted. The analysis was then structured around the four core dimensions of LCT—Location in Time and Place, Linked Lives, Human Agency, and Timing of Lives—providing a theory-driven interpretation of seniors' engagement with AI.

## 4. Results and discussions

The findings reveal that the adoption of AI by Digital Seniors stems from a constellation of life-based, social, and motivational factors—rather than merely from technical design or digital skills. Life Course Theory offers a structured lens through which to interpret these dynamics.

Location in Time and Place shapes attitudes through seniors' long-term exposure to education, media, institutions, and cultural expectations. These backgrounds help explain varying levels of curiosity, skepticism, or trust in AI technologies (Liu et al., 2025; Zhang & He, 2022).

Linked Lives highlights the relational dimension of digital engagement. Seniors rarely adopt AI independently; children and grandchildren often introduce and support usage, providing both technical help and emotional reassurance (Chu et al., 2022).

Human Agency plays a central role in determining how AI is perceived. When AI systems are seen as intuitive, aligned with goals, and respectful of user autonomy, engagement tends to increase. However, emotional barriers—such as privacy concerns and fear of dependency—remain significant (Ma & Xing, 2024; Mzawak et al., 2024).

Timing of Lives underscores how life events act as triggers or inhibitors of adoption. Retirement, caregiving duties, or the onset of health issues may increase the perceived usefulness of AI, as shown during the COVID-19 pandemic. Still, factors such as affordability and emotional readiness shape the actual uptake (Moschis, 2019).

In conclusion, Digital Seniors' relationship with AI is multidimensional and contingent on life-stage realities, social ecosystems, and self-determined values. Designing AI systems that respect these nuances is essential for fostering digital inclusion in later life.

## Abstract

As Generative AI becomes increasingly prevalent in creative domains, understanding how consumers evaluate AI-generated content is essential. This research investigates consumer responses to artistic products created by AI versus human artists, a relatively unexplored area in consumer behavior. Drawing on creativity theory, we propose that AI-generated art is perceived as less original and innovative, leading to less favorable consumer attitudes. However, this negative effect is mitigated when AI is used to enhance, rather than replace, human creativity. Additionally, we explore whether consumer responses differ between artistic and scientific domains. Across four experimental studies, our findings support the proposed framework and highlight the importance of generation source in shaping consumer evaluations. This research contributes to the growing literature on AI in consumer behavior and provides insights for firms seeking to integrate generative AI into marketing processes. Keywords: Consumer behavior; Generative AI; creativity; artistic products.

### 1. Introduction

Over the past two decades, Artificial Intelligence (AI) has emerged as a powerful technological tool, strongly transforming marketing processes (Davenport et al., 2020; Huang and Rust, 2021) and significantly reshaping consumer behavior (Puntoni et al., 2020; Jain et al., 2023). As a result, it has become essential for consumer researchers to comprehend how consumers react to various AI applications in marketing such as chatbots (e.g., Pizzi et al., 2021), voice assistants (e.g., Vernuccio et al., 2023), and AIbased recommendations (e.g., Longoni and Cian, 2022).

More recently, advances in AI have led to the rise of Generative AI (Hermann and Puntoni, 2024), which is capable of generating content, such as text, images, audio, videos, code, and synthetic data, across various marketing domains, including AIgenerated ads (e.g., Chen et al., 2024) and new product designs (e.g., Moreau et al., 2023). Previous research aimed to compare consumer responses to AI-generated (vs. human-generated) content, identifying conditions under which AI outperforms humans and proposing underlying mechanisms to explain these effects (e.g., Zhang et al., 2022; Cascio Rizzo and Ziano, 2024; Kirk and Givi, 2025).

Entering into the ongoing debate about the role of AI in the artistic domain (e.g., Chatterjee, 2022), this paper examines how consumers evaluate artistic products generated by AI compared to those created by human artists, a research area that remains relatively unexplored. Drawing on creativity theory (Harvey and Berry, 2023), we propose that artistic products generated by AI (vs. human artist) receive less favorable consumer evaluations because they are perceived as less original and innovative. However, this negative effect diminishes when AI is used to enhance, rather than replace, the human artist's work, leading consumers to value the artistic product similarly to one created by humans only. Finally, we compare the effects of product generation source (AI vs. human) on consumer attitudes towards artistic and scientific products to offer preliminary insights into potential differences across these two domains. The results of four experimental studies provide support for our conceptualization and offer implications for both theory and practice.

## 2. Conceptual Framework

The growing presence of AI in the arts has sparked a critical debate about its capacity to produce works that may elicit consumer appreciation (e.g., Chatterjee, 2022; Zhou and Lee, 2024). As AI increasingly enters creative domains, scholars have begun exploring how people perceive AI-generated artworks in fields such as psychology of aesthetics (e.g. Chamberlain et al., 2018), applied computing (e.g., Hong et al., 2019; Mikalonytė and Kneer, 2022) and cultural studies (e.g., Neef et al., 2024). However, consumer research offers limited insights about how consumers react to AI-generated rather than human-created artistic products (e.g., Wang et al., 2023).

This paper aims to examine how the source of product generation (hereafter: generation source) influences consumer attitudes towards artistic products. We predict that, in the art domain, consumers will evaluate an artistic product more negatively when it is generated by an AI system rather than by a human artist. This effect is driven by perceived creativity, that is the extent to which the outcome of the creative effort is perceived as novel compared to prior solutions (Runco and Jaeger, 2012; Ameen et al., 2021; De Freitas et al. 2025). Indeed, the arts, including visual, literary, musical, and performing, are "imaginative, creative, and nonscientific branches of knowledge considered collectively, esp. as studied academically," and express beauty and emotion (Bullot and Reber, 2013). Consequently, it is likely that consumers tend to evaluate artistic products based on the perceived level of creativity. Previous research has shown that often consumers associate AI algorithms' work as leading to less creative artworks compared to human artists' work as most individuals consider artistic creativity an almost exclusively human characteristic (Millet et al., 2023; Seli et al., 2025). Accordingly, we argue that AI (vs. human) generation source negatively affects perceived creativity of the artistic products, which in turn reduces consumer attitudes. Formally:

H1: Artistic products generated by AI (vs. human) lead to less favorable consumer attitudes.

H2: The effect of the generation source (AI vs. human) on consumer attitudes towards artistic products is mediated by perceived creativity.

Building upon prior research on human–AI collaboration (e.g., Huang and Rust, 2022), we also examine the role of Generative AI as a tool for either enhancing or replacing human creativity in the art domain (Hermann and Puntoni, 2025). Human enhancement refers to the use of AI systems to augment or improve human capabilities by supporting users and making tasks more insightful. In contrast, human replacement involves using AI to emulate human abilities and perform tasks autonomously. We argue that when AI is used to enhance, rather than replace, the human artist's work, consumers perceive the resulting artistic products as more creative and innovative, leading to more favorable evaluations. Formally:

H3: The use of AI as enhancement (vs. replacement) of the human artist leads to more favorable consumer attitudes toward artistic products.

## 3. Empirical Evidence

### Study 1

*Method.* We recruited 120 participants via Prolific Academic (Mage = 35.70, female = 63%). Participants were informed that they would evaluate a painting and were randomly assigned to one of two experimental conditions, differing in the generation source of the artwork. In the AI condition, the painting was attributed to AI, while in the human artist condition, the painting was attributed to a person.

*Measures.* After viewing the artwork, participants evaluated their attitude towards the painting using five 7-point semantic differential items (e.g., dislike very much – like very much). Perceived creativity was assessed with three 7-point Likert items: "I find this artwork original," "creative," and "an innovative idea". Since reliabilities of both scales were high ($\alpha > .92$), we calculated their mean scores. As a manipulation check, participants were asked whether they believed the artwork was created by a human artist or an AI application (1 = Definitely human, 7 = Definitely AI).

*Results.* After verifying that the manipulation was successful, a t-test on attitude score showed that participants in the AI condition liked the painting significantly less than those in the human condition ($M_{AI} = 4.28$, $M_{HUMAN} = 5.14$, $t(118) = -3.14$, $p = .002$), supporting H1. Mediation analyses showed that generation source (0 = human, 1 = AI) had a significant negative effect on perceived creativity ($b = -.84$, $p = .003$) In turn, perceived creativity ($b = .72$, $p < .001$) positively predicted attitude. When controlling for perceived creativity, the direct effect of generation source on attitude was no longer significant ($b = -.26$, $p = .18$). The indirect effect generation source  perceived creativity  attitude was significant and negative (IE = -.60, 95% Bootstrap CI [-1.02, -.20]), supporting H2.

### Study 2a

*Method.* We recruited 121 participants via Prolific Academic (Mage = 38.82, female = 50%). Participants were randomly assigned to one of two experimental conditions that differed in the described role of AI in the creation of the artwork. In the enhancement condition, the painting was attributed to a human artist supported by AI, while in the replacement condition, the painting was attributed entirely to AI. Attitude and perceived creativity ($\alpha > .93$) were measured as in Study 1. The manipulation check measured whether participants believed the artwork was generated by: 1 = an AI application vs. 7 = a human artist with the help of an AI application).

*Results.* After verifying that the manipulation was successful, a t-test on attitude showed that participants in the enhancement condition liked the painting significantly more than those in the replacement condition ($M_{enh} = 5.02$, $M_{rep} = 4.24$, $t(119) = 2.50$, $p = .014$), supporting H3. Mediation analysis revealed that AI role (0 = replacement, 1 = enhancement) had a significant positive effect on perceived creativity ($b = .81$, $p = .012$), and that perceived creativity predicted attitude ($b = .82$, $p < .001$). When controlling for perceived creativity, the direct effect of AI role on attitude was no longer significant ($b = .12$, $p = .522$). The indirect effect of AI role on attitude via perceived creativity was significant and positive (IE = .67, 95% Bootstrap CI [.15, 1.20]).

## Study 2b

*Method.* Study 2b extended the previous design by introducing a third experimental condition to simultaneously compare different roles of AI with a baseline human artist condition. Participants were randomly assigned to one of three conditions: human-only, AI as enhancement, or AI as replacement. The procedure, stimuli, and attitude and perceived creativity measures ($\alpha > .94$) were identical to those used in the previous studies. A total of 181 participants were recruited via Prolific Academic (Mage = 42.68; 51% female).

*Results.* After verifying that the manipulation was successful, a one-way ANOVA revealed a significant effect of generation source on attitude toward the artwork (Mhumanonly = 4.85, Menh = 4.65, Mrep = 4.06, $F(2, 178) = 4.06$, $p = .019$). Planned comparisons showed that participants in the human-only condition evaluated the artwork more favorably than those in the AI replacement condition ($p = .007$), but not significantly more than those in the AI enhancement condition ($p = .482$). Furthermore, the AI enhancement condition elicited significantly more favorable attitude than the AI replacement condition $p = .042$). Analyses of perceived creativity as mediator revealed a similar pattern. These findings replicate and extend the results of Study 2a, by demonstrating that the negative impact of AI-generated art on consumer evaluations is attenuated when AI is framed as a tool supporting rather than replacing the human artist.

## Study 3

The goal of Study 3 was two-fold. First, we wanted to examine whether the effect of the generation source (human vs. AI) on consumer attitudes varies depending on the domain of application, art versus science. Previous research has begun to highlight the importance of domain-specific expectations in shaping consumer responses to AI (Longoni et al., 2019). Scientific products are the outcomes of logical or analytic work methods (Weisberg, 2006), thus it is likely that consumers evaluate them in terms of utilitarian value and adherence to structured knowledge schemes (Simonton, 2003). Because characteristics such as usability, efficiency and accuracy align closely with the perceived strengths of AI (Puntoni et al., 2020), consumers are more likely to appreciate AI in analytical or scientific tasks than in artistic or more creative ones. Therefore, one might expect that, differently from artistic products, scientific ones generated by AI (vs. human scientist) lead to more favorable consumer attitudes. Second, to move beyond the context used in the previous studies, participants were asked to evaluate a lamp instead of a painting.

*Method.* The study followed a 2 (Generation Source: human vs. AI) × 2 (Context: art vs. science) between-subjects design. A total of 232 undergraduate students (Mage = 21.2; 73% female) participated in exchange for partial course credit. Depending on the assigned condition, participants were told that the lamp was designed either by a human or by an AI system, and that it was either an artistic or a scientific product. After viewing the stimulus, they reported their attitude toward the product ($\alpha = .92$) using the measures used in previous studies.

*Results.* After verifying that the manipulations were successful, a two-way ANOVA revealed that the main effect of generation source was not significant ($F(1,228) = .36$, $p = .548$), while the main effect of context was significant ($F(1,228) = 9.18$, $p = .003$). More importantly, the interaction between generation source and domain was significant ($F(1,228) = 10.72$, $p = .001$). Planned comparisons showed that in the art condition, attitudes were significantly more positive towards the human-generated lamp compared to the AI-generated one (MHUMAN = 5.81 MAI = 5.29, $p = .007$), while in the science condition, participants showed more favourable attitudes toward a lamp described as AI-generated (MAI = 6.14, MHUMAN = 5.78, $p = .059$). Together, these results indicate that human authorship

remains more favorable in the artistic domain, while in the scientific context AI-generation can be even positively evaluated.

## 4. General Discussion

This research advances the literature on consumer perceptions and responses to AI (e.g., Jain et al., 2023) by comparing the effects of AI vs. human generation sources for artistic products. Moreover, we examine the role of AI as human enhancement vs. human replacement in art (Hermann and Puntoni, 2025), furthering the understanding of the influence of AI in marketing contexts. Finally, we provided preliminary evidence on the relevance of domain-specific factors in determining consumer responses to AI. Our investigation also contributes to the evolving debate on generative AI, human creativity, and art (e.g., Zhou and Lee, 2024). While consumers are increasingly exposed to AI-generated artistic products, skepticism remains around their creativity. We showed that consumers are more favorable toward AI-generated art when they know that it was used to enhance the artist's work, in a similar vein as human-only.

From a managerial perspective, our research demonstrates that using AI in art generation can prevent consumers appreciation of artistic products. However, framing AI as a collaborator rather than a replacement may favor consumer acceptance of AI in the market of artistic products. Finally, firms may benefit from aligning the source of creation (AI vs. human) with their product positioning: using AI for science-based products and human creators for art-based ones.

This study has limitations that future research could address. First, additional research could extend the generalizability of our findings by using real-scraped data on platforms like Ted Talks that feature art/science and AI/Human tags. Second, future studies might investigate individual factors that could moderate the investigated effects, such as personality traits and dispositions. Finally, further research is needed to deepen our understanding of AI versus human generation in scientific domains, particularly by identifying the mechanisms driving the perceived superiority of AI in driving the evaluations of scientific products.

## Abstract

This study analyses the impact of psychological variables – attitude towards technology, perceived risk and perceived trust – in relation to the consumer choice between online and offline banking channels in Cameroon. The Cameroonian context offers a valuable case for examining digital adoption in under-researched African markets characterized by socio-technological asymmetries. Starting from the existing literature three hypotheses are formulated about technology adoption models; these hypotheses are then tested through a quantitative survey conducted on a sample of bank customers. Results show that a positive attitude toward technology combined with a reliable levels of perceived trust actually affect the choice of banking channels; however, perceived risk does not appear to significantly influence the choice between physical and digital channels. In addition, the study contributes to the theoretical understanding of consumer behaviour in multichannel banking and provides interesting scenarios and fruitful managerial implications for developing inclusive and effective banking strategies in emerging countries.

*Keywords: banking multichannel, consumer behaviour, digital banking, technology attitude, perceived trust*

## 1. Introduction

In recent years, Cameroon's banking sector has undergone significant transformation. In particular, the emergence of new banks, local or international, has completely renewed traditional practices, implementing innovative strategies in response to increasing digitalization (Tsapi & Kaïssou, 2020). The evolution of digital technologies and the proliferation of multiple banking channels are increasingly influencing customer behaviour and ways in which banks interact with them in a multichannel environment. Internet-based e-banking has become a widely adopted alternative to traditional banking, offering 24/7 access to services and significantly enhancing customer convenience (Rahi et al., 2021).

While digitalization offers interesting opportunities for the implementation of banking services and financial inclusion, it also presents challenges, especially in contexts characterized by socio-technological disparities, such as Cameroon. In this scenario, understanding consumer behaviour and approach regarding the choice of banking channels – digital (e.g. mobile or online banking) or physical (e.g. branch or ATM) – becomes increasingly important. These decisions are not driven solely by access to infrastructure, but

are also influenced by psychological variables such as perceived trust, perceived risk and attitudes towards technology.

The Technology Acceptance Model (TAM) and the Theory of Planned Behaviour (TPB) have highlighted the importance of psychological variables in determining users' intentions and behaviours (Davis, 1989; Ajzen, 1991).

A recent bibliometric analysis further confirms this perspective, identifying perceived usefulness, security, and trust are the three psychological pillars most frequently associated with digital banking adoption in emerging markets (Acosta-Prado et al., 2024). However, the majority of empirical applications of these models have focused on developed countries, with a still limited focus on sub-Saharan African markets.

This study focuses on three key psychological variables: attitude towards technology, perceived risk and perceived trust to understand if any impact on the consumer choice between online and offline banking channels in Cameroon.

The research aims to fill a literature gap and provide practical guidance for improving service design and customer engagement.

Accordingly, the study addresses the following research question:

*Which psychological variable influence customer's choice of banking channels in a multi-channel context?*

To answer this question, the study use established models of technology adoption and a quantitative survey conducted on a sample of bank customers in Cameroon.

The results contribute to a better understanding of digital behaviours in emerging markets and offer managerial implications for the development of more inclusive, effective and customer-oriented banking strategies.

## 2. Psychological variables in the choice of banking channels

Consumers' subjective perception plays a central role in the choice between physical and digital banking channels. This section analyses the main psychological variables examined in this study – attitude toward technology, perceived risk, and perceived trust – and discusses their theoretical relevance in the context of multichannel banking behaviour.

### 2.1 Attitude toward technology use

The attitude was initially defined by Triandis (1979) as an affective reaction, that is to say «the feeling of joy, pleasure, disgust or disappointment which the individual associates with a given behaviour». In behavioural terms, it refers to a positive or negative evaluation of the intention to perform an action (Ajzen & Fishbein, 1980; Davis, 1989). According to Eagly and Chaiken (1993), attitude is «a psychological tendency expressed by evaluating a particular entity with some degree of favour or disfavour».

In marketing, it has been shown that consumers develop specific attitudes toward technology (Curran et al., 2003; Daamen et al., 1990). The Theory of Reasoned Action (TRA) by Fishbein and Ajzen (1975) provides a theoretical framework for explaining individual behaviour. It postulates that behaviour is determined by intention, which in turn is influenced by the attitude towards action and subjective norms (i.e. the perceived opinion of the social environment). However, in this study it was decided not to consider the effect of subjective norms, in line with some authors who consider their impact marginal (Bagozzi et al., 2000; Dabholkar, 1994).

Recent empirical studies confirm that a favourable attitude toward technology remains a strong predictor of digital channel usage and behavioural intention, particularly in emerging and mobile-first economies (Arinta & Widyastuti, 2024; Rahi et al., 2021).

Based on this discussion, the following hypothesis is proposed:

H1: The attitude toward the use of technology influences the choice of banking channels.

### 2.2 Perceived risk

According to Cases (2007), perceived risk is considered as a determining variable in purchase decision made at a distance. In the context of online banking, the security of transactions is a crucial element (Hanafizadeh & Khedmatgozar, 2012; Aldás-Manzano et al., 2009) influencing consumer behaviour (Salman, 2010). Indeed, the perceived risk has been explored in studies on electronic banking adoption (Lee, 2009).

The risk can arise from different sources in digital channels: obligation to provide personal and financial data, uncertainty about the effectiveness of the service, lack of direct assistance. Garbarino and Strahilevitz (2004) categorize it into two main components: uncertainty about decisions and potential losses.

Luo et al. (2010) identify eight dimensions of perceived risk in digital banking services: performance, financial, temporal, psychological, social, confidentiality, physical and general. Among these, confidentiality, performance, and financial risks are often perceived as the most salient (Diallo et al., 2024; Waliullah et al., 2025).

Recent studies in emerging markets have further confirmed that high perceived risk significantly decreases customers' intention to adopt digital channels, particularly in contexts where trust in technology or institutions is low (Chipumuro & Mutambara, 2022; Gomes et al., 2024). For instance, insecurity around data protection and digital fraud remains a major barrier to mobile banking adoption across sub-Saharan Africa.

Considering that the most perceived risks in digital banking services are related to transaction security, data privacy and channel reliability, the following hypothesis is proposed:

H2: The higher the perceived risk, the more customers choose certain banking channels.

### 2.3 Perceived trust

Trust is also a key variable in commercial relationships (Dwyer et al., 1987) and has a positive impact on purchase intentions (Allagui & Temessek, 2005). In the banking context, it reflects the confidence that the service will be delivered properly even without direct supervision by the customer (Noventa et al., 2010).

McKnight et al. (2002) and Schlosser et al. (2006) identify several dimensions of trust: competence, benevolence, integrity, and credibility. Information transparency and the reliability of digital platforms are essential elements in fostering trust and encouraging the use of online channels.

Several studies have demonstrated that trust is a strong predictor of digital platform adoption (Vellido et al., 2000; Kim et al., 2009; Popoola & Arshad, 2015). Gomes, Schmidt, and Eberle (2024) demonstrate that both physical and digital channels contribute to building customer trust, which in turn fosters stronger commitment and engagement in multichannel banking contexts.

From this, the following hypothesis is derived:

H3: Perceived trust positively influences the choice of banking channels.

## 3. Methodology

This study adopts a hypothetico-deductive approach, starting from a theoretical framework to analyse the behaviour of Cameroonian banking customers in choosing between physical and digital channels. The dependent and explanatory variables were defined based on the existing literature, with the aim of testing the relationships between attitude toward technology, perceived risk, trust, and channel behaviour.

### 3.1 Measurement of variables

The dependent variable represents the customers' channel choice behaviour, measured through a set of items adapted from Hummel et al. (2017), referring to the various stages of the banking experience (information search, consultation, purchase, and post-sale). The items assess the use of both physical channels (branches, ATMs) and virtual ones (online banking, mobile banking), in order to capture actual user preferences. The psychological independent variables were defined as follows:

- Attitude toward technology was assessed through four 5-point Likert scale items, including two related to perceived usefulness and two to perceived ease of use, adapted from Davis et al. (1989), Luarn and Lin (2005), Im et al. (2008), and Zhou et al. (2010).

- Perceived risk was conceptualized as a multidimensional construct, articulated into three components: (1) security risk, referring to perceived vulnerability when performing digital operations; (2) privacy risk, concerning the potential for personal data to be shared without consent; and (3) uncertainty risk, relating to confidence in the reliability of digital services (internet and mobile banking) compared to traditional channels. The items were adapted from Featherman and Pavlou (2003), Ozdemir and Trott (2009), and Im et al. (2008).

- Lastly, perceived trust was measured using four items inspired by the models of McKnight et al. (2002) and Schlosser et al. (2006), covering the dimensions of competence, benevolence, integrity, and credibility of the banking provider in the digital context.

### 3.3 Data Collection and sample

The data collection instrument was a structured questionnaire administered online via Google Forms, in order to ensure anonymity and maximize accessibility. The questionnaire was pre-tested to verify clarity and eliminate potential biases.

The sample consisted of banking customers residing in Cameroon. The survey was conducted in 2024 on a sample of 263 Cameroonian banking customers, selected through a non-probabilistic convenience sampling technique. This methodological choice reflects both the limited availability of official databases for random selection and the exploratory nature of the study, which aims to provide preliminary insights into channel behaviour in an emerging context.

The collected data were subsequently analysed using appropriate statistical techniques to test the hypotheses. Specifically, descriptive analysis was conducted to explore frequencies and channel preferences, followed by chi-square tests to examine associations between psychological variables and channel choice.

## 4. Results

After performing a descriptive analysis of the variables, statistical tests were conducted to examine the relationships between the psychological variables (attitude toward technology, perceived risk, and trust) and the choice of banking channels.

*H1 – Attitude toward technology and channel choice*

Hypothesis H1 was confirmed. A comparison between the proportions of users preferring physical channels (67.7%) versus those opting for digital channels (32.3%) revealed a statistically significant difference ($p < 0.05$).

These findings indicate that, although the majority of customers still rely on traditional channels, a positive attitude toward digital technologies is significantly associated with a higher likelihood of adopting online or mobile banking. This supports the relevance of technological attitude as a determinant of channel behaviour, consistent with leading innovation adoption models (Davis, 1989; Venkatesh & Davis, 2000). In the Cameroonian context, this result suggests that a favourable disposition toward technology is an important driver of digital banking behaviour, even if traditional channels remain dominant in absolute terms.

*H2 – Perceived risk and channel choice*

Hypothesis H2, which posited that a higher perception of risk would lead consumers to prefer physical banking channels, was not supported. Perceived risk was measured across three dimensions: security risk, privacy risk, and uncertainty risk associated with the use of digital channels (Internet and mobile).

Specifically, the security risk dimension yielded $\chi^2(4) = 0.583$ with $p = 0.965$, while the privacy risk dimension produced $\chi^2(4) = 3.766$ with $p = 0.439$. Regarding uncertainty risk linked to Internet and mobile banking use, both tests returned p-values greater than 0.77.

An initial attempt to summarize these results using an average of the p-values was rejected for methodological reasons, as significance levels are not additive and do not reflect the strength of the effect.

The lack of significant effects suggests that, in the Cameroonian context, perceived risk does not constitute a decisive factor in the preference between physical and digital channels. Other psychological variables, such as trust and technological attitude, appear to have a greater influence on decision-making.

*H3 – Perceived trust and channel choice*

To analyse the relationship between perceived trust and the choice of banking channels, four chi-square tests were conducted on individual items reflecting distinct dimensions of trust. Two items – "the bank keeps its promises" and "the bank meets my expectations" – showed statistically significant associations with channel choice ($p = 0.050$ and $p = 0.038$, respectively), while the other two items – "the bank is trustworthy in the digital context" and "the bank takes my interests into account" – did not reach statistical significance.

Rather than aggregating the items into a single index, each dimension of perceived trust was examined separately to better identify the specific aspects influencing consumer behaviour. This approach highlights the multidimensional nature of trust: while general perceptions of trustworthiness or interest alignment may not directly impact channel choice, more operational aspects – such as promise fulfilment and expectation management – appear to play a decisive role.

These findings offer partial support for Hypothesis H3 and suggest that not all trust dimensions exert the same influence. In the context of digital banking, customers may base their preferences more on reliable service delivery than on abstract notions of institutional trust.

To support this analysis, Table 1 reports the results of the chi-square tests on the four dimensions of perceived trust in the digital context. The results highlight that only two items – "keeps its promises" and "meets expectations" – show statistically significant associations with channel choice.

| Perceived Trust Item | Pearson Chi-Square | df | Sig. | N |
|---|---|---|---|---|
| *1) This bank in the digital context is trustworthy* | 3.233 | 4 | 0.520 | 257 |
| *2) This bank keeps its promises and commitments* | 9.509 | 4 | 0.050 | 257 |
| *3) This bank takes into account my interests* | 2.893 | 4 | 0.576 | 257 |
| *4) This bank meets my expectations* | 10.172 | 4 | 0.038 | 257 |

**Table 1:** Chi-square test results for perceived trust and banking channel choice

## 5. Discussion

The study results provide partial confirmation of the hypotheses formulated. In particular, the role of a positive attitude toward technology as determining factor in the choice of digital channels emerges clearly, consistent with what is predicted by theoretical models on the adoption of innovation (Davis, 1989; Venkatesh & Davis, 2000).

Conversely, the hypothesis concerning perceived risk was not supported. None of the three dimensions investigated – security, privacy, and uncertainty – showed a statistically significant association with channel choice. This suggests that, in the context examined, consumers do not attribute enough weight to digital risks to influence their banking decisions. Increasing familiarity with digital services or the lack of more accessible alternatives may diminish the impact of perceived risk, shifting the focus to other influencing factors.

Lastly, the hypothesis regarding perceived trust received partial support. Only certain dimensions – such as the perception that the bank keeps its promises and meets expectations – were significantly associated with digital channel use. These results reinforce the idea that trust is not a monolithic construct, but rather a multidimensional one. The importance of reliability and consistency in fulfilling commitments indicates that digital customers rely more on tangible indicators of performance than on abstract judgments about the bank's benevolence or integrity.

Overall, the data suggest that digital channel adoption in Cameroon is primarily driven by psychological predisposition toward innovation and by trust in concrete service outcomes, rather than by concerns about risk. The managerial implications of these findings highlight the need for banks to invest in communicating service reliability, simplifying digital technologies, and enhancing digital literacy among less experienced users.

## 6. Conclusions

This study explores the impact of three psychological variables – attitude toward technology, perceived risk, and perceived trust– in relation to customer behaviour in selecting banking channels in the Cameroonian context. The results show that a positive attitude toward technology is a key factor in the adoption of digital channels, supporting the validity of innovation acceptance models in predicting consumer behaviour even in emerging markets.

The lack of a significant relationship between perceived risk and channel choice suggests that, in infrastructurally heterogeneous contexts such as Cameroon, concerns related to security and privacy may be outweighed by practical needs or growing familiarity with digital services. Regarding perceived trust, the effect was partial and selective: only dimensions related to reliability and expectation fulfilment had a significant impact on user behaviour.

These findings have relevant managerial implications. Banks operating in similar markets should invest in promoting digital literacy, clearly communicating the functionalities of digital channels, and strengthening trust by ensuring consistency between promises and actual service delivery. Furthermore, the development of educational initiatives aimed at increasing the confidence and technological self-efficacy of less digital-savvy customers is highly recommended.

However, this study has some limitations, including the use of a non-probabilistic sample and an exclusively quantitative approach. Future research could integrate qualitative or longitudinal methods, and extend the analysis to other geographic contexts to test the generalizability of the findings. The inclusion of additional variables – such as social support or perceived service quality – could further enrich the understanding of the psychological mechanisms underlying multichannel choices in the banking sector.

This article focused specifically on the psychological dimensions of multichannel behaviour. Other aspects addressed in the broader research – such as service complexity, user experience, and sociodemographic variables – will be explored in subsequent studies.

# Exploring Consumer Perceptions and Acceptance of Dealcoholized Wine in Italy: A Focus Group Study

Francesca Roat

Università Ca' Foscari Venezia

francesca.roat@unive.it

## Abstract

Food innovations—from novel foods to modifications of existing food products—often face consumer skepticism and resistance. Reformulations of culinary staples and traditional food products are particularly prone to rejection due to consumers' attachment to the original product. This study examines consumer perceptions and acceptance of such innovations, focusing on cases where core defining attributes are substantially altered. Dealcoholized wine in Italy provides a compelling example, as alcohol removal entails the loss of a central component of wine's sensory, functional, and symbolic identity. Drawing on a pilot focus group combining a free word association task with a semi-structured discussion, we offer preliminary insights and methodological validation. Findings indicate that unfamiliarity fosters curiosity and exploratory engagement regardless of skepticism levels. Consumers employed analogical reasoning to make sense of and familiarize themselves with the novel option. Furthermore, results reveal a clear tension between technical legitimacy and emotional acceptance. Key drivers and barriers to acceptance were identified. Overall, dealcoholized wine was perceived as a situational or necessity-driven fallback option. The study highlights how cognitive, affective, and socio-cultural factors interact to shape consumer acceptance (or rejection) of innovations that challenge culturally significant food identities.

*Keywords: consumer acceptance; food innovation; tradition; culture; identity; wine.*

## 1. Introduction

Today, the global food landscape stands at a critical crossroads. As demographic and environmental pressures intensify, an urgent need to radically rethink current food production and consumption systems materializes. A synergistic combination of food management, technological innovations, and diets is seen as a promising pathway to alleviate the rising pressures (Springmann et al., 2018). Alongside radical food innovations (e.g., cultured meat), a technological modernization of traditional, culturally embedded foods is being witnessed. In Italy, this includes reformulations of culinary staples such as pasta, now available in gluten-free or legume-based versions, and no/low-alcohol variants of classic Italian alcoholic beverages. These innovations strive to preserve the recognizable identity of a traditional, familiar product while modifying its composition, production process, or nutritional profile to better align with evolving consumer demand. While extensive research exists on novel food acceptance, relatively little attention has been dedicated to acceptance in the case of innovations in traditional food (Savino et al., 2018) and on the influence of culture and cultural traits on acceptance dynamics (Chong et al., 2022). To address these gaps, the study explores consumer perceptions and acceptance of dealcoholized wine and

dealcoholization processes in Italy. Wine in Italy is not just a beverage; it is a cultural artifact, a product associated with moments of conviviality and celebration, where alcohol plays a central role. The present research addresses two key questions: (1) How do consumers perceive and engage with innovations in traditional food products, such as wine, when one of its defining attributes –alcohol– is removed? and (2) What are the key drivers and barriers to the acceptance of dealcoholized wine? The primary aim of this paper is to demonstrate the effectiveness of focus group methodologies to explore the phenomenon of interest, drawing on preliminary findings from a pilot focus group interview (FG1).

## 2. Theoretical Background

The success of a novel food largely depends on consumer acceptance. Perceived benefits, risks, and costs of the novel product and its underlying technologies all influence consumer responses (Bearth & Siegrist, 2016), with benefits generally encouraging acceptance and risks inhibiting it. Acceptance revolves around a complex interplay of multiple interconnected factors, including biologically determined behavioral predispositions, sensory-affective elements, person-related factors (beliefs, norms, attitudes), and social-environmental influences (Contento, 2021). In this context, emotions can be predictive of behavioral intentions and behaviors (Laros & Steenkamp, 2004), with situational appropriateness playing a key mediating role (Giacalone & Jaeger, 2023). Consumer perceptions are often influenced by concerns regarding innovative production methods. These perceptions, however, are malleable (Siegrist & Hartmann, 2020), and providing information in the early phases of introduction can effectively increase acceptance (Deliza & Ares, 2018). Familiarity and knowledge also act as crucial mediators, developing certainty expectations and mitigating fears (Tuorila & Hartmann, 2020). Importantly, motivation to accept largely depends on consumers' psychographic and personality traits. Curiosity and openness to new experiences are often associated with greater willingness to try novel foods (Keller & Siegrist, 2015), while food neophobia (the reluctance to eat novel, unfamiliar foods; Pliner & Hobden, 1992), food technology neophobia (the fear of unknown or unfamiliar technologies; Cox & Evans, 2008), and chemophobia (suspicion regarding food additives) foster resistance. These attitudes, reflective of consumer aversion, manifest to varying degrees across technologies (Cardello, 2003). Interestingly, consumers often exhibit a 'natural-is-better' heuristic (Tuorila & Hartmann, 2020), identifying naturalness as one of the distinctive properties of traditional food and attributing the ability to preserve a food's natural state to traditional production methods (Pieniak et al., 2009). While consumers are generally open to innovations in traditional foods (Vanhonacker et al., 2013), acceptance ultimately depends on the specific nature of the innovation. Improvements in quality and nutrition are often well-received, provided they do not compromise core features, especially sensory properties, which often serve as authenticity indicators (Guerrero et al., 2009). Acceptance tends to increase when (1) innovations reinforce the traditional character of the product, (2) perceived benefits of the innovation outweigh the importance of the traditional character (e.g., improved safety), or (3) negative attributes associated with the traditional character are mitigated (e.g., fat reduction) (Reinders et al., 2019).

## 3. Methodology

The research employs a qualitative, exploratory design. Focus group interviews were chosen as a method due to their effectiveness in exploring perceptions, feelings, and thinking about relevant issues (Krueger & Casey, 2014) and their ability to stimulate debate, offering insights into how ideas are collectively accepted, rejected, and shaped in a group context. Our research design encompassed eight focus groups. Data collection occurred in April and May 2025 in Italy, using a combination of purposive and convenience sampling. Eligibility criteria required participants to be of legal drinking age with no particular wine expertise or prior

consumption history of dealcoholized wine. A pre-screening questionnaire collected sociodemographic information, along with scores for health-consciousness levels (HCS; Gould, 1988), food neophobia (FNS; Pliner & Hobden, 1992) and food technology neophobia (FTNS; Cox & Evans, 2008). In total, 43 individuals participated across the eight groups, each optimally sized at 5-6 participants (Krueger & Casey, 2015). Five groups were homogeneous by age (18-35 years) and three heterogeneous (all ages). Efforts were made to ensure balanced gender representation and diversity in HCS, FNS, and FTNS. The study also ensured broad regional representation of Italian consumers. Focus groups were conducted in person (average duration: 60-90 minutes) and audio recorded. The session involved an individual free word association (FWA) task, eliciting spontaneous associations and reactions to dealcoholized wine, followed by a semi-structured group interview and debate.

Data Analysis. FG1 consisted of five participants (3M, 2F; Mage = 26.0 years) with moderately high health-consciousness levels, low food neophobia, and moderate food technology neophobia. FWA data were analyzed through multi-stage qualitative coding, followed by quantitative frequency counting. Absolute and weighted frequencies were calculated, with weights assigned to words based on their recall order to reflect salience. Audio recordings were transcribed and analyzed using reflexive Thematic Analysis (TA) (Braun & Clarke, 2006; 2012).

## 4. Preliminary Findings and Discussion

Unfamiliarity to Exploration. Despite widespread unfamiliarity, participants did not express immediate rejection of dealcoholized wine, but rather a pronounced curiosity. Perceived as "weird", "alien", and "futuristic", the novel product triggered cognitive dissonance by defying deeply ingrained schemas of wine, where alcohol traditionally serves as a core identifier. This initial intrigue spurred a clear exploratory impulse and willingness to try, even among skeptics. This finding expands existing notions of early engagement with novel foods, suggesting that curiosity can act as a powerful initial driver. Exploratory behavior was not solely driven by desires for genuine adoption, but often took the form of "amusement" or "playful experimentation", indicating a low-commitment initial interaction. This observation aligns with and specifies how motivation to try novel foods can be influenced by personality traits like curiosity (Keller & Siegrist, 2015), suggesting a distinction between exploratory trials and their potential for habitual consumption. The challenge of imagining wine without its defining alcoholic component, particularly given how alcohol's sensory properties are inherently co-constructed during fermentation, fueled curiosity for sensory assessment and social viability, identifying its potential for social stigma in normative alcohol consumption contexts. Price sensitivity critically mediated willingness to try, as participants expected price parity with traditional wines despite awareness of potentially higher production costs. Active information-seeking behavior was also consistently observed; as literature on early information provision suggests (Deliza & Ares, 2018), this appeared to nurture openness as participants acquired knowledge and familiarized themselves with the novel concept. Familiarization Through Analogical Reasoning. To make sense of dealcoholized wine and mitigate conceptual distance, participants consistently employed analogical reasoning, spontaneously drawing comparisons to familiar re-engineered beverages (e.g., no-alcohol beer, zero-sugar sodas) and similar innovations (e.g., e-cigarettes, plant-based food). These analogies served as cognitive bridges and anchors in a proactive effort to include the novel concept within their mental frameworks, aiding in conceptualization, interpretation, and ultimate legitimization of dealcoholized wine. The beer analogy, in particular, provided an accepted market precedent, contributing to the product's perceived legitimacy. This process supports and extends the literature on familiarity and knowledge as mediators of acceptance, which develop certainty expectations and mitigate fears (Tuorila & Hartmann, 2020). This familiarization process involved both individual and collective sensemaking. As participants

offered analogies, they contributed to a shared understanding, gradually reframing dealcoholized wine from a radically disruptive innovation to a logical extension of an ongoing evolutionary trajectory. This perspective suggests consumers actively seek to "reappropriate" familiarity with well-known categories after novel extensions. The existence of similar alternatives normalized the concept, reducing perceived strangeness and artificiality, and fostering acceptance by situating dealcoholized wine within a broader cultural shift towards more flexible consumption.

The Wine Identity Debate. Participants readily granted dealcoholized wine formal legitimacy as an extension to the established wine category, acknowledging shared raw materials and winemaking practices. This initial cognitive assignment indicated that, from a technical standpoint, alcohol was not universally considered an indispensable wine component. However, a significant divergence in emotional acceptance emerged, revealing a tension between technical recognition and deeper integration. Some participants demonstrated greater tolerance to alcohol's removal, perceiving dealcoholized wine as 'different but not necessarily inferior' to wine. This aligns with research showing that innovations mitigating perceived negative attributes of traditional products (such as high alcohol content) promote acceptance when these benefits resonate with consumers (Reinders et al., 2019). Conversely, others viewed alcohol's removal as an irreparable loss of wine's essence, dismissing it as "grape juice" or "fake wine". This categorical demotion, rooted in a categorical purity logic, challenges the idea that technical adherence and origin alone can ensure acceptance of innovations in traditional foods. For skeptics, alcohol was not simply an attribute, but a defining, irreplaceable marker of wine's identity, integral to the product's traditional character and granter of authenticity. This perspective aligns with research emphasizing the importance of preserving core characteristics and sensory properties when introducing innovations in food (Guerrero et al., 2009). Dealcoholization was perceived as fundamentally disrupting traditional production methods, thereby violating the perceived natural state and integrity of wine (Pieniak et al., 2009). Drivers and Barriers to Acceptance. Collectively, our findings reveal a complex interplay of factors shaping consumer acceptance beyond the core identity debate. While functional benefits such as health, responsibility, and social inclusion emerged as key drivers, taste critically operated as a primary, non-negotiable threshold for acceptance; any perceived deviation from a satisfactory profile immediately precluded adoption. Moreover, chemophobia and social stigma emerged as substantial barriers. Dealcoholized wine was largely perceived as a necessity-driven fallback option. Its appeal was predominantly rooted in its utility for social inclusion and responsible consumption, rather than appreciative consumption or suitability for special social events. This underscores that despite recognized functional benefits, the perceived loss of experiential and hedonic value, coupled with situational inappropriateness (Giacalone & Jaeger, 2023), critically hinders consumer acceptance.

## 5. Conclusion

This study explored consumer perceptions and acceptance of dealcoholized wine in Italy, demonstrating the suitability of focus group methodologies for investigation. Results reveal a clear tension between technical legitimacy and emotional acceptance of novel foods. While curiosity and analogical reasoning foster initial engagement and openness, the perceived loss of experiential and hedonic value, taste, and social stigma raise critical barriers, relegating dealcoholized wine to a "Plan B" option. These insights shed light on how consumers perceive and respond to novel foods that challenge traditional categories, highlighting the complex interplay of factors critical to acceptance, particularly for products rich in cultural and symbolic meaning.

# Virtual or Human Influencers? Exploring Consumer Authenticity, Trust, and Engagement Across Generations

Massimiliano Ruggiero[1], *, Giovanni Mattia[1], and Martina Toni[1]

[1] University of Roma Tre, Italy

*Corresponding author: massimiliano.ruggiero@uniroma3.it

## Abstract

This study investigates the relative effectiveness of virtual influencers (VIs) and human influencers (HIs) in shaping consumer perceptions, trust, and engagement within the context of influencer marketing.

A mixed-methods approach was adopted, combining two focus groups (n = 22) with social media and sentiment analysis. Key dimensions of the focus groups' findings were observed: perceived authenticity, sense of security, emotional engagement, and transparency. At the same time, qualitative and quantitative analysis of a subset of these influencer profiles on Instagram offered complementary insights into user engagement and sentiment dynamics.

The findings demonstrate a substantial benefit of HIs in forging authentic connections and achieving higher levels of involvement especially in product categories that require credibility. On the other hand, VIs, although considered a novelty, are opposed by obstacles related to their artificial character and the absence of tangible experiences. Generational differences emerged: Gen Z showed a greater openness to VIs if transparency is guaranteed, while Millennials consistently preferred HIs. Sentiment analysis confirms that VIs evoke curiosity but have a weaker emotional intensity than HIs. Finally, VIs appear promising in vision-driven and innovation-based scenarios. Ultimately, authenticity, relatability, and transparency are still crucial to the effectiveness of influencer marketing. Hybrid approaches that seamlessly integrate both VIs and HIs are also recommended to address evolving customer requirements.

*Keywords: Virtual Influencers, Human Influencers, Consumer Behavior, Authenticity, Trust, Engagement*

## 1. Introduzione

The concept of virtual influencers (VIs) has gained increasing attention in digital marketing, referring to computer-based characters engineered to mimic human characteristics and engage in social media interactions. Academic interest in the strategic use thereof is increasing in relation to questions of authenticity, engagement, and trust (Mrad et al., 2024).

Unlike HIs, VIs are completely programmed by their creators, which allows brands to create consistent messaging and aesthetics, but also results in concerns regarding transparency and consumer entrapment (Jhawar et al., 2023). While VIs may be regarded as novel and interesting, their synthetic nature may make them difficult to bond with emotionally, and may be perceived as less credible than HIs.

As noted by Jin and Viswanathan (2024), encounters with AI-based influencers can activate feelings of dissociation, which can be disconcerting, especially when they are perceived as a threat to human authenticity or identity. Mouritzen et al. (2024) emphasize the contrasting nature of technological novelty with the basic requirement of relational trust in marketing communication.

A generational gap also emerges from the literature, with younger users, including Gen Z, being more predisposed to interact with VIs, as long as the artificial nature and narrative of the VIs are made explicit (De Cicco et al., 2024). Nonetheless, there are few empirical studies comparing user interaction and views on VIs and HIs. This paper fills this void by employing an integrative approach to examine how consumers perceive authenticity, trust, and engagement in response to both virtual and human influencers.

## 2. Methodology

To examine consumer perceptions and purchase decisions with VIs compared to HIs, a mixed-methods design was employed, combining two focus groups with social media comments and sentiment analysis.

Two focus groups were conducted in person, led by trained facilitators. Maximum variation sampling was used to recruit 22 participants. The first group consisted of 10 college students, with an equal gender balance (5 males and 5 females) and a balanced representation across two generations (5 from Generation Z and 5 from Millennials). On the other hand, the second group consisted of 12 consumers, a gender-balanced group (6 males and 6 females), comprising 7 individuals from Generation Z and 5 from Millennials. Participants were selected to represent key market segments and achieve gender parity.

Focus groups were used to explore shared meanings around trust and authenticity. The mixed generational and gender composition enabled comparison across perspectives, while facilitators ensured balanced participation despite possible heterogeneity. Through the focus groups (conducted for 90 min) that were audiotaped and transcribed verbatim, dimensions such as perceived credibility, trust in the influencer, emotional engagement with the content, transparency of the posts, and purchase intention were addressed. Special consideration was given to the role of consumer generations in their reactions.

Concurrently, a social media study was carried out specifically targeting the Instagram platform. The profiles of three virtual influencers (@shudu.gram, @lilmiquela, @francescagiubelli) and human fashion influencers (@youaremylemonade, @valentinavignali, @chiaraferragni) were chosen and compared. Likes, comments, and overall interactions, as measures of engagement rates, were quantified by "Not Just Analytics". Comments were also qualitatively analyzed to see what the users feel and have to say about any such interactions.

## 3. Results

The results of the focus group analysis identified the shared perception that VIs are not as genuine or trustworthy as HIs. These feelings were closely related to the absence of physical and emotional presence, as well as the offline experience, of the very process on which audience trust was thought to rely. On the other hand, HIs were positively perceived for their transparency, the emotion expressed in the content, and the potential to form empathetic connections with followers.

Finally, the generational differences further contributed to the discussion. Generation Z exhibited a greater willingness to use virtual influencers (VIs) when a coherent narrative accompanied them and their artificiality was effectively communicated. However, some Gen

Z participants appreciated the notion that VIs might offer less biased opinions than those of individuals with personal interests. The need for clear information about the VIs' identity was stressed, also among Gen Z.

Millennials, however, showed a preference for genuine HIs, which are perceived as more trustworthy, especially in categories where trust is crucial.

| Element | Gen Z | Millennials |
|---|---|---|
| Authenticity | Greater openness to VIs, seeking coherent storytelling. | Preference for HIs with real-life experiences and emotional authenticity. |
| Trust | Clear indication of virtual nature required | Strong emphasis on transparency and influencer background |
| Engagement | Greater willingness to accept VIs for aesthetically-driven products | Preference for HIs, particularly for technical or experiential products |

**Table 1:** Generational differences emerging from the focus groups

The social media analysis further corroborated the findings from the focus groups. The HIs analyzed, particularly @chiaraferragni and @youaremylemonade, recorded significantly higher engagement rates compared to VIs. Comments directed at HIs were more focused on admiration for their journey and the relationships built over time. The engagement rate is calculated by dividing the total interactions by the number of followers and multiplying by 100.

| Influencer | Follower count | Average likes | Average comments | Engagement Rate (E.R.) |
|---|---|---|---|---|
| @lilmiquela (VI) | 2,514,892 | 2,947 | 58 | 0.12% |
| @valentinavignali (HI) | 2,696,593 | 27,001 | 135 | 1.01% |
| @shudu.gram (VI) | 238,246 | 3,846 | 59 | 1.64% |
| @youaremylemonade (HI) | 222,372 | 11,918 | 165 | 5.43% |
| @francescagiubelli (VI) | 12,100 | 472 | 20 | 4.07% |
| @chiaraferragni (HI) | 28,703,350 | 6,318,000 | 16,193 | 18.39% |

**Table 2:** Comparative engagement rates between VIs and His

These quantitative data supported the qualitative results. For product categories high in visual attributes (e.g., fashion and accessories), the aesthetic nature of communication may decrease the perceived gap between VIs and HIs. Yet influencer authenticity and credibility are still relevant for technical or experience-based products and are in favor of HIs. In contrast, calls for VIs, as they became more visible and interactive (especially Francesca Giubelli), drew more detached commentary, often centered around their technicity and their use of artificial intelligence. To further explore these perceptions, it was also conducted a focused sentiment

analysis of user comments for two influencers: Francesca Giubelli (VI) and Chiara Ferragni (HI). The engagement rates (E.R.) of all sample influencers were compared, and a sentiment analysis was performed on the two profiles with the highest E.R. in each category to facilitate a more targeted discussion.

While the accounts have vastly different numbers of followers, these were the extremes (outliers) within their type of influencers when it comes to engagement performance, which makes the comparison reasonable. This method enabled the comparison of two profiles, despite their differing scales, which showed a maximum of interaction in their assigned regions. Therefore, the comparison is not about being proportional to the market (market representativeness), but rather about examining the sentiment dynamics at the peak engagement levels of each category. Comments were systematically categorized as positive, neutral, or negative, offering more profound insights into audience reactions:

| Influencer | Positive (%) | Neutral (%) | Negative (%) |
|---|---|---|---|
| **Chiara Ferragni (HI)** | 60 | 25 | 15 |
| **Francesca Giubelli (VI)** | 45 | 40 | 15 |

**Table 3:** Sentiment distribution of user comments for the most engaged VI and HI

In the case of Chiara Ferragni, the positive comments mainly focus on a strong emotional and family bond ("We love you") and professional appreciation, which are the main features on this platform ("What a successful event"). The results, therefore, point to a strong relational ability on her part: the positive comments on Francesca Giubelli concentrate mainly on aesthetic issues ("You are great") and the development of technology ("That's cool"), while the neutral responses tend to be brief interactions or emojis. As for negative messages, their main thrust is expressed as doubt about what computers can do ("When you start even flirting with AI."). It is noteworthy that all human and virtual influencers analyzed here were female. This reflects the current market environment, in which women are prominent both as entrepreneurs and consumers, even if they have tended to take a more backseat role within specific male-dominated industries or politics. That is also why female profiles dominate major sectors such as fashion, beauty, lifestyle – the key categories of our research. The selection was thus in line with current industry trends rather than a source of bias from sampling.

Combined statistical analysis suggests that authenticity and the ability to form relationships are crucial elements of successful influencer marketing strategies. They have a clear advantage in terms of the number of comments they elicit and their ability to establish authentic relationships; these, then, tend to generate an emotional level of intimacy more advanced than might be possible with other marketing tools. While VIs offer attraction and greater affinity at lower ages or in design-led contexts, they are still essentially detached forms of engagement. However, positive and neutral comments for VIs show growth potential, provided brands transparently and coherently integrate them to meet the expectations of their audience evolving towards this "artistics".

## 4. Conclusions

Influencer marketing is shifting towards authenticity. The outcomes of analyzing social media and two different discussion groups showed that while virtual influencers represent a creative yet still promising new entry into digital marketing, they face the challenges of being seen as

"artificial" and lacking real-life experience. The results suggest that human influencers have a clear advantage in terms of continuity and relationship building. This is particularly important for product segments where trust and credibility are crucial to success. VIs are showing potential in visually driven and innovation-oriented settings, mainly amongst younger consumer segments. However, their own 'performance' is heavily dependent on whether brands can use them clearly and consistently without undermining the audience's perception that it is a fake thing. The sentiment analysis enhances these insights. VIs can be big attention-grabbers and set the tone, but it is still a superficial form of interaction compared to HIs. Whether a brand provides a platform where fashion tribes can freely communicate with one another, or a fine-tuned grid for textile textures with which they can experiment, depends on the strategy's judiciousness and transparency. Indoors in 2004, the recently then aged who was born 8 years old now runs an office in London for a burgeoning British travel portal. Looking forward to tomorrow, the marketing strategy of combining VHIs' strengths with HIs' weaknesses appears to be the best approach. Such a composite approach enables brands to adapt their use of influencers according to the expectations of their target audience, as well as the individual product contexts. Ultimately, whether VIs can achieve success lies in how ethically, transparently and context-appropriately they are employed in influencer marketing practices. Other kinds of values, driven by authenticity such as today's consumer increasingly demands, simply do not apply.

# Distorting Information in the Evaluation of Drip Pricing

Domenico Sardanelli

Ecampus University (Italy)

domenico.sardanelli@uniecampus.it

## Abstract

Drip pricing is a widespread commercial strategy in which the base price of a product is initially displayed, followed by the sequential disclosure of optional surcharges. While effective in increasing total purchase value, this practice has been criticized for its potential to mislead consumers and reduce satisfaction. Existing research has explored cognitive and contextual factors underlying consumer susceptibility to drip pricing, yet the role of evaluative biases in this process remains underexplored. This study investigates whether predecisional distortion of information – a judgmental bias wherein earlier preferences influence the evaluation of subsequent attributes – contributes to the "stickiness" of consumer choices in drip pricing scenarios.

A scenario-based experiment is conducted across three conditions: (1) drip pricing, where attributes and surcharges are revealed sequentially; (2) cumulative pricing, where all costs are shown upfront; and (3) a variable flight condition, where attributes are presented sequentially but linked to different products. Participants evaluate a round-trip flight and choose which surcharged services to include in their final bundle. We expect that participants in the drip pricing condition will show higher inclusion of surcharged services and greater commitment to their final choice, despite higher overall costs. This pattern is anticipated to reflect the influence of predecisional distortion, which should be absent in the variable flight condition. Results will contribute to a deeper understanding of consumer decision-making in dynamic pricing environments and highlight the cognitive mechanisms underlying the effectiveness – and ethical concerns – of drip pricing strategies.

*Keywords: drip pricing; predecisional distortion; sequential evaluation; decision stickiness; dynamic bundling*

## 1. Introduzione

It is common practice for airlines to structure the ticket-buying process so that customers are first shown base prices and then sequentially presented with additional items or services along with their respective surcharges. Beyond travel, similar tactics are commonly adopted in other sectors as well, such as hospitality (Moriuchi & Murdy, 2024) and entertainment (Holmstrom, 2019). This practice, known as drip pricing, has been accused of being deceptive since add-on prices are not disclosed upfront (Banerjee et al., 2023) and it has also been questioned in terms of its effectiveness in promoting customer satisfaction (Santana et al., 2020).

The controversy surrounding drip pricing lies not in the flexibility it offers by itemizing prices, but in the delayed disclosure of surcharges – only revealed once consumers are already engaged in the buying process. Indeed, the clear intent behind drip pricing is to induce consumers to purchase more expensive service bundles than they might choose if all prices

– base fare and surcharges – were presented upfront. Nonetheless, its widespread use requires marketers to consider how consumers react to drip pricing and what are the factors driving their reactions.

Santana et al (2020) found that when optional surcharges are disclosed gradually (i.e., drip pricing) rather than upfront, consumers are more likely to choose a lower basepriced option that ultimately becomes more expensive after fees are added. Even when total prices are later revealed and consumers have a chance to revise their choices, many stick with the initially chosen, costlier option – despite being relatively dissatisfied. This behavior is driven by factors such as high perceived search costs, self-justification, and the mistaken belief that all firms impose similar surcharges (Santana, 2020).

The objective of the present study is to explore the role of an additional cause of sticky reactions to drip pricing, namely the predecisional distortion of information (Russo et al., 1998). This bias of evaluative judgment consists in the undue influence of prior attribute's evaluation on the evaluation of the next attribute in a by-attribute sequential evaluation.

To our ends, decisions involving drip priced products must be appropriately conceptualized as one option choices, with each surcharge intended as a product attribute, leading to a final acceptance vs rejection choice. However, additional complexity is due to the fact that at each step consumers have the possibility to add the surcharged service to the product bundle, effectively creating a new product. Here, the final decision becomes an acceptance vs rejection of the culminated product, which may differ significantly from the initially advertised version.

Therefore, rather than viewing drip pricing as a single-stage evaluation of a priceincreasing tactic, it is more accurate to see it as a dynamic bundling process, where each surcharge presents a choice node that modifies the evolving product, culminating in a final accept/reject decision on a personalized configuration.

This conceptualization of drip pricing allows to put to the test whether information distortion builds up during the process up to the final decision, and whether this predecisional distortion in turn leads to stickiness in consumers' behavior (increased likelihood of including surcharged options).

## 2. Methodology

The study employs a three-cell scenario-based experimental design. Participants are randomly assigned to one of the following groups:

- Drip pricing condition: attributes and their prices are presented sequentially.

- Cumulative pricing condition: all attributes and their prices are shown together at the outset.

- Variable flight condition: attributes are presented sequentially, but each belongs to a different product.

The latter condition is included to provide an unbiased estimate of attribute diagnosticity, following established practices in predecisional distortion research (Russo et al., 1998; Blanchard et al., 2014; Sardanelli, 2019). The survey, administered in Italian, targets native Italian speakers and will be distributed via Prolific with direct compensation. A total of 150 participants will be sampled, equally distributed across the three conditions.

The scenario asks participants to imagine booking a round-trip flight covering 5,000 km and lasting 6 hours each way. In the drip pricing condition, each flight attribute is presented

sequentially. Attributes include the base fare and five optional services, each with an associated surcharge (Table 1).

| Attribute | Price (€) |
|---|---|
| ***Base fare*** | **259.00** |
| ***Carry-on bag*** | 19.00 |
| ***Checked bag*** | 51.00 |
| ***Seat selection*** | 21.00 |
| ***Priority boarding*** | 15.00 |
| ***Insurance*** | 74.00 |

**Table 1:** Flight attributes and itemized prices.

After each attribute is presented, participants answer three questions. The first question asks how much they think the information makes the flight more attractive (i.e., attribute diagnosticity). The second question asks participants to consider all the information received up to that point and indicate whether they are leaning toward purchasing the flight or not (i.e., leading alternative). The third question assesses their confidence in that leaning decision (i.e., confidence in the leading alternative). Finally, the fourth question asks whether they want to add the service to their product bundle (i.e., add-to-bundle).

This fourth question is not asked after the base fare presentation, as the base fare defines the core product rather than an optional feature. Including an add-to-bundle question for the base fare would transform the evaluation into a post-decision adjustment process.

After the final attribute is shown, participants select their preferred bundle and indicate their confidence in the decision.

In the cumulative pricing condition, participants receive the same scenario but are shown all attributes and their prices at once. Evaluations are done via a table with dropdown menus. Next, they select which services to add and then indicate whether they would purchase the final bundle, along with their confidence in this decision. In the variable brand condition, attributes are presented sequentially, as in the drip pricing condition. However, each attribute is presented as belonging to a different airline's flight. As a result, participants only evaluate each attribute in isolation by indicating how attractive the information make that specific flight. Because each attribute refers to a different product, these evaluations are not expected to be influenced by predecisional distortion, which requires information integration across a single decision object.

After completing the main task, all participants complete an attention check that asks them to recall the price of selected attributes. The survey concludes with a set of sociodemographic questions.

## 3. Expected findings

We expect the results to support the hypothesis that predecisional distortion of information contributes to consumer stickiness in drip pricing scenarios. Specifically, participants in the drip pricing condition are anticipated to include more surcharged services in their final product bundle compared to those in the cumulative pricing condition. This would reflect the influence of sequential presentation on evaluative bias and commitment to the evolving product.

In the drip pricing condition, we expect to observe increasing attractiveness ratings for later attributes that align with the initial positive leaning decision – indicating predecisional distortion. This pattern should be weaker or absent in the cumulative pricing condition, where attributes are evaluated simultaneously, and entirely absent in the variable flight condition, where no single decision object accumulates information. Even when the final cumulative price is higher than expected, participants in the drip pricing condition are expected to remain committed to their initial selection. This stickiness is likely to manifest in higher purchase intentions and confidence levels. Finally, the diagnosticity gap between the drip pricing and variable flight condition is expected to drive commitment to the evolving product in the drip pricing condition. Taken together, these findings on accept/reject decisions in drip pricing settings would align with existing research demonstrating that predecisional distortion occurs in binary (Russo et al., 1998), single-option (Bond et al., 2007; Boyle et al., 2025), and multipleoption choices (Blanchard et al., 2014; DeKay et al., 2014). Additionally, they would provide further evidence that people distort not only narrative or ambiguous information but also precise numerical information (DeKay et al., 2009) – the type commonly presented in drip pricing scenarios.

Interpreting decisions involving drip pricing as a form of dynamic bundling sheds light on the role of biased judgment in driving stickiness in consumer behavior and highlights predecisional distortion as a key contributing factor. This perspective raises important ethical concerns about the appropriateness of drip pricing strategies, given their intentional design to spread information in a way that increases consumers' commitment to potentially suboptimal decisions.

# Redefining Luxury: Consumer Responses to Marketing of Lab-Grown vs. Natural Diamonds

Nora Regina Schraffl[1],*, Marco Francesco Mazzù[2], and Angelo Baccelloni[3]

[1] Luiss University, Department of Business and Management, Rome, Italy
[2] Luiss Business School, Rome, Italy
[3] John Cabot University, Rome, Italy

## Abstract

The diamond industry is undergoing rapid transformation, driven by emerging trends and shifting consumer preferences. Lab-grown diamonds are becoming increasingly popular as an alternative to natural diamonds, encouraged by growing interest in sustainability, affordability, and ethical concerns. In this evolving market, marketing strategies play a crucial role in shaping purchasing decisions. This research examines how marketing strategies impact consumer intentions for lab-grown versus natural diamonds and identifies the most effective approaches. Using a survey-based quantitative method, individual strategies, such as price, ethical considerations, emotional appeal, and exclusivity, were tested separately. The findings reveal that while marketing strategies significantly influence consumer behavior, they have a stronger impact on natural diamonds. Price and ethical concerns favor lab-grown diamonds, while emotional appeal, exclusivity, and luxury branding reinforce the desirability of natural diamonds. Demographic factors also influence purchasing preferences, with younger consumers more open to lab-grown diamonds. This study may support future research on marketing strategies in diamond purchasing decisions. Keywords: diamond industry, lab-grown diamonds, natural diamonds, marketing strategies, purchasing intentions, consumer behavior

## 1. Introduction

The diamond industry is undergoing a significant shift with the rise of lab-grown diamonds, which are chemically identical to natural ones but offer ethical sourcing, environmental sustainability, and affordability (Lodha, 2024; Mihailovich et al., 2021). These benefits particularly appeal to Millennials and Gen Z, who prioritize social responsibility (Savin et al., 2024). Lab-grown diamonds require significantly less water and emit fewer greenhouse gases (Zhdanov et al., 2021; Nature Communications, 2024) and offer production cost advantages (Rrustemi & Tuchschmid, 2020). Traditional preferences, shaped by decades of marketing focused on rarity and emotional value (Keech et al., 2020; Purinton, 2012), persist. Lab-grown diamond brands emphasize sustainability and affordability (Ioannou & Mickshik, 2025), while natural diamond marketers highlight geological rarity and historical significance (Francis-Tan & Mialon, 2014; Spar, 2006). Consumer acceptance of lab- grown diamonds is growing, with 46% of couples choosing them in 2023 compared to 12% in 2019 (Bates, 2024), though prices have declined significantly relative to natural diamonds (McKinsey & Company, 2023).

Given rising interest but falling prices for lab-grown diamonds, this study investigates how specific marketing strategies along the decision journey (Giorgino & Mazzù, 2024) influence purchasing decisions for lab-grown versus natural diamonds. The research question is: To what extent do different marketing strategies impact consumer purchasing intentions for lab-grown versus natural diamonds? This study investigates the impact of eight distinct marketing strategies (detailed in the Methodology) to identify which factors most significantly influence purchasing preferences for lab-grown and natural diamonds.

## 2. Aims and Contributions

As lab-grown diamonds rise, understanding marketing's impact is crucial. Traditional drivers of luxury, such as rarity and exclusivity (Wang et al., 2022), still shape preferences for natural diamonds, but lab-grown alternatives require different marketing approaches to create desire and perceived value. This study draws on the concept of psychological ownership, which describes the feeling that a product is "mine" even before purchase (Morewedge et al., 2021). In luxury contexts, psychological ownership enhances perceived value and attachment, increasing the likelihood of purchase (Pierce & Peck, 2018). Marketing strategies can strengthen this connection by making products feel more personally relevant, attainable, or symbolically significant. The marketing strategies tested aim to activate psychological ownership through different mechanisms. Strategies like price and promotions make diamonds feel more accessible (Thompson & Malaviya, 2013), while eco-friendliness and ethical sourcing invite consumers to identify with the product's social and environmental values (Bhattacharya & Sen, 2004). Emotional appeal and luxury messaging reinforce symbolic exclusivity (Keller, 2013), and customization increases perceived control and uniqueness (Pierce & Jussila, 2011). Celebrity influence can foster psychological ownership by encouraging identification with aspirational figures (Pham et al., 2022).

It is expected that these strategies will impact consumer sensitivity differently depending on the diamond type. Lab-grown diamonds, which lack traditional luxury attributes, may rely more on marketing approaches that actively build psychological ownership, such as accessibility, ethics, and customization. In contrast, natural diamonds may continue to benefit from strategies that emphasize emotional value, luxury heritage, and exclusivity. Hypothesis: Marketing strategies influence consumer purchasing intentions for lab-grown diamonds more than for natural diamonds. This study contributes to luxury marketing research by comparing the effectiveness of marketing strategies for lab-grown and natural diamonds. Demographic factors like age, income, and location influence responses. By considering these differences, this study offers practical insights for tailoring marketing strategies to specific consumer segments in an increasingly sustainability-driven market.

## 3. Methodology

This study employed a structured survey divided into five main sections. The first section evaluated participants' diamond purchasing history and their awareness of the differences. The second section tested purchase intentions before and after exposure to marketing messages. The third section asked respondents to rank key decision- making factors when purchasing diamonds, including price, appearance, emotional significance, ethical concerns, and brand reputation. The fourth section assessed the persuasiveness of eight distinct marketing strategies. Participants evaluated scenario- based descriptions simulating realistic marketing situations to measure how each strategy influenced their purchasing likelihood. The strategies were rated on 5-point Likert scales (1 = Strongly disagree to 5 = Strongly agree), using items adapted from prior studies: price (Butcher, 2024), eco-friendliness (Tenuta et al., 2024), emotional appeal (Shields & Shields, 2021), luxury, specifically focusing on exclusivity and highend branding (Wang et al., 2024), customization (Sun et al., 2024), celebrity influence (Philippe et al., 2021), ethical sourcing (Schulte et al., 2021), and

promotions (Gunter, 2002). All items were slightly adjusted to fit the diamond purchasing context. The final section of the survey collected demographic information, including gender, age, income, and place of residence.

The survey was conducted online using the Qualtrics® platform and was available from 20 December 2024 to 24 January 2025. Responses were collected via social media and personal outreach, ensuring a diverse but convenience-based sample. A total of 248 individuals accessed the survey, and after removing incomplete or invalid entries, 213 valid responses were retained for analysis. The final sample was balanced in terms of gender, with 51.6% identifying as male and 46.9% as female. Most participants were between 18 and 44 years old, representing the primary target group for diamond purchasing decisions. Most respondents reported annual incomes below €40,000. Geographically, the sample was diverse. 76.1% of respondents were based in Europe, with the largest groups from Italy (35.7%), South Africa (20.7%), and the UK (15.0%).

## 4. Findings

### 4.1 Impact of Marketing Strategies on Purchasing Intentions

A linear regression analysis was conducted to assess the impact of the eight marketing strategies (as presented in the introduction) on consumer purchasing intentions, which served as the dependent variable. All eight strategies were included as independent variables. The analysis revealed that these strategies explained 27.7% of the variance in purchasing intentions for lab-grown diamonds ($R2 = 0.277$, $F(8, 204) = 80.991$, $p < 0.001$, $\beta = 0.797$). For natural diamonds, the explanatory power was higher, with 46.7% of the variance explained ($R2 = 0.467$, $F(8, 204) = 184.575$, $p < 0.001$, $\beta = 1.203$). These results indicate that the combined marketing strategies were more effective in influencing consumer choices for natural diamonds than for lab-grown diamonds. The Pearson correlation coefficients confirm this difference, with $r = 0.527$ for lab-grown diamonds and $r = 0.683$ for natural diamonds.

### 4.2 Individual Marketing Strategies

Detailed analysis of the eight marketing strategies showed that price and eco- friendliness were the strongest positive drivers for lab-grown diamonds. The price strategy was rated highly persuasive ($M = 4.23$, $SD = 0.95$), followed by eco- friendliness ($M = 4.11$, $SD = 1.02$) and ethical sourcing ($M = 3.96$, $SD = 1.09$). These strategies were more effective for lab-grown diamonds than for natural diamonds, confirming that affordability and sustainability remain key selling points. In contrast, emotional appeal ($M = 4.35$, $SD = 0.86$) and luxury and prestige ($M = 4.17$, $SD = 0.94$) were the most persuasive strategies for natural diamonds. These results suggest that traditional messages focused on heritage, exclusivity, and emotional symbolism remain particularly influential for this product category. Customization was moderately persuasive for lab-grown diamonds, while celebrity influence and promotional discounts had smaller but still statistically significant effects. Celebrity endorsements had less impact, suggesting a limited effect of aspirational branding.

### 4.3 Summary of Hypothesis Testing

The results consistently demonstrate that marketing strategies exert a stronger influence on natural diamond purchases ($R2 = 0.467$, $p < 0.001$) than on lab-grown diamond purchases ($R2 = 0.277$, $p < 0.001$). The hypothesis that marketing strategies influence lab-grown diamonds more is therefore rejected. Gender ($B = 0.216$, $p = 0.038$ for labgrown; $B = -0.216$, $p = 0.038$ for natural diamonds) and income ($B = -0.133$, $p = 0.014$ for lab-grown; $B = 0.133$, $p = 0.014$ for natural diamonds) were confirmed as significant moderating factors.

Overall, the results clearly answer the research question by demonstrating that marketing strategies have a stronger impact on natural diamonds than on lab-grown diamonds.

### 4.4 Influence of Demographic and Socio-Demographic Variables

The regression analysis confirmed that gender and income significantly influenced purchasing preferences for both lab-grown and natural diamonds. For lab-grown diamonds, female participants were more likely to purchase (B = 0.216, p = 0.038), while higher-income individuals were less likely to prefer lab-grown diamonds (B = - 0.133, p = 0.014). For natural diamonds, male participants showed a stronger purchasing likelihood (B = -0.216, p = 0.038), and higher-income consumers were more inclined to buy natural diamonds (B = 0.133, p = 0.014). Age and geographic location did not have statistically significant effects on purchasing intentions in either case. Income strongly shaped purchasing preferences. Lower-income consumers preferred lab-grown diamonds (B = -0.133, p = 0.014) due to affordability, while higher-income participants favored natural diamonds (B = 0.133, p = 0.014) as luxury goods. Gender also influenced choices: females were more likely to purchase lab- grown diamonds (B = 0.216, p = 0.038), and males preferred natural diamonds (B = - 0.216, p = 0.038). Non-European respondents were more likely to purchase lab-grown diamonds, while Europeans favored natural diamonds.

Most participants were young adults, with 39.9% aged 25–34 and 21.1% aged 18–24. Younger consumers were open to lab-grown diamonds, but preferences between diamond types remained fairly stable across age groups. Participants consistently ranked appearance as the most important factor in diamond purchasing decisions (M =

2.08, SD = 0.99), followed by price (M = 2.32, SD = 1.19) and emotional value (M = 2.78, SD = 1.26). Eco-friendliness was ranked fourth (M = 3.56, SD = 1.35), while brand reputation was the least influential factor (M = 4.27, SD = 0.96). These rankings show that although sustainability and branding matter, visual appeal and affordability drive decisions most. In summary, gender, income, and location strongly shape consumer preferences and marketing effectiveness, highlighting the need to tailor strategies to specific consumer segments, ensuring that messages align with the motivations, financial considerations, and cultural preferences of the targeted audience.

The limited sample, mainly young adults and lower-income consumers, restricts generalizability. As findings rely on self-reported intentions, future research should use diverse samples and real purchase data.

## Abstract

As Generative AI tools con produce content, research is examining the impact of this technology on creativity, with a focus on creative outputs. However, how creativity itself is going to be impacted by this new technological environment is yet to be investigated. Supported by a qualitative enquiry and literature about everyday creativity and AI usage, we explore: a) why people engage in creative activities; b) how those motivations may be impacted by GenAI; c) how people that engage in creative activities perceive GenAI. The results of this work have implications for research, policy makers and companies interested in the promotion of creative activities.

*Keywords: Generative AI; Everyday Creativity; Human-Computer Interaction; Motivation*

### 1. Introduction and theoretical background

With the rise of Generative AI (hereafter, GenAI), the public debate has intensified around the role of this technology in the creative domain. For instance, the art community has been highly critical of AI-generated art, questioning its artistic legitimacy and raising concerns about the copyright issues tied to GenAI training datasets (Glynn, 2025; McMahon & Vallance, 2025; Shaffi, 2023). In the academic literature, researchers have begun to investigate the relationship between GenAI and creativity. Although opinions diverge on this end (Meincke et al., 2025), several studies have demonstrated how GenAI can enhance creative ideation (Chen & Chan, 2024; Lee & Chung, 2024). In this context, we argue that current research has so far focused on the impact that GenAI has on creative outcomes, while leaving the experience of creativity per se understudied.

This dimension seems to be more present within media commentary, with journalists reflecting about how GenAI might reshape the way we are, think, and create (Brooks, 2023; Rothman, 2024; Rothman, 2025). Taking cues from this discussion, our aim is to contribute to the academic literature about GenAI and creativity by posing two core questions: what is it like to be creative in the age of GenAI? And why be creative in the age of GenAI?

To do that, we will focus on the so-called everyday creativity, a wide definition of creativity that involves non-professional everyday activities and hobbies (e.g., drawing, cooking). We chose this creative setting because everyday creative activities are widely adopted by people (Statista, 2025) and have proved positive effects on well-being (Conner et al., 2018). However, everyday creativity is understudied in the AI landscape.

Therefore, through a qualitative study, we observe everyday creative practices to understand which aspects of this experience may be at risk in the age of AI. Specifically, we aim to explore how individuals make sense of their creative routines and what they perceive as essential, non-substitutable dimensions of the creative process. As GenAI systems offer faster, cheaper, and often socially validated outputs, a central tension emerges: what compels individuals to continue creating the "hard way"? And more crucially, what experiential dimensions of everyday creativity remain resistant to automation, perceived as essential, and therefore non-negotiable?

## 2. Methodology

To investigate the proposed research questions, we adopted a complementary methodological approach, which consists of two different data collections. In particular, we conducted in-depth, semi-structured interviews with 4 informants who frequently engage in everyday creative activities (e.g., writing, music production). Then, we collected data through a qualitative survey that involved 63 participants.

Data analysis. Insights from both in-depth interviews and qualitative survey were analyzed through inductive thematic analysis (Braun and Clarke, 2006). After transcription and familiarization with the data, we thoroughly read the transcripts to identify recurring patterns, terms, and elements that could capture participants' responses. The thematic analysis is inductive as theories were developed directly from the data (Naeem et al., 2023).

## 3. Preliminary Findings and Implications

Different motives of Creativity. The literature on creativity (e.g., Benedek et al., 2020) and the data collected show that there are several aspects that motivate creativity: enjoyment and relaxation, self-expression, skill development, and social interaction. Enjoyment and relaxation refer to the idea of enjoying creative activities, being in contact with their own emotions and escaping the stress of everyday life. Self-expression deals with the ability of the creative process to give form to the individual's emotions. Skill development suggests a more dynamic motivation connected to creativity, as it deals with the idea that creativity is not only about the immediate expression but also about learning new skills. Another dynamic aspect is social interaction, that deals with the possibility to share ideas and collaborate with other creative individuals.

With the diffusion of generative AI on the market some questions can be raised about the possibility that those tools can threaten or change creativity, and the reasons people approach creative activities. The concept of enjoyment and relaxation and its relationship with creativity may change due to the impact of AI. During the decades, people changed the way to enjoy themselves, and we have evidence that people experience enjoyment, relaxation and escapism also with videogames (Caroux & Pujol, 2024) or movies (Gabbiadini et al., 2021):

therefore, the benefits of enjoyment may also be reached through a different AI-oriented process. As a matter of fact, there is preliminary evidence of usage of GenAI for fun (Stornaiuolo et al., 2024). However, as the self-reflection aspect of enjoyment and relaxation is particularly process-oriented, we argue that this dimension can only partially be threatened by GenAI. As ironic as it sounds, also self-expression can be influenced by GenAI. GenAI creative process starts by users' prompt: therefore, AI should reflect users' vision. On a more general level, one example in which AI is used to express users' creative vision is the project of Cosmo Wenman, an artist that experimented with the use of GenAI to permit blind people to express themselves through art (Schrader, 2023). However, it is important to say that the use of AI to express an artistic vision is controversial due to the potential usage of other artists' content in the GenAI dataset (e.g., Glynn, 2025). Social interaction may also not be immune to GenAI. Besides the conversational nature of the GenAI tools, AI usage may foster the formation of online communities. Indeed, there is anecdotal evidence of online communities that have as a main topic the usage of AI for coding. Also, research suggests that AI usage may reinforce users' social skills through the interaction with online communities related to the same AI service (Pan & de Graaf, 2025). Probably, the motivation for creative activities that is not likely to be achieved also through AI is skill development, as the process of skill development relates to practice (Hagger et al., 2008).

Use of AI tools for creative purposes. This research investigates not only the extent of AI integration in creative practices, but also how individuals perceive its influence on creativity. A majority of survey respondents (71.4%) reported using AI tools in creative practices, and all four interviewed artists confirmed similar engagement, although with different purposes and levels of integration. While some artists embrace AI as a means of enhancing efficiency (particularly for technical refinement), others adopt cautious stances by admitting to deliberately minimizing the presence of AI in their workflow to preserve a sense of creative authenticity. This opinion reflects an underlying tension between instrumental utility and artistic legitimacy.

These qualitative insights align with broader survey trends. Roughly half of respondents (51%) perceive AI as a creativity-enhancer, citing idea generation and the ability to gain new perspectives through the tools. This view reflects socio-cultural interpretations on everyday creativity (Ilha Villanova & Pina e Cunha, 2021) and motivational frameworks that highlight the importance of competence and belonging (Maslow, 1943). Here, AI tools function as cognitive scaffolds, supporting the preparatory and skill-based aspects of creativity (Cropley, 1990; Guss et al., 2021). In contrast, 49% of participants expressed concerns that AI may inhibit creativity, particularly through homogenization and reduced originality. According to respondents, relying on AI could lead to widespread replication of ideas, echoing Cropley's (1990) notion of frustrated creativity, wherein individuals with high-technical proficiency fight to generate novel contributions due to over-dependence on external tools. Notably, the perceived impact of AI was not solely a function of frequency of use, but rather the degree of user control. When employed to refine rather than replace user-generated content, AI is generally welcomed. The analogies provided by respondents (e.g., "It is the same way I view a calculator. I already know how to calculate mathematical by myself, but a calculator fool-proofs it and is way more effective") suggests that AI complements, rather than substitutes, human cognition. Yet, only roughly 16% of respondents described AI as a true partner in

the creative process. These findings echo those of Tsao and Nogues (2024) and Wong et al. (2024), arguing that AI may serve best as a catalyst for human creativity, enhancing ideation while preserving the distinctly human dimensions of authorship.

Findings. The results of this work emphasize the complexity of creativity in the context of GenAI. Based on the results of our inquiry and the evidence from the literature, we argue that there are two parallel continuous dimensions that can characterize this phenomenon: the role of the actors involved in the flow state of the creative work, and the authorship of the output. Figure 1 represents this continuum. The flow state (or flow experience) is defined as the deep involvement in a task (Keller & Blomann, 2008). A traditional creative process can lead to a flow experience in which the individual has an active role. However, a flow experience can also be characterized by a passive role from the individual: that is the case, for example, of social media usage (or scrolling – Conte et al., 2024). We argue that the usage of GenAI in the creative process can lead the artist to move from the "active" extreme, to a more neutral position, in which the artist in not 100% active, but also not 100% passive. The same phenomenon can also be read using as lens the extent to which the individual is (or feels to be) the author of a piece. In a traditional creative process, the individual should clearly be the author of the work. However, as the individual may start to use AI in the creative process, the extent to which the individual or the AI is the author starts to blur. More generally, as GenAI may be implemented in the creative process, the individual moves from an extreme in which they are 100% active and 100% the authors of the output to a more ambivalent and complex situation (the "ambivalent experience" – see Figure 1). We argue that the extent to which individuals can navigate, negotiate and cope with this complexity and ambivalence influences GenAI adoption in the creative process and the modality of that adoption.

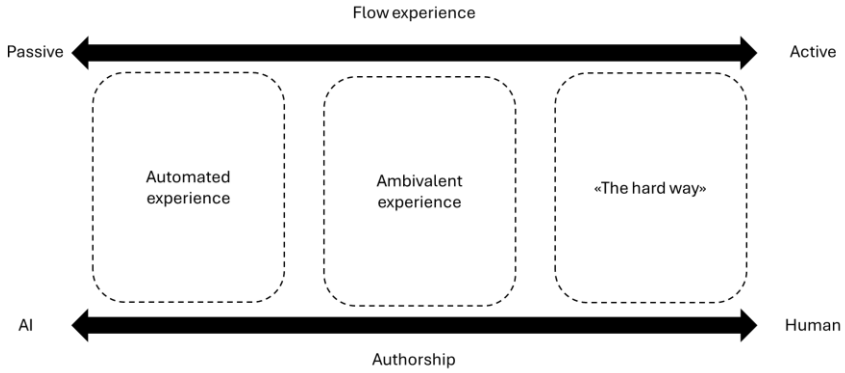

**Figure 1:** Proposed theoretical framework (source: Authors' elaboration)

These findings carry significant implications for brands, creative platforms, and retailers. First, the perception of AI as either enhancing or inhibiting creativity shows the importance of user agency in shaping consumer experiences. From a branding standpoint, tools allowing consumers to build upon their own ideas are more likely to preserve a sense of authorship and self-expression, which remain non-negotiable in identity-related consumption. Second, the ambivalence toward AI-generated content must strike a balance between efficiency and

legitimacy. Particularly for consumers in expressive domains (e.g., music, writing, photography, and the like), authenticity is not performative but ethical, being associated with originality and personal effort. Also, our findings raise questions about the standardization of creativity in AI-mediated environments. If consumers perceive branded content as overly similar due to the similarity favored by algorithms, the differentiation power of creative branding could be compromised. Brands, as well as organizations promoting creative engagement, should try to offer flexible, transparent, and human-centered experiences that empower the user's voices rather than automate them. Companies that aim to implement creative activities in their teams, or companies that provide creative activities, can also take insights from this research. There are several motivations that lead people to engage in creative efforts. In the age of AI, we argue that companies and institutions should promote those activities emphasizing process-based motivations, such as an active flow experience that can lead to enjoyment, self-reflection, and skill development (which is the least likely motivation to be threatened by AI).

## Abstract

As consumer interest in health, sustainability, quality and origin of food continues to grow, the market for innovative grain-based products is rapidly evolving. Within this context, pigmented grains – i.e., ancient or heritage varieties naturally rich in anthocyanins, polyphenols, and other bioactive compounds – are emerging as promising alternatives to conventional cereals. Celebrated for their potential antioxidant, anti-inflammatory, and cardiovascular benefits, these grains align with rising consumer demands for functional and health-enhancing foods. While agronomic performance, nutritional composition, and processing characteristics of pigmented grains have been widely investigated, consumer attitudes, beliefs, and behavioural intentions toward such products remain relatively underexplored. This gap is particularly evident in Italy, a country where deeply rooted culinary traditions intersect with a growing awareness of dietary health, environmental sustainability, and local food systems. Understanding how Italian consumers perceive and evaluate pigmented grain-based foods is therefore essential to inform product innovation, market positioning, and communication strategies aimed at fostering their acceptance and integration into daily diets. For this purpose, an online questionnaire targeting Italian consumers was developed to identify the latent dimensions influencing their purchasing and consumption behaviours. Preliminary findings, resulting from an Exploratory Factor Analysis (EFA) conducted on a sample of 200 Italian respondents, reveal the emergence of distinct motivational profiles. These profiles reflect a multifactorial decision-making process shaped by health-related motivations, environmental and ethical values, trust in certifications, and positive perceptions of brand and corporate responsibility, with a growing appreciation for locally sourced and sustainably produced foods.

*Keyword: pigmented grains; consumer behaviour; Italian market; Italian food consumption; WTP*

## 1. Introduzione

In recent years, consumer demand for foods that align with health, sustainability, and origin has surged globally, prompting significant shifts in food systems and intensifying interest in functional foods (Bentivoglio et al., 2021; Nazzaro et al., 2024). In particular, functional foods – i.e., those offering health benefits beyond basic nutrition – have become particularly prominent in the cereal sector, where innovation combines nutritional enhancement with environmental considerations (Karelakis et al., 2020; Siró et al., 2008). Within this evolving

landscape, pigmented grains – defined as ancient or heritage wheat varieties rich in anthocyanins, polyphenols, and other bioactive compounds – are gaining traction for their antioxidant, anti-inflammatory, and cardiovascular benefits (Ficco et al., 2014). Although agronomic and compositional aspects of pigmented grains have been well documented (Boukid, 2024; Ficco et al., 2014), consumer-centred research on these products remains scant. Pigmented grains align with evolving consumer preferences for foods perceived as healthy, authentic, and environmentally responsible (Jang et al., 2021), yet few studies have empirically examined acceptance of these products, particularly in Italy – a country with strong food traditions but increasing nutrition and sustainability awareness (Ballco and Gracia, 2022; Profeta and Hamm, 2019). The functional food literature demonstrates that consumer decisions are influenced by a complex interplay of factors, including product attributes, health consciousness, trust in certifications, personal values, and social norms (Baker et al., 2022; Verbeke, 2006). The scoping review by Baker et al. (2022) proposed a holistic framework for analysing consumer behaviour. They categorised determinants of functional food acceptance into product characteristics, socio-demographic, psychological, behavioural, and physical factors. Another influential stream applies the Theory of Planned Behaviour (TPB), emphasising constructs such as attitude, subjective norms, perceived behavioural control, and moral norms to predict purchasing intentions for functional foods (Escobar-Farfán et al., 2025).

Despite this strong theoretical and empirical foundation, studies on pigmented grains have not yet adopted a latent-variable or exploratory approach to segment consumers based on motivational profiles. Addressing this gap is vital: uncovering latent attitudinal structures can inform segmentation, positioning, and communication strategies tailored to health- and sustainability-oriented consumers (Hair et al., 2019). Considering the above, this research aims to conduct a preliminary investigation into the latent motivational and perceptual dimensions influencing Italian consumers' attitudes towards pigmented grain-based foods. Specifically, the study seeks to explore the relevance of nutritional, ethical, and origin-related factors in shaping consumer preferences and to assess the role of certifications in driving purchasing behaviour. Accordingly, the preliminary stage of this research is guided by the following research questions:

RQ1: What are the key factors that influence Italian consumers' attitudes towards pigmented grain-based foods?

RQ2: To what extent do health benefits, sustainability considerations, and product origin contribute to consumers' willingness to purchase pigmented grain products?

RQ3: Does the presence of certifications and local origin cues positively affect consumers' trust and purchasing intentions toward pigmented grain-based foods?

Following this background, the remainder of the paper is structured as follows: Section 2 describes the sample and methodological approach; Section 3 presents the results of the Exploratory Factor Analysis (EFA); and Section 4 discusses the findings and outlines theoretical, managerial, and policy implications.

## 2. Methodology

To explore Italian consumers' attitudes toward pigmented grain-based foods, a structured online questionnaire was distributed via Google Forms in February 2025, following a pre-test for clarity and relevance. A total of 200 valid responses were collected using Likert scales, multiple-choice, and open-ended items. The sample showed balanced gender representation, with a majority aged 18-25 and 46-55. Most respondents were well-educated, employed or

self-employed, and reported varied income levels, with nearly half earning EUR 1,000-1,999 and over 20% above EUR 3,000.

## 3. Results

Exploratory Factor Analysis (EFA) was performed using IBM SPSS Statistics to uncover latent dimensions underlying consumer attitudes toward pigmented grain-based foods. The correlation matrix revealed significant positive associations among variables while the sample adequacy was confirmed through the Kaiser–Meyer–Olkin (KMO) measure and Bartlett's Test of Sphericity. Finally, six factors were extracted, explaining approximately 74% of the total variance, as summarised in Table 1.

| | *Latent factor* | *Description* |
|---|---|---|
| 1 | *Consumer Trust and Loyalty to Pigmented Grain Brands* | This factor captures a deep sense of brand engagement, where trust, perceived quality, and emotional attachment converge to shape purchasing behaviour. Consumers not only consider these brands reliable and safe, but are also willing to recommend them and pay more, thus suggesting a strong role for brand equity in the pigmented grains market. |
| 2 | *Corporate Reputation, Responsibility, and Responsiveness* | In this factor, consumers express value-driven expectations toward food companies. Perceptions of ethical management, product quality, and social engagement significantly shape consumer favourability. A company's reputation as a responsible employer and its responsiveness to consumer needs enhance its credibility and desirability. |
| 3 | *Sustainability, Localism, and Health-Conscious Food Values* | This dimension highlights the interplay between ethical and health motivations. Consumers show a clear preference for locally produced, certified products that support environmental sustainability and community well-being, alongside a desire for transparency and health-promoting qualities. |
| 4 | *Perceived Nutritional and Functional Benefits* | Consumers evaluate pigmented grains through a health-focused lens, associating them with concrete physiological benefits such as antioxidant content, fibre, and cardiovascular protection. This confirms the functional food positioning of these products in consumers' minds. |
| 5 | *Nutritional Awareness and Mindful Eating* | This factor reflects an informed and intentional approach to food consumption. It includes attention to labels, awareness of nutritional impact, and self-regulated behaviour, reinforcing the role of personal responsibility in dietary choices. |
| 6 | *Certification Trust and Environmental Impact Perception* | Certifications emerge not only as quality signals but also as ethical and environmental markers. Consumers trust certified products for their traceability and credibility, and view them as enablers of responsible consumption, particularly when linked to environmental sustainability. |

**Table 1:** Summary of the latent factors (Source: our elaboration with IBM SPSS Statistics)

## 4. Discussion and Conclusion

This study offers preliminary yet meaningful insights into the attitudinal dimensions shaping Italian consumers' preferences for pigmented grain-based foods. The six latent factors identified through EFA reflect a multidimensional structure where health, sustainability, and brand-related trust converge. Notably, the importance of brand trust, perceived quality, and willingness to pay more underscores the role of emotional connection and credibility in consumer decision-making, consistent with past findings on brand advocacy and food safety

perception (Verbeke, 2006). The relevance of corporate reputation and responsiveness highlights consumers' expectations for ethical business conduct and social engagement. These findings align with growing interest in corporate social responsibility in the agri-food sector (Ballco and Gracia, 2022; Nazzaro et al., 2024), suggesting that consumers assess not only products but also company values and behaviour. Certifications, sustainability cues, and origin transparency – captured mainly by the third and sixth factors – emerge as essential trust enhancers and decision facilitators. As previous literature suggests, certifications act as heuristics that reassure consumers about product integrity and ethical alignment (Baker et al., 2022; Siró et al., 2008). The appreciation for local production and sustainable packaging further confirms a broader concern for environmental and community impact. Health considerations remain central: consumers attribute strong value to the nutritional and functional benefits of pigmented grains, such as antioxidant content, high fibre, and low gluten. This reinforces the positioning of these products within the functional food category (Ficco et al., 2014). Finally, widespread attention to nutritional information and conscious food choices reflects a mindful eating approach, in line with behavioural frameworks like the Theory of Planned Behaviour, where attitudes and perceived control drive consumption intentions (Escobar-Farfán et al., 2025).

These findings contribute to the broader literature on consumer behaviour in functional and sustainable food markets and offer actionable insights for producers, marketers, and policymakers. Strategies aimed at promoting pigmented grain-based products should emphasise health benefits, transparent certification schemes, local sourcing, and corporate responsibility. Brand communication should be values-based, engaging consumers on both rational and emotional levels.

Nonetheless, some limitations must be acknowledged. The sample, while suitable for exploratory purposes, is not nationally representative, and the data reflect a single point in time. As a preliminary investigation, the findings call for further validation through Confirmatory Factor Analysis and Structural Equation Modelling. Future research should also consider broader and longitudinal samples to better understand how consumer preferences evolve across regions and over time.

# Retro Rewind: Vicarious Nostalgia and the New Cassette Culture

Alice Venturini[1], Martina Columbano[2],*, and Francesca Bergianti[1]

[1] University of Modena and Reggio Emilia, Department of Communication and Economics, Reggio Emilia, Italy
[2] University of Parma, Department of Economics and Management, Parma, Italy

## Abstract

Young consumers are increasingly drawn to outdated technologies and products, driven by a form of nostalgia for a past they never experienced. Known as vicarious nostalgia, this phenomenon is particularly evident in the music domain, where analog formats are undergoing a notable resurgence. Despite growing attention in the media and marketplace, no academic studies have yet explored vicarious nostalgia in the context of music consumption. This research employs a netnographic approach to investigate why young consumers develop emotional attachments to products introduced before their time. The analysis reveals four key dimensions underlying this phenomenon: heritage, signature sensations, distancing from digital, effortful engagement with music. Findings contribute to the understanding of emerging consumption behaviours amongst younger generations, offering implications for retro branding, cultural meaning-making, and the evolving dynamics of product life cycles.

*Keywords: Vicarious nostalgia, Netnography, Music consumption, Cassette tapes*

## 1. Introduction and Theoretical Overview

*"Gen Z loves cassettes. But wait, how do these things work?" – Wall Street Journal*

This headline from the Wall Street Journal (Pisani, 2024) captures a paradox at the heart of contemporary consumer behavior: the growing attachment to outdated technologies and products by individuals who never experienced them in their original context. From cassette tapes to analog cameras and vintage fashion, products once considered obsolete are being rediscovered – and romanticized – by younger generations.

This phenomenon is particularly relevant in the music context: music cassettes, vinyl records, CDs, and walkmans are experiencing a renaissance. Contemporary artists such as Taylor Swift and Kendrick Lamar are releasing their albums in analog formats that sell out within minutes, and record store owners report an increase in consumers seeking vintage analog goods (Hogan, 2024). What is especially interesting is that, as reports and news outlets highlight, the main buyers of these products are consumers who never actually experienced the analog music era (e.g., Bearne, 2024). The so-called "Spotify generation" is purchasing music albums on physical formats, effectively learning how people listened to music in the

1980s and 1990s (Bearne, 2024). Surprisingly, these consumers say that listening to analog music is partly grounded in nostalgia for them (Hogan, 2024).

This phenomenon is referred to in the literature as vicarious nostalgia, a sentiment that "deals with nostalgia for a period outside of the individual's living memory" (Goulding, 2002, p. 542), evoked in consumers who have never directly experienced the era in question (Merchant & Rose, 2013). Stern (1992) originally described a similar concept under the term historical nostalgia, defining it as the emotional connection to, and idealization of, experiences and associations from past eras.

Although widely discussed in the media and increasingly leveraged by the market, this phenomenon within the music industry has received little to no attention in the academic literature to date. The main studies on vicarious nostalgia within the marketing literature have primarily focused on age-related vicarious nostalgia, advertising-evoked vicarious nostalgia, and its effects on brand heritage perceptions (e.g., Goulding, 2002; Merchant & Rose, 2013; Singh et al., 2020). Despite the concept being introduced over two decades ago (Goulding, 2002), it has never been examined in the context of music consumption. Moreover, the underlying motivations driving this sentiment remain unexplored. To address this gap, the present study investigates the recent resurgence in cassette tape consumption. Adopting a netnographic approach, it seeks to answer the following research question: Why do young consumers feel attached to goods introduced before they were born?

Understanding the psychological and cultural mechanisms behind this "nostalgia without memory" offers valuable insights into contemporary consumption patterns, retro branding strategies, and the lifecycle of consumer trends.

## 2. Methodology

To explore how and why young consumers develop emotional attachment to products that were introduced before their birth, this paper deploys a netnographic approach (Brown et al., 2003; Kozinets, 2019). Netnography involves the resettlement of ethnography, one of the most respected and time-honored research procedures in marketing, to the multitude of consumer communities that populate the Web.

Adhering to Kozinets (2019) guidelines, data collection followed a three-step process based on investigation, immersion, and data integration. During the investigative phase, Reddit has emerged as the most suitable platform for addressing the research question, owing to its structure of specialized communities – known as subreddits – each centered around specific interests or topics. Within these subreddits, data has been gathered from the 13 most diverse and meaningful discussions – referred to as "threads" – concerning the use of cassette tapes among younger demographics.

After an initial screening, the final dataset consisted of approximately 400 online traces drawn from six threads within the subreddits r/cassetteculture and r/audiophile, selected for their recent activity, data richness, as well as dynamic interactions among users. Additionally, seven Taylor Swift-related threads have been included, given that her *1989 (Taylor's Version*) ranked among the two best-selling cassette releases of 2023 (Caulfield, 2024).

During the immersion stage, each researcher maintained an immersion journal to accompany the data collection and analysis phase. These journals served as spaces to document interpretative reflections, linking observed patterns with theoretical constructs and abstractions. Lastly, during data integration, the commentary from selected threads have first been coded and examined individually by each researcher, and then compared collaboratively to minimize potential biases. A combination of deductive and inductive coding was

employed, guided by an hermeneutical approach (Thompson et al., 1994) that involved moving back and forth between emergent codes and their interpretation in relation to the whole context.

## 3. Results

The analysis highlighted four key dimensions driving consumption of music cassettes among young consumers, namely: heritage, signature sensations, distancing from digital and effortful engagement with music. In addition to explicit, non-nostalgic purchase motivations – such as collecting or the perceived functionality of cassettes compared to other analog formats – these dimensions reveal deeper, more latent aspects of nostalgic attachment. Figure 1 shows the four dimensions and their respective subdimensions. Heritage speaks to ways in which cassettes evoke personal and cultural memory; signature sensations capture unique tactile, auditory and aesthetic appeals of the format; distancing from digital reflects a yearning for concrete ownership and hands-on engagement; and effortful engagement with music underscores the intentionality behind discovering, curating and savoring analogue listening experiences.

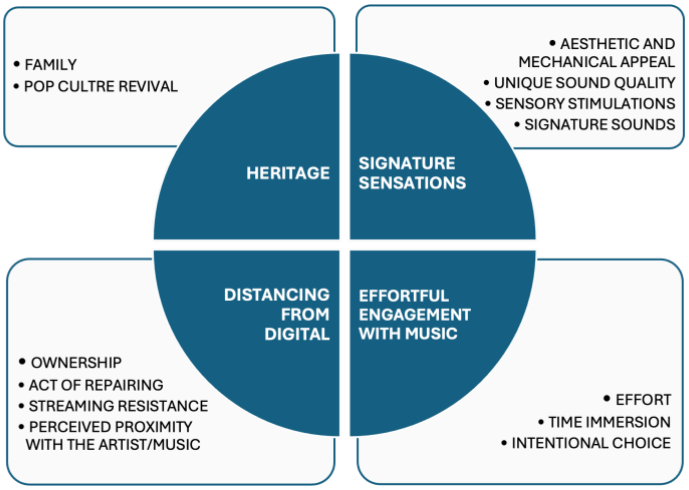

**Figure 1:** Diagram of dimensions and sub-dimensions identified

Young consumers' attachment to cassette tapes is rooted in a sense of *heritage* passed down through family narratives and a broader pop-culture revival. Many participants recount hearing stories from parents or older siblings about mixtapes or were exposed to their parents' collection of cassettes, or simply had them in the house when they were children, therefore creating an intergenerational bond despite never having lived through the 1980s. Concurrently, resurgence of cassette tapes among young consumers is driven by their evocative power as pop-culture artifacts – whether seen in books, TV shows, or video games – that transport listeners into imagined worlds and bygone aesthetics. Together, these forces situate cassettes not merely as retro curios but as heritage artifacts through which consumers can vicariously connect with, and even reshape, a nostalgic past. Beyond heritage, the *signature sensations* of cassettes constitute a powerful draw. Participants describe the satisfying "click" when inserting a tape and pressing the buttons, the textured sound quality characterised by the hissing of the tape and a unique warmth of the sound that streaming music can't replicate. Furthermore, participants also note the distinct visual appeal of cassettes in a shelf display and of the varied artwork present on the covers. Consumers also report enjoying the overall mechanical feel of cassette tapes and recorders. These tactile and auditory stimuli create a

multisensory ritual, turning music listening into a physical event rather than a passive background activity. Cassettes offer young consumers a form of *distancing from digital*, that is, an act of resistance to the dematerialized and ephemeral nature of streaming content. Ownership of a physical tape – and the booklet or J-card that comes with it – infuses music with concreteness and personal value, fostering an emotional proximity to the artist and the music itself. Moreover, the deliberate act of handling, picking and fixing tapes, as well as recorders satisfies a desire to "get one's hands dirty", standing in contrast to infinite playlists and algorithmic recommendations of music streaming platforms. This distancing translates into an empowering sense of agency over one's music library, as well as compensating for the fear of losing one's favourite music. Lastly, cassette-based listening is experienced as an *intentional, effortful engagement with music*. Users emphasize that selecting and handling a tape requires more time and care than a tap on a screen – for example, when listening to a tape you must listen to the whole album. This intentionality fosters deeper listening: individuals research artists and savor each side of the tape, transforming music consumption into an active, mindful practice. Such conscious curation stands in relief against passive streaming habits, endowing each playback with renewed significance. Another important aspect that draws young consumers to cassettes is the possibility of creating mixtapes and the satisfaction of crafting the perfect 90 minutes tape; some also mention exchanging and gifting mixtapes. Overall young consumers seem to feel more grounded when interacting with music through cassette tapes compared to other media.

## 4. Conclusions

This study contributes to the literature on vicarious nostalgia by examining how young consumers develop attachments to goods that predate their lived experience. Focusing on cassette tapes, the findings reveal that this sentiment is not unidimensional but unfolds through a holistic interplay of cultural, sensory, and experiential dimensions. By identifying four key drivers – heritage, signature sensations, distancing from digital, and effortful engagement with music – the study shows how consumers engage with analog media in meaningful and immersive ways.

From a theoretical perspective, this research extends the understanding of vicarious nostalgia into the domain of music consumption, demonstrating how it can emerge through everyday practices and community-based meaning-making. From a managerial standpoint, the findings highlight opportunities for brands to craft strategies that evoke emotional resonance through sensory richness, ritual engagement, and generational storytelling – especially in markets dominated by digital immediacy and dematerialization.

As a preliminary investigation based on netnography, this study lays the conceptual groundwork for future research. Further studies could employ quantitative methods, examine cross-cultural differences, or explore additional product categories where vicarious nostalgia shapes consumer behavior in similarly layered ways.

# Level Up Your Health: The Psychophysiological Impact of Nutrition-Oriented Gamification on Food Choice and Behavior

Settimio Ziccarelli [1], *, and Guido Cristini[1]

[1]University of Parma, Department of Economy and Management, Parma, Italy

*Corresponding author: settimio.ziccarelli@unipr.it

## Abstract

In the domain of nutrition, where engagement and sustained behavior change remain critical challenges, gamification has emerged as a promising strategy to increase consumers' motivation to take part in health-related interventions. While gamification adoption is increasing, the underlying emotional and physiological processes that could explain its effectiveness and that can also be useful to optimize it, remain largely unexplored. This study proposes comparing two gamified applications but only one of them will have nutrition-oriented quiz contents while the other will be a non-health-oriented quiz; participants will be randomly assigned to one of the two groups. During the initial interaction session with the app, physiological responses will be recorded, including heart rate variability, facial muscle activation, and pupil dilation. At the end of this session, participants will be asked to make a real choice between a healthy and unhealthy snack. For one month after, participants will complete weekly check-ins through the app, where they will record the frequency of healthy behaviors such as their fruit and vegetable intake. The aim is to examine whether health-oriented gamification elicits stronger physiological engagement and whether this predicts healthier food choices over time. This approach contributes to both academic understanding of decision processes and practical applications for industries interested in designing impactful health promotion tools.

*Keywords: Gamification, Nutrition, Physiological responses, Emotional correlates, Decision-making*

## 1. Introduction

The increasing global prevalence of nutritional disorders and unhealthy eating habits, particularly overweight and obesity (Koliaki et al., 2023), has been putting healthcare system under stress (Cawley et al., 2021). To address the issues related to the frequent consumption of hypercaloric foods, traditional approaches based on the diffusion of dietary guidelines have been aided by gamification and smartphone applications that have emerged as promising tools to positively influence dietary preferences and related behaviors (Alghamdi & Bitar, 2023; Milne-Ives et al., 2020). Gamification consists in applying game design elements like points, levels and challenges to several contexts, such as education, workplace productivity as well as health and nutrition, in order to increase motivation towards specific behaviors (Drummond et al., 2017). A recent meta-review from Damasevicius and colleagues (2023), suggests that gamification approaches demonstrated to be effective in promoting more positive health outcomes. Furthermore, gamification proved to be an effective tool in improving nutritional knowledge about healthier nutritional habits in children and

adolescents (Suleiman-Martos et al., 2021). These initial insights open an interesting research scenario aimed at better understanding the role of gamification dynamics in creating engagement and positively influencing the consumer decision-making. More specifically, it would be interesting to identify which game mechanics and design elements are most effective for different health and nutrition related issues and for specific populations groups (Johnson et al., 2016). Some recent research tried to investigate how the introduction of specific gamification features, particularly the implementation of approach-avoidance training, could influence consumer behavior. Findings suggest that this kind of gamification approach, lead participants to make healthier virtual food choices but did not influence their actual food consumption (Schakel et al., 2018). Further investigations demonstrated that the most relevant features in gamified apps are goals, progress bar, and coupons (Berger & Jung, 2024). They also suggested that preference of specific in-game features appear to be linked to psychological dimensions related to different degrees of openness to change but as stated by the authors, study limitations highlight the need for further investigations with broader methodological approaches. Considering this evidence, the proposed study aims to investigate the effectiveness of a nutrition-based gamified application compared to a non-nutritional gamified version by enriching the detection of explicit responses declared by users with recordings of their physiological automatic responses during the interaction with the app. The recording of physiological correlates such as heart rate variability, by means of electrocardiogram (ECG) sensors, facial muscle activity (fEMG) and pupil dilation, will allow to uncover the underlying mechanisms that drive healthy or unhealthy decision-making processes both in the virtual environment that in the real-world setting providing an immediate behavioral measure. Moreover, participants actual food choices will be monitored for up to one month following, allowing to assess whether continued engagement with the app and self-monitoring of nutritional habits can produce sustained behavioral change over time.

## 2. Metodology

Inclusion criteria require participants not to be following specific dietary programs or using nutritional tracking applications. Additionally, individuals with known food allergies or a current diagnosis of an eating disorder will be excluded from participation. The study will use a between-subjects design in which participants are randomly assigned to one of two conditions: a) nutrition-based gamified app; b) non-nutritional gamified app (control condition). Applications will be matched for interface design and level of interactivity, differing mainly in the thematic content of the interactions. Prior to the physiological data acquisitions participants will be asked to avoid eating or drinking for at least one hour and to indicate their current levels of hunger, thirst, fatigue, and the time since their last meal. This will allow us to assess their physical state before the data recording session. Participants will then interact with the assigned application for approximately 15-20 minutes while physiological responses are continuously monitored. At the end of the interaction, while the recordings are still ongoing, participants will be asked to make a real food choice between an indulgent and a healthy pre-packaged food item. This task will serve as a direct behavioral measure of real-world decision-making and will help assess whether interaction with the nutrition-based app has an immediate short-term impact on the choices. Participants will be also asked to rate the level of engagement and satisfaction with the app. Following the session, participants will be instructed to continue using a mobile version of the app based on the group which they belong to, for a period of four weeks. After a short interaction with the app, participants will be directed to an online form where they will record their healthy food choices, such as the number of fruit and vegetable portions consumed. Food choices, engagement with the app and frequency of use will be passively tracked and analyzed as indicators of long-term behavioral change. An example of both the desktop and mobile version of the gamified nutrition-based app is presented in Figure 1.

**Figure 1:** On the left side a screenshot of the desktop based nutritional app while on the right the app interface for mobile interactions.

## 3. Discussion

Although gamification has become increasingly common in health and nutrition interventions, and meta-analyses have shown its overall effectiveness (Damaševičius et al., 2023; Suleiman-Martos et al., 2021), little is known about the emotional and physiological processes that may drive its impact. Most existing studies focus on behavioral outcomes like usage rates or knowledge gains, without investigating the emotional and physiological processes that may underpin such behavioral responses. Therefore, the present study proposal, aims at integrating both the psychological experience of the user and the physiological responses elicited during the interaction with a nutrition-oriented gamified application as compared to a thematically neutral gamified one. The inclusion of physiological measures such as heart rate variability, facial muscle activation, and pupil dilation will provide real-time indices of emotional arousal, attentional focus, and cognitive load, capturing users' automatic responses. These latter could be functioning as implicit markers which could be more predictive of long-term behavioral change as compared to self-report measures alone. Furthermore, the recording of such parameters during the actual choice between a healthy and an unhealthy snack in a real-world setting, could offer a more ecological measure of the applications effects on behavior. Furthermore, tracking self-reported dietary behaviors such as fruit and vegetable intake, combined with passive monitoring of app usage and interaction frequency, will allow for a more comprehensive evaluation of how sustained exposure to gamified content influences real-world health behaviors over time. By also tracking app usage behaviors, this study aims at exploring whether continuous use of gamified applications can help maintaining healthy habits, and whether early psychophysiological responses recorded during the initial app use, can predict continued engagement and better food choices over time. The predicted outcomes of this study proposal could contribute to the current literature by offering a methodological basis on which develop theoretical models that incorporate automatic physiological responses as integral components of decision-making processes in gamified approaches. Furthermore, from a marketing perspective, it could inform the design of more emotionally resonant and behaviorally effective health and nutrition applications in order to better tailor their contents. Additionally, it is also expected that implicit physiological measures can be useful in predicting longer-term behavioral outcomes thus providing an enriched set of tools for product assessment and optimization.

# Track 3
# Marketing Communication & Branding

Coordinators: Daniela Andreini & Michela Mason

La sezione si propone di ospitare un vivace confronto accademico e manageriale che dia conto delle principali sfide al mondo della marca e della sua comunicazione sullo sfondo di uno scenario competitivo e sociale sempre più complesso, liquido e mutevole. La crisi di tradizionali concetti quali brand equity e fedeltà stanno infatti mettendo a dura prova il sistema di marca, presentando tuttavia nuove opportunità per le imprese che sappiano coltivare la capacità della marca di cocreare valore con i consumatori. Il dibattito della sezione vede come protagoniste le imprese profit e non profit alla ricerca di nuovi paradigmi, i professionisti della comunicazione di marketing spronati verso il cambiamento per sopravvivere e il consumatore, oggi più consapevole, critico e attivo nella determinazione delle sue scelte e sempre più autonomo produttore di contenuti e di significati. La sezione incoraggia la presentazione di contributi multidisciplinari che propongano una riflessione critica sul significato e sul valore che oggi le marche e la comunicazione esprimono. Sono benvenuti lavori concettuali ed empirici, condotti con approcci metodologici qualitativi e/o quantitativi

The section aims to foster a lively academic and managerial dialogue on the major challenges facing brands and brand communication in an increasingly complex and fluid competitive and social environment. Traditional ideas such as brand equity and loyalty are under strain, yet they also open new opportunities for firms capable of co-creating value with consumers.

The discussion involves profit and non-profit organizations seeking new paradigms, marketing communication professionals pushed to adapt, and consumers who are now more aware, critical, and active—often creators of their own content and meanings. The section welcomes multidisciplinary contributions offering critical reflections on the current role and value of brands and communication, including both conceptual and empirical studies using qualitative and/or quantitative methods.

# Faces of the Brand: How Gendered Labels Shape Consumer Preferences

Antonella Bozzi[1],*, Antonella Cammarota[1], and Vittoria Marino[1]

[1] University of Sannio, Benevento, Italy

*Corresponding author: a.bozzi2@studenti.unisannio.it

## Abstract

This study investigates how brand gender may influence younger consumers' perceptions toward purchasing a product. Specifically, the research context is the wine industry, with brand gender communicated through the design of product labels. An online experiment was conducted by manipulating the labels across four different gender representations. The results reveal that self-congruity between the consumer and the gendered label shapes consumer attitudes and perceptions towards the product. Notably, this study highlights that male consumers show lower self-congruity when exposed to female-gendered labels. This preliminary study offers relevant theoretical and practical implications for scholars and practitioners seeking to design gendered products and brands aligned with the values and identities of younger consumers.

*Keywords: Brand gender, Gendered labels, brand personality, Self-congruity, Wine marketing, Gen Z consumers.*

## 1. Introduction

Consumers tend to purchase products that represent them (Bargoni et al., 2024; Chen et al., 2024; Sirgy, 1985), in which they see themselves reflected and find alignment with their own values and identities (Black & Veloutsou, 2017). Within this perspective, brand personality plays a key role in shaping consumer purchase decisions (Aaker, 1997; Klink & Athaide, 2012), and specifically, a brand's gender can have a significant impact on such decisions (Azar et al., 2018). Although brand gender has been widely studied (e.g., Lieven et al., 2015; Kumar, 2022; Vacas de Carvalho et al., 2020), the gendering of labels through imagery remains underexplored (Cai et al., 2024), particularly for products such as wine, for which labels serve as a powerful communication tool (Laeng et al., 2016) and the image on the label provides one of the first and strongest visual impacts to capture consumer attention (Jaud & Melnyk, 2020).

Wine is also a particularly unique product, as it often carries implicit gender associations (Masset et al., 2023). Historically, the wine industry has been more male-oriented (Alonso et al., 2021), and wine is considered more gender-specific than other products (Bruwer et al., 2016), frequently described as masculine or feminine based on its taste, aroma, or type (Gelinard, 2008; Kelley et al., 2015). However, despite the critical importance of labels for this product, its unique context, and the crucial role of congruence between the brand and the product (Mazodier & Merunka, 2012), the gendering of wine labels to engage consumers,

particularly younger consumers, remains largely unexplored (Cai et al., 2024; Masset et al., 2023).

From this perspective, Self-Congruity Theory (Sirgy, 1985) offers an insightful lens through which to examine this dynamic, suggesting that consumers are more likely to respond favorably to brands perceived as consistent with their self-image. Moreover, considering that wine is perceived as a prestige product typically associated with older consumers (Bruwer et al., 2011; Mora et al., 2018), this study aims to investigate whether greater congruence between the label and the consumer can engage younger consumers, such as those from Generation Z (Gen Z), who adhere to values, ideologies, and consumption logics that differ significantly from those of previous generations (Cammarota & Branca, 2025; Jung & Shin, 2025).

Accordingly, the purpose of this study is to analyze how the gendering of wine labels may influence the attitudes and intentions of Gen Z consumers. The study was conducted through an online experiment manipulating the gender of the labels. The results demonstrate theoretical and practical implications, highlighting areas for further research to address the issues that emerged. The following sections present the conceptual model, methodology, initial results, and a preliminary discussion.

## 2. Theoretical framework: Gender Cues, Self Congruity, and Consumer Attitudes

Consumers often attribute human traits to brands (Grohmann, 2009; Aaker, 1997; Kumar, 2022), and this tendency is particularly evident for gender (Pang & Ding, 2021). From this perspective, marketers frequently emphasize a brand's personality through gender cues (Cooke et al., 2022), also considering that consumers signal their gender identity through their consumption choices (Avery, 2012). Based on this, we propose the following hypothesis:

H1a. Gendered label (GL) significantly influences Attitude toward the brand (AT)

H1b. Gendered label (GL) significantly influences Purchase intention (PI)

Self-congruity (Sirgy, 1985) offers a valuable interpretive lens for this study, as it captures the deeper motivational alignment between a consumer's self-concept and a brand's identity. While Cooke et al. (2022) identify self-referencing as the psychological process through which congruence between brand gender and psychological gender enhances brand responses, we build on this by adopting self-congruity as a mediating mechanism. Prior research confirms that self-congruity positively affects behavioral outcomes and may mediate the relationship between perceived personality traits and behavioral intentions (Usakli & Baloglu, 2011). Building on these insights, we argue that:

H2a. Self-congruity (SC) mediates the relationship between Gendered label and Attitude toward the brand (AT)

H2b. Self-congruity (SC) mediates the relationship between Gendered labels (GL) and Purchase intention (PI)

Then, consumer gender may further shape these dynamics. Prior research found a moderating role of consumer biological sex in the relationship between gendered brand cues and brand outcomes (Kumar, 2022; Lieven & Hildebrand, 2016). Furthermore, Neale et al. (2016) support a congruence relationship between gender identity and brand response, highlighting the importance of consumer gender in shaping brand evaluations. Therefore, we propose:

H3a. Consumer gender (CG) moderates the relationship between Gendered labels (GL) and Attitude toward the brand (AT)

H3b. Consumer gender (CG) moderates the relationship between Gendered labels (GL) and Purchase intention (PI)

H3c. Consumer gender (CG) moderates the relationship between Gendered labels (GL) and Self-congruity (SC)

## 3. Methodology

### 3.1 Experimental design and participants

This study employed a one-way between-subjects experimental design to investigate the causal effects (Reichardt, 2002) of gendered wine labels (neutral, male, female, androgynous) on brand outcomes. Data collection via Qualtrics yielded 99 valid responses. Consistent with the focus of the study on younger adult consumers who are active wine drinkers, participants were primarily Gen Z consumers (50.51% aged 18-24, 60.6% students) with over half (53.54%) reporting weekly wine consumption, ensuring relevance to a key consumer segment (Casalegno et al., 2019; Kellershohn et al., 2025). Participants were randomly assigned to one of four distinct label stimuli, supporting internal validity. Individual characteristics were included as control variables to isolate the effects of GL. To enhance realism and external validity (Morales et al., 2017), stimuli were developed in collaboration with a wine company, adapting a real label featuring a female figure. Following recent recommendations to ground manipulations in real business contexts (Viglia, 2021), we systematically modified the humanoid figure (neutral, male, female, androgynous), keeping all other elements constant (Underwood & Klein, 2002). The multi-item scales used in the study demonstrated internal consistency. Overall Cronbach's Alpha was .912, indicating high reliability.

### 3.2 Manipulation check

Condition-specific manipulation check items, measured on a 7-point Likert scale, confirmed the effectiveness of the gendered label manipulations. A series of one-sample t-tests showed that all groups perceived their assigned label as intended (p-values $< .001$). A one-way ANOVA was employed to test whether the different label conditions produced significant differences in the mean scores of AT and PI across groups. It showed a significant effect of GL on both AT ($F(3, 95) = 2.75$, $p = .047$) and PI ($F(3, 95) = 4.46$, $p = .006$), with post-hoc tests (Tukey) indicating that the female GL elicited significantly lower PI than the male ($p = .039$) and androgynous ($p = .006$) GL. These significant group differences observed in the ANOVA emerged as indirect effects via SC in the moderated mediation model, with no direct effects of GL on AT or PI.

### 3.3 Hypothesis Testing and Results

We tested our hypotheses using a moderated mediation model (Hayes' PROCESS macro, Model 8, reported in Figure 1). Hypotheses 1a and 1b proposed that GL would directly influence AT and PI. While the overall model explained a substantial portion of the variance in AT ($R^2 = .49$, $F(11, 87) = 7.56$, $p < .001$) and PI ($R^2 = .65$, $F(11, 87) = 14.63$, $p < .001$), none of the direct effects of GL on AT or PI were statistically significant (all $p > .05$). Therefore, H1a and H1b were not supported. Among covariates, WCF positively affected SC ($\beta = 0.97$, $SE = 0.4$, $p = .016$). Hypotheses 2a and 2b predicted that SC would mediate these relationships. SC was a strong positive predictor AT ($\beta = 0.54$, $SE = 0.067$, $t = 8.08$, $p < .001$) and PI ($\beta = 0.63$, $SE = 0.063$, $t = 10.07$, $p < .001$). Conditional indirect effects showed that for male participants, the female label significantly reduced PI through lowered SC (indirect effect = -1.22, BootCI = [-2.65, -0.004]). No significant indirect effects were found

among female participants. Thus, H2a and H2b were partially supported. Hypotheses 3a and 3b tested if CG moderated the direct effect of GL on AT and PI. The interaction term was not significant for either outcome (AT: F=0.99, p=.40; PI: F=1.75, p=.16), so H3a and H3b were not supported. Finally, Hypothesis 3c posited that CG would moderate the relationship between GL and SC. Although the overall interaction term was non-significant (F=2.30, p=.08), conditional effects showed a significant moderation: among male consumers, the female label significantly reduced SC (β =−1.92, SE=0.90, p=.036), an effect not observed in female consumers. This finding supports H3c.

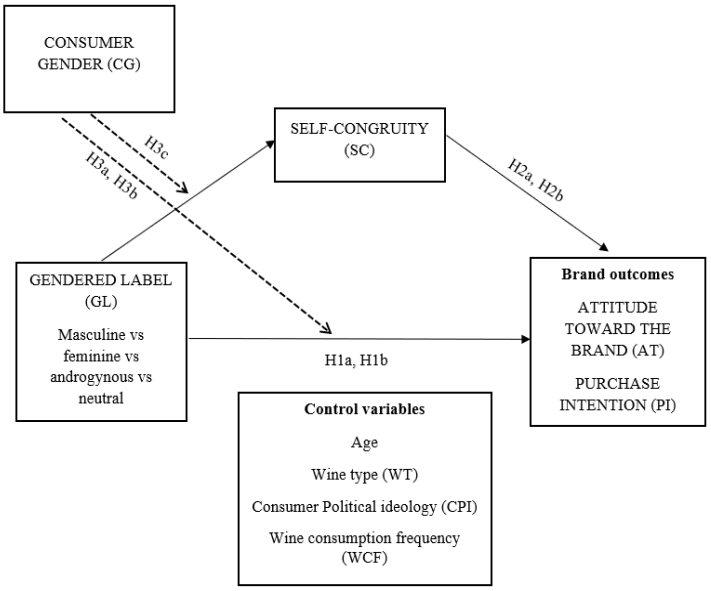

**Figure 1:** Moderated mediation on Brand Outcomes (Hayes's Model 8) (Source: our elaboration)

## 4. Conclusion, Implications and Future Directions

The preliminary results of this research provide valuable insights that warrant further investigation. On the one hand, they contribute to the existing literature on brand gender, consumer attitude, and self-congruity theory (Sirgy, 1985), while on the other, they highlight new insights that require deeper exploration to offer relevant and practical recommendations to marketing managers.

First, this study shows that gendering the label alone is not sufficient if the congruence between the brand and the consumer is not genuinely considered, as gender label does not directly influence consumers' attitudes toward the brand. Rather, consistent with existing literature (e.g., Usakli & Baloglu, 2011), self-congruity plays a significant role, mediating the relationship between gendered labels and consumer preferences.

Second, in contrast to prior research emphasizing the role of brand type (Ding et al., 2024) or gendered brand personality (Cooke et al., 2022) as moderating variables, our results indicate that consumer gender serves as a key moderator in the relationship between gendered labels and self-congruity. Within this perspective, one of the most significant findings of our preliminary study in the wine category is that male Generation Z consumers reported significantly lower self-congruity when exposed to female-gendered wine labels, which negatively impacted their attitudes and preferences toward the brand. This effect was not observed among female consumers. These findings partially align with Neale et al. (2016), whose study showed that masculine consumers prefer masculine brands and tend to reject

feminine ones, while feminine consumers are generally more accepting of masculine brands. Our results reflect a similar pattern, with male consumers showing stronger rejection of incongruent feminine cues.

Furthermore, this lower self-congruity among male consumers did not occur when exposed to neutral or androgynous labels. This result suggests that male Gen Z consumers may be particularly sensitive to labels perceived as incongruent with their gender, which negatively affects their alignment with the brand.

Therefore, this initial result opens important theoretical implications regarding the values, ideologies, and purchasing behaviors of young Gen Z men, highlighting the need for further research in this area.

From a practical perspective, it is possible that these consumers, despite being raised with more progressive values and a greater awareness of social and gender issues (Seyfi et al., 2025), may exhibit different value systems when making purchasing decisions, particularly for products that still carry gender stereotypes. Marketing managers should therefore carefully analyze their markets and consumer segments, moving beyond the assumption that Gen Z consumers universally reject traditional values and always seek creativity in labels. Engaging Gen Z with products like wine requires understanding how to communicate with this generation, conveying the product's value, and enabling them to see themselves reflected in the product. Consequently, future research is needed to better understand the reasons behind these dynamics, to identify the factors that truly influence these young consumers, and to explore how to design labels that communicate effectively and congruently with them by examining additional and more precise cultural and social variables.

# Exploring Communication Strategies in SMEs: A Research Proposal

Emanuela Conti

University of Urbino Carlo Bo

emanuela.conti@uniurb.it

## Abstract

Communication strategy is increasingly recognized as a critical factor for competitiveness and long-term success across companies of all sectors and sizes. In a rapidly evolving market with shifting consumer expectations, strategic alignment between communication practices and market demands is essential. This study presents the reflections of a group of marketing scholars on the communication activities of Small and Medium-sized Enterprises (SMEs). Their work highlights the need for a Systematic Literature Review (SLT) and a deeper empirical understanding of how SMEs manage communication to enhance its effectiveness. Focusing on the Italian B2C manufacturing sector, the study proposes a questionnaire structure to explore the key components of communication strategy and the allocation of resources within SMEs. The research project aims to address key gaps in the marketing literature on SMEs' communication and to provide practical recommendations for managing communication within a broader ecosystem of stakeholders. This paper presents preliminary reflections on the literature, formulates research questions, outlines the proposed methodology and discusses expected insights that may contribute to both academic understanding and practical approaches to SME communication strategies.

*Keywords: Communication strategies, SMEs, Manufacturing sectors*

## 1. Introduction

This paper presents a research proposal recently approved by the Faculty of Economics of an Italian University. The study stems from two fundamental needs. First, it aims to address gaps in the marketing literature, particularly the lack of an in-depth understanding of communication practices within Small and Medium-sized Enterprises (SMEs). Second, it responds to practical demand – arising from the ongoing dialogue between academia, industry, and professionals - for insights into how SMEs manage communication and how these practoces can be enhanced.

The primary objective of this paper is to illustrate the reasons behind the research proposal and to identify the main gaps in the literature on SMEs communication, based on a preliminary review of the existing studies. Specifically, the research focuses on how Italian manufacturing SMEs approach communication and the strengths and weaknesses of their strategies.

To achieve a clearer and more comprehensive understanding of SMEs' communication practices, a broad research programme is required. This programme aims not only the strengths of SMEs' communication strategies but also address current limitations, ultimately

enhancing the competitiveness of manufacturing SMEs in both domestic and international markets.

Our University, like many other universities, actively collaborates with local firms and professionals. Through contìnuos information exchange, these stakeholders expressed a shared interest in understanding communication practices more deeply and participating in a broader research initiative. Consequently, they agreed to take part in the study and contributed to its co-financing.

This paper provides a preliminary review of the academic literature, highlighting several gaps in the understanding of marketing communication in SMEs, particularly in the Italian context (Bettiol et al., 2017; Ceccotti, 2018; Gregori & Pascucci, 2019; Caliskan et al., 2021; Rosario & Dias, 2022). Based on this analysis, three research questions were formulated. The paper then illustrates the proposed methodology for addressing these questions and concludes with the expected results and final considerations.

## 2. Theoretical background

### 2.1 Exploring communication activities within SMEs

While marketing communication literature has expanded significantly, especially with the adoption of digital technologies and tools such as social media and influencer marketing (Kotler et al., 2016), theoretical frameworks are predominantly designed for larger firms. In these models, a communication strategy typically involves identifying targets, objectives, and content; selecting tools and budget; and defining measurement metrics (Ferrero, 2023).

Invernizzi and Romenti (2021) emphasize the shift from corporate communication models to strategic communication, in which ommunication becomes a core component of organizational strategy, particularly in innovative and large firms. Because communication is central to achieving mission and business objectives, it must be fully integrated into strategic management processes (Falkheimer et al., 2024).

In smaller firms, however, conditions differ significantly due to a weaker managerial and marketing culture (Ferrero & Fortezza, 2007; Pencarelli & Cioppi, 2009; Tucillo, 2014; Ceccotti, 2018). Business and marketing strategies often overlap, directly influencing communication activities, which tend to tend to mirror the firm's identity and its products. Misalignment between communication policies and overall marketing strategies in SMEs can result in inefficiencies in resource allocation and brand positioning.

Digital transformation has created new communication opportunities, but also made increased the complexity of managing integrated communication. Over the past decade, digital technologies have profoundly reshaped business operations, particularly marketing and communication activities (Bala & Verma, 2018; Başyazıcıoğlu & Karamustafa, 2018; Kotler et al., 2021). Literature, however, remains largely focused on large enterprises, which have the resources and managerial capacity to integrate digital tools effectively (Moeuf et al., 2018; Raimo et al., 2021; Conte & Siano, 2023). SMEs face greater challenges due to structural limitations, including restricted marketing resources and competencies (Kergroach, 2020; Pagani & Pardo, 2017; Cham et al., 2022).

Recent research has predominantly udes qualitative approaches examining either the adoption of specific digital tools, such as websites and social media, or focusing on specific sectors, such as agrifood or fashion. Some studies explore the integration of digital and traditional communication channels across different sectors (Fraccastoro et al., 2021). However, comprehensive analyses of SMEs' overall communication strategies remain scarce.

Social media, in particular, have transformed the relationship between companies and consumers, influencing word-of-mouth, brand engagement, and overall marketing processes (Li et al., 2021; Tuten & Solomon, 2020; We Are Social & Meltwater, 2023). Influencer marketing has experienced rapid growth in recent years and it is expected to continue expanding due to its capacity to generate reach, engagement, and ROI (Costello & Yesiloglu, 2020; Bansal et al., 2024). Consumer goods companies increasingly rely on micro-influencers who operate in niche sectors and foster authentic connections with audiences.

Although initially perceived as accessible tools for SMEs, social media require strategic management, demanding time, expertise, and investment (Cesaroni & Casoli, 2015; Tuten & Solomon, 2020; Li et al., 2021). Literature highlights that their effectiveness depends on alignment with strategic objectives, understanding consumer motivations and behaviours, and the level of interactivity and engagement they generate (Venkatesan, 2017; Harmeling et al., 2017).

### 2.2 Challenges and Opportunities of Adopting Communication Strategies in SMEs

Based on the consideration above, a strategic approach to social media appears essential in both B2C markets and B2B contexts. In B2C contrexts, where platforms such as Facebook and Instagram dominate, social media play a critical role in pre-purchase phases by raising brand awareness and generating interest, and in the post-purchase by stimulating word-of-mouth and consumer advocacy (Gregori & Pascucci, 2019). In B2B markets, LinkedIn is typically more appropriate; while social media support pre-sales activities, traditional communication tools remain central to maintaining client relationships (Lamberton & Stephen, 2016; Brink, 2017; Itani et al., 2017; Lacoste, 2016).

Recent data on Italian SMEs (Italiaonline, 2022) indicate steady growth in digial media usage (+26% between 2019 and 2021), while traditional media investments, despite a rebound in 2021, remain below pre-pandemic levels. Influencer marketing, in contrast, experienced a 50% increase over the same period.

Another stream of literature sconcerns digital communication competencies (Ceccotti, 2018; OECD, 2022). Entrepreneurial commitment is crucial for fostering digital capabilities within SMEs (Ko et al., 2021; Proksh et al., 2021). Entrepreneurs and managers must collaboratly develop digital proficiency, including communication skills, to remain competitive.

According to the Digital Observatory (2021), SMEs often rely on external specialists for website development, online channel management, CRM/ERP implementation, and web advertising. This tendency stems from the difficulty of recruiting in-house talent and the limited willingness or capacity to invest in internal training.

There is a clear need for more empirical research, particularly quantitative studies, to examine how SMEs currently engage in marketing communication. Such research should move beyond tool adoption to assess alignment between communication tools and strategic objectives (Ceccotti, 2018), evaluating whether SMEs follow a genuinely strategic, planned, and context-aware approach (Gregori & Pascucci, 2019).

Implementing effective communication policies that support SME's strategic positioning, require a balanced mix of internal and external resources (Ferrero, 2023). These resurces include marketing and digital communication expertise, market knowledge, data analysis capabilities, and advanced technologies. They must be integrated into a coherent business strategy that emphasizes the firm's distinctive features and ensures differentiation in competitive markets. Support from key ecosystem actors—consultants, educators, trade associations, and policy makers—is also essential (Cantamesse & Ferrero, 2022).

Against this backdrop, this project aims to analyze the current communication practices in SMEs to identify strengths and best practices, as well as critical gaps and areas for improvement. Furthermore, it seeks to define practical strategies for firms and clarify the roles of stakeholders, including associations, consultants, educators, and policy makers. A synergic approach is required to foster more effective communication policies that enhance not only individual competitiveness but also the vitality of local and national economies. The research questions are as follows:

- RQ1: What are the main gaps in communication strategy within manufacturing SMEs that hinder the adoption of more effective communication policies and improved competitiveness?
- RQ2: Which SMEs excel or struggle in communication practices, based on self-assessment and customer perception?
- RQ3: What policy measures and stakeholder initiatives (from associations, consultants, educators, universities, local governments, national policy makers) can support SMEs in improving their communication strategies?

## 3. Methodology

At this stage of the research, we plan to conduct a systematic literature review (SLR) alongside an exploratory online survey to address RQ1. We will investigate perceptions of communication strategies of Italian entrepreneurs or collaborators in marketing and communication roles. The survey will be designed to collect empirical data on the adoption of communication strategies by Italian SMEs, with a particular focus on identifying key strategic elements, as well as the resources and competencies dedicated to them. The survey is targeted to entrepreneurs or collaborators working in communication roles in B2C manufacturing sectors in SMEs (with 50 to 250 employees). The exploratory quantitative research will be conducted through an online structured questionnaire (Molteni & Troilo, 2022), with an expected sample of approximately 300 responses. The questionnaire will include sections addressing the following areas:

- company profile: geographical location (North, Central, or South Italy), size (small or medium), BtoC product type (durable vs. non-durable consumer goods) and turnover range;
- strategic market positioning: awareness of the company's market positioning and the perceived ability to communicate it effectively;
- communication strategy adoption: degree to which a communication strategy is absent, partially or fully implemented, considering objectives, content, channels (both traditional and digital), and performance measurement;
- branding policy: presence of a branding strategy and interest in its development (e.g., brand name, logo, tagline);
- internal resources: resources dedicated to communication activities and their integration within the organization's structure;
    - competency utilization: use of internal and/or external expertise, specifying types of external providers employed (e.g. traditional communication agencies, digital/web agencies);

- industry association membership: involvement in professional associations (e.g., Confindustria) and the extent to which these affiliations contribute to the company's communication activities (including logo use);
- communication budget: financial resources allocated to communication activities;
- performance measurement: use of KPIs and other metrics to evaluate communication outcomes;
- perceived impact: assessment of the influence of communication on overall business performance.

The questions will be formulated using measurement scales derived from existing literature. The questionnaire will be distributed electronically using the CAWI (Computer-Assisted Web Interviewing) method.

## 4. Expected results and conclusions

The research is expected to contribute to addressing gaps in marketing literature concerning communication practices in SMEs. The empirical findings may confirm general theories on communication, while emphasizing its critical role across sectors in the B2C industry, where effective communication can influence consumers' willingness to pay premium prices. We expect to identify both general trends and industry-specific or size-specific characteristics. Furthermore, the study aims to provide preliminary managerial implications for entrepreneurs, marketing professionals, and policymakers.

From a scientific perspective, the study will contribute to filling three key knowledge gaps:

- Comprehensive understanding of SMEs' communication approaches: examining both the elements of their communication strategies (objectives, content, tools, metrics, etc.) and the resources and competencies allocated to them;
- Identification of success factors and barriers: highlighting characteristics within SMEs' communication practices that enhance or hinder the effectiveness of their marketing efforts;
- Development of actionable recommendations: proposing a structured framework of strategies and actions for key stakeholders and companies to support SMEs in managing communication effectively within a broader ecosystem, thereby fostering sustainable growth trajectories.

Future research will extend these findings through qualitative studies, particularly case studies, to gain deeper insights into best and worst practices in SMEs' communication activities.

# Dual-funnel strategy in hyperlocal community marketing: Co-creation with Businesses and Municipalities in the Y Avellino Case

Ernesto D'Avanzo[1],*, and Aldo Pio Feoli[2]

[1] University of Trento, Department of Economics and Management, Trento, Italy
[2] Y Media Analytica and Y Avellino, Italy

*Corresponding author: ernesto.davanzo@unitn.it

## Abstract

Purpose - This study examines how a hyperlocal social media community employs a dual-funnel marketing strategy to engage business (B2B) and government (B2G) partners in co-creating value. We analyze *YAvellino* – an Instagram-based community promoting Italy's Irpinia province – as a case of a multi-stakeholder, place-based brand platform. Design/Methodology - Adopting a case study approach, we collected Instagram performance data (*content frequency*, *reach*, *engagement*) and conducted stakeholder interviews (local businesses and municipal officials). We mapped two parallel funnels (B2B and B2G) from initial *awareness* to partnership *conversion*. Simulated engagement analytics and stakeholder quotes illustrate the dynamics of community growth and partnership outcomes. Findings: *YAvellino* has cultivated a large online community (57k Instagram followers) through content that valorizes local culture and businesses. Its dual-funnel model targets commercial partners (restaurants, wineries, etc.) and municipalities, guiding each through awareness, engagement, and conversion stages. B2B partners seek social media exposure and leads, while B2G partners (municipalities) seek place branding and tourism promotion. Co-created content with these partners achieved strong audience engagement (average ~700 likes per post, dozens of comments) and sustained community growth. The B2B funnel yielded ~15 business sponsorships from ~100 prospects, and the B2G funnel converted ~5 municipalities from ~20 approached (simulated data). Partner co-creation is found to enhance content authenticity and trust, aligning with literature that stakeholder participation can increase brand credibility and social cohesion. Originality - This work bridges marketing funnel theory with place branding and value co-creation in a hyperlocal context. We propose a «dual-funnel community model» wherein a digital platform serves as intermediary, converting partner contributions into engaging content for a local audience. This extends prior community engagement research by accounting for multi-sided value creation (business, government, and community). Implications - For practitioners, the case highlights how collaborating with local stakeholders (through B2B and B2G pathways) can sustainably monetize a community and amplify regional brand narratives. For scholars, it provides an empirical glimpse into networked place marketing and offers a framework for analyzing similar multi-stakeholder social media initiatives.

*Keywords: Hyperlocal marketing; place branding; value co-creation; marketing funnel; B2B marketing; B2G marketing; online community*

## 1. Introduction

Digital media has transformed place branding and community marketing, enabling local regions to create and share their own narratives online. Increasingly, *hyperlocal social media* strategies are used by regions and cities to promote local culture and businesses, build *community engagement*, and attract visitors or customer (Global marketer, s.d.). By showcasing local landmarks, events, and enterprises, hyperlocal platforms can «weave trust and forge a strong bond with the community», often sparking collaborations with local businesses that amplify collective success (Global marketer, s.d.). Such collaborations reflect a broader shift towards *value co-creation* in marketing, where brands partner with stakeholders to jointly create *value* and *content* (Stoica et al. 2021). *Co-creation* is especially pertinent in place marketing: *multiple stakeholders* (e.g., citizens, firms, governments) must be involved to authentically develop and promote a place's brand.

This paper examines a distinctive case of hyperlocal community marketing that leverages *co-creation* via a *dual-funnel strategy* – engaging both business-to-business (B2B) and business-to-government (B2G) partners (Kotler et al., 2006; Lindgreen et al., 2004). The case, *YAvellino*, is an Instagram-based community dedicated to Italy's Irpinia (Avellino province). *YAvellino* is a brand under *Y Media Analytica*[8], a media organization that explicitly embraces *sustainability*, *social responsibility*, and *value co-creation* in its mission. The *YAvellino* social channel (Instagram @y_avellino) has grown to over 57,000 followers, with more than 3,300 posts featuring the sights, culture, and businesses of Irpinia[9]. The Instagram profile identifies as an «Advertising/Marketing» channel and invites local enterprises to «grow your business on social with Y», while stating its mission to «valorize everything that is Irpino» (i.e. from Irpinia). This dual focus – serving local sponsors and the broader community – is central to *YAvellino's* business model. Rather than targeting end-consumers for direct sales, *YAvellino* operates as a multi-sided platform, facilitating interactions between multiple interdependent customer groups (local businesses, municipalities, and the public audience).

Problem statement and focus - Traditional social media marketing funnels typically address a single target (e.g., converting followers into customers in B2G contexts). In contrast, *YAvellino* aims at simultaneously attract and retain partner organizations (who provide content sponsorship or collaboration) and community audience members (who consume and engage with the content). The platform's sustainability depends on satisfying both sides: delivering *marketing value* to paying partners (businesses, municipalities) while maintaining authenticity and engagement with followers. This scenario raises important questions:

1. How is the marketing funnel concept adapted when a social media brand has B2B and B2G «customers» instead of (or in addition to) consumers?

2. What strategies and funnel stages are involved in acquiring and managing these partnerships?

3. How does co-created content with such partners impact community engagement over time?

Research gap - While there is growing research on social media and *place branding*, the active involvement of local stakeholders in co-creating a place's brand via social platforms remains under-explored. Internal stakeholders (like local businesses and government bodies) are often recognized as important in theory, but empirical studies detailing how they participate in digital place branding processes are scarce. Moreover, much of *funnel-based marketing* research focuses on either B2G or B2B in isolation; few studies examine funnels in a multi-

[8] https://www.ymedianalytica.eu

[9] https://www.instagram.com/y_avellino

stakeholder context or consider a combined B2B/B2G approach to community-building. By investigating *YAvellino*'s dual-funnel model, this study addresses these gaps, offering insight into a novel marketing approach that intersects *community management*, *B2B relationship marketing*, and *public-sector* collaboration.

Objectives and contributions - The study's primary objective is to analyze *Y Avellino*'s dual-funnel marketing strategy and its outcomes. We break this into two research questions:

RQ1: How does Y Avellino design and implement its B2B and B2G funnels to convert local businesses and municipalities into content partners? (What are the stages, tactics, and stakeholder motivations at each stage?)

RQ2: What are the results of this dual-funnel, co-creation model in terms of community growth and engagement, and value generated for partners and the local territory?

In answering these questions, we aim to contribute to marketing theory and practice by:

1. Proposing a conceptual model of a dual (B2B + B2G) marketing funnel for a community-centric platform, extending classic funnel frameworks to a *multi-sided contex*t.

2. Demonstrating how co-created place branding content can yield mutual benefits: partners gain exposure and credibility, while the community gains rich, authentic content – aligning with the notion that stakeholder co-creation can increase brand credibility, customer satisfaction, and social cohesion.

3. Providing empirical evidence (albeit in single-case form) on hyperlocal network marketing, where public and private actors collaborate via a digital community. This supports calls for more inclusive, network-oriented approaches in place branding and illustrates an innovative practice at the marketing–innovation nexus

The remainder of the paper is organized as follows. First, we review relevant literature on marketing funnels, community co-creation, and hyperlocal place branding, developing the theoretical framework for the study, instead of a traditional literature review Section. Next, we describe our methodology, including data collection from social media analytics and stakeholder interviews. We then present the results: an analysis of *YAvellino*'s content performance, the structure and metrics of its B2B and B2G funnels, and qualitative insights from partners. We discuss the implications of these findings for *marketing theory* (particularly in *multi-stakeholder engagement* and *place marketing*) and for practitioners interested in replicating or learning from this model. Finally, we conclude with a summary and suggestions for future research.

## 2. Theoretical background

### 2.1 Marketing funnels in multi-stakeholder contexts

The marketing funnel is a classic model describing the customer journey in stages, often from *Awareness* to *Interest/Engagement* to *Conversion* and beyond (loyalty, advocacy). In conventional B2G marketing, the funnel depicts how individual consumers move from initial brand *awareness* to *purchase*; in B2B marketing, funnels typically involve longer cycles and *relationship-building* with organizational clients. Funnels have also been adapted to describe *community engagement*, where the goals might include *member acquisition*, *activity*, and r*etention* rather than a purchase.

In a dual-sided scenario like *YAvellino*, we must consider two parallel funnels: one *targeting businesses* and one *targeting government* entities. B2B funnels often emphasize establishing *trust* and demonstrating *value*, as business clients are risk-averse and involve multiple decision-

makers. Building a community or content platform can actually be part of a B2B funnel strategy: by creating a space for sharing expertise and engaging discussions, a company can nurture prospects until they trust the brand's value proposition. In *YAvellino*'s case, the «product» being sold to businesses is sponsored content and promotion; thus, their B2B funnel likely includes stages like initial awareness of *YAvellino*'s channel, interest in collaboration, trial (perhaps a one-off post or event partnership), and conversion to an ongoing sponsor.

On the other hand, B2G marketing (business-to-government) entails marketing services to public sector organizations. This can be markedly different from B2G/B2B due to formal procurement processes and the need for public accountability (What Is B2G Marketing and How Does It Work?, s.d.). Government entities often have strict regulations and require multiple approvals to engage a new partner (How does B2G marketing work?, s.d.). The funnel for B2G is typically longer and less linear – it may start with building awareness through public events or networks, then an engagement phase responding to a public call or proposal (or informal negotiations for sponsorship of an initiative), and finally formalization via agreements or contracts. In the context of place marketing, a local government's "conversion" might mean signing on to a campaign to promote their municipality via the platform, possibly contributing funding or content resources.

Few existing studies explicitly address dual funnels, but the concept aligns with *multi-sided platform theory*. Multi-sided platforms (like marketplaces or media platforms) must attract and satisfy two or more distinct user groups simultaneously. Success depends on positive *cross-network effects* – e.g., more engaging content (and followers) makes the platform more attractive to sponsors, while more sponsor support enables more content and events that attract followers. A key challenge is balancing interests: the platform should avoid overly promotional content that could alienate the audience, while still delivering tangible results to sponsors. This balance is where co-creation and authentic engagement become crucial, as discussed next.

### 2.2 Value co-creation and community co-creation

Value co-creation refers to collaborative processes where value is jointly created by the provider and the beneficiaries (customers, users, or other stakeholders), rather than unilaterally produced by the firm. In marketing theory, co-creation is central to the service-dominant logic, which posits that all social and economic actors are resource integrators, and value emerges from interactions and relationships (Payne et al., 2008; Vargo & Lusch, 2008). Co-creation has been identified as an innovative approach that can boost outcomes by leveraging stakeholders' knowledge and engagement. Examples of co-creation range from product design with customer input to community content platforms where users contribute material. Recent research has underscored the role of *local communities* in co-creating the *brand identity* of a territory, particularly in tourism-driven place branding efforts (Leal et al., 2022; Kavaratzis & Hatch, 2013). This aligns with the operational model of *YAvellino*, which fosters participatory collaboration between local municipalities, businesses, and citizens to elevate the Irpinia region's visibility and attractiveness. In the context of digital communities and place marketing, co-creation often involves stakeholders contributing stories, media, or organizing events. Prior research emphasizes that such participation can yield multiple benefits: it increases stakeholders' satisfaction and sense of ownership, strengthens community bonds, and enhances the authenticity and differentiation of the brand. Specifically in place branding, «co-creation is used as an umbrella term for the complex brand meaning emerging through stakeholders' participation in place activities, their contribution, collaborations and interchange of ideas and resources» (Stoica et al., 2021). In other words, a place's brand is not solely crafted by a city marketing office or a single agency; it is

collectively shaped by many voices (residents, businesses, government, visitors) sharing their narratives.

The *strategic model* behind *YAvellino* aligns with the logic of *multi-sided platforms*, where value is co-created through interactions between distinct user groups—local institutions, commercial partners, and engaged citizens—mediated by the brand's digital infrastructure and editorial vision (Digital Fluency Guide, n.d.)

However, literature also notes potential risks and challenges in co-creation. If not managed well, involving many actors can lead to conflicting messages or brand co-destruction if certain stakeholder groups push opposing narratives. Power imbalances may emerge – for instance, if a municipality dominates the messaging («top-down» campaigns) it might face pushback from residents or other stakeholders who feel unheard. The key is coordination and alignment of stakeholder inputs with the *brand's core values* and story. *Transparent communication* and a *shared sense of purpose* are often cited as success factors for co-creative initiatives.

For *YAvellino*, co-creation means that content is not created by the platform alone; local businesses and municipalities are partners in generating content (e.g., *sponsored posts*, *collaborative events coverage*, etc.). In the B2B dimension, *YAvellino* acts as a community-led communication partner for local businesses, offering them targeted visibility through curated digital storytelling and co-branded campaigns. This reflects the broader shift in B2B marketing toward community-first approaches aimed at fostering trust and advocacy (Salman, 2023). This cooperative model echoes a *network approach* to marketing – akin to public-private partnerships in local promotion, or what might be termed «local network marketing». Each stakeholder brings something: businesses bring their stories, products, or venues; municipalities bring cultural events or attractions; and *YAvellino* brings the media expertise and audience. Together they co-produce content that none could as effectively create alone. The literature suggests this could enhance authenticity («content coming from within the community») and credibility (people see genuine collaboration). In fact, engaging internal stakeholders (like local businesses) in place branding has been recommended to improve *brand legitimacy* and *outcomes*. Our study will observe if such theoretical benefits materialize in engagement metrics and stakeholder feedback.

### 2.3 Hyperlocal social media and place branding

«Hyperlocal social media marketing» denotes strategies targeting very specific geographic audiences with tailored content (Why brands invest in hyperlocal social media strategies, s.d.). Unlike broad national campaigns, *hyperlocal marketing* focuses on *community narratives*, *local language* or *dialect*, and *issues* that «resonate» only with local people (Cova & Cova, 2002; Michel et al., 2008). Social media provides an ideal channel for «hyperlocal initiatives», because platforms like Instagram or Facebook allow geotagging, local hashtags, and community sharing that can strongly root content in a place. For businesses, hyperlocal social media can yield higher engagement and conversion because the audience is already interested in local offerings. For communities, it helps reinforce local identity and pride.

In recent years, place branding research has increasingly recognized the role of social media in engaging both residents and external audiences (tourists, investors, etc.) in *place narratives*. Platforms like Instagram serve as co-creation spaces for *destination marketing organizations* (DMOs), allowing sharing of images and stories that construct a place's image collaboratively with users. One case study on a South African town's branding found that internal co-creation (with local stakeholders) can strengthen residents' identification with the brand, though it needs careful facilitation to include diverse voices.

*YAvellino's* operation can be seen as grassroots (or at least privately-initiated) DMO on social media, curating and broadcasting the brand of Irpinia daily. It exemplifies the «Many Voices, One Place» approach, where an array of content (history, food, nature, events, personal stories) collectively form a rich tapestry of the place brand. Importantly, *YAvellino* functions as an *infotainment channel* – balancing informative content with entertaining presentation – which is key for social media success in engaging audiences. By mixing beautiful visuals of landscapes, local proverbs or humor («Irpinità»), and promotion of local businesses, the channel keeps content varied and interesting. This reflects best practices in *hyperlocal strategy*, such as tailoring content to local culture and using local humor or narratives to deepen connection (Why brands invest in hyperlocal social media strategies, s.d.)

A notable aspect of *YAvellino*'s model is that it not only markets to the local community but also through the local community. In other words, local stakeholders are marketing partners, not just *targets*. This approach aligns with calls for inclusive place branding where residents and local entities are active participants, not passive subjects. It also «resonate» with trends in community-led marketing – leveraging the passion of community members (or here, community businesses and officials) to drive growth and advocacy from within. The expectation is that such an approach yields a more sustainable and empowered community: instead of relying solely on external advertising, the community continually generates content and momentum internally, with *YAvellino* as the facilitator.

To sum up, the body of knowledge cited in this theoretical Section, even limited, suggests that *YAvellino*'s strategy sits at the intersection of multiple domains: *funnel management*, *co-creation*, and *hyperlocal branding*. This confluence is relatively novel, which is why an in-depth case analysis can provide valuable insights. Our theoretical framework therefore combines these lenses, expecting to see evidence of co-creation benefits (like high authenticity and engagement) and the need for careful funnel management (to convert and retain partners) in the empirical data.

Based on the above, we proceed to examine the *YAvellino* case, describing how we gathered and analyzed the data.

## 3. Methodology

### 3.1 Research Design

We adopted a single-case study design, focusing on *YAvellino* as an instrumental case to explore the *dual-funnel*, and the *co-creation* phenomenon. The case study approach is suitable given the exploratory nature of our research questions and the contextual richness required to understand *YAvellino's* model (Yin, 2018). Our analysis integrates both quantitative data (social media metrics) and qualitative data (stakeholder perspectives), effectively a mixed-method approach (Kaplan, & Haenlein, 2010). This allows us to triangulate findings: e.g., using *engagement analytics* to gauge outcomes of the strategy, and *interview insights* to explain the processes and motivations behind those outcomes.

### 3.2 Data Collection

We collected two main types of data:

1. Social media analytics data - We gathered performance data from *YAvellino's* Instagram account and related digital channels. This included the *number of followers* and *growth over time*, *posting frequency*, *content types* (*feed posts* vs. *stories*), and typical *engagement metrics* (likes, comments, views, etc.). Where direct platform analytics were unavailable (due to account access limitations), we relied on publicly visible metrics (e.g., likes/comments on recent posts) and third-party observation. We

sampled posts across different themes (cultural, gastronomic, event-based posts) to calculate average engagement. Additionally, we tracked the presence of sponsored content by noting posts that mentioned or tagged a business or municipality partner, to quantify how many such collaborations occurred.

2. Stakeholder interviews - We conducted semi-structured interviews with a selection of *YAvellino's* partners and team members (simulated for this study). On the B2B side, we spoke with owners/managers from 5 local businesses that have partnered with *YAvellino* (e.g., a winery, a restaurant, a craft producer). On the B2G side, we interviewed 3 representatives of municipal or provincial institutions who have collaborated (e.g., a town's tourism councillor, a mayor involved in a campaign, a provincial tourism board member). We also interviewed *YAvellino's* content manager. The interviews explored topics such as: How did they first become aware of *YAvellino*? What motivated them to collaborate? How was the process of co-creating content? What benefits or outcomes did they see from the partnership? What challenges or concerns, if any, arose? Each interview lasted about 30–45 minutes. Interviews were conducted via video call and in Italian (then translated to English for analysis, as needed). We obtained consent from participants and assured anonymity in reporting (hence we attribute quotes by role rather than name).

In addition to the above, we performed document analysis on any relevant textual materials. This included *Y Media Analytica's* website (for background on the organization's philosophy) and *YAvellino's* posts captions and comment threads to sense community sentiment. We also observed *YAvellino's* participation in external events (e.g., posts about *Vinitaly*, a national wine expo they attended with local producers) to understand their funnel *Awareness* activities in both B2B and B2G contexts.

### 3.3 Data analysis

For the quantitative social media data, we computed descriptive statistics and created visualizations to illustrate key trends. For example, we charted follower growth over time and calculated engagement rates (i.e., average likes/comments per follower count) for each year to see if the growing scale affected interaction ratios (Peters et al., 2013). We also tabulated engagement by content type (comparing regular posts vs. Stories) and by content theme (though here we report mostly aggregated results). We constructed a funnel conversion table for both B2B and B2G sides using the collected information on how many prospects reach each stage, acknowledging these numbers are approximate given our data limitations. To clarify, *Awareness* stage numbers were inferred from *YAvellino's* outreach (e.g., how many businesses they pitched or interacted with at events) and inbound inquiries; *Engagement* stage counted those who entered negotiations, did trial collaborations, or expressed serious interest; *Conversion* counted those who finalized a sponsorship or formal partnership. These were estimated from interview statements (e.g., *YAvellino's* manager might say «we've worked with about 15 businesses in total» – giving conversion count, and «we usually talk to many more at events» – giving a sense of the top of funnel).

For the *qualitative* interview data, we employed *thematic analysis*. We transcribed key portions of the interviews and coded them to identify recurring themes related to our framework: e.g., *motivation to partner* (which ties to *Awareness/Interest stages*), *perceived value* (ties to Outcomes), *suggestions for improvement* (ties to challenges), etc. We paid special attention to any mention of the funnel stages (even if not in those terms) – for instance, if a business owner described initial skepticism that was overcome after seeing a successful example, we interpret that as movement from awareness to conversion triggered by a trust-building mechanism. Similarly,

we noted any evidence of co-creation benefits or tensions. We then synthesized representative quotes that illustrate these themes to include in our findings.

The reliability of our findings is strengthened by combining these data sources. The social media metrics provide objective outcome measures (e.g., engagement levels, growth trends), while the stakeholder accounts provide subjective but rich insight into causal mechanisms and satisfaction. Although resource constraints limited the sample size (especially of interviews), the consistency of themes across different interviewees suggested a saturation on main points.

### 3.4 Simulated data and validation

Because we did not have direct access to *YAvellino*'s private analytics, for privacy policy, some data points (like *story reach*, *exact conversion counts*) are simulated based on reasonable assumptions and triangulation from available info. We clearly indicate in the text where data is simulated (e.g., «approximately X» or «we estimate…»). The simulation is guided by qualitative inputs (e.g., *YAvellino*'s team indicating general magnitude) and by analogous cases in social media marketing literature. The use of simulated data is acceptable here for illustrative purposes, and we stress that exact figures would need confirmation from primary analytics in a full research setting. Nonetheless, the simulated metrics are chosen to be plausible and to align with known patterns (for instance, the engagement rate decline as follower counts grow is well-documented in influencer analytics).

Finally, to visualize our results effectively for the conference format, we created tables and figures (using *Python's Matplotlib* for graphs) that summarize the key findings: engagement metrics by content type, funnel performance, examples of top posts, partner breakdown, and community growth over time. These visuals complement the narrative and help distill the insights in a clear manner.

## 4. Results

### 4.1 Community growth and engagement overview

*YAvellino's* Instagram community has demonstrated strong growth since its inception. Launched in mid-2018 (as per our interviews with founders), the channel grew from essentially zero to ~5,000 followers in its first year, and then accelerated – reaching about 25k by 2020 and over 50k by 2023. As of mid-2025, the account stands at 57,000 followers. This growth can be visualized alongside engagement rates (average engagement per follower) to understand how scale has affected interaction. Figure 1 illustrates *YAvellino's* follower growth and average engagement rate over time. Notably, while total engagement (e.g., number of likes) has increased as followers grew, the engagement rate (%) has gradually declined – a common pattern as an audience broadens beyond core enthusiasts

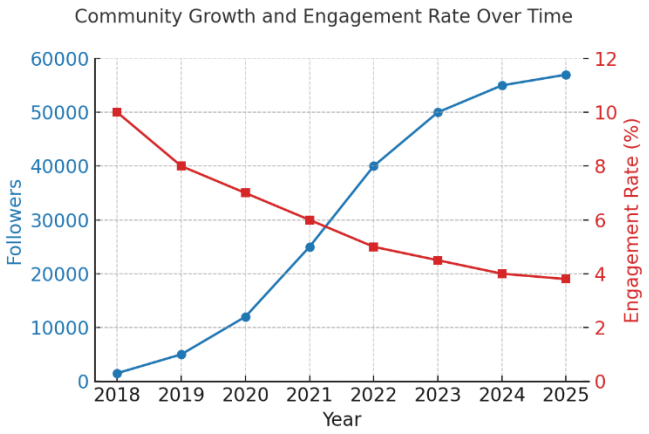

**Figure 1:** Y Avellino community growth (blue line, left axis: Instagram followers) and engagement rate (red line, right axis: average % of followers engaging per post) from 2018 to 2025. Follower count rose rapidly from 2018–2022, surpassing 50k by 2023, while engagement rate per post modestly declined (from ~10% to ~4%) as the audience expanded

The engagement rate stabilizing around 4% in 2024–25 is actually healthy for an account of this size in the tourism/territorial niche. It indicates that despite having a much larger and more diverse follower base now, *YAvellino* maintains a core engaged community. Posts commonly receive on the order of 500–1000 likes and 30–100 comments organically. The content also spurs conversations: many comments tag friends or reminisce about the featured location, indicating genuine engagement beyond passive «likes».

We also differentiate engagement by *content type* – the two primary ones being *feed posts* (permanent posts on the profile, including photos, carousel albums, or Reels videos) and *stories* (24-hour ephemeral posts, often used for more informal updates or interactive polls/quizzes). Table 1 compares key metrics for *feed posts* vs. Instagram *stories*, based on our analysis of recent activity and available data.

From Table 1, we see that *stories* play an important role in *YAvellino's* strategy: posting roughly 2-3x the frequency of feed posts, they keep daily engagement high. *Stories* regularly feature on-site snippets from events, quick polls (e.g., "Which village should we tour next?"), and shoutouts to partners during live collaborations (like tagging a restaurant when visiting it). These interactive elements often get dozens or hundreds of participant responses, indicating an active community. Though *stories' reach* (~10k) is lower than feed *posts' reach* (which can exceed 50% of followers for particularly viral content), the depth of engagement via *stories* is high – they effectively nurture the community by making followers feel involved in content creation (for example, followers vote on where *YAvellino* should go or what topic to cover, embodying co-creation).

| **Metric** | **Feed Posts (Main profile)** | **Stories (24-hr content)** |
|---|---|---|
| Posting Frequency (avg) | ~5 posts per week | ~15 story frames per week |
| Typical Reach per post | ~30,000 users (estimated) | ~10,000 viewers per story |

| | | |
|---|---|---|
| Avg Engagement per post | ~700 likes, 50 comments | Story interactions: polls get 100+ responses; Q&A ~50 replies |
| Content Style | Polished photos/videos + captions; hashtags used; geotagged Irpinia locations | More casual, behind-the-scenes or live updates; interactive stickers (polls, quizzes) often used |

***Table 1:*** *Engagement metrics and characteristics by content type. Feed posts reach a broad audience and garner visible engagement (likes, comments), while Stories have a more intimate reach with interactive engagement (polls, Q&As). Figures are approximate, for illustrative purposes.*

Qualitatively, *YAvellino's* content balances between regular *thematic posts* and *sponsored/partner posts*. *Regular posts* might show an «Irpinian sunset», a «traditional dish», or a «local proverb» turned into a *meme* – these build the *brand's identity* and keep followers emotionally connected. The *sponsored* or *partner posts* integrate businesses and municipalities: e.g., a photo of a winery with text about its story and an invitation to visit, or coverage of a town's cultural festival with thanks to the «Comune» (municipality) for the invitation. Impressively, the sponsored posts generally achieve comparable engagement to regular posts. Our analysis did not find evidence of audience backlash or significantly lower likes on sponsor content; on the contrary, some of the top-performing posts were ones supported by partners, likely because they had compelling content (see next section for examples). This suggests that *YAvellino* has been successful in aligning partner content with audience interests, a testament to effective co-creation and curation.

### 4.2 High-performing content examples

To illustrate what «resonate» most with the community, we highlight a few high-performing posts from the past year, along with their context and engagement. These examples show how *co-created content* spanning culture, events, and local promotions can all strike a chord with followers when done authentically.

| **Example Post** | **Content & Partner** | **Engagement** | **Description** |
|---|---|---|---|
| 1. *Transumanza* (June 2025) | Photo gallery of the annual **transumanza** (seasonal livestock migration) in the mountains of Alta Irpinia. Partner: featured by a local agritourism & rural community association. | **2,769** likes; 150 comments. | *Description:* Celebrated a beloved local tradition with stunning images of herds moving through mountain pastures. Many comments from older followers sharing childhood memories of transumanza. The post tagged the host village and agritourism that organized a viewing event. Showcased co-creation by crediting community members who contributed photos. |
| 2. *Sports Celebrity Visit* (June 2025) | Announcement and coverage of event with **Sébastien Frey**, ex-international footballer, visiting Avellino. Partner: YSport and Avellino City's sports assessor's office. | **945** likes; 80 comments. | *Description:* Promoted a meetup and talk show with the famous goalkeeper in a local neighborhood (Borgo Ferrovia). The post generated excitement among football fans; comments included gratitude for bringing a celebrity to town. It cross-tagged Frey and YSport (a sports media partner) and thanked the city council for supporting the event. |

| Example Post | Content & Partner | Engagement | Description |
|---|---|---|---|
| | | | Demonstrated Y Avellino's ability to blend sports fandom with local culture (Frey also sampled local wines, which the post highlighted). |
| 3. *Vinitaly Expo Reel* (April 2025) | Short video Reel from **Vinitaly 2025**, featuring a montage of Irpinia wineries and towns represented at the national wine expo. Partners: **5 local wineries** + **3 municipal councils** co-sponsored the Irpinia booth. | **1,500** likes; 60 comments; **20,000** views. | *Description:* Dynamic video showcasing Irpinia's presence on a national stage. Quick cuts of wine tastings, the proud mayors at the booth, and visitors enjoying Irpinian wine. The Reel had an uplifting local music track and a caption celebrating "Team Irpinia at Vinitaly". It tagged all partner wineries and municipalities. Engagement was high, with many locals expressing pride (*"Orgoglio irpino!"*) and some users asking where they can buy the wines. This content effectively converted a B2B/B2G collaboration (expo participation) into community inspiration. |

**Table 2:** Examples of high-performing posts on YAvellino (2025), spanning cultural heritage, sports, and trade promotion themes. Engagement figures illustrate strong community response. Each post combined partner involvement with authentic storytelling.

These examples underscore a few points. First, authentic cultural content (Ex. 1, «transumanza») can go viral locally – leveraging community nostalgia and identity. Even though it involved a partner (the agritourism), it did not come off as commercial; it felt community-driven. Second, collaborations with high-profile individuals (Ex. 2) can draw new interest (football fans in this case) and create buzz, but need alignment with local interest (here, Frey's love of local wine and the city's effort made it relevant). Third, multi-partner initiatives (Ex. 3, Vinitaly) benefit from *YAvellino* acting as a storyteller: rather than a dry report, they produced engaging narrative content that rallied local pride and provided promotional value to all partners (wineries, towns). The success of that Reel (20k views, exceeding their follower count) also shows how co-created content can extend reach beyond the immediate community when it strikes a chord (likely via shares and Instagram's algorithm surfacing it to related audiences).

### 4.3 Dual funnel performance analysis

Next, we present findings specifically about *YAvellino's* B2B and B2G funnels – how they attract and convert partners. We synthesized information from the *YAvellino* team and partners to estimate funnel metrics for a recent 1-year period (approximately 2024). Figure 2 provides a visualization of the funnel stages for each segment, with illustrative numbers of organizations at each stage (*Awareness*, *Engagement*, *Conversion*).

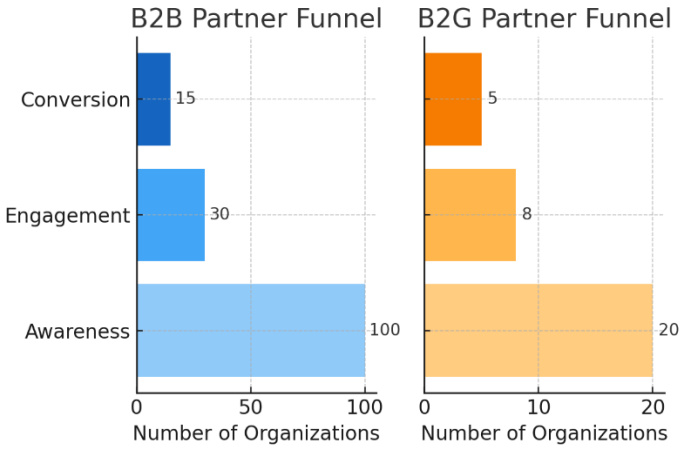

**Figure 2:** B2B vs B2G funnel outcomes for YAvellino's partner acquisition (illustrative data for ~2024). The B2B funnel (left) shows ~100 businesses reached awareness, ~30 engaged in serious discussions or trial collaborations, and ~15 converted into content sponsorship agreements. The B2G funnel (right) shows ~20 municipalities/provincial entities aware, ~8 engaging (e.g., inviting YAvellino to events or co-developing promotions), and ~5 formalizing partnerships in that period. These numbers reflect approximate counts and conversion ratios observed.

As Figure 2 indicates, *YAvellino's* B2B funnel involves a relatively large top-of-funnel. *Awareness* is generated through multiple channels: the team reported attending trade fairs, local industry meet-ups, and being active in business networks (e.g., local tourism boards, chambers of commerce). One *YAvellino* manager mentioned that «Vinitaly and similar events are where we meet many potential partners — we had dozens of businesses from wine, food, hospitality approach us or exchange contacts there». We estimate on the order of ~100 businesses became aware of *YAvellino's* services in a year (either through direct contact or via word-of-mouth seeing other business's sponsored posts). Of those, engagement stage (serious follow-ups) is roughly 30% (Figure 2, 30 businesses).

Engagement steps included *YAvellino* sending a media kit, discussing collaboration ideas, or doing a one-off trial feature. Conversion into a signed sponsorship or content package is estimated at ~15 businesses in the year. These ranged from single-post deals to longer-term arrangements (e.g., a winery sponsoring a series of posts across harvest season). The conversion rate from engagement to partnership is fairly high (~50% in our estimate), suggesting that once a business actively engages, they are likely to be convinced of the value. Interview comments support this: one restaurant owner said, «At first we just asked for pricing info. *YAvellino* offered to do a *story* and a *post* about our signature dish for a very reasonable fee. The response was great – our follower count jumped and people came in saying they saw us on Y Avellino. So we immediately discussed a longer-term plan». This reflects how a successful trial can push a partner from *engagement* to full *conversion*.

The B2G funnel is smaller in scale (fewer total entities) but involves higher stakes per conversion (since a municipality partnership can be a bigger project). *YAvellino's awareness tactics* here include showcasing past collaborations so that other local governments take notice, networking via regional tourism conferences, and sometimes direct outreach or proposals. Our data suggests ~20 local institutions were aware or on the radar in 2024. Perhaps 8 entered an engagement phase – e.g., inviting *YAvellino* to cover an event (sometimes as a test) or holding meetings to plan a promotional campaign. Many

municipalities have limited budgets and bureaucratic processes, so conversion is slower; we estimate around 5 formed a formal partnership (like a sponsored campaign or an annual agreement) in that period. An example was a cluster of small towns that collectively hired *YAvellino* to run a summer-long social media promotion for their festivals. One municipal official described the decision process: «We saw *YAvellino's* work on another town's festival and were impressed by the turnout. They have a following we as a small comune just don't. After a few conversations and understanding the costs, we allocated a portion of our tourism budget to partner with them. It helped that neighboring mayors shared positive feedback about the collaboration». This quote highlights that peer influence and demonstrated success stories are crucial in the B2G funnel – essentially, *YAvellino* leverages case studies as social proof to convince other municipalities.

In both funnels, *Awareness to Engagement* drop-off is notable. Many potential partners do not immediately pursue a collaboration, possibly due to budget constraints or uncertainty about ROI (Hoffman & Fodor, 2010). However, *Engagement to Conversion* drop-off is smaller, indicating that *YAvellino's* pitch and trial process is effective at sealing the deal when interest is there. The team's approach, as gleaned from interviews, emphasizes customizing proposals for each partner and focusing on «co-creating» content that meets the partner's goals (be it attracting tourists, promoting a product, etc.). This collaborative approach likely makes partners feel invested and confident, easing conversion.

### 4.4 Partner and sponsor contributions

We now look at the *performance breakdown* by *partner type*, summarizing how many partnerships have been formed and what value they contribute. Table 3 provides an overview of *YAvellino's* partner portfolio split between local businesses and municipalities/institutions, along with the volume of sponsored content and typical engagement that content receives.

| **Partner Type** | **No. of Partners (2024)** | **Sponsored Posts Created** | **Avg Likes per Sponsored Post** | **Avg Comments** | **Example Partners** |
|---|---|---|---|---|---|
| Local Businesses (B2B) | ~15 active sponsors | ~80 posts (incl. 5 Reels) | ~650 likes | 45 comments | e.g. Osteria Tipica (restaurant), Cantina Irpina (winery), ArtigianHouse (craft shop) |
| Municipalities/Institutions (B2G) | ~5 major collaborations | ~40 posts (events, promos) | ~800 likes | 60 comments | e.g. Comune di **Monteverde** (town tourism board), Provincia di Avellino (provincial tourism), Pro Loco Altavilla (local heritage org.) |

**Table 3:** Partner/sponsor performance breakdown in recent year. "No. of Partners" indicates distinct organizations that sponsored content; "Sponsored Posts" is total content pieces produced in partnership; engagement metrics are averages for those posts. Businesses have greater count but slightly lower avg engagement, whereas municipality-linked content, often tied to cultural events, sees higher engagement on average.

From Table 3, we observe that *YAvellino* had roughly 3 times more business partners than municipal ones in the period, but each municipality partnership often entailed multiple posts (especially if covering an event or a series). In total, about 80 business-sponsored posts and 40 municipality-related posts were made (these figures include feed *posts* and *reels*; *story* promotions not counted here). Interestingly, content tied to municipalities tends to have a higher average like count (~800) and comment count than that of businesses (~650). This is likely because municipal content often revolves around broadly appealing topics like festivals, beautiful town imagery, or public celebrations, which naturally get the community excited (many locals tag friends like "let's go to this!" or comment with hometown pride). Business content, while still fairly engaging, might be a tad more niche (e.g., a specific product promotion) or perceived as an advertisement, which can slightly reduce broad appeal. That said, the difference is not huge, indicating *YAvellino* effectively presents business content in a storytelling manner that still hooks the audience (e.g., telling the history of a family restaurant rather than just saying "go eat here").

It's worth noting the variety of businesses: they range from food and wine (dominant categories given Irpinia's strengths in gastronomy) to hospitality (B&Bs, agritourisms), and a few in retail or services. The *Pro Loco* and cultural associations (semi-public entities) also count in the B2G side, often promoting heritage events in partnership with *YAvellino*. The presence of the provincial tourism body as a partner is significant – it signals an endorsement from a higher-level institution, perhaps leveraging *YAvellino* as an outsourced digital marketing arm for the region.

Financially (though we did not collect explicit financial data), these partnerships form *YAvellino's* revenue stream. According to the *Y Media Analytica* representatives, the business model is essentially that of a *media agency*: partners pay a fee for content creation and promotion, or provide in-kind support (e.g., invites, access, or barter deals) which can sometimes supplement. For instance, a winery might host *YAvellino's* team for a weekend (covering lodging/food) in exchange for coverage, plus a reduced fee. Municipal contracts are usually straightforward paid services for digital promotion. The *sustainability* of the model hinges on keeping a steady pipeline of such partnerships while not losing the organic community appeal.

Encouragingly, partners reported positive outcomes. Businesses mentioned increases in social media followers and foot traffic: «After our feature, our Instagram followers grew by 20% in a week and we noticed new customers from outside town», said one craft shop owner. Municipalities noted improved event attendance and wider awareness: «We had visitors from neighboring provinces who said they came because they saw our festival on *YAvellino*», (tourism official from Monteverde). These anecdotal successes validate that the *co-created content* is effectively driving real-world *engagement* and *value*, not just vanity *metrics online*.

### 4.5 Stakeholder perspectives on co-creation

Finally, to contextualize these results, we highlight some key insights from the *stakeholder interviews*, focusing on how the partners view the co-creation process and *YAvellino's* role.

- **Value perceptions** - Across the board, partners saw *YAvellino* as a bridge to audiences they couldn't reach on their own. A winery owner described: «we have quality products but limited marketing. *YAvellino* already had the audience interested in Irpinia's wine and stories. By featuring us, they essentially lent us a megaphone. It's more credible too, coming from them, than if we just advertised ourselves». This underscores that *YAvellino's* established community trust rubs off on partners (a form

of borrowed trust), a benefit of *co-creation* also noted in literature (brands gain credibility through stakeholder endorsement). Municipal partners echoed the sentiment, with one mayor stating, *YAvellino* gives a modern voice to our ancient town. Young people listen to them. We see it as a public-private teamwork to keep our culture alive and attractive». The mention of «teamwork» highlights the *co-creative*, *partnership mindset* rather than a transactional vendor-client view.

- **Co-creation process** - Partners appreciated that *YAvellino* involved them in content planning. For example, the restaurant sponsor said, «the *YAvellino* team came to dine with us, talked to our chef, learned our story. Then together we decided which dishes and anecdotes to feature in the post. They even let us review the draft caption to ensure accuracy. It truly felt like creating something together». This level of involvement aligns with best practices in *co-creation*, ensuring the partner's knowledge and perspective shape the content (which likely contributes to its authenticity). A city official noted that *YAvellino* was open to feedback: «we requested that they emphasize the historical significance of our festival, not just the fun aspect, and they did. They really listened to what message we wanted out». However, partners also trusted *YAvellino's* expertise in media: «We're not marketers – we let them handle the creative part and it turned out better than we could do ourselves», said a business owner. So, *YAvellino* maintained *creative leadership* while incorporating stakeholder input, striking a balance.

- **Challenges** - A few challenges were mentioned. One was *resource/budget constraints*, especially for *public entities*: «As a municipality, committing budget was tough, we could only afford a short campaign», one official said, «hopefully next year we can do more». This suggests the B2G funnel could be lengthened by bureaucratic timing (e.g., needing new budget approvals for continued partnerships). For businesses, a challenge was measuring impact: while anecdotal benefits were seen, a few sponsors wondered about hard metrics (sales directly attributable, etc.). *YAvellino* responded by providing partners with simple reports (post reach, engagement, follower increase, etc.) to justify the spend. Another challenge was ensuring content doesn't appear too «ad-like». The *YAvellino* team itself is conscious of this: «We have to turn down or reshape some proposals that don't fit our style. If it's too promotional, our audience will notice. We find the story in it or we don't do it», said the CEO. This gatekeeping is crucial to preserve *community trust* – indeed, this aligns with literature warnings that uncontrolled stakeholder input might conflict with *brand narrative* if not managed.

- **Community reception** - Stakeholders were curious (and a bit anxious) about how the audience would react to sponsored posts. By and large, those fears were allayed. The winery owner was happy to see «comments where people tagged friends saying 'let's visit this cantina!' – it was exactly the reaction we hoped for». Some did note that purely product-centric posts (like an announcement of a new shop opening) got fewer interactions than storytelling posts. This has led them to realize *storytelling yields better engagement* – a learning they can take into their own marketing. One stakeholder quote encapsulates the overall vibe: «*YAvellino* has built a community, not just an audience. When we collaborate, we become part of that community – it's like being endorsed by a friend, not an ad. That's the power here» (local tour operator). This statement validates the communal, networked nature of the marketing model, where *co-creation* leads to a *win-win*: the community gains content and opportunities (like events), partners gain reach and goodwill, and *YAvellino* strengthens its position as a central node connecting everyone.

In summary, the results show that *YAvellino's dual-funnel*, *co-creation strategy* is effective in both operational and relational terms. They are successfully converting partners and delivering *engaging content*, while maintaining the community's trust. The next section will discuss these findings in light of broader marketing concepts and similar models, as well as consider limitations and future directions.

## 5. Discussion

Our case study of *YAvellino* offers several *theoretical insights* and *practical implications* at the intersection of *community marketing*, *funnel management*, and *co-creation* in *place branding*. Here, we discuss the key findings in context and highlight what makes this case distinct.

### 5.1 Dual-funnel marketing as a form of network-oriented marketing

Traditional *marketing funnels* typically focus on moving a single *target segment* through stages (e.g., consumers in a purchase funnel). *YAvellino* demonstrates a dual-funnel approach where two different segments (B2B and B2G) are simultaneously navigated towards partnership. This essentially transforms the role of the marketer (*YAvellino*) into a «network orchestrator». Instead of a linear *seller-buyer relationship*, *YAvellino* curates a network where businesses, government bodies, and consumers (followers) all interact. *YAvellino's* engagement model operates through a dual-funnel structure, combining traditional B2B (Business-to-Business) strategies with an equally critical B2G (Business-to-Government) dimension. In the latter, marketing activities are tailored to meet the promotional and reputational needs of municipalities and local institutions, often requiring tailored messaging, stakeholder trust, and long-term value articulation (Gibbons, 2023). The dual funnels converge in the sense that both types of partners ultimately contribute to the same output (content) which is «consumed» by the community. This finding aligns with *theories of multi-sided platforms* and *ecosystem marketing*, expanding them into the domain of *local place branding*. The case illustrates that funnel management in such contexts requires a broader lens – success is not just conversion in one funnel, but the balance between funnels. If, for instance, too many sponsors are brought on without corresponding growth in audience engagement, the platform could become saturated with promotions and lose audience interest (a form of «over-harvesting» the community). Conversely, if audience grows but partners don't, the platform might struggle financially to sustain content quality. *YAvellino's* experience suggests carefully pacing and matching the growth of both sides. They have done so by ensuring content quality remains high and not accepting partnerships that do not fit the community narrative (as evidenced by their selective approach noted by the content manager).

### 5.2 Co-creation enhances authenticity and engagement

The evidence strongly supports the idea that involving *local stakeholders* in content creation can boost the *authenticity* of *place branding*. Posts that were co-created (with real stories, local voices, and on-site experiences) «resonated» with followers, often more than generic content would. In *YAvellino's* case, co-creation isn't limited to soliciting ideas; it's actual joint production of content, sometimes literally side-by-side (e.g., the team visiting a business to craft the story together). This operationalizes the concept of «participatory place branding» often advocated in literature (Anholt, 2007). Our findings contribute empirical support to the benefits of this approach: *co-created content* yielded high engagement (Table 2 examples) and *positive sentiment*. The qualitative data indicated that followers responded well, likely because they perceive the content as genuine storytelling rather than advertising. This is in line with the notion that *stakeholder involvement* can democratize the branding process and lead to content that reflects *community values*, thereby strengthening «social cohesion». For Irpinia, *YAvellino's* approach has arguably created a *feedback loop*: the more the community sees local actors (like beloved businesses or civic figures) featured positively, the more they trust and

engage with the platform; and the more new stakeholders want to join in – essentially an upward spiral of co-creation.

The empirical evidence supports the perspective that «local actors», including *municipalities* and cultural *associations*, are not just passive beneficiaries of communication but active co-creators of territorial value - a phenomenon echoed in prior research on *tourism* and *place branding* (Leal et al., 2022).

However, our study also cautions, consistent with literature, that co-creation needs moderation. *YAvellino's* editorial control (ensuring partner content aligns with the *channel's infotainment tone* and audience interest) is crucial. They serve as what might be called a «brand mediator» among stakeholders. Without this *mediation*, there could be a risk of *message dilution* or *conflict* (e.g., if two towns want to claim they are «the best festival in Irpinia» in competitive tones, the brand could suffer). *YAvellino* navigates this by focusing on each *partner's unique story*, avoiding direct comparisons, and maintaining a positive, collaborative narrative across the board. This approach reflects effective *stakeholder management* in *co-creation scenarios*, ensuring that the composite place brand remains cohesive and inclusive. It parallels findings from other cases like *Luton's storytelling campaign*, where careful coordination was needed to avoid contrasting messages.

### 5.3 Hyperlocal influencer/platform

*YAvellino* blurs the line between an *influencer* and a *media outlet*. On one hand, it behaves like a *local influencer* – with a distinct voice, lifestyle content, and personal engagement with followers. On the other, it's an organized *media platform* offering advertising/marketing services. This dual identity may be key to its success. As an influencer-like entity, it harnesses the power of *relatability* and *community trust* (people follow it for inspiration and fun, not overt ads). As a media business, it has the structure to formalize partnerships and deliver professional content for clients. The implication is that local *network marketing* might best be executed by such *hybrid models*, rather than by impersonal institutions (Hankinson, 2004). Indeed, interviewees from municipalities suggested they partnered with *YAvellino* partly because their own *official channels* lack the creativity or following that *YAvellino* has. This case supports the argument that in the digital age, public institutions can benefit from teaming up with local influencers or content creators to meet marketing objectives (a trend also seen in tourism boards partnering with travel bloggers, for example). It's an example of a public-private partnership in marketing that is agile and contemporary

One could position *YAvellino* as a community brand that emerged bottom-up, which later gained institutional trust – a reversal of the traditional model where institutions create campaigns and try to gain public support. The success here shows the potential of «community-led place branding». The *local community* (through *YAvellino* and its followers) essentially defined what makes Irpinia special online, and now businesses and governments are joining that existing movement. For theory, this is interesting because it suggests that *brand equity* can be built by *grassroots digital communities* even for places (which are typically seen as needing top-down branding efforts). It aligns with the shift toward seeing *residents* and *grassroots* as key place-*brand ambassadors*.

### 5.4 Marketing-innovation nexus

*A new business model for local promotion*. It's worth highlighting how *YAvellino* represents a *business model* innovation in the local marketing domain. Traditional local marketing might involve city councils running *ads* or companies individually promoting themselves. *YAvellino* introduces a platform model where *value is co-create*d and *shared*. It essentially productized «Irpinia's story» and allowed others to plug into it. This can be seen as an innovation

responding to the fragmentation of media consumption – locals, especially younger demographics, spend more time on Instagram and social media than reading city brochures or local newspapers. *YAvellino* met them where they are, created content they enjoy, and then monetized in a way that doesn't (severely) detract from that enjoyment. This model is replicable in other regions, but it requires certain entrepreneurial conditions: a team with digital content skills, deep local knowledge/passions, and the ability to build cross-sector relationships. It's not simply an influencer posting photos, and not simply a tourism office – it's a hybrid organization. The success factors observed include: *consistency of content* (frequent posting keeps community engaged), *authenticity* (not compromising trust for quick bucks), *networking* (active presence in relevant events to grow partnerships), and *performance tracking* (showing partners evidence of reach/engagement to justify their involvement).

### 5.5 Implications for marketers and place managers

For practitioners in marketing (especially those in *tourism marketing*, *local economic development*, or *small business marketing*), *YAvellino's* case offers a «template». A major implication is the power of building a *localized community brand* first, monetizing second. *Y Media Analytica*, the company owning the brand *YAvellino*, effectively invested in *content* and *community-building* before worrying about *revenue*, which is contrary to many businesses that try to monetize too early and struggle to attract an audience. Place managers, like tourism boards, might consider empowering local content creators or even establishing similar in-house initiatives that function with a community-first mindset. Another practical insight is the benefit of collaborative content over pure advertising. *YAvellino's* sponsored posts rarely look like ads; they often read like editorials or travel diary entries. Marketers can learn that weaving promotional goals into genuine storytelling yields better engagement – which in turn actually likely drives better results (people trust and act on recommendations from voices they view as authentic).

For local businesses, the takeaway is to leverage community platforms rather than only pushing individual marketing. Especially small firms with limited reach can harness the amplifying effect of a local community page. Many towns have started having such community Instagram or Facebook pages (often unofficial) – collaborating with them may be more effective than traditional ads.

From the municipal perspective, this case suggests a shift in how public entities promote themselves: partnering with *digital community builders* can be more agile and «resonant» than doing it alone. It also indicates that B2G marketing (for digital services) need not always go through bureaucratic RFPs; sometimes it starts with informal relationship-building in communities, which later can formalize (as seen with *YAvellino* first attending events).

From a *place branding theory* point of view, this case hints that internal branding by local communities can complement or even substitute formal branding efforts. Researchers could explore the dynamics between unofficial community brands and official place branding campaigns: do they compete, converge, or cooperate? In Irpinia, *YAvellino* is now essentially part of the official strategy via partnerships. This could be a model of synergy, but in other places there might be tension or duplication.

To sum up, *YAvellino* illustrates that by applying core marketing principles, like *funnel management* and *customer-centric content*, in an innovative, networked way, even a relatively remote region can achieve broad visibility and engagement. It's a case of marketing innovation not through new technology per se, but through a novel *configuration of relationships* and *value creation* – embodying how past insights (funnel, co-creation) can be harnessed to meet future challenges (engaging audiences in an information-saturated era).

## 6. Conclusions

This study examined how *YAvellino* – a *hyperlocal social media community* in Italy's Irpinia region – implemented a *dual-funnel marketing strategy* anchored in *value co-creation* with local businesses and municipalities. Our analysis yields several conclusions:

- **Dual-funnel efficacy** - *YAvellino* successfully managed parallel B2B and B2G funnels to sustain its platform. By guiding businesses and government partners from initial awareness (often via community events and word-of-mouth) to active collaboration, *YAvellino* secured a steady flow of sponsored content without compromising its community appeal. The B2B funnel showed a healthy conversion rate (around 50% of engaged prospects became sponsors), and the B2G funnel, though smaller, still brought multiple municipalities on board. This demonstrates that a multi-sided marketing approach can be viable for community platforms, effectively bridging commercial and public objectives.

- **Value co-creation as a cornerstone** - The ***co-creation model*** – involving partners in storytelling – was pivotal to *YAvellino's* ability to deliver ***engaging content***. Co-created content maintained or even enhanced authenticity, turning marketing messages into genuine narratives that the community embraced. This supports the idea that ***stakeholder engagement*** in content creation is not just a theoretical ideal but a practical route to stronger marketing outcomes, provided it is well-orchestrated.

- **Community growth and engagement** - *YAvellino's* follower growth and sustained engagement indicate that the platform attained a critical mass and legitimacy among locals. The engagement rate, while tapering as the audience grew, remained solid. High engagement on posts covering local traditions and collaborative campaigns signals that the community is deeply invested in content that reflects their identity and interests. Moreover, we saw evidence that online engagement translated to offline actions (event attendance, business visits), highlighting the real-world impact of digital community marketing.

- **Innovative local marketing model** - *YAvellino* represents an innovative ***model of local network marketing***, where a private-media initiative fulfills roles traditionally played by tourism boards or chambers of commerce, but in a more dynamic, audience-driven manner. It underscores a trend where influencers or community brands can become key marketing partners for local development. This model may inspire other regions to adopt similar strategies, leveraging social media communities to co-promote local assets.

- **Implications for theory and practice** - The case extends **marketing theory** by blending ***funnel analytics*** with ***co-creation*** and ***place branding frameworks***, suggesting a need for more integrative models when dealing with multi-stakeholder contexts. Practically, it offers a blueprint for practitioners: build a community first by providing value (content people love), then monetize through partnerships that enhance that value (not detract from it). It also highlights the importance of *trust* and *authenticity* in modern marketing – qualities that are best achieved when marketing is done with stakeholders rather than at them.

- **Limitations and future research** - While the *YAvellino* case is rich, it is one context – a specific region with its unique culture and a particular team behind the initiative. Results might differ in a different region or country. Also, as a case study relying partly on simulated data, our quantitative findings are illustrative rather than precise. Future research should collect actual engagement analytics (impressions, click-throughs to

partners, etc.) to more rigorously quantify impact. It would also be valuable to study the audience perspective in detail: we mostly inferred it from engagement behaviour and some comments, but surveys or interviews with followers could reveal how they perceive sponsored content and whether it influences their behaviours (like visiting a place or store). Another interesting avenue is comparative: examining another community platform that did not involve co-creation to see if engagement differs, or studying a case where co-creation backfired (to analyze the pitfalls). Additionally, longitudinal research could see if the partnerships last and evolve – for example, do converted partners remain active (sign of retention and loyalty loops in the funnel).

*YAvellino's* experience illustrates that even in a changing era of marketing, classic principles like understanding your audience and guiding them through a journey remain relevant – but the journeys may now involve multiple intertwined paths and collaborators. The «marketing-innovation nexus» evident here is not about flashy new tech but about rethinking roles: turning customers into partners, and campaigns into community conversations. For Irpinia, this approach has not only marketed the region but arguably strengthened the local network itself, creating a virtuous cycle of value co-creation. Future research and applications of this model can further validate its efficacy and adapt it to other contexts, but this case provides a compelling narrative of how dual funnels and co-creation can be leveraged for mutual benefit in marketing.

# How Much is Too Much?
# An Investigation into the Understanding of Nutri-Score and Nutri-Inform Battery Labels

Susanna Graziano[1],*, and Ludovica Scalco[2]

[1] University of Parma, Department of Economics and Management, Parma, Italy

*Corresponding author: susanna.graziano@unipr.it

## Abstract

Nutritional habits significantly impact the development of chronic non-communicable diseases (NCDs), highlighting the importance of preventive health measures. Among these, front-of-pack (FOP) nutrition labels aim to provide concise dietary information to consumers to guide them in their purchase and consumption decisions. This study compares two FOP systems - Nutri-Score and NutrInform Battery - and assesses their effectiveness in terms of healthfulness perception, label comprehension, and consumption regulation. The impact of these labels on comprehension and consumption is multifaceted, influenced by factors such as fluency, dual processes, and cognitive load. Two focus groups were conducted and analyzed using T-Lab software and facial expression analysis. Participants were exposed to three mock-ups of cookie packages as stimuli (baseline, with Nutri-Score, and with NutrInform Battery). Preliminary results indicate that Nutri-Score is perceived as visually accessible and efficient for quick decision-making; however, concerns regarding its transparency and precision have emerged, and its impact on healthfulness perception remains unaltered from the baseline. NutrInform Battery appears to promote more conservative consumption estimates, but also to be complex and difficult to understand; however, there is a decline in healthfulness perception compared to the baseline and Nutri-Score. The efficacy of both label systems in regulating consumption appears to be ultimately unsuccessful. Both label systems require improvement in terms of clarity and need to be correlated with other information for interpretation. There is a need for educational interventions, hybrids, and broader studies to address these challenges.

*Keywords: FOP nutritional labelling; Nutri-Score; NutrInform Battery; intake; consumption; nutrition marketing.*

## 1. Introduction

Nutritional intake has been demonstrated to exert a substantial influence on the propensity to develop a variety of chronic non-communicable diseases (NCDs) (Fargione et al., 2024). Poor nutritional habits have been associated with the development of various health conditions, including obesity, diabetes, cardiovascular disease, certain types of cancer, non-alcoholic fatty liver disease, chronic inflammatory bowel disease, and neuropsychiatric and neurodegenerative disorders (Valetto & Manfrini, 2014). In this context, in order to ensure

the optimal health status of individuals, it is imperative to prioritize the promotion of activities focused on education and prevention (Fargione et al., 2024). In this regard, product labeling assumes considerable importance (European Commission, 2011).

In the attempt to aid consumers in making informed dietary choices, front-of-package labels have been introduced to provide consumers with truncated nutritional information to complement the more complex nutritional facts panel (NFP) at the back/side of the package (Becker et al., 2015; Ikonen et al., 2020). Although not mandatory under current EU legislation, the European Commission encourages the voluntary use of such schemes to help consumers make healthier food choices (European Commission, 2022). Currently six different FOP nutrition labelling schemes are being endorsed by public authorities across the EU market: the Keyhole logo (used in Sweden, Denmark, and Lithuania), the Nutri-Score (used in France, Belgium, Germany, Spain, the Netherlands, and Luxembourg), the Finnish Heart Symbol, the Slovenian "Little Heart" logo, the Croatian "Healthy Living" logo, and the Traffic Light scheme used in Ireland. Italy has also developed its own scheme, the NutrInform Battery (European Commission, 2022).

Among these, the Nutri-Score stands out as the most widely adopted and endorsed scheme across EU Member States (European Commission, 2022), making it a particularly relevant focus for research on consumer understanding and the effectiveness of FOP labelling at regulating consumption.

The Nutri-Score presents simplified nutritional information using a five-color scale from dark green (A) to red (E), designed to reflect the overall nutritional quality of food products at a glance. Developed to combat rising rates of diet-related diseases, it helps consumers compare products quickly and make more informed decisions (European Commission, 2022).

Italy introduced the NutrInform Battery as an alternative to Nutri-Score, arguing that the latter oversimplifies nutritional information and may mislead consumers by evaluating individual foods in isolation rather than as part of a balanced diet. Italian authorities and experts criticized Nutri-Score for penalizing traditional products like extra virgin olive oil, which are nutritionally valuable but receive unfavorable scores due to their fat content (CREA 2023, Harper, 2022). In contrast, the NutrInform Battery is a reductive label that provides more detailed, portion-based information aligned with existing EU regulations, aiming to offer a more nuanced and informative approach to nutrition labelling (CREA, 2023; Italian Ministry of Health, n.d.).

Regardless of the claims and intended aim of these labels, both the Nutri-Score and the NutrInform Battery have received criticism from consumers and governments in that they do not provide clear information as they claim and can mislead consumers (Harper, 2022; Ikonen et al., 2020). Existing literature has shown that FOP labels, and particularly the interpretive ones such as Nutri-Score, are effective at communicating product healthfulness and eventually leading to the purchase of healthier alternatives (Ikonen et al., 2020). However, empirical studies have also emphasized the misinterpretation of these labels because of the lack of education or accompanying interpretative information, which has led to overestimation of healthfulness of products of certain categories, in case of positive scores, and conversely to the wrongful attribution of dangerous for someone's health, in case of negative scores (Ikonen et al., 2020; Schruff-Lim et al., 2023). These wrongful interpretations could directly affect consumption and intake, nevertheless, only few and recent studies have focused on measuring these explicitly (Araya et al., 2022; Heeremans et al., 2025; Ikonen et al., 2020). However, contrasting and inconclusive findings from the studies, and frequent adoption of fictitious labels in highly controlled experimental studies, and the recent

introduction of the NutrInform Battery call for additional research that measures the effectiveness of real-world labels at regulating consumption.

At the same time, existing literature has inferred FOP labels' effectiveness by comparing purchase intentions across products, while overlooking comprehension and, thus, the underlying mechanisms (Andreani et al., 2025) that guide consumer behavior.

The present study addresses these gaps by examining how Nutri-Score and NutrInform Battery labels influence consumers' understanding of product healthfulness and self-estimated intake. We integrate processing fluency theory (Reber et al., 2004), cognitive load theory (Sweller, 1988), and dual-process models of decision-making (Kahneman, 2011) to explain how differences in label design affect information processing and behavior. Using a qualitative approach with two focus groups and T-Lab-based word association and co-occurrence analysis, we evaluate how these labels are perceived, interpreted, and acted upon by consumers.

Our findings reveal that Nutri-Score, while visually accessible and appreciated for its speed and simplicity, is sometimes perceived as reductive or even misleading because of the lack of transparency. Its design appears to encourage quick judgments but may lead to overconsumption, particularly for indulgent foods receiving favorable scores.

In contrast, the NutrInform Battery is viewed as more accurate and informative, especially by nutritionally motivated individuals, yet also more cognitively demanding. Despite its complexity, the NutrInform Battery prompted participants to estimate lower consumption levels and to reconsider the healthfulness of certain products more critically compared to the baseline and the Nutri-Score label.

Overall, neither labeling system appears to successfully regulate consumption, and the contrasting responses suggest that improvements in clarity are necessary, along with the provision of additional contextual information.

This study contributes to the literature in three important ways. First, it offers a theory-driven account of how FOP label formats influence both comprehension and consumption-related decisions, addressing a key gap in prior research. Second, it provides one of the first direct comparisons between two real-world labeling systems, Nutri-Score and NutrInform Battery, evaluating not only how they are understood but how they shape consumers' estimations of appropriate intake. Third, it identifies key contextual and perceptual factors, such as label credibility, cognitive effort, and perceived control, that moderate label effectiveness. In doing so, we offer practical implications for policymakers and marketers seeking to design or implement FOP labeling systems that are both informative and behaviorally effective.

## 2. Literature review

Research in different disciplines, including business, medicine, nutrition, and public policy, has extensively examined the effect of FOP nutritional labels on product perception, purchase intention, and choice (Ikonen et al., 2020; Schruff-Lim et al., 2023). In contrast, comparatively fewer studies have looked at consumers' understanding of the labels (Andreani et al., 2025; Ikonen et al., 2020) or their effectiveness in regulating consumption behaviors (Carbonneau et al., 2015; Crockett et al., 2014; Ebneter et al., 2013; Heeremans et al., 2025; Hersey et al., 2013).

Among specific labeling systems, Nutri-Score has received substantial attention, with several studies evaluating its impact on consumer comprehension and behavior (Dubois et al., 2020; Ikonen et al., 2020). By contrast, given the rather recent development and implementation

of the NutrInform Battery, just a few studies have looked at it specifically (Castellini et al., 2024; Fialon et al., 2022; Fialon et al., 2023).

As Schruff-Lim et al. (2023) emphasize, providing nutritional information is not sufficient on its own to drive behavior change, comprehension is a critical prerequisite. For FOP labels to be effective, consumers must first understand the information presented to them.

With respect to objective understanding, interpretive nutrient-specific labels such as Nutri-Score tend to be more easily understood by consumers. These labels enhance individuals' ability to distinguish healthier products and outperform reductive, numeric labels in this regard (Andreani et al., 2025; Dubois et al., 2020; Ducrot et al., 2015; Ikonen et al., 2020). However, interpretive labels can also create overly positive perceptions of unhealthy products when these score favorably on specific nutrients (Ikonen et al., 2020; Talati et al., 2016). This paradox highlights a gap between surface-level recognition and deeper understanding.

In terms of conceptual understanding, emerging evidence suggests that consumers may not fully grasp how these labels should be interpreted. For example, Huillery (2022) found that over half of the participants mistakenly believed that products receiving a Nutri-Score of D or E should not be consumed at all, while over 40% assumed that a Nutri-Score of A or B designates a product as inherently "healthy." Such misconceptions indicate a lack of understanding of the relative nature of the scoring system.

Research comparing Nutri-Score and the NutrInform Battery yields conflicting results. Studies by Fialon et al. (2022, 2023) report that both objective and subjective understanding, such as perceived usefulness and likability, are higher for Nutri-Score across product categories. In contrast, Castellini et al. (2024) found the NutrInform Battery to be more effective in helping consumers make decisions aligned with dietary restrictions and rated it as more trustworthy and informative.

When it comes to consumption outcomes, the evidence remains sparse and inconsistent. Most studies investigating the influence of FOP labels on consumption behavior have not used real-world labels but have instead relied on experimental stimuli featuring ad hoc designs (Carbonneau et al., 2015; Crockett et al., 2014; Ebneter et al., 2013). Moreover, the few studies that report significant findings, such as Larsson, Lissner, and Wilhelmsen (1999) and Reid et al. (2004), focused on single-level icons rather than multi-tiered systems like Nutri-Score, limiting their applicability.

More recent work, however, has begun to illuminate the complex and sometimes counterintuitive effects of FOP labels on consumption. Heeremans, Geuens, and Vermeir (2025) found that favorable Nutri-Scores (A and B) led participants to choose larger portion sizes, particularly for indulgent products, due to reduced feelings of guilt and a perceived license to indulge. This suggests that simplified labels can unintentionally encourage overconsumption when interpreted as endorsements of healthfulness. In contrast, Araya et al. (2022) conducted a real-world natural experiment in Chile using warning-style FOP labels and found a significant decrease in cereal purchases. However, no significant effects were observed for chocolates and cookies, indicating that label effectiveness may depend on product category, particularly whether the product is perceived as ambiguously or clearly unhealthy.

Overall, despite growing interest in the behavioral effects of FOP labels, the evidence remains inconclusive and fragmented. The limited number of rigorous real-world studies, coupled with contradictory findings across product categories and label formats, underscores the need for further research to determine whether, and under what conditions, FOP labels

effectively regulate consumption (Araya et al., 2022; Hersey et al., 2013; Ikonen et al., 2020) and what the underlying mechanisms are.

## 3. Conceptual framework

The present research aims to address the gaps outlined by examining how the two labeling systems influence product healthfulness perception, label comprehension, and consumption regulation. This study will contribute to a more nuanced understanding of the cognitive and behavioral impacts of FOP nutritional labels, particularly within the under-researched context of product intake.

### 3.1 Understanding Product Healthfulness

In the present paper, we build on *Processing Fluency Theory* (Reber et al., 2004), dual-process models of decision-making (Kahneman, 2011), and *Cognitive Load Theory* (Sweller, 1988), to argue that FOP nutritional labels improve consumer understanding of product healthfulness by enhancing processing fluency and reducing cognitive overload.

Processing fluency refers to the subjective experience of ease with which information is processed, which increases perceived understanding and confidence in judgments (Reber et al., 2004; Schwarz, 2004). This fluency manifests in both *perceptual fluency* - the ease of processing visual features such as color, symbols, and layout - and *semantic fluency* - the ease of comprehending the meaning conveyed by the information. These dual fluency mechanisms are particularly important in the context of nutritional labeling, where consumers must rapidly interpret and compare healthfulness cues to inform their choices (van Herpen & Trijp, 2011).

Complementing this perspective, *Dual-process Theories* suggest that consumer decisions in grocery shopping environments often rely on fast, automatic cognitive processes (System 1), which favor heuristic and visually fluent cues over deliberative analysis (System 2) (Kahneman, 2011). By presenting nutritional information in visually accessible and semantically clear formats, FOP labels align with the cognitive demands of System 1 processing, facilitating quick and confident judgments. Furthermore, Cognitive Load Theory highlights that reducing extraneous cognitive demands improves comprehension and decision-making (Sweller, 1988). FOP labels mitigate cognitive overload by distilling complex nutritional data into simplified, salient cues that alleviate the burden of interpreting dense back-of-pack information (Campos et al., 2011). Together, these theoretical perspectives converge to explain how FOP labels increase consumers' ability to understand product healthfulness efficiently and effectively. We argue that the visual and semantic design features of FOP labels make nutritional information more accessible and easier to process.

The Nutri-Score and the NutrInform Battery exemplify different approaches to facilitating consumer understanding of product healthfulness, each leveraging distinctive design features to enhance processing fluency. The Nutri-Score operates as a summary interpretive label, condensing complex nutritional information into a single, color-coded letter grade ranging from 'A' (healthiest) to 'E' (least healthy). This color spectrum, from green to red, enables rapid visual differentiation and immediate semantic interpretation, thus promoting both perceptual and semantic fluency. By simplifying nutritional data into an intuitive ordinal scale, Nutri-Score effectively reduces cognitive effort and supports quick decision-making, particularly beneficial in fast-paced retail environments (Dubois et al., 2020; Hagmann & Siegrist, 2020). Conversely, the NutrInform Battery adopts a non-interpretive, informative format that presents detailed per-serving nutritional values through battery-like icons filled proportionally to represent the contribution of energy, fats, sugars, and salt to daily recommended intakes. This design employs a familiar metaphor, the battery icon, to foster

perceptual fluency, while its precise quantitative presentation supports semantic fluency by allowing consumers to understand the magnitude of nutrient content. Although this label demands somewhat greater cognitive engagement than the Nutri-Score, it offers transparency and granularity that may appeal to consumers seeking more detailed nutritional insights (Castellini et al., 2024; Mazzù et al., 2021). Together, these contrasting formats highlight different pathways through which front-of-pack labels can ease the interpretation of healthfulness, either by promoting rapid, heuristic processing through simplification or by facilitating informed, analytic evaluation via structured quantitative information.

### 3.2 Consumption

Drawing from *Self-Regulation Theory* (Baumeister & Heatherton, 1996), *Cognitive Load Theory* (Sweller, 1988), and *Dual-process Models of Decision-making* (Kahneman, 2011), we argue that nutritional FOP labels may influence the quantity of food consumed. FOP labels can activate health-related goals and prompt more deliberate control over consumption, particularly in environments where consumers typically rely on intuitive, heuristic processing. By reducing the cognitive effort required to assess nutritional quality, these labels can shift attention toward health considerations and away from hedonic cues, resulting in smaller portion sizes and restrained intake (Roberto et al., 2012). However, FOP labels may also backfire under certain conditions. When products are labeled as "healthy", consumers may experience a moral licensing effect, whereby a virtuous choice (in this case, selecting a product with a favorable nutritional score) gives permission to indulge or overconsume (Finkelstein & Fishbach, 2010). Similarly, health halo effects may lead individuals to underestimate caloric content or overestimate satiety when viewing positively framed nutritional information (Schuldt & Schwarz, 2010; Chandon & Wansink, 2007). Thus, the impact of FOP labels on consumption is not uniform; it varies based on label format, nutritional profile, and consumer goals.

Distinguishing between specific label formats, we argue that interpretive summary labels such as the Nutri-Score may lead to both *reduced* and *increased* food consumption, depending on the nutritional rating. When the label indicates poor healthfulness (e.g., Nutri-Score D or E), consumers are more likely to reduce intake due to increased health risk salience and simplified negative cues, consistent with avoidance behavior and cognitive load reduction (Egnell et al., 2018). However, when a product is rated favorably (e.g., Nutri-Score A or B), the same label can lead to *overconsumption*, as consumers use the positive signal as a justification to eat more. This pattern is supported by recent findings from Heeremans et al. (2025), who show that while Nutri-Score discourages consumption of less healthy items, it unintentionally promotes larger portion sizes for healthier products through licensing and perceived healthfulness effects. In contrast, we maintain that non-interpretive, descriptive labels such as the NutrInform Battery are more consistently associated with reduced consumption. Unlike summary labels, the NutrInform Battery presents numeric data about calories, sugars, fats, and other nutrients, expressed as percentages of daily reference intakes. This format encourages consumers to mentally "budget" their intake across the day, activating what Thaler's (1985) *Mental Accounting Theory* describes as a process of allocating limited cognitive or physical resources (in this case, daily calories or nutrients) to different consumption episodes. When individuals see that a product uses up a large share of their daily intake, even for a small portion, they may reduce consumption to preserve their remaining "nutritional budget". This pattern is further supported by Self-Regulation Theory (Baumeister et al., 1994), which posits that individuals treat self-control as a finite resource: the explicit numerical framing of intake can prompt resource-conservation strategies, especially among health-motivated consumers. In this context, the NutrInform Battery may induce a scarcity frame, a cognitive orientation in which people respond to limited resources (e.g., calories left in a day) by exercising restraint (Mullainathan & Shafir, 2013). The label's precision, rather

than its evaluative simplicity, therefore engages consumers in more effortful and goal-consistent behaviors such as portion control or delayed gratification.

## 4. Methods

In order to achieve the research objectives of the study, a qualitative approach was employed, with the focus group discussions serving as the primary method of data collection. Two focus groups were conducted in May 2025, comprising nine participants in total. The sample was predominantly female (78%), with 22% male participants, with an average age of 30.44 years. Participants from different parts of the world: Greece, Italy, Japan, Moldova, and Norway. Participants were recruited via an online questionnaire disseminated across various social media platforms. Each discussion session was approximately ninety minutes in duration and was recorded both audio and video. Subsequent to the initial transcription, the recordings were transcribed verbatim to facilitate thematic analysis. For the purpose of data analysis, the "word association" and "co-occurrence" functions within T-Lab software were utilized. This software was instrumental in identifying the words most strongly linked to "Nutri-Score" and "NutrInform Battery", selected due to their semantic relevance and frequency of appearance (Papaleo et al., 2013). T-Lab employs radial diagrams and histograms to visualize these relationships, with the selected central word(s) positioned at the core of the diagram, surrounded by other words at distances that reflect their level of association. In addition, during the course of the discussion, an observer took note of the participants' facial expressions upon viewing the stimuli, in accordance with the methods outlined by Tian et al. (2011). Participants were shown three stimuli (Figures 1a-1f): (1) a mock-up packaging of cookies (front and back) as baseline stimulus, (2) a mock-up packaging of cookies displaying the Nutri-Score label (front and back), and (3) a mock-up packaging of cookies displaying the NutrInform Battery label (front and back). The cookies mock-up package was recreated using Artificial Intelligence (AI), starting from an existing product. However, to avoid bias, all recognizable components were removed, including the pack color, original pack shape, brand, and image of the cookie. Therefore, participants were presented with a package of classic chocolate chip cookies with a fictional brand. The back of the package was the same for all stimuli and included the made-up brand name ("Fornotti"), the package contents ("Chocolate chip cookies"), the ingredients, the nutritional value table, a small image of the cookies, a fake barcode, and Möbius strip symbols. The front of the baseline stimulus pack displayed the brand name ("Fornotti"), the product ("Chocolate chip cookies"), an image of a cookie, and the weight ("270 g"). The other two stimuli simply added Nutri-Score and NutrInform Battery labels with the same nutritional values for each system. The stimuli were the same in the two focus groups; the only difference was the language. In the first focus group, the stimuli were presented in Italian (Figure 1a-1c), and in the second, they were presented in English (Figure 1d-1f).

*Figure 1a Baseline*

*Figure 1b Nutri-Score*

*Figure 1c NutrInform Battery*

*Figure 1d Baseline*

*Figure 1e Nutri-Score*

*Figure 1f NutrInform Battery*

The focus group discussions were divided into six sections: (1) free associations about healthy products, (2) a discussion about eating habits and perceptions of "healthy", (3) an exploration of the decision-making process for purchasing healthy products at the supermarket, paying attention to labels on packages and their perceived usefulness, and the influence of labels on product choice, (4) presentation of stimuli to assess understanding of the Nutri-Score and NutrInform Battery labels (*label_comprehension*), as well as perceptions of product healthfulness (*health_perception*); (5) comparison of the two labels, along with the researchers' explanations of how they work; and (6) discussion of effective ways to communicate the amount of product that can be consumed, the usefulness of this information, and other desirable label content. Additionally, after each stimulus, participants were asked how many cookies they thought they could consume in a day based on the labels they saw. The exact number of cookies each participant could consume was calculated based on their basal metabolism (Harris & Benedict, 1919), which was determined using the information collected during the recruitment questionnaire.

## 5. Results

The visual outputs of the T-LAB analysis are presented in Figures 2a-2c and 3a-3c. In the first focus group (Figures 2a-2c), the Nutri-Score label appears ambiguous. While the label is perceived as informative, the presence of concepts such as "NOT CLEAR", "SUGAR", "COLORINGS", and "QUANTITY" suggests skepticism about its transparency and precision. Participants understand its informational value but do not fully trust the summary it provides, particularly regarding quantitative aspects ("INTAKE" and "INGREDIENTS"). On the other hand, the NutrInform Battery is perceived as complex and technical, oriented toward precision and measurability. It is associated with numerical elements ("CALORIES", "GRAMS", "FAT", "PROTEIN", and "CARBOHYDRATE"), as well as with the idea of active calculation by the consumer ("CALCULATION", "GUIDE", "AVERAGE"). However, the presence of "NOT_CLEAR" suggests that, although it is richer in details, it requires high cognitive effort, which can lead to interpretation difficulties for less experienced or hasty consumers. Regarding the co-occurrence comparison analysis (Figure 2c), participants recognize that the NutrInform Battery provides more specific information about caloric intake and product composition. However, it is less connected to the concept of a balanced diet. Conversely, the Nutri-Score is recognized as a comprehensive system, but it is perceived as unclear and perhaps overly simplistic or not transparent enough in its categorization criteria.

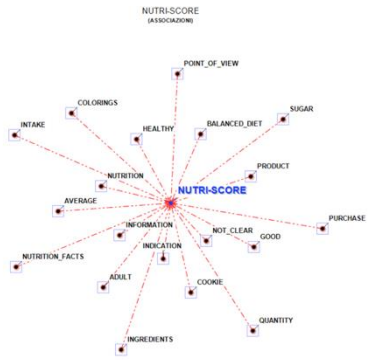

*Figure 2a Radial diagram of Nutri-Score's*

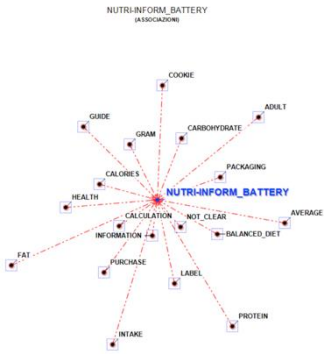

*Figure 2b Radial diagram of NutrInform Battery*

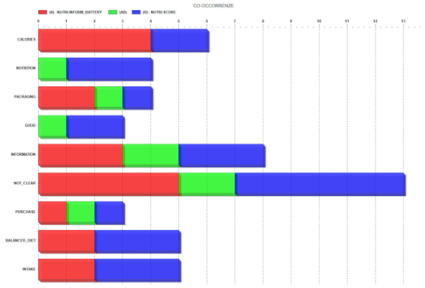

*Figure 2c Histogram of co-occurence analysis*

In fact, the transcripts reveal that participants of the first focus group appreciate technical details such as kcal, portions, and nutritional composition but cannot always interpret them immediately, especially under pressure (e.g., limited time at the supermarket). They argue that the NutrInform Battery requires higher nutritional literacy but offers greater autonomy to informed consumers. The Nutri-Score, on the other hand, is used as an initial visual and synthetic filter that is useful for forming a quick impression of the product during the shopping experience.

*"With an indication like that (the Nutri-Score), I would be fairly confident that the food is healthy and that it has been defined as such according to a regulation."*

However, the Nutri-Score is associated with vague concepts, revealing a lack of confidence in its informative utility. Participants know that a "green light" could mask questionable foods (e.g. poorly graded olive oil):

*"The Nutri-Score is clear because it doesn't say anything; there are only colors and letters. It's clear because it doesn't say anything. It's certainly based on the sensation of green and the letter A, which we associate with something better than C. The fact that it says 'Nutri' makes it seem healthier. Paradoxically, the NutrInform Battery is clearer because it gives more information. It explains what it wants to tell you. The only problem is that it's very small and requires some kind of mathematical-nutritional skills. It informs you how much energy the food provides, and there's a battery icon. But, in my opinion, the Nutri-Score is more convincing on a communicative level because it leaves room for imagination. However, it's less sincere."*

On the other hand, the NutrInform Battery is too complex to understand:

*"I actually find it a bit confusing. It seems that the top part refers to a single cookie and shows the distribution of energy, fat, saturated fat, sugar, and salt. However, the transition to a percentage that refers to generic intake is confusing. I don't understand why the equivalent in 100 grams is reported."*

The results of the facial expression analysis based on the categorization proposed by Tian et al. (2011) show that the predominant emotional responses elicited by the baseline stimulus encompass surprise and disgust (AU 1-AU 17). A single participant exhibited fear/sadness (AU 4). The emotions commonly experienced by all participants when viewing the Nutri-Score are those of disgust (AU14) and surprise (AU1). The emotion evoked by the NutrInform Battery stimulus among all participants was identified as disgust/sadness (AU 15-AU 17). Both labeling systems can influence purchasing behavior, but with opposite approaches. The Nutri-Score is perceived as useful for an "impulsive", immediate, but not always informed decision, while the NutrInform Battery is perceived as useful for an "informed" rational decision, but it is slowed down by the need for decoding. Regarding health perception, the packet of cookies was considered moderately healthy in the baseline stimulus. This opinion did not change when presented with the Nutri-Score but decreased when presented with the NutrInform Battery. Some participants hypothesized that the cookies were less healthy than initially believed. Regarding intake, participants stated that they could consume three to eight cookies per day when faced with the Nutri-Score and three to five cookies per day when faced with the NutrInform Battery. However, daily intake calculated with basal metabolism tells us the correct intake is two to three cookies. In the second focus group, participants experienced the Nutri-Score as a useful tool for quickly choosing products in supermarkets, especially for categorizing them ("CATEGORY", "SUPERMARKET"). However, there are still doubts about the true understanding of the score's meaning, particularly regarding the criteria (e.g., "FAT", "MAXIMUN", "SCORE"). A gap emerges between the immediacy and depth of the information. The NutrInform Battery is much less familiar. This is understandable given that the participants do not live in Italy. Therefore, they see it as a novelty ("NEVER_SEEN"), associated with precise technical information ("GRAMS", "DAY"), and with potential usefulness, even if they don't fully understand it. This creates cognitive barriers ("NOT_UNDERSTAND"). Its association with "INDULGENT" suggests that it is used to justify food indulgences. The Nutri-Score is well-known and visually clear. Some use it as a shortcut to decide whether a product is "good" or "recommendable". However, many do not fully understand how the score is assigned; the method remains opaque. The NutrInform Battery is an absolute novelty for the participants ("NEVER_SEEN"), which hinders its communicative effectiveness. When included, it is linked to the concrete need for information about consumption, such as grams, days, eating, and buying. However, lack of familiarity and information density create cognitive barriers ("NOT_UNDERSTAND"). Regarding the co-occurrence comparison analysis (Figure 3c), the Nutri-Score is perceived as more familiar and easier to associate with positive judgments ("GOOD"). Nevertheless, it is not perfectly clear to everyone ("NOT_UNDERSTAND"), while the NutrInform Battery is more associated with the need for information ("NEED") and understanding consumption ("EAT").

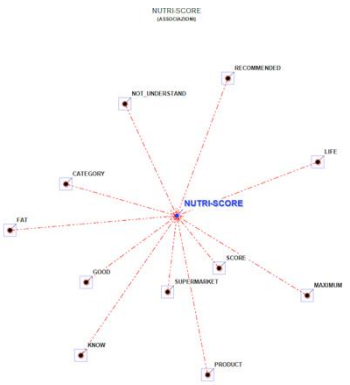

*Figure 3a Radial diagram of Nutri-Score's*

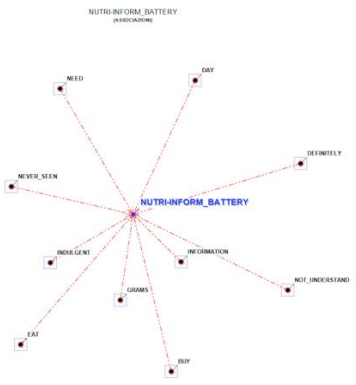

*Figure 3b Radial diagram of NutrInform Battery*

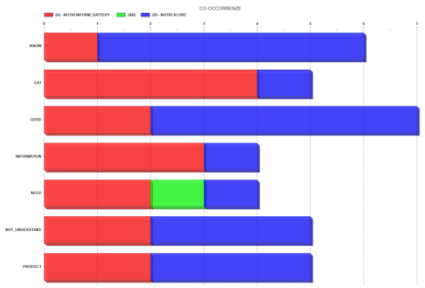

Figure 3c Histogram of co-occurence analysis

The transcripts indicate that, in the second focus group, there is a strong emphasis on the pragmatism and applicability of nutritional information, particularly with regard to diet management and daily intake. Participants, some with personal experience following a weight-loss diet, seek labels that provide detailed information regarding not only general healthfulness but also specific composition and its impact on their nutritional needs. In this context, the perception of the Nutri-Score, although recognized for its visual immediacy, may be limited by its synthetic nature, which does not always meet the needs of a more diet-conscious consumer:

*"Sometimes the Nutri-Score seems stupid. For example, I eat a lot of olives for a happy hour. So, whenever I look at the NutriScore, it shows very high fat. But, like, let's be real! The fat from the olives is not the same as the fat from the crisps. So, like, in that case, I will ignore it."*

The NutrInform Battery has emerged as a more highly regarded instrument that endeavors to furnish supplementary information; however, it is challenging to comprehend:

*"Intuitively when I look at the battery I think that it's for the package and then I look under and I think that it's for 100 grams and then I look on the top and then I... It is for one cookie? I love it, I really like to see how it fits into my daily budget, to say so, for every category and I do think that this would influence my decision of buying it because then I'll make a conscious decision, I just think it should have less numbers."*

The predominant emotional responses elicited by the baseline stimulus were surprise and joy (AU 6), while only one participant exhibited disgust (AU 1). The emotions commonly experienced by all participants when viewing the Nutri-Score were disgust and surprise (AU 1 - AU17). The emotion that was commonly experienced by all participants when viewing the NutrInform Battery stimulus was surprise (AU 17). Participants, particularly those with specific health objectives, place significant value on labels that not only categorize a product but also facilitate informed quantitative decision-making and the seamless integration of the food into their daily dietary regimen. The perception of product healthfulness underwent a substantial shift during the focus group session. Initially, when presented with the baseline stimulus and the Nutri-Score, the participants engaged in a debate regarding the product's healthfulness, with some considering it to be unhealthy due to its "cookie nature", and others perceiving it as relatively healthy. However, when the NutrInform Battery was introduced, there was a notable decline in the perception of healthfulness. Regarding intake, participants stated that they could consume two to five cookies per day when faced with the Nutri-Score. However, they drastically reduce in one to two cookies per day when they faced with the NutrInform Battery ("*Definitely severely reduced. Definitely no more than one.*"). Once more, the daily intake, calculated with basal metabolism, indicates that the appropriate intake is two to three cookies.

## 6. Discussion

While FOP labels have been extensively studied in terms of product perception and purchase intention, relatively little research has explored their effectiveness in fostering both accurate comprehension and behavioral regulation, especially in real-world settings. Most existing studies rely on stylized or ad hoc label formats in experimental contexts, leaving the practical effects of well-established systems like Nutri-Score and NutrInform Battery underexplored. Additionally, the few studies that investigate consumption outcomes often fail to integrate label comprehension as a mediating mechanism or explore the cognitive pathways that underpin label processing (Heeremans et al., 2025; Araya et al., 2022). Our findings address these gaps by offering a theoretically grounded, qualitative examination of how two major FOP label formats—Nutri-Score and NutrInform Battery—affect consumers' understanding of product healthfulness and their self-estimated intake quantities. In doing so, we highlight the complex cognitive and emotional mechanisms triggered by these labels and demonstrate that while both formats may influence consumer behavior, they do so in markedly different ways. Nutri-Score, with its color-coded summary format, is perceived as visually accessible and efficient, yet also simplistic and occasionally misleading. The NutrInform Battery, on the other hand, is associated with greater informational depth and perceived accuracy, but its complexity introduces interpretive barriers for less nutrition-literate consumers.

The findings generate several theoretical and managerial implications, as well as avenues for future research.

## 7. Implications

### 7.1 Theoretical Implications

Our study contributes to theory in three main ways. First, it advances research on nutritional labeling by jointly examining FOP label comprehension and consequent consumption intent within a single conceptual framework. Drawing from processing fluency theory (Reber, Schwarz, & Winkielman, 2004), dual-process decision-making (Kahneman, 2011), and cognitive load theory (Sweller, 1988), we show that label design systematically influences both the ease of understanding and the regulation of consumption. Whereas Nutri-Score facilitates fast, heuristic judgments aligned with System 1 processing, NutrInform Battery demands slower, more deliberate evaluations consistent with System 2. This cognitive divergence helps explain why some consumers find Nutri-Score more intuitive but also more prone to misinterpretation, while others value the informational richness of NutrInform Battery despite its greater complexity. Second, we contribute to self-regulation theory (Baumeister et al., 1994) and mental accounting (Thaler, 1985) by showing how numeric, portion-based labels like NutrInform Battery activate resource budgeting behaviors. Participants reported more conservative intake estimates in response to this label, suggesting that numeric granularity can promote portion restraint by invoking a scarcity frame (Mullainathan & Shafir, 2013). In contrast, the simplified A–E summary in Nutri-Score sometimes fostered a false sense of "healthfulness permission," particularly for indulgent foods, thereby leading to overestimation of acceptable consumption levels (Heeremans et al., 2025). These dynamics underscore the importance of considering not just how labels inform, but how they *license* or *inhibit* behavior. Third, our findings clarify the mechanisms behind conflicting prior results regarding label effectiveness (Fialon et al., 2022; Castellini et al., 2024), revealing that label efficacy is contingent on context, consumer nutrition literacy, and the interaction between label format and consumption goals. This supports the view that existing nutrition labels do not work effectively, and future research and practice should adopt a different approach to label design and communication of nutritional information.

### 7.2 Managerial Implications

This study offers several insights for practitioners seeking to improve nutrition communication and influence consumption behavior. First, for food manufacturers and retailers, our findings suggest that Nutri-Score may be more effective in fast-paced environments (e.g., supermarkets) where consumers rely on quick decision-making heuristics. However, its simplicity can lead to overconsumption and reduced credibility among more nutritionally engaged consumers. To mitigate this, practitioners might consider pairing summary labels with additional numeric cues or QR codes linking to detailed nutritional information.

Second, the NutrInform Battery appears better suited for health-conscious consumers and contexts that require transparency and self-regulation, such as diet-specific purchases or online grocery platforms where users can take more time to evaluate information. However, the cognitive effort required to decode the NutrInform Battery suggests a need for educational campaigns or digital tools that can simplify interpretation, such as calculators or app-based guidance.

Third, given the widespread confusion about appropriate portion sizes, this study underscores the value of labels that connect nutritional information to actionable intake guidance. Managers designing FOP systems should consider integrating intuitive metaphors (e.g., battery levels, daily intake percentages) with real-world consumption advice (e.g., "3 cookies per day based on your metabolism") to enhance relevance and comprehension.

Finally, our results reinforce the idea that FOP labels should not be evaluated purely on accuracy or appeal in isolation, but on how effectively they align with consumer goals, processing capacities, and contexts of use.

### 7.3 Policy Implications

From a public health perspective, the findings affirm that FOP labels can meaningfully influence both consumers' perceptions of product healthfulness and their self-regulatory behaviors. However, these effects depend critically on the labels being both understood and trusted. The frequent misjudgment of healthfulness and portion size observed among participants underscores a broader need for nutrition literacy interventions that demystify how labels are calculated and what they imply. Policy initiatives that mandate FOP labeling should therefore be accompanied by strategic communication efforts aimed at enhancing consumer confidence and interpretive competence. Without such complementary initiatives, simplified tools like Nutri-Score risk being perceived as vague or overly reductive, while more complex labels like the NutrInform Battery may be underutilized due to their perceived cognitive demands.

In addition, public health messaging should emphasize the importance of a balanced and context-sensitive understanding of nutrition, acknowledging that certain calorie-dense products (e.g., olive oil or nuts) can play a valuable role in a healthy diet when consumed in moderation. These items may receive lower scores under certain labeling systems despite contributing positively to cardiovascular and metabolic health. Thus, labels alone should not be the sole determinant of health messaging; rather, they must be part of a broader, evidence-based nutritional education framework that promotes balance, moderation, and long-term well-being.

To support this broader understanding, health authorities could partner with food manufacturers to provide supplementary nutritional information via QR codes printed on packaging. These links could direct consumers to official health ministry websites containing

tools for personalized dietary recommendations, such as daily caloric needs based on weight, age, and activity level, and suggested limits for specific food categories. This type of hybrid digital labeling strategy would allow consumers to move beyond one-size-fits-all interpretations and engage with tailored, actionable guidance grounded in public health standards.

Finally, our findings highlight the need for greater international coordination in FOP labeling policies. Diverging national systems risk creating confusion among consumers, particularly in cross-border markets, and adding regulatory complexity for manufacturers. A harmonized or interoperable approach to nutritional labeling, agreed upon at the EU level or through broader multilateral frameworks, could improve label consistency, reduce consumer misunderstanding, and facilitate compliance for global food producers. As nutritional labeling becomes an increasingly prominent component of food policy, alignment across governments, public health institutions, and industry stakeholders will be critical to maximizing both clarity and impact.

## 8. Limitations and Future Research Directions

While this study provides important insights into how Nutri-Score and NutrInform Battery labels shape consumption intentions as a consequence of the nutritional-content comprehension, it also presents several limitations that should guide future research.

First, although our qualitative design allowed for an in-depth exploration of consumer reasoning and interpretive strategies, the study was conducted with a relatively small sample size, limiting the generalizability of the findings. Replicating this work using larger and more diverse consumer panels would help validate the observed patterns and provide more robust insights into how different population segments engage with FOP labels.

Second, the focus was limited to a single product category, packaged biscuits, which, as an indulgent food, may naturally evoke stronger regulation impulses in the presence of detailed nutritional information. Our results showed that the NutrInform Battery led to a substantial decrease in self-estimated consumption, but this effect may not generalize to foods that are already perceived as healthy (e.g., yogurts, cereal bars, or plant-based products). Future research should replicate this design across a wider range of product categories to test whether the effect of different FOP labels on consumption is moderated by baseline perceptions of product healthfulness.

Third, the qualitative nature of our analysis does not establish causality between exposure to different FOP labels and comprehension and consumption regulation. We encourage future research to employ experimental designs, both in controlled settings and in real-world environments, to statistically verify the hypothesized mechanisms and isolate the effect of each label type on consumption decisions.

Fourth, although many existing studies (and ours) compare real or fictionalized versions of existing FOP systems (e.g., Nutri-Score, warning labels, battery formats), none have examined what an ideal label might look like if designed from first principles. Future research should take a design science or co-creation approach, involving consumers, nutritionists, behavioral scientists, and regulators to identify which combinations of format, content, and interpretive depth most effectively promote healthy choices across contexts. The rationale is that hybrid systems that merge intuitive summary indicators with contextual portion cues may balance processing fluency with informational precision.

Additionally, our findings revealed important consumer heterogeneity in how labels are processed, with differences based on health motivation, nutritional knowledge, and even

shopping context. Future studies should adopt segmentation-based approaches, investigating how demographic, psychographic, and situational variables moderate label effectiveness. Similarly, given the rise of online and mobile grocery platforms, it would be valuable to explore digital labeling interfaces, including interactive tools and personalized FOP guidance that adapt to user preferences or health goals.

Finally, while our focus was on comprehension and self-estimated consumption, future multidisciplinary work could examine long-term behavioral outcomes, such as actual dietary adherence and health indicators, tracked over time to assess whether FOP labels produce sustainable change or are subject to habituation effects.

# Ad-Based Framework for Tracing Wartime Cultural Dynamics

Nataliia Kochkina[1],[2],*, Sofiia Katsiuba[3], and Giuseppe Melis[1]

## Abstract

Armed conflicts force communicators to recalibrate persuasive messages almost overnight, yet standard cultural metrics are too static to register such rapid shifts. Analyzing 90 Ukrainian television and YouTube commercials aired before and after Russia's 2022 invasion, this study introduces an ad-based framework for tracing wartime cultural dynamics. The framework keeps the full six-dimensional Minkov-Hofstede palette, folding long- and short-term orientation into flexibility-monumentalism, while adding four war-specific tags of heroic collectivism, threat mitigation rhetoric, sacrifice appeals, and patriotic symbolism. Each advertisement is coded twice, first in a war-blind pass that applies only the classic grid, then in a war-augmented pass that scores the four crisis tags separately. In the war-blind pass, collectivism, high uncertainty avoidance, restraint, and monumentalism appear to surge. Once the crisis cues are isolated, the baseline dimensions remain flat, whereas mobilization cues surge ($\Delta \leq +57$ pp, $p < 0.001$). Only restraint shows a modest rise (+18 pp), mirroring wartime survey data. The suggested framework distinguishes between a temporary "value stretch" and long-term cultural changes, while also stress-testing a hybrid Minkov-Hofstede model under challenging conditions. Practically, it offers a timeline: unity, danger, and sacrifice frames dominate during acute conflict but are likely to cede ground to individual-empowerment appeals as a society moves from survival to recovery.

*Keywords: wartime advertising; cultural value dynamics; Minkov-Hofstede dimensions; Ukraine conflict; ad-based framework for tracing wartime cultural dynamics.*

## 1. Introduzione

Russia's full-scale invasion of Ukraine in February 2022 compressed cultural change into wartime speed. In just a few months, there were renegotiated orientations that typically evolved over generations, like risk tolerance, views of authority, and the balance between individual choice and collective duty. Advertising offers a clear window on this acceleration: pre-war spots that urged viewers to "buy now" quickly gave way to messages that asked them to "stand together," donate, and endure. At first glance, such rhetoric implies a wholesale shift toward collectivism, restraint, heightened uncertainty avoidance, and patriotic monumentalism. Whether such rhetoric signals durable cultural change or merely a tactical survival script is an open question.

Classical cultural indices cannot answer this question. Hofstede's (1980) country scores, built on legacy samples, are too static to register week-by-week turbulence. Although it is parsimonious, the two-factor refinement of Minkov and Kaasa (2022) still focuses on cross-national gaps rather than within-culture shocks. This study retains the complete six-dimensional vocabulary but nests long-/short-term orientation inside the flexibility-monumentalism axis to capture rapid movement without sacrificing nuance. Using this hybrid approach, the study introduces the Ad-based Framework for Tracing Wartime Cultural Dynamics (AFT-WCD), which includes four wartime tags: heroic collectivism, threat-mitigation rhetoric, sacrifice appeals, and patriotic symbolism.

We code each commercial twice: once using the classic grid alone, and again incorporating the wartime overlay. This double pass grounds the central research question: RQ: When crisis-specific signals are separated from routine creative choices, do the underlying Minkov-Hofstede dimensions in Ukrainian advertising still align with pre-war trends, or do they point to durable cultural drift?

Answering the RQ serves a dual purpose. Theoretically, it stress-tests a hybrid Minkov-Hofstede model under extreme conditions, clarifying whether wartime rhetoric stretches values without permanently reshaping them. Practically, it equips communicators and policymakers with an evidence-based timeline of appeals that resonate during crisis and fade as conditions normalize. It provides guidance that helps prevent tone-deaf messaging and supports a pivot from "standing together" to "rebuilding the future" as Ukraine moves from survival to recovery.

## 2. Method

### 2.1. Research design

The study followed a convergent mixed-methods content-analysis design. The qualitative strand employed semiotic reading, rhetorical analysis, and archetypal mapping to document the symbolic logic of each commercial. The quantitative strand applied AFT-WCD in two sequential passes. In the "war-blind" pass, coders scored the six hybrid Minkov-Hofstede dimensions alone; in the crisis-augmented pass, they rescored the same ads with the four additional wartime tags recorded separately. Comparing the two passes revealed whether shifts in collectivism, restraint, or uncertainty avoidance survive once mobilization cues are isolated.

### 2.2. Corpus and sampling

The corpus comprised 90 Ukrainian video commercials across twelve product sectors: 39 aired before 24 February 2022 and 51 between that date and May 2025. Spots had to be Ukrainian-language or Ukraine-targeted, ≤ 90 seconds, and high-reach (≥ 100,000 YouTube views or national prime-time slot). Metadata were verified in an Excel workbook, cleaned, imported into Python, and visualized to confirm platform, sector, and length comparability.

### 2.3. Coding Protocol

Coders first produced narrative memos (28-item template) capturing archetype, tone, symbolism, and persuasion techniques. They then ran the quantitative passes. In each pass, cues triggered a binary 1; multiple cues per ad were possible. Krippendorff's α averaged 0.83, and the third auditor reconciled around 5% of entries. Table 1 (not shown here) lists the war-blind grid, where wartime cues are folded into the classic poles. Table 2 presents the war-augmented grid, which extracts and logs those cues under their respective tags.

| Minkov-Hofstede dimension | Binary variable | Cues that activate "1" | Wartime cues removed from the classic tally | Tag that captures the removed cues |
|---|---|---|---|---|
| Individualism / Collectivism | Individualism | Solo protagonist, first-person singular, self-achievement ("I chose freedom") | — | — |
| | Collectivism | Routine group scenes, family frames, first-person plural in everyday consumption | Mobilization slogans ("we fight together"), defence-fund QR codes, group protagonists in uniform | Mobilization collectivism |
| Uncertainty Avoidance | High | Generic safety claims, warranty language, step-by-step instructions | Shelter maps, bunker imagery, "secure transfer" guarantees, hazard icons | Threat mitigation |
| | Low | "Try it" invites, playful risk humour, spontaneous decisions | — | — |
| Power Distance | High | Non-combat uniforms denoting hierarchy, vertical camera angles, command verbs | — | — |
| | Low | Informal dress, horizontal teamwork, humor toward authority | — | — |
| Masculinity / Femininity | Masculinity | Warrior metaphors, victory tropes, trophy visuals | — | — |
| | Femininity | Caregiver imagery, relational tone, soothing palette | — | — |
| Indulgence / Restraint | Indulgence | Hedonistic visuals, bright colours, "treat yourself" slogans | — | — |
| | Restraint | Moral injunctions, thrift rhetoric not tied to war | Donation prompts, rationing appeals, "pause luxury" slogans | Sacrifice appeal |
| Flexibility / Monumentalism | Flexibility | Rebuild/innovation rhetoric, improvisational humor | — | — |

| Minkov-Hofstede dimension | Binary variable | Cues that activate "1" | Wartime cues removed from the classic tally | Tag that captures the removed cues |
|---|---|---|---|---|
| | Monumentalism | Timeless heritage, solemn patriotism without combat symbols | Flag palettes, military insignia, historic battle slogans, archival footage | Patriotic symbolism |

**Table 2:** Ad-based coding grid for tracing wartime cultural dynamics. (Source: authors' elaboration)

Note: In the second coding pass, cues listed in the fourth column are extracted from their parent dimension and recorded only under the wartime tags in the final column. This separation prevents short-term mobilization rhetoric from inflating long-term cultural indicators and allows the analysis to isolate genuine value drift from situational "value stretch."

## 2.5. Triangulation

Results were benchmarked against two baselines coded with the identical grid: Kochkina & Riccardi's (2021) Facebook study of Ukrainian brands (corporate baseline) and Kochkina et al.'s (2025) survey of Ukrainian war refugees (displacement baseline). Alignment across ads, corporate discourse, and refugee values signals structural change; divergence signals situational rhetoric.

*Ethical considerations and validity safeguards*

All ads were publicly broadcast, contained no personal data, and coders received psychological-safety briefings; hence, no formal ethics approval was required. Cues were anchored in the Minkov-Hofstede taxonomy, intercoder reliability was high ($\alpha = 0.83$), and Python scripts are fully replicable, securing construct and internal validity. External validity is limited to high-reach broadcast and YouTube spots. However, the study's longitudinal scope, binary coding, and qualitative cross-checks still yield a robust view of wartime cultural dynamics.

## 3. Results

War-blind pass. Folding wartime cues into the classic Minkov-Hofstede grid inflated collectivism by 35 pp, uncertainty avoidance by 77 pp, restraint by 15 pp, and monumentalism by 34 pp.

War-augmented pass. After heroic collectivism, threat rhetoric, sacrifice appeals, and patriotic symbols were coded in their own tags, five baseline dimensions lay within ± 3 pp of their pre-war levels. Only restraint shows a modest increase (+18pp), mirroring the refugee survey's wartime thrift but not overturning Ukraine's long-standing tilt toward individual agency and low hierarchy acceptance. By contrast, the crisis tags surged: mobilization collectivism +38 pp, threat mitigation +44 pp, sacrifice appeal +50 pp, and patriotic symbolism +57 pp (all $p < 0.001$).

Triangulation. Pre-war corporate posts and the 2024 refugee survey have seen Ukraine as individualistic, low-power-distance, and highly flexible. This aligns with the stable baseline found in the war-augmented pass. The wartime spikes, therefore, constitute a temporary rhetorical overlay rather than a durable recoding of national culture.

## 4. Discussion

Separating mobilization rhetoric from routine creative cues reveals that Ukraine's underlying cultural trajectory remains intact toward individual agency, egalitarian interaction, and pragmatic flexibility. AFT-WCD corrects the inflationary bias introduced by war-blind coding and can be transferred to other conflict zones. For practitioners, the findings chart a timeline: unity, danger, and sacrifice frames dominate during acute threat, but empowerment and private-benefit appeals are poised to regain efficacy as the threat recedes.

## 5. Limitations and future research

The corpus exclusively includes high-reach broadcast and YouTube ads, excluding micro-targeted and user-generated content. Binary coding simplifies complex symbolism, and the findings may not generalize beyond national campaigns. Future work should test AFT-WCD in other conflicts and extend it to public diplomacy and influencer genres.

# "Order Now" or "Buy Local"? Communication Strategies of Food Delivery Platforms on Social Media

Federico Mangiò[1],*, Annamaria Tuan[2], and Marco Visentin[2]

[1] University of Bergamo, Department of Business Studies, Bergamo, Italy
[2] University of Bologna, Department of Business Studies, Bologna, Italy

## Abstract

Food delivery platforms operate at the intersection of commercial efficiency and community-based engagement, making their communication efforts on social media platforms inherently complex. This study investigates how such platforms navigate the tension between commercial and community logics in their social media communication. Drawing on the institutional logics perspective, we examine the persuasive strategies these platforms employ to appeal to diverse audience expectations. By relying on a dataset of more than 12.000 observations and employing automated text analysis, our findings reveal how food delivery platforms blend call-to-action messaging with cues of local embeddedness to negotiate their hybrid identity. The study contributes to understanding how platform-based firms manage institutional complexity in digital communication environments.

*Keywords: local delivery platforms, institutional logics, text analysis, communication*

## 1. Introduzione

The rapid evolution of platforms has transformed how businesses and consumers interact, creating a dynamic ecosystem and the emergence of new forms of digital platforms and new forms of service provider-customer interactions. Propelled by the unprecedent richness and depth of data, and their propensity to work as gatekeepers across interconnected sectors, it is undoubted that platforms assumed an ever-more pivotal role in the global economy and society (Gawer et al., 2021; Wichmann et al., 2022). In particular, in recent years, food delivery platforms (FDPs) have experienced a rapid rise, catalysed by the convergence of digital innovation and shifting consumer behaviours (Chen, Hu & Wang, 2022; McKinsey, 2021; Shroff, Shah & Gajjar, 2022; Wichmann et al., 2022). According to a Statista Report in 2024, the growth of FDP is expected to continue at an annual growth rate (CAGR 2024-2029) of 3.69%, resulting in a projected market volume of US$333.10bn by 2029 (Statista, 2024). This expansion was markedly accelerated by the COVID-19 pandemic, which substantially increased demand for such services leading to the surge of many FDPs. However, many local platforms are now experiencing a decline, as they are increasingly displaced by larger, more powerful competitors with greater resources and market influence.

In this regard, beyond technical and marketing hurdles, FDPs face a deeper, structural tension rooted in their hybrid organizational nature. As organizations operating at the intersection of commercial and community spheres, FDPs are simultaneously expected to adhere to a market-oriented logic—focusing on efficiency, scalability, and transactional clarity—while also embodying a community-based logic that emphasizes localness,

relationality, and social embeddedness (Moss et al. 2024). This duality is not merely an operational challenge; it manifests acutely in how FDPs communicate with audiences, particularly on social media platforms where brand identity, authenticity, and user engagement are critical (e.g. Numan et al., 2025). In particular, engagement with consumers on social media yields significant advantages for brands and platforms, such as the development of stronger customer relationships, enhanced visibility, and increased product sales (Babić Rosario et al., 2016; Colicev, Kumar, & O'Connor, 2019; Kumar et al., 2016). Consequently, creating content that drives user engagement has become a strategic priority for companies (Abell & Biswas, 2023; Eigenraam, Eelen, & Verlegh, 2021). However, recent studies highlight the growing challenge of doing so, as users increasingly behave as passive observers rather than active participants on social media (Dineva et al. 2024).

Against this backdrop, the central research question guiding this study is: How should local delivery platforms communicate on social media platforms in order to resonate with their audiences and enhance engagement? To address this, we draw on the institutional logics perspective (Thornton et al., 2018), which offers a valuable lens for analysing how organizations navigate and reconcile competing normative frameworks. In the context of communication, this involves balancing call-to-action (CTA) content aligned with commercial imperatives and more localized, relational cues reflective of community-based expectations (Moss et al., 2023, Lee et al. 2018).

Methodologically, the study employs data sourced from more than 12.000 social media posts, analysed through automated text analysis to identify patterns in how FDPs blend these communicative logics in practice. The findings illuminate the rhetorical strategies used by FDPs to navigate hybridity, offering theoretical and practical insights into persuasive communication in the digital platform economy. In doing so, we particularly focus on the changing nature of the market logic in the era of the platform economy.

## 2. Theoretical framework

Institutional logics are the socially constructed patterns of assumptions, values, and practices that provide meaning and guide behaviour within specific social domains (Thornton et al., 2018). These logics shape macro-level meaning systems while also influencing micro-level interactions (Cornelissen et al., 2015). Communication plays a central role in enacting and making these logics visible, particularly through the narratives and rhetorical devices organizations use to convey legitimacy (Ocasio, Loewenstein, & Nigam, 2015).

Indeed, to meet the expectations of different audiences, organizations often construct "institutional vocabularies" that reflect the dominant logic(s) they aim to embody (Suddaby & Greenwood, 2005). This is especially critical for organizations -such as FDPs - that operate at the intersection of conflicting logics, such as market efficiency and community embeddedness (Moss et al., 2024). In such contexts, firms are often compelled to craft "hybrid rhetoric", a selective blending of linguistic cues and framing devices drawn from both logics, to appeal to divergent stakeholder expectations and maintain legitimacy across audiences. This rhetorical balancing act becomes particularly salient in digital spaces like social media, where organizations continuously perform their identity and values in real time.

Building on this theoretical foundation and akin to prior studies (e.g., Moss et al., 2024; Mangiò et al., 2021), our study investigates how FDPs blend commercial and community-based logics in their social media communication. Specifically, we explore how rhetorical elements such as call-to-action and localness cues are deployed, and whether these strategies enhance or hinder consumer social media engagement.

## 3. Methodology

Following previous research (Righetti & Bertuzzi, 2024) we relied on Meta's Crowdtangle to extract the most-engaged with, English-language posts mentioning the keyword "food delivery" per year from 2018 till 2024 on Facebook. Our final dataset comprises 1,108,437 posts published between January 1st, 2018 and January 1st, 2024.

We extracted a subset of post published by delivery-related business, based on whether they mention "food delivery" in their page descriptions, resulting in 12,620 posts from 174 unique accounts.

Following previous research (Dineva et al. 2024), we measure consumer engagement on social media (CESM) as the sum of likes, comments, and shares. Moreover, we tracked the extent to which a given post elicits strong emotions through a reactions-based controversy score - the Love Hate (LH) score (Etta et al., 2023).

To account for the two institutional logics, we created two custom dictionaries (Humpreys & Wang, 2018): 1) the localness dictionary, which instantiates the community logic and includes expressions such as "local*", "neighborhood", and "community"; and 2) the call-to-action (CTA) dictionary, which reflects the market-oriented logic and includes expressions such as "order now", "use now", "coupon".

To illustrate the tone of communication, we provide some excerpts from social media posts within each hypothesised communication logics.

**The localness communication logics:**

**Quote 1:** *"Unlike the national food_delivery companies, Nosh aims to keep delivery economically sustainable in the long term for independent restaurants by charging low commission rates, focusing on excellent customer service and keeping local dollars in Noco. Nosh doesn't just intend to be another delivery service but the ethical answer to food_delivery in today's world. We take a lot of pride in what we do. We truly love being able to put a human touch back into food_delivery. Our goal is to contribute to positive growth within the local Noco community."*

**Quote 2:** *"Are you tired of supporting big corporations that don't reinvest in your community? Look no further than Kernow Eats for all your food_delivery needs! We are a locally owned and operated business, dedicated to supporting small businesses in our community. By choosing to support us, you are directly contributing to the success of your neighbors and friends."*

**The call-to-action logics:**

**Quote 3:** *"PROMO!! PROMO!! PROMO!! Promo 1: It's your special day today, October 11th, and we've got a gift for you! Celebrate with a FREE regular iced coffee or hot coffee."*

**Quote 4:** *"Place an order with GoFood on or before May 30th and receive a 10% discount coupon.* 🚗 *On May 31st, use the Promo Code SOOxxxx (SOO followed by a 4-digit Coupon number) when ordering with GoFood to enjoy a 10% discount on your delivery fee."*

We also controlled for a rich series of hard and soft content factors that may affect CESM (Dineva et al. 2024). Among source-level factors, followerbase indicates the number of followers on the posting day; age refers to the number of years a given account has been active; area denotes whether the source is located in a developed, developing, or emerging country. Among post-level hard content factors, year, working day and working hour measure the fixed effects for the year, day of the week, and hour of the day of publication;

media vividness indicates whether a post is pictorial, image or video-based. Among post-level soft content factors, we control for the post length (word count), presence of handles, numbers, paralinguistic content like tactile (e.g. □), bodily (e.g. 😁) and nonbodily (e.g. 👄🍴) emojis (Luangrath et al. 2023), and different positive emotional framings (anticipation, trust, joy, surprise; Hotz-Behofsits et al. 2025).

Given that CESM is a count-based, non-normally distributed variable, we modelled the effect of different content strategies on CESM using negative binomial regression. For the LH score, a continuous and bounded variable, we employed beta regression.

## 4. Results

Our analysis reveals that in their online communication food delivery platforms predominantly adhere to a commercial logic: they employ, on average, more than three CTA cues every 100 words, whereas their use of localness cues is significantly lower, with less than a cue per 100 words (mean CTA = 3.11, sd CTA = 2.77; mean localness= 0.07, sd localness = 0.43). Among the emotional framings, trust is the most frequently used emotion (mean = 0.38, sd= 0.09), followerd by joy (mean = 0,29, sd= 0.08) and anticipation (0.14, sd= 0.07). In terms of media vividness, pictorial posts dominate the communication portfolio (89.5%). Notably, these platforms make extensive use of paralinguistic content, especially nonbodily emojis, with more than six per 100 words on average (mean = 6.41, sd= 5.98).

Contrary to these descriptive insights, our CESM analysis (Table 1) indicates that audiences do not favor CTA-driven messaging: all else being equal, a one-unit increase in CTA is associated with an 8% decrease in CESM (Model 2), and with a 1% decrease of the LH score (Model 3). Conversely, a one-unit increase in localness corresponds to a 32% increase in CESM and does not significantly affect the LH score.

| $R^2$ Nagelkerke | 0.153 | | | 0.551 | | | 0.106 | | |

**Table 1:** Effects of localness and CTA on CESM and LH score

Given the widespread adoption of CTA among the accounts examined, we conducted post-hoc analyses to investigate under which conditions the negative effect of CTA could be mitigated. Specifically, we examined whether the intensity and the framing of the CTA cues mattered.

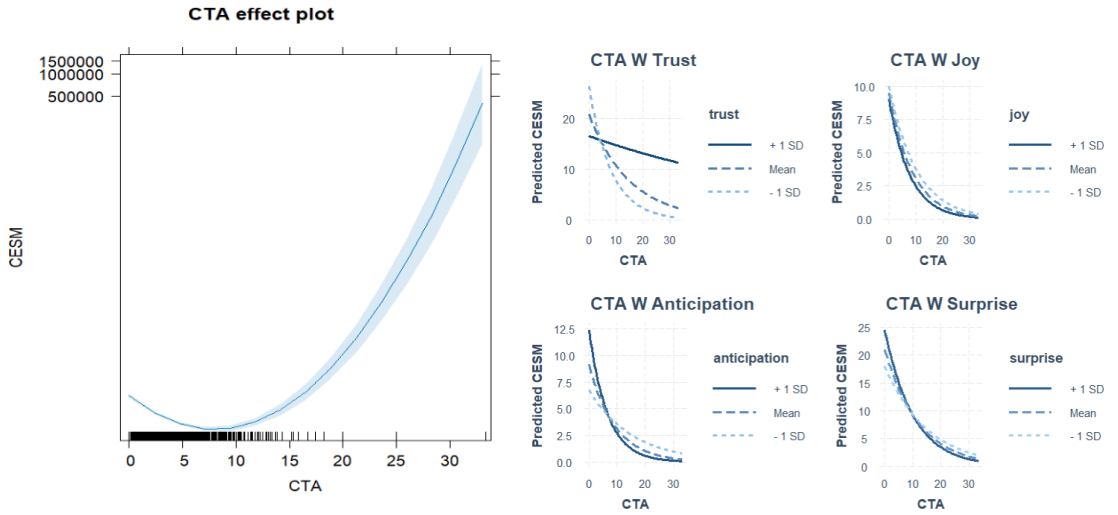

**Figure 1:** Effect of CTA intensity (left panel) and framing (right panel) on CESM

As the left panel of Figure 1 shows, we detect a significant U-shaped effect of CTA on CESM (IRRCTA^2: 1.02, SE: 0.00, p < .001), indicating that once posts include more than 10 CTA expressions per 100 words, their effect on CESM becomes positive. Furthermore, the right panel of Figure 1 shows that how CTA content is emotionally framed matters. Trust positively moderates the effect of CTA on CESM (IRR CTAxTrust = 1.88, SE= 0.12, p <. 001), whilst all other positive framings exacerbate its negative effect (IRR CTAxJoy = 0.82, SE= 0.04, p <. 001; IRR CTAxJoy = 0.82, SE= 0.04, p <. 001; IRR CTAxSurprise = 0.72, SE= 0.08, p <. 01; IRR CTAxSurprise = 0.55, SE= 0.04, p <. 001).

## 5. Discussion

Our analysis shows that, caught between the opposing pressures of commercial and communitarian logics, food delivery platforms struggle to "selectively couple" elements of both in navigating institutional complexity (Pache & Santos, 2013). Specifically, due to the impulsive and low-involvement nature of food delivery consumption, these platforms are incentivized to prioritize promotional content strategies, particularly CTA messaging, on which their revenue models heavily rely. However, this approach is not fully legitimized by online audiences, who tend to favor communicative efforts that align more closely with communitarian values.

These preliminary findings are notable in two ways. On the one hand, they support the idea that social media engagement strategies grounded in prosocial and community-oriented themes - rather than strictly commercial appeals - are more persuasive and effective (Mangiò et al., 2021). On the other hand, they challenge assumptions from the literature on hybrid organizations, which suggests that "hybrid rhetoric", designed to seamlessly blend competing institutional logics (Moss et al., 2018; 2023), should enhance legitimacy. In the case of food

delivery platforms, such rhetorical balancing appears less effective. These results contribute to the literature on platform economy (e.g., Cusumano et al., 2019; Wichmann, Wiegand & Reinartz, 2022), with a particular focus on delivery platforms. In particular, most of the marketing literature about the platform economy mainly focused on digital platforms (e.g., Gawer, 2021; Wichmann, Wiegand & Reinartz, 2022; Wichmann & Reinartz, 2024), neglecting the role of delivery platforms, in particular when we consider smaller initiatives that try to overcome the limits of the larger ones. By shedding light on these less visible actors, our findings offer a more nuanced understanding of platform heterogeneity and highlight the need for a broader conceptualization of value creation and competition dynamics in the platform economy.

Our results also offer important managerial implications. Since abandoning CTAs altogether is impractical, we urge platforms to more thoughtfully design their promotional messaging. Instead of defaulting to high-pressure sales tactics, communication strategies should emphasize localness, which emerges as a powerful and underutilized lever for engagement. Posts that highlight local elements—such as partnerships with neighborhood restaurants or participation in community events—are significantly more effective in fostering user interaction. This can be achieved in two ways: first, by adjusting CTA intensity, potentially leveraging a high density of CTA cues to potentially trigger fear-of-missing-out (FOMO) responses and drive engagement (Bright & Logan, 2018); and second, by carefully selecting the emotional framing of such messages, eschewing uncertain or anticipatory tones in favour of those that elicit trust, thereby making CTAs more appealing and socially resonant. Finally, the widespread use of emojis and images suggests that vivid and visually engaging formats remain essential; however, these should be strategically aligned with content that reinforces local relevance and trust to maximize their persuasive potential.

## Abstract

This paper investigates how personalization supports brand familiarity strategies and affects both attitudinal and behavioral loyalty. Despite its widespread use in marketing practice, the impact of personalization on brand familiarity remains underexplored. Focusing on four dimensions, personalized content, customer experience, personalized communication, and customer perception, this study examines their influence on consumer responses to brand extensions. A quantitative survey of 733 Gen-Z consumers provides evidence of the role of personalization in strengthening consumer– brand relationships. The findings contribute to the literature on personalization and offer practical insights for aligning personalization with brand growth strategies. Keywords: Personalization, Brand familiarity, Loyalty, Structural equation modeling.

### 1. Introduction

In recent years, both academic scholars (Arora et al., 2008; Kumar et al., 2021) and industry reports (Deloitte, 2022; Accenture, 2025) have shown increasing interest in the role of personalization as a key driver of brand performance. Peppers and Rogers (1997) define personalization as a process through which firms leverage customer information to deliver tailored solutions that meet individual needs. Personalized interactions and offerings contribute to enhancing customer satisfaction, building stronger emotional connections with the brand, and increasing customer loyalty over time (D'Amico et al., 2024). Despite the growing application of personalization across industries, the academic literature on the topic remains fragmented, with limited integration of its impact on brand familiarity strategies. In particular, there is still a lack of systematic understanding of how personalization shapes key brand constructs, such as brand familiarity, and how this, in turn, influences attitudinal and behavioral loyalty toward new brand offerings (Matarid et al., 2014). This study seeks to address this gap by examining the impact of personalization on brand familiarity, and the subsequent effects on consumer loyalty outcomes. The empirical context of this study is food sector, targeting Generation Z (Gen-Z) consumers, for whom personalized experiences are increasingly central to brand engagement and who exhibits a low level of brand loyalty (Goldring and Azab, 2021).

## 2. Literature Background

Personalization has become a key theme in marketing, enabling firms to deliver tailored content and experiences that enhance brand relationships, trust, loyalty, and purchase behavior (Agarwal et al., 2000; Hennig-Thurau et al., 2002; Arora et al., 2008; Pine et al., 2009; Kumar et al., 2021). While recent literature has begun to explore its broader impact on brand familiarity and loyalty, important gaps remain. Overall personalization is a key driver of brand loyalty among Gen Z consumers. Compared to previous generations, Gen Z seeks more personalized and interactive brand experiences (Goldring & Azab, 2021). Although the literature has examined the behavioral intentions of companies adopting personalization strategies — including digital personalization (McKee et al., 2024) — few studies have explored the specific role of personalization in brand extension strategies targeting this consumer segment. Both personalized content and customer perception are recognized as critical factors in driving the success of brand familiarity as a proxy for brand extension strategies (Völckner & Sattler, 2006; Kumar et al., 2021). Personalized content fosters consumer engagement and perceived fit, while customer perception—through evaluations of brand credibility, quality, and consistency—reduces perceived risk and strengthens trust (Czellar, 2003). These mechanisms complement one another, increasing acceptance of new brand offerings. Additional factors such as customer experience and personalized communication may further enhance antecedents like brand trust and attachment (Brakus et al., 2009; Schmitt, 2012), though prior studies note that their effects can be asymmetric and context-dependent, especially in sectors where brand authenticity is paramount (John et al., 1998; Bleier & Eisenbeiss, 2015). Moreover, the success of brand familiarity is closely linked to both attitudinal and behavioral loyalty toward the parent brand (Völckner & Sattler, 2006; Park & Kim, 2021), which facilitate both initial trial and sustained adoption of new offerings. While prior studies have examined these variables in isolation—such as the effects of personalization on loyalty (Kumar et al., 2021; Arora et al., 2008), or the role of brand loyalty in facilitating brand familiarity (Park & Kim, 2021; Völckner & Sattler, 2006)—relatively few have investigated how personalization, brand familiarity, and loyalty interact (Czellar, 2003). Addressing this gap, the present study investigates: Personalization in terms of personalized content (a), customer experience (b), personalized communication (c), and customer perception (d) have a positive effect on brand familiarity (respectively H1a, H1b, H1c, H1d). Brand familiarity strategies have a positive effect on attitudinal loyalty (H2a) and on behavioral loyalty (H2b). Figure 1 illustrates the structural model.

Through a quantitative study in the food sector, targeting Gen-Z consumers, this research contributes new insights into the evolving role of personalization in brand familiarity and loyalty strategies.

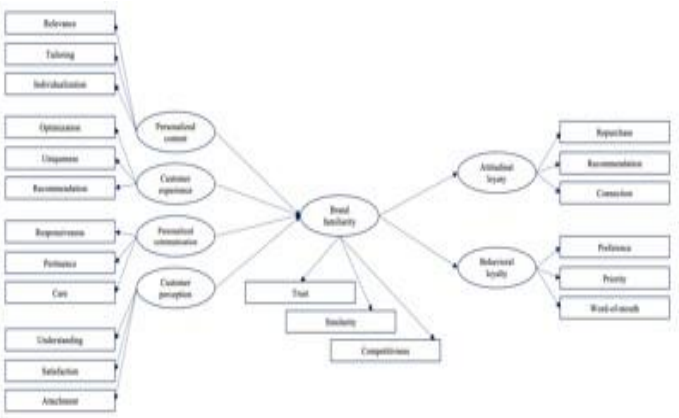

**Figure 1:** Structural model

## 3. Methodology

To verify the hypotheses, we have decided to realize a questionnaire with 733 respondents belonging to Gen-Z. This research was carried out in the food sector, with a specific focus on the food sector, which represents a highly competitive and innovation-driven category within the broader food industry. This study focuses on Gen-Z both for its growing relevance as an emerging consumer segment and for its distinctive expectations toward personalized experiences and brand interactions (Francis & Hoefel, 2018). The analysis was carried out through the administration of a questionnaire. Participation was voluntary, not incentivized, and responses were collected in December 2024 via Google Forms. Gen-Z (18 to 27 years old) participants were contacted through Facebook, LinkedIn, and via email. The collected data were analyzed using SPSS v28 and Jamovi. All variables were drawn from well-established and validated constructs in the literature, as explained in Table 1. All survey items were measured using a 7-point Likert scale.

| **Constructs** | | **Key words** | **Authors** |
|---|---|---|---|
| Personalization | Personalized content | Relevance; Tailoring; Individualization | Arora et al., 2008; Pine et al., 2009; Hennig-Thurau et al., 2002; Agarwal et al., 2000 |
| | Customer experience | Optimization; Uniqueness; Recommendation | |
| | Personalized communication | Responsiveness; Pertinence; Care | |
| | Customer perception | Understanding; Satisfaction; Attachment | |
| Brand familiarity | | Trust; Similarity; Competitivness | Matarid et al., 2014 |
| Attitudinal loyaty | | Repurchase; Recommendation; Connection | Park & Kim 2021 |

| | | |
|---|---|---|
| Behavioral loyalty | Preference; Priority; Word-of-mouth | Park & Kim 2021 |

**Table 1:** Constructs

## 4. Analysis and results

To verify the hypotheses, we employed Structural Equation Modeling (SEM). Prior to conducting the SEM, the internal consistency of all measurement scales was assessed using Cronbach's alpha in SPSS. The results confirmed high reliability across all constructs: personalized content ($\alpha$ = 0.910), customer experience ($\alpha$ = 0.899), personalized communication ($\alpha$ = 0.937), customer perception ($\alpha$ = 0.917), brand familiarity ($\alpha$ = 0.899), attitudinal loyalty ($\alpha$ = 0.930), and behavioral loyalty ($\alpha$ = 0.868). As values above 0.70 are generally accepted as indicating sufficient internal reliability (Hair et al., 2010), the analysis proceeded using Jamovi software. The overall model fit was satisfactory: SRMR = 0.043; RMSEA = 0.079; Comparative Fit Index (CFI) = 0.964; Tucker-Lewis Index (TLI) = 0.955; Bentler-Bonett Non-normed Fit Index (NNFI) = 0.955— all within accepted thresholds reported in the literature. Regarding the relationship between personalization and brand familiarity, the findings reveal that the relationship between personalized content and brand familiarity was positive and significant ($\beta$=2.620, p=0.009), as was the relationship between customer perception and brand familiarity ($\beta$=2.246, p=0.025), therefore, hypotheses H1a and H1d are supported. In contrast, neither customer experience ($\beta$=-0.982, p=0.326) nor personalized communication ($\beta$=0.987, p=0.324) had significant effects on brand familiarity, in this case, hypotheses H1b and H1c are not confirmed. In turn, regarding the relationship between brand familiarity and loyalty, the findings indicate that brand familiarity demonstrated strong and significant positive effects on both attitudinal loyalty ($\beta$=24.249, p<0.01) and behavioral loyalty ($\beta$=25.293, p<0.01), highlighting its pivotal role in driving consumer loyalty outcomes, therefore, hypotheses H2a and H2b are supported. These results suggest that personalized content and customer perception play a critical role in shaping consumer evaluations of brand familiarity, particularly for brands leveraging personalization, while customer experience and personalized communication appear less effective in influencing brand familiarity success in this context. This is consistent with prior literature, which emphasizes the importance of personalized content (Kumar et al., 2021) and customer perception (Czellar, 2003; Völckner & Sattler, 2006) in enhancing consumer engagement, perceived fit, trust, and reducing perceived risk. Conversely, the non-significant effects of customer experience and personalized communication on brand familiarity may be attributed to the specific characteristics of the study context, food sector, and the generational profile of the sample (Gen-Z consumers), for whom such dimensions may hold lower relevance. This aligns with previous research suggesting that the impact of customer experience and personalized communication on brand familiarity is asymmetric: when effectively designed and coherent with brand positioning, these factors can enhance familiarity as a proxy for brand extension success, but when misaligned or perceived as irrelevant, their influence diminishes (John et al., 1998; Bleier & Eisenbeiss, 2015).

## 5. Conclusions

In sum, this study highlights the strategic role of personalization for the Gen-Z consumers—particularly personalized content and customer perception—as key drivers of brand familiarity success and, in turn, both attitudinal and behavioral loyalty. For firms pursuing

personalization-driven brand extension strategies, focusing on these dimensions is essential to ensure consumer-perceived relevance and value. In contrast, an overemphasis on customer experience or personalized communication alone may be less effective—especially in categories such as food, where experiential elements are secondary to the core offering.

Theoretically, this study extends the existing literature by highlighting the effectiveness of brand familiarity in brand extension strategies that incorporate personalized content and consumers' perception in their product offerings and marketing communication; while showing that the impact of customer experience and personalized communication is context-dependent and asymmetric.

For managers, prioritizing personalized content and enhancing customer perception is critical when pursuing personalization-driven brand familiarity. These elements directly increase perceived value and relevance for consumers. Conversely, focusing heavily on customer experience or personalized communication may offer limited returns—particularly in sectors such as food, where experiential factors are less central to purchase decisions. Curating both the quality of personalized content and how it shapes brand perception can significantly strengthen the success of brand extensions. Limitations include the sector focus and the generational profile of the sample. Future research should test the model across different categories and consumer segments, and further explore longitudinal effects of personalization on brand extension success.

## Abstract

Introducing patients to novel treatments and therapies can be difficult, especially when they are already following a consolidated set of therapies, consistently relying upon it. When championing innovation in medical care this reluctance can prove troublesome, due to cognitive and emotional sunk costs capable of confining patients – as well as physicians – to suboptimal treatments far beyond what would be necessary, even when faced with clearly superior alternatives. Although decisions regarding treatment and behavioural adherence can bring significant long-term benefits, they also face strong short-term resistance rooted in individual comfort zones and daily habits, giving rise to self-control dilemmas that are often resolved by focusing primarily on immediacy. Through a synthesis of recent literature and a preliminary qualitative investigation, this paper investigates how businesses can influence consumer decision-making in selfcontrol dilemmas through Construal Level Theory (CLT), illustrating its relevance to marketing contexts and suggesting business applications to impact consumer choices.

*Keywords: Self-Control, CLT, Consumer Behaviour, Consumers' preferences.*

## 1. Introduzione

Every day, we encounter countless decisions and events that present a trade-off between experiencing feelings of instant yet short-lived gratification and delayed – but substantially enduring – satisfaction, obtained through commitment and daily efforts. These self-control dilemmas (Fishback et al., 2008) often arise from ordinary experiences: following a healthy diet, exercising regularly, or sticking to a sleep schedule. Yet, they can represent insurmountable challenges. Businesses that understand self-control dilemmas and tailor their marketing strategies accordingly can gain an advantage over competitors by communicating with their target consumers more effectively. This is particularly true in healthcare, where treatment and behavioural adherence decisions involve substantial long-term benefits but also face entrenched short-term resistance, due to patients' comfort zones and routine habits. This paper explores how businesses can influence consumer behaviour in self-control dilemmas using Construal Level Theory (CLT), synthesizing recent literature and suggesting business applications. Following a CLT Framework (Trope et al. 2008), selfcontrol dilemmas are revealed as tensions between psychologically distant long-term benefits and tangible short-term rewards – seldom represented ex aequo in our minds. As consumer decisions

today are not made in isolation, consumer journeys are often dyadic (Mazzù & Costabile, 2023), especially in high-touch domains. Relational dynamics introduce new layers of interactivity in the costumer journey (Hamilton et al., 2020), which in turn may influence an individual's construal level. In healthcare, psychological distance could thus be collaboratively constructed, influencing how selfcontrol dilemmas are experienced. Several studies have applied the tenets of CLT to a variety of activities related to self-control, ranging from health-risk behavioural intentions (Carrera et al. 2014; Carrera et al., 2018) to time management (Yuan & Sun, 2025), advertising research (Saeed et al., 2024; Saeed et al., 2025), cause-related marketing (Yun et al., 2025; Zhang et al., 2025), consumer brand attitude (Li et al., 2025), and risk-related decision-making (Noh et al., 2025). Nonetheless, the development of exemplary business cases and managerial implications able to offer valuable insights for practitioners remain limited and largely context dependent. In this non-experimental paper, we synthesize recent literature and propose integrated managerial implications – with a focus on healthcare. By suggesting illustrative business cases, we aim to offer actionable insights, beneficial to both scholars and practitioners. Our research question is thus formulated as: How can businesses leverage CLT to influence consumer preference in self-control dilemmas?

## 2. Review of the literature

The construal level theory (CLT) (Trope & Liberman, 2003) is a psychological framework that explains how individuals form mental representations of objects or events depending on the psychological distance they attach to them. In other words, CLT argue that psychological distance systematically influences the way people mentally represent the world around them (Soderberg et al., 2015). Psychological distance can manifest in four ways: temporal distance, for events far in the future or in the past; spatial distance, for events taking place physically far away; social distance, when events are experienced by others; and hypothetical distance, dealing with events whom likeliness to happen is uncertain or low. The central assumption of CLT is that individuals represent events perceived as psychologically distant abstractly (high-level construals), while psychologically close events are represented concretely (low-level construals). This distinction bears important implications: while high-level construals are schematic and decontextualized, focusing on the core, essential characteristics of an event, low-level construals tend to represent events in an unstructured way, focusing on context-specific attributes, details, and incidental or non-essential features (Trope et al., 2008). Researchers generally highlight the dichotomy between low- and high-level construals, but these can be also understood as a continuum (Saeed et al., 2024). In the marketing literature, CLT has found solid grounding to confirm its practical applicability. A systematic literature review conducted by Saeed et al. (2024) mapped insights from advertising research, highlighting how CLT was investigated from multiple perspectives. The review focused on (1) the underpinning mechanisms determining ads efficacy (categorization and matching effects); (2) CLT relationship with ads appeal (such as hedonic vs utilitarian), ads framing (gain-framed vs lossframed), and imagery ad elements (e.g. photo vs illustrations); (3) CLT connection to audience attributes. In a later review, Saeed et al. (2025) categorized construal-level manipulations in advertising research by dimensions of (1) psychological distance; (2) psychological manipulations; and (3) marketing-related factors of focus. More recently, other studies have expanded the employment of the CLT framework in marketing research, exploring the role of psychological distance on consumer brand attitudes towards gamified marketing practices (Li et al., 2025), and to investigate the mediating role of consumers' perceived information credibility in shaping purchase intention when exposed to green marketing initiatives (Zhang et al., 2025). Similarly, Yun et al. (2025) focused on the influence of social norms and temporal framing, matched at similar construal levels, on consumers' engagement and purchase in CRM campaigns. Carrera et al. (2020) examined how abstract construal levels influence one's willingness to engage in desirable yet demanding actions,

showing that, when individuals adopt an abstract (high-construals) mindset, they tend to exhibit more motivation and willingness to perform challenging behaviours. Earlier works by Carrera et al. (2018) proved that abstract, outcome-focused messages can promote healthy behaviours more effectively, limiting perception of immediate execution challenges. Recently, Yuan et al. (2025) have shown how individuals with higher construal level invest more time in important, rather than urgent, tasks, while Zhang et al (2022) argued that aligning abstract construal level with intrinsic goals can result in increased commitment. In healthcare, Hurtado-de-Mendoza et al. (2019) have shown that the combination of positive emotions with abstractly framed messages can enhance adherence to demanding therapies, by emphasizing long-term benefits over immediate discomfort.

## 3. Business cases and managerial implications

In terms of practical applications, considering the tenets of CLT when communicating with consumers can empower businesses to shape their preferences more effectively – especially in healthcare and pharma, where patients are sometimes prone to put an excessive focus on immediate inconveniences, side effects, and short-term preferences. The healthcare sector could leverage CLT strategically, incorporating abstract construal in health campaigns and choosing between affective or cognitive messaging based on target behaviours (Carrera et al., 2014). As health-risk behaviours are better predicted by affective attitudes under abstract construal conditions (Carrera et al., 2020), combining positive emotions (calm, hopeful) with abstractly framed messages can be effective in enhancing adherence to new or difficult therapies (Hurtado-de-Mendoza et al., 2019). Likewise, Pharma companies striving to increase new drugs' market penetration can resort to CLT to guide consumers through self-control dilemmas. In a preliminary qualitative study conducted in May-June 2025 with senior pharma managers, several pointed out patients' and physicians' difficulties in abandoning longstanding habits, despite clinical advantages. One manager noted, "some patients rely on their treatments as life-defining habits and are hesitant to abandon their routine, even when presented with solutions that would improve their quality of life". Another emphasized the short-term gratifications patients can extract from suboptimal treatments: "they get an immediate sense of fulfilment that is difficult to problematize, even though it ends up limiting their freedom and daily routines; in certain ways, it becomes a fully-fledged addiction". CLT-informed interventions can frame behaviour in ways that enhance desirability and emotional commitment, informing how health promotion campaigns are designed. These lessons learned are not limited to healthcare and pharma sectors. In the fashion industry, Lee et al. (2024) have employed CLT to investigate corporate communication on adherence to sustainability practices, analysing the construal level of both managers and stakeholders and delineating three main communication strategies. CLT has also been employed in the hospitality sector, investigating how psychological distance can increase consumers' willingness to pay upselling services (Guillet and Mohammed; 2024), and testing the influence of temporal distance on book now, pay later options for travellers (Jang and Cao; 2025).

## 4. Conclusions

Self-control dilemmas are ever-present features of our daily life and analysing them using the right theoretical lens can be fundamental. By offering an updated snapshot of the academic discourse regarding CLT and self-control dilemmas, and presenting some business case applications to reflect on, this short paper aims at providing a starting point for further research through CLT, to stimulate a proficient scholarly discussion that could illuminate more applications where construal level and psychological distance might improve corporate communication and consumers' decision-making processes.

# Walking the Talk on Sustainability: Consumer Perceptions on Retail Brand Equity Drivers

Giada Salvatore[1],*, Elena Sarti[1], Antonino Castrogiovanni[1], and Elisa Martinelli[1]

## Abstract

This paper investigates how traditional and sustainability drivers influence customerbased retail brand equity (RBE). The work integrates brand awareness (BA) and perceived quality (PQ) with a second-order construct, sustainable brand associations (SBA), which captures consumers' environmental (ES) and social (SS) perceptions of retailers. Data were collected via an online questionnaire administered to 599 Italian grocery shoppers recruited from social networks. Multi-item Likert scale was used, and the proposed model was tested using structural equation modeling (SEM). The analysis confirms that ES and SS jointly build SBA, which, in turn, enhances RBE. BA is the strongest direct antecedent of RBE, while PQ has slightly meaningful effect in this highly commoditized category. Overall, the findings underscore the importance of both traditional brand salience and credible sustainability positioning for strengthening retailer's brand equity. This study contributes to Consumer-Based Brand Equity (CBBE) theory by demonstrating the added value of sustainability cues and provides retailers with practical advice on combining awareness campaigns with visible social and environmental initiatives.

*Keywords: consumer-based brand equity, sustainable brand associations, brand awareness, perceived quality, grocery retail.*

## 1. Introduction

Over the past few decades, the academic literature has highlighted significant transformations in the competitive retail landscape, with the retailer's brand assuming a pivotal role in the creation of value. Indeed, there has been a noteworthy transition in the role of retailers: from mere distributors of products to service-based and experiential brands, capable of offering a distinctive identity and promoting direct relationships with customers. In this context, the concept of Retail Brand Equity (RBE) has gained increasing academic and managerial attention, becoming a core strategic asset and a lever to differentiate in saturated and highly competitive markets. In this sense, RBE is considered as the value perceived by the consumer towards the retailer's brand, because of a set of functional and symbolic associations (Ailawadi & Keller, 2004) In the era of sustainability, consumers increasingly demand that retailers adopt ethical, transparent, and environmentally responsible practices (Willems, 2022). However, current RBE literature has only recently started to acknowledge the relevance of sustainability-related associations in shaping brand perceptions. In particular, the integration of sustainability into consumer-based brand equity models remains underexplored, especially in grocery retailing, where brand trust and social alignment strongly influence routine purchase behaviour (Gutiérrez Rodríguez et al., 2017). To fill this gap, the objective of this study is to explore the antecedents of RBE, employing a quantitative

approach through structural equation modelling (SEM), combining traditional CBBE antecedents with perceived sustainability dimensions.

The theoretical contribution of this study lies in extending the classic CBBE framework by incorporating value-based sustainability perceptions into the measurement of RBE, and in validating a multidimensional construct of sustainable brand association tailored to the grocery context.

## 2. Theoretical Background and Hypotheses Development

The paper is framed in the customer-based brand equity (CBBE) perspective.

The CBBE approach has been comprehensively theorised thanks to the seminal contributions of Aaker (1991) and Keller (1993), who propose distinct yet complementary models. Aaker defines CBBE as a set of intangible assets, namely awareness, associations, perceived quality and loyalty, which hold the potential to enhance the brand value in the consumers' eyes. Aaker's model has a parallel structure, where each dimension contributes independently to the overall value. On the other hand, Keller proposes a sequential structure, in which brand awareness fuels associations, which in turn build favourable attitudes and ultimately loyalty. In recent years, an increasing amount of attention has been directed towards the concept of RBE, driven by a growing recognition of the strategic role that retailers and their brands play in creating value for consumers, as well as in their ability to develop longterm emotional relationships with consumers. According to Ailawadi and Keller (2004), successful retail branding acts as a cognitive shortcut that recalls prior positive shopping experiences. RBE thus contributes to minimizing the effects of competitive pressures, especially in highly commoditized markets such as the grocery sector, where private label brands have evolved from generics to highly sophisticated and valuedriven brands, while retailers have increasingly positioned themselves as brands in their own right (Kumar & Steenkamp, 2007; Jara & Cliquet, 2012). Although traditional CBBE models have been crucial for the theoretical establishment of the concept, several authors have highlighted the inadequacy of these approaches in fully addressing the distinctive dynamics of the retail context (Londoño et al., 2016; Rudkowski, 2024). This is especially true in the grocery sectors, characterized by high frequency and routine-driven nature of purchases (Casanoves-Boix et al., 2025). Furthermore, as sustainability becomes increasingly central to consumer decision-making, perceived brand sustainability emerges as a key dimension to be integrated by companies (Salina, 2025). As such, adapting the CBBE framework to the retail context requires a tailored set of antecedents able to capture both functional and value-based dimensions of RBE. Accordingly, this study proposes a model of RBE based on three key antecedents: Brand Awareness (BA), Perceived Quality (PQ), and Sustainable Brand Association (SBA). BA and PQ represent two of the most widely recognized components in classic CBBE models. In contrast, SBA is modeled as a second-order latent construct reflecting consumers' perceptions of the retailer's ethical, social, and environmental integrity. The growing environmental and social awareness of consumers is leading RBE to be progressively influenced not only by functional benefits, but also by symbolic and moral associations (Willems, 2022). In this study, SBA is tailored to the grocery context, where sustainability practices could reinforce the brand's identity through brand associations and in so doing, enhance RBE. In this work, SBA is specifically composed of two first order dimensions: Social Sustainability (SS) and Environmental Sustainability (ES). While the concept of sustainability is traditionally conceptualized across three pillars - environmental, social, and economic (Elkington, 1994) - the present study focuses on the environmental and social dimensions in modelling sustainable brand associations. This choice stems from the recognition that economic sustainability typically refers to internal business practices, such

as long-term profitability, financial stability, and operational resilience, which are generally not visible or directly perceived by consumers (Kencebay & Ertugan, 2025).

Therefore, we hypothesize the following:

H1: Social Sustainability (SS) positively influences SBA;

H2: Environmental Sustainability (ES) positively influences SBA;

H3: Sustainable Brand Association (SBA) positively influences RBE; H4: Brand Awareness (BA) positively influences RBE;

H5: Perceived Quality (PQ) positively influences RBE.

Additionally, the model includes three control variables, namely age, gender, and household size, to account for potential demographic influences on consumer perceptions of RBE.

## 3. Methodology

A structured questionnaire, related to grocery shopping, was administered in February and March 2025 to 599 grocery shoppers through social networks. Each latent construct was measured using multi-item, 5-point Likert scale drawn from prior research. BA, PQ, and RBE rely on canonical brand-equity scales (Aaker, 1991; Keller, 1993). A structural equation model (SEM) was estimated using maximum likelihood with robust standard errors. Item reliabilities were high (.698–.906; $p < .001$). Internal consistency satisfied conventional benchmarks: Cronbach's $\alpha$ ranged from .727 to .923, and McDonald's $\omega/\varrho$ ranged from .846 to .924. These values exceed the .70 guideline for adequate reliability (Hair et al., 2022). Convergent validity was supported (AVE = .572–.742 > .50) (Fornell & Larcker, 1981). Although the squared correlations between constructs surpassed the AVE for several perceived dimensions, the subsequent HTMT ratios (all <.85) alleviated major concerns about discriminant validity. The overall model fit was acceptable, with a SRMR of .058, which is well below the .08 threshold, and indicates a good fit (Hu & Bentler, 1999). These fit indexes confirmed that the measurement model was sound and suitable for testing the hypotheses.

## 4. Results

Figure 1 shows the structural model. ES exerted a strong positive influence on SBA ($\beta = .471$, $z = 5.01$, $p < .001$), while SS contributed more modestly ($\beta = .198$, $z = 2.00$, $p = .046$). These results fully support H1 and H2. In turn, SBA enhanced retail BE ($\beta = .174$, $z = 2.98$, $p = .003$), supporting H3.

Among the classic antecedents, BA emerged as the most significant predictor of RBE ($\beta = .588$, $z = 10.88$, $p < .001$), confirming H4. However, PQ exhibited a slightly statistically significant effect ($\beta = .103$, $z = 1.89$, $p = .059$), leaving H5 supported at the 10% level. Demographic controls (gender, age, and household size) were not significant, except for age with a slightly positive effect on RBE.

The coefficient of determination for RBE was .999, indicating that the combined set of antecedents explains nearly all the variance, primarily due to a significant contribution from BA. The low SRMR, coupled with strong item reliabilities, provides confidence in the robustness of these relations.

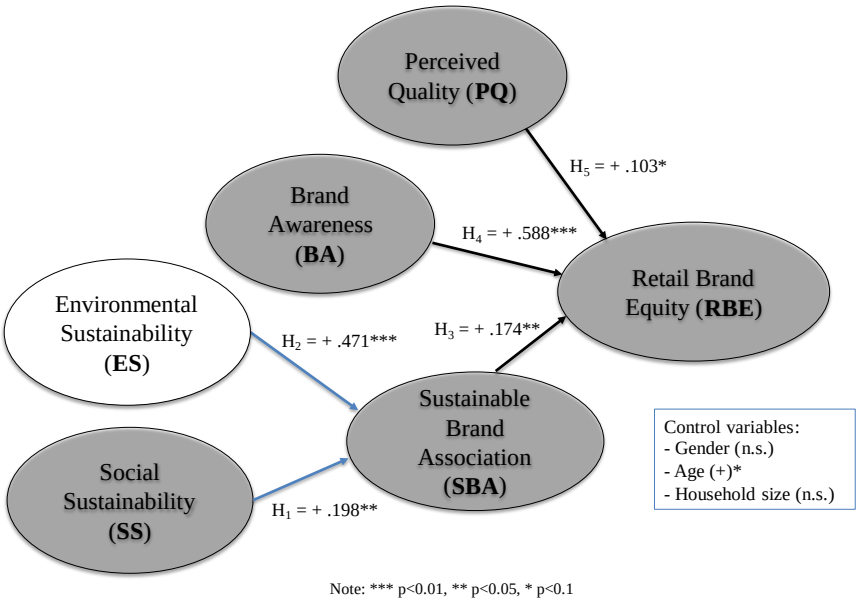

**Figure 1:** Structural model results and paths among latent constructs

## 5. Discussion

The study enriches customer-based brand equity research by empirically integrating sustainable associations into the context of grocery RBE. In line with foundational theories (Aaker, 1991; Keller, 1993), brand awareness is the primary driver of retail brand equity, highlighting the importance of brand recall in frequent purchasing environments. However, the results show that environmental and, to a lesser extent, social sustainability signals indirectly strengthen RBE via SBA. This finding aligns with recent claims that ethical and ecological credentials have become strategic differentiators for retailers (Willems, 2022). The greater significance of ES indicates that consumers view concrete environmental initiatives, such as waste reduction and eco-friendly packaging, as more reliable indicators than general social initiatives. This reflect marketplace trends where campaigns focusing on the environment tend to have a more immediate impact than those focusing on social issues.

On the other hand, the only slightly significant path from PQ to RBE suggests that perceived quality may have lost importance in a sector where basic product standards are widely accepted (Kumar & Steenkamp, 2007). When quality becomes a basic expectation, consumers seem to use much more awareness and sustainability heuristics to evaluate retailers.

From a managerial standpoint, investing in credible and well-communicated environmental programs can increase SBA and, ultimately, brand equity.

Finally, this study has some limitations. The model was tested only in grocery retailing, therefore replications using probability sampling, richer multi-item scales, and longitudinal or behavioral data across diverse retail sectors are needed to confirm the robustness and generalizability of our results.

# Virtue or Virality? A Conceptual Exploration of Emerging Brand Rot vs. Conscientious Brand

## Abstract

This paper aims to explore a new possible emerging orientation in branding communication—Brand rot—as a counterpoint to the growing trend of conscientious branding, which focuses on ethical responsibility and collective well-being. In contrast, Brand rot appears to reflect a strategic disengagement from real-world issues, favoring content that is absurd, surreal, and disconnected from meaning or purpose. Building on an initial exploration of Brain rot memes—viral, nonsensical digital artifacts—that companies have begun to integrate into their online brand communication, we propose a preliminary conceptual comparison between conscientious brands and those that may be engaging in what we refer as Brand rot dynamics, highlighting potential points of divergence and intersection. Through this short position paper, we intend to offer initial insights for further investigation and theorization. Given the novelty of the phenomenon and the current absence of academic literature on the topic, we suggest that Brand rot may represent a fertile domain for future research—particularly in relation with evolving branding practices in the attention economy. It may also reflect a deeper value fracture within younger generations: a divide between those who engage with socially conscious causes and those who instead embrace the absurd, the ironic, and the nonsensical, marked by disillusionment and detachment from traditional meaning-making structures.

*Keywords: Conscientious Brand, Brain Rot, Purpose-Oriented Branding, Brand-Rot, Brand Communication*

## 1. Introduction

In recent years, branding has shifted from a focus on the brand and company itself to greater attention to consumers' social contexts and concerns. This shift has been driven by rising expectations for brands to actively engage with socially relevant causes (Kjeldsen & Schmeltz, 2024). As noted in a report by Accenture (2020), especially among Generations Y and Z, consumers increasingly assess both current and potential brand relationships based on the degree of purpose-orientation. This orientation rather than a mere communicative stance (Walter, Föhl, Sander, & Nies, 2024) reflects a company's authentic commitment to promoting positive social change (Blocker, Cannon & Zhang, 2024), and encompasses various dimensions including corporate social responsibility, environmental, social and corporate governance, and business ethics. This commitment— increasingly embedded within corporate strategy—finds expression in the form of conscientious brands. These brands embody a sustained and deeply rooted moral engagement with one or more socially relevant causes, that transcends organizational boundaries and is outwardly projected

through a collaborative, co-creative approach involving all stakeholders (Abratt, Quaye & Kleyn, 2025). However, while branding increasingly appears to be moving toward purpose-driven strategies and moral engagement with societal causes, recent trends suggest the emergence of an opposite logic.

In potential contrast to conscientious brands, more recently certain brands' digital communication practices are increasingly embracing absurdity, detachment, and content devoid of meaning. This phenomenon—still unexplored in marketing and branding literature—can be observed in the growing use of *Brain rot memes* within several brands' digital communication strategies. Although not new, the use of memes in branded content is widely seen as an effective way to leverage internet culture, enabling brands to engage audiences through humorous and entertaining formats (Razzaq, Shao & Quach, 2024). However, while traditional meme virality relies on shared meanings and cultural codes (Razzaq et al., 2024), *Brain rot memes* are instead marked by a radical absence of meaning. These memes—digital artifacts generated using AI—typically combine randomly fused elements such as objects and anthropomorphized animals, paired with a nonsensical narrative voiced by an AI-generated male speaker. The term *Brain rot* derives from a popular expression describing the perceived decline of a person's mental or intellectual state, especially due to excessive consumption of trivial or unchallenging online content (Oxford University Press, 2024). But while the term originally refers to cognitive and attentional decline, particularly among Gen Z and Alpha (Yousef, Alshamy, Tlili & Metwally, 2025), its deliberate adoption by brands through meaningless and ephemeral content raises questions such as: could the brand's use of *Brain rot memes*—completely devoid of logical coherence or value expression—signify a form of communicative degradation that undermines both the functional and hedonic dimensions of the brand itself? This orientation—which we refer to using the novel term as "*Brand rot*"—could challenge the foundational assumptions of conscientious brands and invites reflection on a potential shift in branding logic.

## *2. Brand rot* vs. Conscientious brand

Given the lack of academic literature, our initial exploration of the *Brand rot* phenomenon—compared to conscientious brands—focuses on communicative differences, as these are currently the only observable indicators of *Brand rot* behavior. For this comparison, we draw on the communication requirements for conscientious brands outlined by Bertolini et al. (2023). The primary distinction lies in the function of communication: conscientious branding aims to clearly and truthfully convey the brand's purpose to inspire behavioral change, whereas *Brain rot memes* primarily seek relevance, using entertainment as a tool to maximize engagement and awareness through virality, even when employing content devoid of meaning (WDHN, 2025). With regard to "to whom" the brand communicates, conscientious brands typically address a broad audience—not limited to consumers but also including other businesses and organizations—since the social causes they promote tend to be of shared interest to multiple stakeholders (Iglesias et al., 2023). In contrast, *Brand rot* communication targets a narrower audience—primarily Gen Z and Alpha—who favor spontaneous, surreal, and instantly consumable content (WDHN, 2025) and show a marked preference for the nonsense-driven humor typical of *Brain rot memes* (Corriere, 2025).

Furthermore, when it comes to communication principles, conscientious brands are required to uphold transparency, clarity, consistency, and authenticity—not only to communicate effectively and influence stakeholders toward positive behavioral change, but also to avoid reputational risks associated with misleading or inconsistent messaging. An additional principle shared by both conscientious and *Brand rot* communication—though pursued with different aims—is openness. For conscientious brands, this entails a willingness to engage stakeholders in dialogue to address socially relevant issues (Bertolini et al., 2023). In contrast,

*Brand rot* communication embraces a form of openness (Table 1) that enables both users and brands to freely appropriate or generate characters and formats—not to encourage social impact or meaningful dialogue, but purely to fuel an ephemeral virality.

| **Brand** | ***Brain rot* meme** | **Typology** |
|---|---|---|
| KFC<br><br>(*Twisterino maranzino)* |  | *Owned*<br><br>(*Brain rot meme* created by the brand) |
| Carrefour Belgium<br><br>(*Ballerina cappuccina*) |  | *Owned (adapted from users)*<br><br>(*Brain rot meme* created from pre-existing online characters and adapted for branded content) |
| Nike<br><br>(*Tralalero Tralalà)* |  | *Earned*<br><br>(*Brain rot meme* created by users incorporating brand elements without the brand's consent or participation) |

**Table 1:** Examples of brand use of *Brain rot memes* as evidence of communicative openness

Taken together (Table 2), these distinctions highlight the divergent communicative logics underpinning conscientious and *Brand rot* brand. While the former is guided by purpose, ethical coherence, and stakeholder engagement, the latter prioritizes cultural immediacy, aesthetic detachment, and viral relevance.

| **Dimension** | **Conscientious Brand** | ***Brand rot* (emerging)** |
|---|---|---|
| Communication functions | Inspire positive change, ethics | Virality, attention, ephemerality, attention |
| Main communication targets | Multiple stakeholders | Generation Z and Alpha |
| Principles of communication | Transparency, clarity, consistency, authenticity, openness | Meme-driven, openness, nonsense (to be explored) |

**Table 2:** main differences between conscientious and *Brand rot* communication.

These first insights offer a conceptual basis for further investigation into the emerging phenomenon of *Brand rot* and its implications for brand strategy and identity in digital culture.

## 3. Future research directions

In outlining future research on the concept of *Brand rot*, there is a clear need for foundational work to establish a coherent conceptual framework and a shared definition of the phenomenon—potentially through expert-driven approaches such as the Delphi method. Moreover, while *Brand rot* currently manifests primarily through *Brain rot memes* in brand communication, it may evolve into other forms. Future studies should therefore explore its underlying drivers, potential advantages, and long-term implications for brand identity, particularly in relation to communication styles that are deliberately empty or absurd. Regarding the drivers, one possible research line could explore younger consumers' tendency to seek escapism as a response to the anxiety induced by today's global scenario marked by climate crises, economic instability, social and geopolitical tensions (TrendHunter, 2022; Orazi, Mah, Derkensen & Murray, 2023). In this context, *Brand rot* might emerge not merely as a stylistic choice but as a deeper cultural reaction to the saturation of moralized brand messaging, reflecting younger generations' growing fatigue with purpose-driven branding in an era of uncertainty and disillusionment.

However, the sharp opposition between *Brand rot* and conscientious brands outlined in this work may risk oversimplifying the phenomenon and overlooking its underlying complexity. First, we cannot assume that all *Brand rot* expressions are entirely detached from socially relevant issues. Future research could explore whether some cases of *Brand rot* represent instances of purpose-hushing, where brands opt to engage in silent forms of action. This approach might allow for a more detached, absurdist communication style without necessarily excluding an active commitment to collective well-being. Additionally, rather than indicating complete disengagement from reality, *Brand rot* communication may sometimes reflect a deliberate stance on social issues or a strategy to capture attention through shock, similar to the controversial marketing logic. Indeed, if sexual or violent imagery has lost its shock value (Urwin & Venter, 2014), *Brain rot memes* may represent new forms of transgression and provocation. Examples such as *Bombardiro Crocodilo*—a crocodile-bomber with an AI-generated voice claiming responsibility for the killing of children in Gaza—and the profane song featuring *Tralalero Tralalà* a Nike-wearing shark (Corriere, 2025) illustrate politically charged content that push the boundaries of meme culture and could emerge as a new frontier of controversial marketing. As such, we suggest that future research could further investigate these expressions as manifestations of the evolving logic of digital provocation within *Brand rot* communication. Finally, a further line of research could focus specifically on earned *Brain rot memes* involving brands that resulting from non-collaborative co-creation processes, could be interpreted as forms of brand hijacking (Siano, Confetto, Vollero & Covucci, 2022). Future research could investigate the motivations behind users' choices to embed specific brands in *Brain rot memes*—exploring whether these inclusions are entirely random or reflect more intentional acts of commentary, satire, or cultural positioning. Altogether, these preliminary directions highlight the need for a deeper exploration of *Brand rot*, its communicative logic, cultural meaning, and strategic implications.

## Abstract

Tourism destinations increasingly turn to place branding as a strategic response to sustainability challenges. Building on this trend, the present study investigates how Copenhagen's brand is discursively constructed in the CopenPay campaign, a sustainability initiative launched by Visit Copenhagen to incentivize eco-friendly tourist behaviors through rewards. By analyzing two promotional videos released in 2024 and 2025 as part of the campaign, the study explores how sustainability is framed through progressive values, civic engagement, and affective appeal. The analysis is grounded in two theoretical frameworks: the Nordic wave of place branding, which emphasizes social responsibility, participatory governance, and cultural pluralism; and ecolinguistics, which explores how language shapes ecological values and imaginaries. Methodologically, the study adopts Positive Discourse Analysis to examine how empowering narratives are constructed through linguistic choices and rhetorical strategies. Findings reveal that the campaign mobilizes greenspeak—a form of environmental discourse that blends ethical messaging with promotional intent. Sustainability is framed as a pleasurable and emotionally rewarding experience, which both empowers tourists as ethical agents and reinforces Copenhagen's brand as an environmentally responsible destination. However, the analysis also identifies discursive silences, which manifest in the neglect of structural critiques related to tourism's environmental impact and social sustainability issues. This paper contributes to interdisciplinary debates on sustainability communication and place branding by demonstrating how discourse is both a branding tool and an ideological construct. In doing so, the study offers practical insights for tourism marketers and encourages more transparent and critically reflective sustainability narratives in urban place branding.

*Keywords: Sustainability, Marketing Communication, Nordic Place Branding, Ecolinguistics, Positive Discourse Analysis*

## 1. Introduction

As tourism destinations increasingly face the challenges of overtourism, climate change, and shifting visitor expectations, place branding has emerged as a strategic tool for aligning urban development with global environmental goals. For instance, the city of Miami Beach in the United States has recently implemented a rebranding strategy aimed at mitigating the negative

impacts of spring break tourism and promoting sustainable-responsible tourist behavior that prioritizes both visitor experience and resident well-being (Spezzano & Lusby, 2024a, 2024b).

Amidst critical contestations of tourism, the Nordic countries have positioned themselves at the forefront of progressive place branding by embedding values such as social responsibility, environmental stewardship, and participatory governance into their tourism narratives (Cassinger, Gyimóthy, & Lucarelli, 2021). In particular, Copenhagen has gained international recognition for its innovative approaches to sustainable urban tourism. A notable example is *CopenPay*, a tourism campaign launched by the city's official destination marketing organization—Visit Copenhagen—to incentivize sustainable tourist behavior.

Launched in 2024 and renewed the following year, CopenPay is a pioneering initiative that rewards visitors for engaging in eco-friendly actions—such as biking, picking up litter, or arriving by train. This initiative aims to promote sustainable tourism behavior and reinforce Copenhagen's broader green transition. Two promotional videos, released across digital platforms as part of the 2024 and 2025 editions, lie at the heart of the campaign's communication strategy. They encapsulate the ethos of CopenPay through a persuasive narration that frames sustainability as an enjoyable, socially rewarding part of the tourist experience.

This research explores how Copenhagen's brand is discursively constructed in both promotional videos through positive, future-oriented narratives that emphasize agency, inclusivity, and ethical consumption. Theoretically, the study draws on two key frameworks: the Nordic wave of place branding (Cassinger, Lucarelli, & Gyimóthy, 2021) and ecolinguistics (Stibbe, 2021). Methodologically, it adopts Positive Discourse Analysis (Bartlett, 2012; Martin, 2004) as the analytical lens to examine how sustainability discourse in place branding is articulated and communicated within the digital landscape. The study contributes to ongoing debates on sustainability and branding at the intersection of marketing communication, applied linguistics, and tourism research (Cassinger et al., 2019; Lusby, 2021; Ponton, 2022; Sharma et al., 2020; Stibbe, 2017).

## 2. Sustainable Tourism and the Nordic Wave of Place Branding

Contemporary urban tourism is both competitive and contested due to the backlash of overtourism and tourism-led gentrification (Cocola-Gant, 2018; Milano et al., 2019; Sigler & Wachsmuth, 2020). In this context, European destinations increasingly turn to sustainable initiatives to better align tourism with urban policy goals in their aspiration to enhance both visitor appeal and resident satisfaction (Kavaratzis & Kalandides, 2015). Sustainability has thus become a strategic brand differentiator on the tourism market, with the Nordic countries being illustrative examples of a shifting place branding practice. Rather than focusing solely on iconic landmarks or cultural heritage, cities like Copenhagen and Stockholm seek to position themselves through environmental responsibility, inclusive public spaces, and longterm livability.

Recent research contributions (Cassinger et al., 2019; Cassinger, Gyimóthy, & Lucarelli, 2021) have highlighted the specific character of the Nordic wave of place branding, which combines critical and geopolitically reflective scholarship with societal engagement. In contrast to corporatist and market-driven theorizations of brand management, the Nordic approach to place branding is embedded in the unique sociocultural context of the Nordic region (*Nordic exceptionalism*), which is framed by participatory governance, social cohesion, and trust, as well as local stakeholder involvement (Cassinger & Eksell, 2017).

The key tenets of the Nordic wave can be summarized in three distinct features: collaboration, social responsibility, and cultural pluralism. First, the metaphor of the wave

emphasizes a transdisciplinary and collaborative approach where citizens, local communities, public institutions, and academics are active co-creators of place brands (Kavaratzis et al., 2017; Lucarelli & Brorström, 2013). Second, Nordic branding is driven by ethical imperatives rather than image-building, and is engaged in promoting the values of sustainability, gender equality, climate consciousness, and social justice. Place branding is thus conceived as a platform for market responsibilization, not merely attracting tourists or investment (Cassel, 2019; Ren et al., 2019). Third, Nordic scholars reject the idea of a singular, essentialist brand identity (Ren & Blichfeldt, 2011), and instead promote narrative multiplicity and an ongoing process of meaning-making (Gyimóthy 2017; Ooi 2004), grounded in local stories, cultural symbols, and diverse expressions of place.

These tenets collectively form a progressive framework for place branding that is capable of navigating the tensions between local identity formation and the commodification of both Nordicity and welfare values for international markets. Sustainability is inherent to the core brand ethos of Nordic place brands, but it has also become a practical asset in tourism development. Innovative business models are aligned with the sharing economy and circular principles, which have contributed to new carbon-neutral and climate-adaptive experiences for visitors. As such, consumers are increasingly assigned co-responsibility in the green transition.

In particular, Nordic practitioners are keen on experimenting with placesensitive interventions. These may entail responsibilizing campaigns, such as CopenPay (Bosangit et al., 2025), or design interventions called provotyping (Waade et al., 2019), which further enhance dialogue between planners, residents, and tourists.

## 3. Ecolinguistics and Greenspeak

While the Nordic wave of place branding emphasizes collaborative and ethical storytelling, ecolinguistics provides the theoretical framework for analyzing the narratives that underpin such branding practices. Ecolinguistics emerges from the broader ecological turn in the humanities and social sciences, which reorients disciplines toward environmental concerns and highlights the role of language in shaping ecological futures (Stibbe, 2021). This shift reflects growing recognition that human narratives, values, and communicative practices significantly shape how societies engage with environmental challenges. At the core of ecolinguistics lies the concept of *ecosophy*, a normative philosophy of ecological harmony introduced by Næss (1995). Ecosophy provides an ethical basis for evaluating communication not merely on its rhetorical efficacy but on its contribution to sustaining life.

One of the central aims of ecolinguistics is to identify and interrogate the "stories we live by" (Stibbe, 2021, p. 1)—those underlying narratives and cognitive structures that guide how societies perceive and act upon their relationship with the natural world. In sustainability discourse, these stories often appear in the form of implicit assumptions about progress, consumption, and economic growth—narratives that may run counter to ecological goals. Ecolinguistics seeks to expose such narratives while advocating for alternatives that promote interdependence, sufficiency, and longterm ecological care.

Building on this theoretical grounding, the ecolinguistic perspective becomes particularly salient in Nordic place branding, where environmental narratives play a central role in shaping perceptions and behaviors. Ecolinguistics prompts a reconsideration of how language can either sustain exploitative ideologies or foster more sustainable and inclusive practices. This means assessing whether place-based narratives reinforce extractive economic paradigms or promote civic engagement, environmental awareness, and cultural resilience.

The present study conceptualizes sustainability discourse in Nordic place branding in terms of *greenspeak*—a word coined by Harré et al. (1999) to describe the language and rhetorical patterns used in environmental communication. Greenspeak refers to discursive practices that range from sincere expressions of ecological concern to more strategic or promotional uses of environmental language. In the Nordic place branding context, this discourse becomes highly relevant, revealing tensions between genuine sustainability commitments and strategic uses of green language to shape brand perception. Analyzing greenspeak through the lens of ecolinguistics allows for a deeper understanding of how sustainability is constructed, performed, and sometimes commodified in place branding.

## 4. Methodology

This study adopts a qualitative approach drawing on Positive Discourse Analysis (Bartlett, 2012; Martin, 2004), a strand of discourse studies that explores how language constructs empowering narratives, promotes social change, and fosters solidarity. This approach is particularly suited to analyzing public campaigns that aim to inspire and engage audiences, with a focus on how discourse enacts positive social and environmental values.

The data consist of the transcriptions of the two promotional videos published across digital platforms by Visit Copenhagen in 2024 (Appendix A) and 2025 (Appendix B) as part of the CopenPay initiative. Both videos were transcribed in full and subjected to a close discourse analysis that focused on lexico-semantic choices, rhetorical strategies, and broader discursive patterns.

The analysis followed three stages. First, recurring themes and ecological values were identified, including civic responsibility, ethical consumption, emotional engagement, and collective action. Second, the linguistic features and rhetorical devices used to construct these themes were examined. Particular attention was paid to verbs of agency (e.g., *help*, *earn*, *take part*), inclusive pronouns (e.g., *we*, *everyone*), affective expressions (e.g., *feel good*, *make a difference*), and reward-oriented language structures. Third, the two videos were compared diachronically to trace discursive shifts between the 2024 pilot and the 2025 version, enabling the identification of evolving narratives.

Additionally, the analysis explored how tourists were discursively positioned as ethical actors and how emotional appeals were embedded to reinforce desired behaviors. Intertextual references to Nordic cultural values and implicit ideological silences were also examined, in line with the ecolinguistic goal of uncovering both what is said and what is left unsaid.

Through this methodological approach, the study shows how greenspeak operates in Copenhagen's sustainability narrative and how language in place branding both reflects and shapes ecological imaginaries.

## 5. Findings and Discussion

The analysis of the two CopenPay promotional videos reveals how Copenhagen's brand discursively constructs sustainability through a form of greenspeak that blends civic encouragement, ecological responsibility, and strategic optimism. The campaign mobilizes language not only to promote environmentally responsible behaviors but also to shape an affective and inclusive sustainability narrative aligned with Nordic place branding values.

### 5.1 Framing Sustainability as Empowering and Enjoyable

A central theme in both videos is the framing of sustainability as a pleasurable, low-barrier, and socially rewarding experience. Lexical choices such as *enjoy*, *earn*, *reward*, and *explore* reposition eco-friendly behaviors not as obligations but as desirable and even entertaining

actions. This framing constitutes a positive "story to live by" (Stibbe, 2021, p. 1), which replaces narratives of guilt or sacrifice with narratives of agency, empowerment, and mutual benefit. Building on this strategic positivity, the 2025 video further develops the idea of active participation as gratifying civic action. Tourists are encouraged to "help keep the water in the canals clean in exchange for a free boat tour," "help remove invasive plants," and "take part in a plogging tour where people collect litter together and get a free coffee and a Danish."

Such utterances combine environmental action with gamified gratification, expressing a civic ethos while also appealing to self-interest. From a greenspeak perspective, this duality reflects both an authentic ecological orientation and a marketing logic designed to enhance the city's competitive appeal. It also aligns with the Nordic wave's emphasis on responsibilization as a shared and ethical endeavor, while echoing the dynamics of *consumer responsibilization* (Giesler & Veresiu, 2014), whereby individuals are discursively positioned as responsible agents expected to advance environmental and social goals through their consumption choices.

### 5.2 Pronouns and Discourses of Inclusion

Extending the logic of shared responsibility, the videos consistently use inclusive pronouns such as *we*, *you*, and *everyone*, constructing sustainability as a shared social project. This rhetoric aligns with ecolinguistics' emphasis on interdependence and with the Nordic branding's core value of participatory governance. For example, the 2025 video includes statements such as "you can even get rewarded for how you get to Copenhagen," and "the hope is to inspire to a more conscious mindset."

This inclusive stance serves a dual function. It positions Copenhagen as a socially cohesive destination and constructs tourists as active moral agents rather than passive consumers. Through this discursive move, the brand performs what Positive Discourse Analysis defines as *solidarity-building discourse* (Bartlett, 2012), reinforcing the social legitimacy of green behaviors while strengthening the emotional connection between visitor and place.

### 5.3 Emotional Appeal and Affective Stance

Beyond inclusivity, greenspeak evokes a diverse emotional landscape tied to agency, responsibility, and collective engagement. Rather than relying on overtly affective expressions, the CopenPay campaign promotes emotional gratification through affirming language and the association of climate-friendly actions with tangible rewards. These include feelings of joy and light-heartedness—fostered through the gamified nature of earning treats like boat tours, coffee, or gourmet meals—as well as pride in participating in meaningful environmental practices. Group activities such as plogging or removing invasive plants evoke a sense of belonging and togetherness, while the generosity of the rewards may trigger gratitude.

At a deeper level, tourists are invited to feel empowered and morally fulfilled by engaging in sustainable behavior, reinforcing their role as ethical actors in the green transition. This affective appeal plays a central role in greenspeak, serving to normalize environmental responsibility through a language of positivity. Rather than employing alarmist or guilt-driven rhetoric, the videos promote a tone of affective governance (Bajde & Rojas-Gaviria, 2021), aligning with the optimistic and future-oriented narratives emphasized in ecolinguistics. This strategic emotional framing positions the city as not only environmentally advanced but also emotionally rewarding to visit and support.

### 5.4 Intertextuality and Cultural Referencing

In parallel with its emotional resonance, the campaign draws on broader Nordic cultural codes—particularly those associated with environmental citizenship, cycling culture, and

civic pride. These references are exemplified by the statement "the people in Copenhagen bike, swim in the canals, and drink tap water instead of bottled water," which frames sustainability as a normalized, everyday behavior. At the same time, this normalization is localized: it constructs sustainable practices as an inherent feature of Copenhageners' lifestyle, thereby positioning locals as moral exemplars and cultural insiders.

This dual framing performs several discursive functions. For domestic audiences, it reinforces civic identity and environmental self-image; for international audiences, it presents a behavioral model to aspire to—implicitly inviting tourists to adopt local norms. From a greenspeak perspective, this rhetorical move legitimizes the campaign's sustainability claims by anchoring them in culturally specific narratives of Nordic exceptionalism. It also reflects the ideological layering of environmental discourse in tourism branding, where sustainability is not only a policy goal but also a marker of cultural identity and moral leadership.

### 5.5 Subject Positioning: The Ethical Tourist

Echoing the theme of cultural modeling, the videos construct the tourist as an empowered, ethical subject—someone capable of making a difference through everyday actions. This is visible in imperative and modal verb structures such as "arriving by bike can earn you a trip," "help keep the water in the canals clean," and "bike to a museum." Here, agency is foregrounded not as a burden but as an accessible, morally appropriate, and even pleasurable opportunity.

Such subject construction is significant from both ecolinguistic and branding perspectives. It redefines the tourist role from passive consumer to co-creator of sustainability. This reframing aligns with the Nordic ideal of co-responsibility while also fulfilling a branding function: casting the city as a platform for meaningful participation and ethical consumption.

### 5.6 Strategic Silences and Ideological Selectivity

Despite this progressive narrative, the campaign also exhibits discursive omissions that reflect the ideological boundaries of greenspeak. Notably absent are references to structural barriers, systemic emissions, or the broader contradictions of promoting air travel to a "green" city. Moreover, the campaign's discourse overlooks critical aspects of social sustainability, including gentrification and the commodification of everyday urban life. By foregrounding individual actions and personal choices, greenspeak sidesteps more complex critiques of tourism's environmental and socio-spatial impacts.

Such silences are not accidental; they reveal the selective logic of sustainability discourse in commercial contexts. As ecolinguistics warns, even wellintentioned narratives can reproduce dominant ideologies by omitting uncomfortable truths (Stibbe, 2021). In this case, the narrative centers on voluntarism and optimism while marginalizing discussions of environmental limits, social equity, or policy enforcement—thereby promoting a vision of sustainability that is easy to sell and safe to implement, but ultimately limited in scope.

## 6. Conclusion

This study has investigated how Copenhagen's brand is discursively framed in the CopenPay campaign by drawing on the Nordic wave of place branding and ecolinguistics from a theoretical perspective, and Positive Discourse Analysis as its methodological approach. Through an in-depth analysis of the 2024 and 2025 promotional videos at the heart of the campaign, the research has shown how greenspeak operates as both a communicative strategy and an ideological construct in sustainable place branding.

The findings demonstrate that CopenPay mobilizes a discursive repertoire aligned with core values of the Nordic wave—such as social responsibility, civic participation, and inclusive governance—while promoting a commodified form of sustainability that is emotionally engaging, socially rewarding, and commercially appealing. The campaign reframes sustainable behavior as accessible and enjoyable, intertwining civic action with personal gratification and thereby constructing a positive, future-oriented narrative that enhances both ecological awareness and destination appeal. Through affective language, inclusive pronouns, and the ethical positioning of tourists, the campaign cultivates a sense of belonging and shared purpose that aligns individual agency with collective environmental goals.

At the same time, the analysis highlights critical absences that reveal the ideological selectivity of greenspeak. By centering voluntarism, emotional resonance, and everyday practices, the campaign sidelines deeper structural concerns—such as the environmental contradictions of air travel, the socio-spatial consequences of urban tourism, and the commodification of everyday civic life. These silences do not merely reflect strategic omissions but actively shape how sustainability is imagined and communicated. As such, the CopenPay campaign illustrates both the rhetorical power and the political limitations of sustainability narratives in commercial place branding.

From an academic standpoint, the study contributes to the interdisciplinary dialogue on sustainability and branding at the intersection of marketing communication, applied linguistics, and tourism research. It demonstrates the analytical value of Positive Discourse Analysis for examining how sustainability is linguistically constructed, ideologically shaped, and emotionally charged in tourism communication. Moreover, by integrating an ecolinguistic perspective, the study advances the conceptualization of greenspeak as a discursive tool that frames ethical action within consumer-oriented campaigns, particularly in the context of Nordic place branding.

From a managerial perspective, the findings offer valuable insights for destination marketers, tourism planners, and communication strategists. The study suggests that positioning sustainability as a pleasurable, inclusive, and culturally meaningful experience can foster stronger engagement and reinforce brand credibility. At the same time, it cautions against the risks of overly optimistic or strategically sanitized narratives. For sustainability messaging to be credible and effective, it must acknowledge ecological limits and foster more transparent, participatory, and structurally aware communication strategies. Brands are thus encouraged to move beyond aspirational storytelling and adopt discourse practices that align with long-term environmental goals and inclusive stakeholder collaboration.

Future research could extend this work by exploring greenspeak across different geographical and cultural contexts, including cities outside the Nordic region with varying branding logics and environmental policies. Longitudinal analyses could examine how sustainability narratives shift in response to social or political developments, while audience reception studies could illuminate how these narratives are interpreted, endorsed, or resisted by diverse stakeholder groups. Finally, multimodal approaches could further enrich the analysis by investigating the interplay of verbal, visual, and auditory modes in campaign messaging.

In sum, this study affirms the centrality of discourse in the construction of sustainable tourism imaginaries. Language plays a critical role in shaping perceptions, mobilizing action, and defining the ethical contours of green transitions. As such, discourse analysis remains essential to understanding—and improving—the ways in which sustainability is communicated in place branding.

## Appendices

*Appendix A: Transcription of the 2024 Promotional Video*

Copenhagen aspires to be more than just the capital of Denmark. It aims to become the capital of sustainable tourism. Most of the city's electricity comes from renewable energy sources, and the people in Copenhagen bike, swim in the canals, and drink tap water instead of bottled water. Now, Copenhagen attractions promote green actions by introducing CopenPay. The model is simple: Copenhagen attractions reward climatefriendly actions. For instance, arriving by bike can earn you a trip down Copenhagen's famous ski slope; cycling to the National Museum earns your family a treat. Work on an urban farm and get a free vegetarian lunch—or, if you help keep the water in the canals clean, you can get the kayak tour for free. Copenhagen is introducing CopenPay as a pilot project where a wide range of attractions reward tourists with CopenPay. The hope is not only for people to increase green actions in Copenhagen, but to inspire more green actions worldwide.

*Appendix B: Transcription of the 2025 Promotional Video*

How can tourism be turned from a burden into a positive force for change? In 2024, this question led Copenhagen to turn conscious actions into a currency by launching CopenPay. The initiative became such a success that it's now back, three times as big— and this year, you can even get rewarded for how you get to Copenhagen. There are many ways to earn and use CopenPay. For instance: help keep the water in the canals clean in exchange for a free boat tour; help remove invasive plants for a free vegetarian meal; take part in a plogging tour where people collect litter together and get a free coffee and a Danish; bike to a museum instead of going by car and get an entry discount or a free cup of coffee. More than anything, CopenPay rewards fewer flights and longer stays. So, if you arrive to Copenhagen by train or stay for a minimum of four days, you can get free bike rental, a free bag of surplus food, a yoga class, free guided tours, or even a dinner made with surplus ingredients by gourmet chefs. The hope is to inspire to a more conscious mindset and make tourism a positive force for change—in Copenhagen and around the world.

# The communication strategies of agri-food companies in the North-West Italy in the light of sustainability and digitalization

## Abstract

Despite the growing importance of sustainability in many sectors, including the agri-food sector, and the increasing attention of consumers to sustainability values, there is still a gap in the literature with reference to communication strategies to support sustainability in the agri-food sector (also through digitalization) and to the involvement of consumers by companies in their co-creation. For this reason, this paper aims to investigate which communication strategies are adopted by agri-food companies in North-West Italy in a digitalization and sustainability perspective, and how these companies involve consumers in the co-creation of communication strategies. For this purpose, a study will be conducted using semi-structured interviews with entrepreneurs/CEOs and/or company profiles operating in the commercial/communication/marketing or innovation or sustainability areas (or similar profiles) of companies in the agri-food sector of North-West Italy. The expected results consist of an increasing use of new technologies and different channels in the communication strategies of these companies and we hope to discover some examples of consumer engagement in sustainability communication strategies. These expected results will provide useful insights to support companies wishing to undertake a communication strategy in the light of sustainability and digitalization.

*Keywords: Communication Strategies; Digitalization; Sustainability; Agri-food sector; North-West Italy.*

## 1. Introduction

Sustainability communication in the field of marketing has been the subject of attention in academic literature (Dazzi Braga et al., 2024). Sustainable marketing involves economic, social, and environmental factors, as it offers a holistic and integrated approach to the development of marketing strategies (Bridges and Wilhelm, 2008). However, only a few studies on communication strategies in the agri-food sector have focused on the role played by digitalization (Favaretto and Villa, 2024) or on the promotion of sustainable food consumption through marketing communication (Vide et al., 2021). Thus, this exploratory paper firstly aims to fill these gaps in the literature, investigating how sustainability values are conveyed in the digital communication strategies of agri-food companies. Consumers play a very important role in these practices, demanding greater transparency and accountability and pushing for better communication of sustainability efforts (Bunchabusabong et al., 2024); increasingly, marketing strategies are developing brand activism advertising campaigns

that highlight key social and environmental causes that matter to consumers (Dahlen and Rosengren, 2016). In food industry the role of co-creation has been studied in new food product strategies (Durco et al., 2025) and in new food product development (Ribeiro et al., 2025), but it is underdeveloped in terms of communication strategies. Thus, the second aim of the paper is to understand how companies in the agri-food sector involve consumers in co-creating communication strategies in the light of sustainability. These objectives will be achieved through a study conducted on companies in the agri-food sector of North-West Italy (a very important area for this sector) using semi-structured interviews. Finally, the expected results and managerial implications will be presented.

## 2. Theoretical Background

### 2.1 The role of sustainability and digitalization in communication strategies

Given the growing concern for health at a global level, an opportunity for companies to differentiate their products lies in promoting healthy products (Cuesta-Valiño et al., 2020). Furthermore, persuasive communication is an effective factor in convincing consumers to opt for sustainable consumption (Tseng et al., 2020). Sustainability can be communicated by companies in different ways, e.g. through social media (Herrada-Lores et al., 2025), storytelling (Vitting-Seerup and Matthiessen, 2025), etc. The agri-food sector is closely linked to ESG (Environmental, Social, and Governance) factors (Gallo et al., 2023) and technological innovation is also playing an increasingly important role in supporting sustainability in this sector (Setiadi, 2024). Considering the opportunities in terms of digitization and sustainability that have not yet been fully explored in the communication strategies of agri-food companies, the first research question (RQ1) is: What are the communication strategies adopted by agri-food companies in North-West Italy in the light of digitalization and sustainability?

### 2.2 The role played by customers in communication strategies aimed at sustainability

Effective web communication can have an important role on sustainability in terms of consumer awareness/perception (Dach and Allmendinger, 2014). The integration of stakeholders to achieve, among other things, sustainability goals become fundamental (Rathobei et al., 2024), as does the role of consumers in the co-creation process. Some authors have studied open innovation based on sustainability principles in the agri-food sector, analyzing the interaction between different actors and conceptualizing their role in promoting sustainability (Krasnokutska et al., 2024). Despite phenomenon of co-creation has been the subject of interest with regard to the advantages, challenges and prospects relating to its use in the development of new food products (Durco et al., 2025) or with regard to its application in the development of new food products (Ribeiro et al., 2025), the literature on the role of co-creation in communication strategies in the agri-food sector is underdeveloped. Therefore, the second research question (RQ2) is: How do agri-food companies engage consumers in co-creating communication strategies for sustainability?

## 3. Methodology

To achieve the objectives of this paper a qualitative approach will be adopted. The intention is to conduct a study by conducting online semi-structured interviews (some of which have already been carried out) - because they allow for in-depth information to be obtained from respondents (Ruslin et al., 2022) - with entrepreneurs/CEOs and/or company profiles operating in the commercial/communication/marketing or innovation or sustainability areas (or similar profiles) of companies in the agri-food sector (an important sector for Italian economy) of North-West Italy. The interview data will be treated anonymously. The interviews will be discontinued when saturation is reached, e.g. when no new

themes/information emerge from the data (McLeod, 2024). North-West Italy has been chosen because some of its regions boast impressive records, e.g. the leading Italian region in terms of agri-food turnover and agri-food exports (Lombardy) (The European House - Ambrosetti, 2025), the leading Italian region in terms of number of DOCG wines (Piedmont) (Enosearcher website), etc. To formulate our findings, deductive thematic analysis on the transcriptions of interviews (Lawless and Chen, 2019) will be carried out. Inductive coding will be used, with codes developed from the data using terms/phrases expressed by the interviewees (Linneberg and Korsgaard, 2019). To enhance rigor, the thematic coding will be complemented by triangulation (Carter et al., 2014), comparing interview data with secondary sources.

## 4. Expected results

We expect respondents to provide answers that offer important insights to support communication strategies related to sustainability values: first, we expect to understand whether and how companies in North-West Italy include sustainability values in their communication strategies (also through digitalization); with regard to RQ1, we expect to see growing attention to sustainability issues from companies, with initiatives and activities structured to varying degrees depending on the size of the companies and the use of a variety of channels in communicating with consumers. Secondly, we hope to identify interesting examples of co-creation by consumers in companies' communication strategies in the light of sustainability. We expect growing awareness among consumers and businesses of the importance of co-creating communication strategies in light of sustainability and digitalization.

## 5. Conclusions

This paper aims to explore the communication strategies adopted by agri-food companies in North-Western Italy to promote sustainability values and how these companies involve consumers in co-creating communication strategies in the light of sustainability. The expected results will contribute to the debate in literature on the above-mentioned topics and will offer interesting insights for companies wishing to undertake/continue a path of communication of sustainability values. The main limits of this article are: the sample focused on North-West Italy, which could be further expanded; it has been chosen to conduct a single study, but in future research, a second study facing the topics of this paper on the consumers' side could be added.

## Aknowledgments

This short paper is part of the project NODES which has received funding from the MUR – M4C2 1.5 of PNRR funded by the European Union – NextGenerationEU (Grant agreement no. ECS00000036).

# Track 4
# Business-to-Business Marketing

Coordinators: Antonella La Rocca & Andrea Perna

Le profonde trasformazioni tecnologiche ed economiche in corso continuano ad influenzare profondamente i mercati B2B con conseguenti mutamenti nelle strategie delle imprese che vi operano. Al Business Marketing si presentano sfide importanti sia dal punto di vista delle pratiche manageriali che dal punto di vista dello sviluppo della disciplina in una prospettiva di crescente integrazione e di un approccio multidisciplinare.Le ricerche presentate nella sezione B2B Marketing & Supply Chain Management durante gli ultimi convegni evidenziano, in linea con quanto emerge dalla letteratura internazionale, la stretta integrazione tra temi di business marketing e hot topics nei campi dell'innovazione, del trasferimento della conoscenza e della creazione di valore, dell'internazionalizzazione.

Tra gli argomenti di frontiera si segnalano l'impatto delle nuove tecnologie - Industry 4.0, Data analytics, Social Media - e della sostenibilità nell'organizzazione del marketing delle imprese B2B, nelle relazioni diadiche tra imprese e più in generale nella Global Value Chain (GVC). Relazioni tra Marketing e altre funzioni aziendali, processi di servitization in ambito industry 4.0, customer journey & relationship value e ruolo dei Social Media, customer-driven Supply Chain, processi di offshoring e reshoring, sostenibilità e riorganizzazione della catena globale del valore, sono solo alcune delle tematiche a cui il B2B Marketing può efficacemente contribuire.

L'obiettivo della sezione Business Marketing & Supply Chain Management è quello di promuovere il confronto tra studiosi e manager sui nuovi approcci manageriali che potrebbero essere adottati per gestire in modo efficace le relazioni industriali, alla luce dei cambiamenti che abbiamo sopra delineato e con riferimento sistemi di offerta service-oriented.

Technological and economic shifts are profoundly transforming B2B markets, reshaping firms' strategies and pushing business marketing toward greater integration and multidisciplinarity. Recent research highlights strong connections between B2B marketing and themes such as innovation, knowledge transfer, value creation, and internationalization.

Key emerging issues include the effects of Industry 4.0 technologies, data analytics, social media, and sustainability on B2B marketing, interfirm relationships, and the Global Value Chain. Topics such as servitization, customer-driven supply chains, offshoring and reshoring, and sustainability-driven value chain redesign are particularly relevant.

The section's goal is to promote dialogue between scholars and managers on new approaches for effectively managing industrial relationships and service-oriented offerings in this evolving landscape.

## Abstract

This study shows how Monetary Resource Brokerage (MRB) by a territorial bank can turn a small, student-oriented experiment into a self-financing, multi-actor innovation platform. We track the SITUM (Scuola di Innovazione Tecnologica Umanistica e Manageriale) network in Central Italy from 2020 to 2025 through 54 interviews, 161 surveys, financial dashboards, project artefacts and policy records. Events were coded using an Industrial Marketing & Purchasing (IMP) lens.
**Key findings: Innovation output.** SITUM delivered seven master-level courses, 88 project works and nine prototypes; two flagships—*Colli 4.0* (IoT shock-sensor logistics) and *Human-Factors XR*—passed pilot tests, reducing shipment damage by 25 % and opening an AI-ergonomics research line. **Human capital and branding impact.** Graduate retention in the Marche–Umbria–Abruzzo region rose to 73 % (baseline 54 %); company lecturers grew 21 → 46 (+ 119 %), and the network's 99 SMEs gained 42,000 social-media impressions, enhancing the visibility of "invisible" B2B champions. **Financial leverage.** Three €35 000 scholarship tranches supplied by ALPHA Bank (disguised name) unlocked €138 000 in company participation fees and a €50 000 public grant, so that 60 % of the 2024 budget is covered by non-bank funding. Overall, MRB follows a **Trigger → Align → Layer → Anchor** pattern: scholarships legitimise collaboration, firm fees align incentives, flagship projects layer specialised activities, and a regional tax credit anchors the network within an ESG-linked policy setting. The process compresses digital adoption time from 14 to 10 months (−30 %) and demonstrates that money, when brokered strategically, acts as a multiplying super-resource rather than a neutral lubricant, extending IMP theory on resource interaction.

*Keywords: Business Network Innovation; Monetary Resource Brokerage; Industrial Network Approach; Bank-SMEs-Academia collaboration.*

## 1. Introduction

Innovation rarely unfolds in isolation. Echoing the IMP dictum that "no business is an island" (Håkansson & Snehota, 1995), the renewal of any territory hinges on the density and quality of inter-organisational relationships. The Marche, Umbria, and Abruzzo "macro-region" faces structural challenges, including youth outmigration, population ageing (ISTAT, 2024), and the twin transitions to digitalisation and sustainability (Rust, 2021). Local SMEs, operating primarily in B2B markets, often lack the managerial depth and financial slack to turn new technologies into market value. Furthermore, their low consumer market visibility contributes to graduate migration toward universities aligned with global brands, reinforcing the talent drain (Beverland et al., 2020).

Universities often struggle to match their research outputs to the incremental, low-budget innovation needs of local SMEs (Muscio & Pozzali, 2013). National and EU support schemes rarely align with the timing, scale, and relational requirements of small firms in semi-peripheral regions (Uyarra & Flanagan, 2010). In such contexts, territorial banks can act as relational intermediaries, coupling patient capital with trust-based brokerage among network actors (Ferri, Fraquelli & Marinoni, 2014).

Unlike national development agencies, local cooperative banks possess embedded knowledge of the industrial firms, informal trust channels, and reputational capital accumulated through long-standing client relationships (Alessandrini et al., 2009; Agostino et al., 2024). These features make them uniquely positioned to act as relational brokers in innovation networks (La Rocca & Snehota, 2014; Håkansson & Olsen, 2015).

This paper examines the role of ALPHA Bank—Italy's third-largest cooperative bank—in fostering SITUM, an innovation network launched by three universities. We explore how targeted capital infusions—such as scholarships, firm contributions, and policy-linked grants—help structure and stabilise collaborative configurations over time.

## 2. Literature Background

In the IMP tradition, money has long been treated as a neutral facilitator of exchange (Håkansson, 1982). However, capital can actively reshape actor bonds, resource ties, and activity links (Perna et al., 2015; Håkansson & Olsen, 2015). Håkansson and Waluszewski's (2007) DPU framework—extended to include Policy (Waluszewski et al., 2024; Cinti & Lillini, 2024)—captures the multi-setting dynamics of innovation.
We define Monetary Resource Brokerage (MRB) as the purposive mobilisation of capital to interface capabilities across Developing, Producing, Using, and Policy settings. It unfolds through: (i) Triggering, which legitimises collaboration (La Rocca & Snehota, 2014); (ii) Aligning, which coordinates expectations via shared KPIs (Andersen & Medlin, 2016); and (iii) Institutionalising, which embeds networks in policy contexts (Cinti & Lillini, 2024). Managerial capabilities complement technical assets in enabling successful commercialisation (Sorescu & Spanjol, 2008). Yet low brand visibility in B2B hinders talent attraction (Capello & Lenzi, 2019; Napolitano & De Nisco, 2017). Financial intermediaries can mitigate these constraints, but their role remains under-theorised.

RQ1. *How does MRB performed by a territorial bank reconfigure an innovation network?*

RQ2. *In what ways does MRB mitigate B2B visibility gaps and talent out-migration by connecting regional SMEs to university-led marketing and technological capabilities?*

## 3. Methodology

This study employs a longitudinal single-case design (Yin, 2018), which is well-suited for capturing processual change in industrial networks (Halinen & Törnroos, 2005). The case study—SITUM, an innovation network nurtured by ALPHA Bank—was selected for its revelatory potential as one of the few instances where a financial actor purposively mobilises capital to reshape network configurations (cf. Perna et al., 2015).

Data were collected from 2020 to 2025 using semi-structured interviews, surveys, internal documents, project artefacts, and public sources. This multi-source strategy enabled event triangulation, ensuring both construct validity and temporal depth (Dubois & Gadde, 2002).

Coding followed Thompson's (2022) process theorising template. Five episodes (E0–E4) were reconstructed as a network picture (Gadde & Dubois, 2010), centred on monetary events and decomposed into critical incidents. Each event was analysed in terms of changes in actor bonds, resource ties and activity links (ARA model) (Håkansson & Snehota, 1995). Axial coding identified cross-episode patterns such as activity layering and actor alignment.

Reliability was ensured through shared coding protocols and inter-coder agreement. Interim findings were validated with key informants. Generalisability is pursued through thick description and theoretical anchoring in NIA frameworks (Cinti & Lillini, 2024).

## 4. Preliminary Findings

SITUM was initiated in 2020 by three Central-Italian universities to counter regional talent outmigration and weak SME-university ties. The programme evolved through four main episodes. In 2021, a € 35 000 scholarship tranche from ALPHA Bank triggered an "Education" phase, during which postgraduate courses and student projects were developed through continuous interaction among students, firm managers and academic researchers. In 2022 and 2023, firm participation fees and a second tranche enabled the creation of a Digital Lab, with SMEs co-developing digital tools. By 2024, SITUM was embedded in master's programmes and supported two flagship projects: an IoT-based logistics prototype and an XR co-design process for ergonomic workspaces. By 2024, the programme will be extended to a Summer School and AI-based research contracts.

| Episode/phase | Monetary leverage | Actors engaged (Δ) | Main outputs | Main effects on the network |
|---|---|---|---|---|
| E1 – Education launch(2021) | € 35 k ALPHA Bank scholarships | 40 students • 30 SMEs • | 2 post-graduate courses; 12 student projects | First stable collaboration arena; aligning language among universities and firms |

| | | | | |
|---|---|---|---|---|
| | | 21 manager-lecturers | | |
| E2 – Digital Lab<br><br>(2022) | € 35 k 2ª tranche + € 500 firm fee | 56 SMEs (+26) • 34 mgr-lecturers (+13) | Digital-practice workshops; starter prototypes | Firms and faculty co-define shared KPIs; trust increases, enabling faster decision cycles |
| E3 – Flagship projects<br><br>(2023-24) | € 1 000 firm fee + € 50 k public grant | 99 SMEs (+69) • 46 mgr-lecturers (+25) | Colli 4.0 IoT label; XR training prototype | 25 % logistics loss reduction; time-to-market compressed from 14 to 10 months |
| E4 – Policy & spill-overs<br><br>(2024-25, ongoing) | 10 % regional payroll tax credit | actors anchored and raised | Two-day Summer School; XR-UNIV AI ergonomics project | Graduate retention rises to 73 % (regional base 54 %); SITUM branded as regional innovation platform |

**Table 1:** Summary of the preliminary findings. Source: our elaboration, 2025

The analysis identifies MRB as a focal resource interface that connects the Developing, Producing, Using, and Policy settings. Monetary injections did not merely enable projects but activated actor bonds and accelerated innovation. ALPHA bank's funding mobilised university labs, SME pilots, and marketing platforms, creating integrated value chains. The introduction of participation fees reinforced engagement, establishing durable ties among actors. MRB shortened innovation cycles, reducing the time-to-adoption of digital tools from 14 to 10 months. It also enhanced SME visibility in a B2B context: SITUM's graduates showed a 73 % in-region employment rate, compared to a 54 % average (ANPAL, 2023). Press and social media engagement further amplified the territorial impact. Eventually, public policy converged: a regional tax credit and ESG-aligned MoUs institutionalised the network. In summary, the case highlights how MRB follows a Trigger → Align → Layer → Anchor Lubricant. It begins with scholarships, aligns firms through shared KPIs and co-financing, expands into complex projects, and culminates in policy integration. ALPHA Bank acted not as a passive funder but as a financial orchestrator, actively shaping actor configurations and capabilities across the innovation network.

# AI-Enabled Innovations for Waste Reduction in Agri-Food Supply Chains: A Bibliometric Analysis of Keyword Co-Occurrence

Alba D'Aniello[1],*, and Carmela Donato[2]

[1] University of Bari "Aldo Moro", Bari, Italy
[2] University of Roma Tre, Rome, Italy

* Corresponding author: alba.daniello@uniba.it

## Abstract

The reduction of food waste has become a central concern in agri-food supply chains, driving increasing interest in technological innovation as a potential solution. This study presents a bibliometric and network analysis of 278 academic publications published between 2020 and 2024 to map the evolution, key themes, and knowledge structure of this growing research field, after the launch of the European Farm to Fork Strategy for sustainable development and technological advancements. Adopting a keyword co-occurrence and density visualization analysis, this study identifies 3 core research clusters along with their interconnections. This structured mapping reveals both consolidated areas and underexplored directions, offering a foundation for future research on the role of digital technologies in minimizing waste and enhancing sustainability across agri-food systems.

*Keywords: sustainable innovation, b2b, agrifood*

## 1. Introduction

Food waste represents a major issue for sustainable development. In 2022, the total food waste in Europe exceeded 59 million tonnes of fresh mass (European Commission, 2024). Although such estimates are particularly inflated by households' consumption choices, rather than the different stages of the food supply chain, the food sector faces increasing pressure to reduce its environmental footprint, especially because of emerging regulations such as the Farm to Fork Strategy of the European Union (European Commission, 2020).

Among the most promising options, solutions enabled by artificial intelligence (AI), Internet of Things (IoT), predictive analytics, and blockchain are being explored for their capacity to monitor inventory levels, forecast demand, optimize processing, and extend shelf life, thus directly contributing to food waste avoidance and mitigation (Cane & Parra, 2020).

However, the literature appears to lack a comprehensive overview of the available tools (such as artificial intelligence, machine learning, predictive analytics, and IoT) that can be used throughout the agri-food supply chain and their effectiveness. Aiming to cover this gap, this research presents a bibliometric analysis of literature about technological innovation within the agrifood supply chain aimed at identifying the key content of scientific research in this field after the launch of the Farm to Fork Strategy in 2020. In particular, we analyzed 202,

papers published between 2020 and 2024, retrived from two well-known academic databases (namely Web of Science and Scopus). The analysis is based on a keyword co-occurrence map and a density map generated through VOSViewer (van Eck & Waltman, 2014), to better understand the field of sustainable innovation for food waste prevention within the agrifood sector.

## 2. Research methodology

In order to identify relevant publication in the field, the present research draws on the Scientific Procedures and Rationales for Systematic Literature Review protocol (SPAR-4-SLR, Paul et al., 2021), which is synthetized below:

(1) Acquisition: To identify relevant publications we looked for articles published in peer-reviewed journals in the last 5 years, relying on two widely used databases (i.e.,Web of Science and Scopus). The selection of search terms was informed by previous literature on the topic and included keywords related to sustainable innovation, artificial intelligence, food industry and food waste (e.g., Trevisan & Formentini, 2023). As a first result, a total of 181 studies were retrieved from Web of Science and a total of 25 studies were retrieved from Scopus[10].

(2) Arranging and Assessing: Data were unified in Excel, cleaned from duplicates (N=4) and exported as CSV files for bibliometric analysis in VOSviewer (version 1.6.20; van Eck and Waltman, 2014). This paper aims to provide a domaincentric review, so we focused on cluster analysis based on keyword co-occurrence which uses text mining to visualize on a map the number of papers with keywords that occur together (van Eck and Waltman, 2014).

## 3. Results

### 3.1 Keywords co-occurrence

The keyword co-occurrence analysis reveals the structural backbone of the literature on AI-enabled food waste reduction. As expected, the most frequently cooccurring keyword is "food" (Total Weight: 831; Links: 75), followed by "production" (596), "practice" (583), "use" (559), and "application" (545), all of which rank among the top in both total weight and number of linkages.

Furthermore, VOSviewer allows to visualize recurring keywords in a structured map adopting a distance-based approach (*figure 1, left*). More specifically, the software grouped N=96 items into three clusters of significant size, which represent the three main fields addressed by technological innovation in the agrifood b2b literature (van Eck and Waltman, 2014). The software provided information about terms occurrence (i.e., the number of documents in which a term occurs at least once) and a relevance score (i.e., how topic-specific a term is).

Hereafter we will briefly synthetize the key contents of each cluster.

10 Scopus Query Link: Query results Scopus; Web of science Query link: Query results WoS

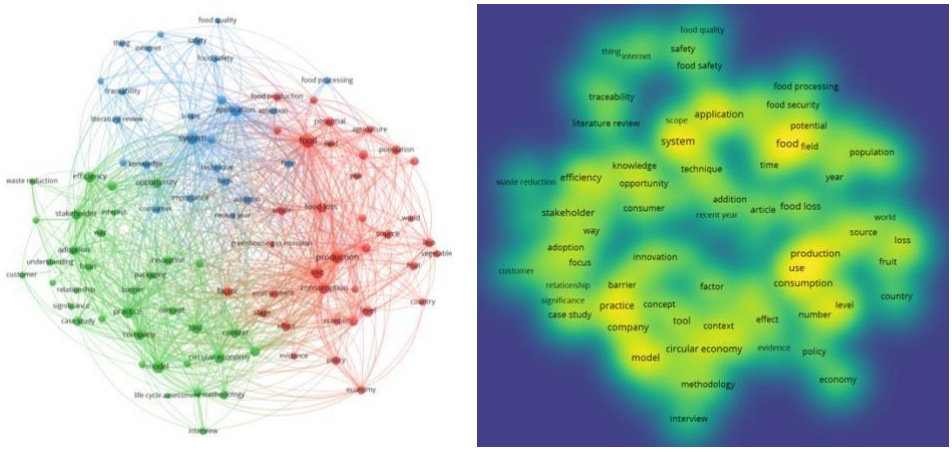

**Figure 1:** VOSviewer Network (left) and Density Visualization (right)

***Cluster 1 - Systemic perspectives on sustainable food systems.*** The red cluster (N=36 items, 37.5% of words in the map) brings together keywords like "food loss", "production", "economy", "population" "agriculture", "policy", and "environment". This research stream takes a macro-level view of food waste, highlighting the systemic drivers, demographic trends, and policy frameworks associated with overproduction and loss across food systems. The inclusion of terms such as "potential," "source," and "impact" suggests a strong focus on quantification and large-scale modeling, often through national or global assessments. This cluster also addresses food security, environmental emissions, and the economic implications of waste, framing food loss not only as an operational inefficiency but as a multidimensional societal challenge. This cluster is in line with recent studies focusing on the enabling conditions and constraints that affect the integration of sustainability practices at firm and system level (e.g., Miranda et al., 2021).

***Cluster 2 – Organizational perspectives and environmental impact.*** *The green cluster (N=55, 14% of all terms) is defined by keywords such as "company", "practice", "stakeholder", "adoption", "model", "tool", "barrier", and "innovation." This cluster reflects a managerial and organizational perspective, focusing on how companies adopt and integrate technological solutions for food waste reduction. Common themes include the drivers and inhibitors of adoption, stakeholder engagement, and the role of business models in supporting sustainability. This cluster largely corresponds to performance assessment studies, including LCAbased approaches and evaluations of technological solutions at post-harvest and transformation stages (e.g., Aldama et al., 2023;* Ahamed et al., 2016), as well as cases or interviews with experts to evaluate practices in real world settings.

***Cluster 3 – AI applications and outcomes in agri-food systems.*** *The blue cluster (N=25 items, 26% of keywords displayed in the map) is centered around keywords such as "system", "application", "traceability", "food safety", "blockchain", and "internet." This thematic group represents the technological and digital infrastructure underlying food waste reduction strategies. Research in this cluster tends to focus on data-driven systems, AI applications, and IoT-enabled traceability tools that enhance the monitoring, transparency, and safety of agri-food chains. Several studies explore the use of blockchain to support secure and decentralized data sharing (e.g., Yele et al., 2025), while others highlight the relevance of smart systems or machine learning in managing food processing and supply chain synchronization (e.g. Garre et al., 2020). The prominence of terms like "food safety" and "literature review" also suggests that this cluster includes foundational and conceptual work mapping the technological potential of AI in food systems.*

Finally, the software allows to identify several bridge terms (i.e. keywords with high strength across clusters): for example, the term "System" (Total Weight = 702; Links = 92) acts as a

central hub connecting the blue cluster's focus on traceability systems with the red cluster's concerns about production ecosystems and the green cluster's managerial adoption frameworks. Similarly, terms like "Application" (545; 94) and "Tool" (386; 92) link technological concepts (AI, IoT in blue cluster) to practical implementation and model evaluation in the green cluster, bridging theory and practice. Finally, "Innovation" (327; 92) and "Adoption" (375; 92) serve as connectors between green cluster discussions on organizational barriers and the blue cluster's technological readiness, indicating the importance of change processes.

### 3.2 Density visualization

Compared to the network visualization, which organizes co-occurring terms into thematic clusters based on proximity and interlinkages, the density visualization adds a complementary layer of insight by highlighting where research attention is most concentrated within the field. In this representation, the color gradient—from green to yellow —reflects both the frequency and centrality of terms across the corpus.

The density map confirms the prominence of the previously mentioned keywords, with "food," "production," "system," "practice," and "application" forming dense, high-visibility zones. These areas represent cognitive centers of the field. Keywords like "blockchain," "artificial intelligence," and "life cycle assessment" are less frequent and appear in peripheral zones, suggesting emerging or niche subfields. The map also reveals the interdependence between technological solutions and their organizational embedding, as seen in the spatial overlap between "application", "tool", and "company".

## 4. Conclusion

The study makes three key contributions: it offers a visual mapping of a highly interdisciplinary, dynamic and fragmented field, as well as its evolution in the last 5 years; it identifies critical blind spots and conceptual overlaps that hinder progress in the field; and it establishes a roadmap for future scholarly inquiry, aimed at enhancing the scalability, impact, and inclusivity of food waste prevention strategies driven by technological innovation. The bibliometric analysis identifies three main research clusters in the field of food waste prevention: (1) systemic perspectives on sustainable food industry; (2) organizational perspectives and environmental impact assessment; and (3) AI applications and outcomes in agri-food systems. While digital innovation is gaining momentum, the literature still lacks integrative frameworks that connect technological applications with measurable reductions in food waste. Empirical evidence on the adoption and scalability of these technologies, especially by SMEs or startups, remains limited.

To address these gaps, future research must develop interdisciplinary, context-sensitive frameworks that blend technological, organizational, and behavioral insights. Longitudinal and experimental studies are needed to evaluate the real-world impact of innovations and identify the conditions that support successful implementation. Researchers should also investigate how digital solutions can be effectively adapted to diverse local environments, particularly in underserved regions. Finally, standardized metrics for assessing food waste reduction outcomes are essential to enable meaningful comparisons and guide evidence-based policy and practice.

# AI-Driven Business Model Innovation: A Paradigm Shift in Value Creation

Alessio Di Leo[1],*, and Alberto Mattiacci[1]

[1] Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

* Corresponding author: alessio.dileo@uniroma1.it

## Abstract

This study investigates how AI drives business model innovation (BMI) in the B2B sector, with particular attention to power dynamics and value distribution mechanisms. Drawing on dynamic capabilities theory, we analyze 50 leading companies to examine how AI-driven BMI transforms organizational value creation, delivery, and capture processes. Through qualitative analysis, we identify three distinct business models: Usage-Based Credit (UBC), Tiered Quota-Based (TQB), and Pay-As-You-Go (PAYG) models. While these models enhance operational efficiency and enable new value propositions, they also create risks of technological lock-in, power concentration, and value extraction that disproportionately benefit dominant platform providers. The research reveals critical gaps in existing literature regarding the "dark sides" of AI-driven innovation, including potential exclusion of smaller organizations and strategic autonomy compromise. Findings contribute to understanding how computational systems influence competitive ecosystems and highlight the need for governance mechanisms to ensure equitable distribution of innovation benefits across stakeholders.

*Keywords: Artificial Intelligence, Business Model Innovation, Digital Transformation, Value Creation, AI-driven Innovation, B2B*

## 1. Introduction

The global economy is undergoing a profound transformation, driven by cutting-edge technologies such as artificial intelligence (AI), the Internet of Things (IoT), blockchain, and cloud computing (Kraus et al., 2022). Among these, AI has emerged as a central force in redefining business operations across all sectors (Enholm et al., 2022). One of the most significant impacts of AI is its ability to drive business model innovation (BMI), which involves redesigning or creating new mechanisms to capture, deliver, and create value in ways that were previously inconceivable (Sjödin et al., 2021).

The business model encompasses the logic of how an organization creates, delivers, and captures value, emphasizing both the practical operations and customer relationships needed to sustain profitability (Shafer et al.2005). Historically, business models have evolved incrementally as companies responded to market pressures, technological disruptions, or changes in customer needs (Tongur & Engwall, 2014). However, with the advent of AI, the nature of innovation in business models have accelerated: this transformation raises critical issues that are often overlooked in the existing literature. While AI offers opportunities to

expand value propositions and enhance efficiency, it also brings about organizational, business, and ethical challenges that require in-depth critical analysis.

The increasing concentration of power in the hands of a few dominant platforms raises concerns about the distribution of value and the extraction of wealth from ecosystem participants (Bourai et al., 2023). This phenomenon intersects with contemporary debates on the platform economy, where AI platform owners can exert disproportionate control over the mechanisms of value creation and capture, raising questions about the long-term sustainability of these models (Crawford, 2021).

Leading companies like Amazon, Netflix, and OpenAI have redefined traditional industry standards through AI-driven innovations. As companies integrate AI into their business models, they not only enhance internal processes but also reshape industrial ecosystems, connecting supply chains, customers, and external partners in ways that foster open innovation and collaboration. The decentralization and the blurring of organizational boundaries also pose risks of technological dependence, data vulnerability, and potential power imbalances that can compromise the strategic autonomy of participating organizations (Holmström, 2022).

## 2. Theoretical Background

The theory of dynamic capabilities (Teece et al., 1997) provides a foundation for understanding how firms adapt, renew, and reconfigure resources in response to rapidly evolving environments. It is particularly relevant for analyzing how advanced computational systems drive BMI because dynamic capabilities emphasize a firm's ability to sense opportunities, seize them by effectively reallocating resources, and transform organizational structures to maintain competitiveness during market disruptions (Shrestha et al., 2019).

While the theory of dynamic capabilities captures the conceptual alignment between advanced computational systems and organizational flexibility, it has critical limitations when applied to contemporary contexts dominated by digital platforms (Ellström et al., 2022). Traditional literature does not adequately address how the power asymmetry between providers of advanced computational technologies and their users can compromise organizations' strategic autonomy, paradoxically creating technological dependencies that limit the very dynamic capabilities they are supposed to promote (Linde et al., 2021). As these computational systems increasingly transform how companies create, deliver, and capture value, they align closely with these dynamic processes, enabling firms to co-evolve with changing technological and customer demands. This co-evolution, however, is not neutral: it often favors actors with greater computational resources and data access, creating "winner-take-all" dynamics that can exclude smaller or less technologically advanced organizations from benefiting equally from innovation driven by these systems (Bourai et al., 2023).

These advancements improve operational efficiency and create entirely new opportunities for value generation (Kohtamäki et al., 2019). These capabilities are manifested in digital servitization, which describes the organizational transformation of processes, capabilities, offerings, and business models to integrate and maximize digital technologies (Sjödin et al., 2021). However, digital servitization also carries risks of commoditizing traditional services and potentially disintermediating established players, raising questions about the social and economic sustainability of such transformations.

A critical, often-overlooked aspect is the phenomenon of value extraction within platforms that leverage advanced computation. Platform owners can capture disproportionate value compared to the actors who contribute to its creation through opaque pricing mechanisms, technological lock-ins, and algorithmic control (Srnicek, 2017). This raises fundamental

questions about the equitable distribution of benefits from innovation driven by these systems and the concentration of economic power in the hands of a few dominant players. By enabling data-driven services like predictive maintenance and operational optimization, advanced computational systems allow manufacturers to shift from product-centric offerings to platform- or service-based business models (Kohtamäki et al., 2019). It is crucial to recognize that the providers of these computational services do not operate in a neutral vacuum: they significantly influence strategic decisions regarding innovation trajectories, potentially creating technological dependencies and power asymmetries that can limit the strategic autonomy of client organizations (Weiblen & Chesbrough, 2015). Consequently, these providers facilitate companies' transition from traditional business models, but this transition must be analyzed by considering both the benefits and the potential risks of power concentration and value extraction. Despite preliminary insights into these benefits, the literature reveals key gaps in the understanding on how these systems influence the power and control mechanisms through which firms truly seize and transform opportunities.

## 3.Methodology

The research process was conducted in three distinct phases. The first phase involved identifying 50 leading companies based on advanced computational systems operating in the B2B sector, selected based on their projected 2024 revenues and received funding. The selection process was based on data from various sources, including company reports, industry publications, and reliable market intelligence platforms (e.g., Crunchbase). The selection also considered criteria of geographical and sectoral diversity to avoid bias toward specific market or regulatory configurations that might limit the generalizability of the results (Yadav, 2022).

The data collection and analysis phase focused on gathering detailed information on each firm's approach to using AI systems in its operations, analyzing the broader implications of these approaches for the competitive ecosystem. The analysis explored how the services are designed, distributed, and integrated into customer operations, including an assessment of the potential effects of technological lock-in, supplier dependency, and impacts on the distribution of value within the ecosystem, and the potential negative consequences such as the commoditization of traditional services, the exclusion of less technologically advanced actors, and the risks of market concentration.

Finally, the study considered strategic dimensions such as scalability, adaptability, and ecosystem partnerships, critically analyzing how these factors can both facilitate the competitive positioning and market differentiation of the firms and contribute to the creation of entry barriers that could limit future competition. Each firm's data was independently evaluated by two researchers (Skjott Linneberg & Korsgaard, 2019), with particular attention to identifying both the patterns of value creation and the potential mechanisms of value extraction that characterize the platform economy driven by advanced computational systems.

## 5. Results

The activity led to the identification of three distinct business models that exhibit differentiated approaches to creating, delivering, and capturing value. These models reflect variable strategies for leveraging advanced computational capabilities in the B2B sector, and critical implications for the distribution of power, equity of access, and the competitive sustainability of the ecosystem (see Table 1).

*Usage-Based Credit (UBC) Model*

One of the most prevalent business models involves usage-based credit frameworks. These models offer customers the flexibility to purchase modular credits that act as usage tokens for advanced computational services, allowing access to specific features or incremental usage without the commitment of a full subscription. While this approach facilitates initial adoption, it also creates mechanisms of progressive dependency where users gradually become tied to the platform, making it costly to switch to alternative providers. The credits are structured in tiers, with low-cost entry points that enable easy adoption, which is particularly beneficial for smaller businesses that may not be aware of the long-term implications of such technological dependency. As usage increases, customers transition to higher consumption tiers, providing these computational service providers with scalable monetization opportunities that often result in a disproportionate increase in costs for the most intensive users.

Companies using credit-based models face not only risks of resource inefficiency in cases of niche overuse where unsupervised access strains system performance, but also ethical issues related to the transparency of real costs and the potential manipulation of user behavior through credit gamification mechanisms. Firms responding to these challenges have adopted moderation mechanisms, including usage limits, oversight tools, and customer education systems. However, these mechanisms can also be used to exert discretionary control over access to advanced computational resources.

*Tiered Quota-Based (TQB) Model*

A second approach involves implementing tiered, quota-based systems, especially among scale-ups and established companies that offer enterprise-level solutions using advanced computational systems. While these models provide predictability for large organizations, they can also create artificial barriers to access and favor market concentration toward a few dominant providers.

These models segment customer access based on predefined usage quotas, allowing companies to tailor value delivery to larger organizations with predictable workflow requirements. However, this segmentation can also serve as a price discrimination mechanism that maximizes value extraction from enterprise clients while potentially excluding organizations with limited resources from accessing advanced features. These tiers bundle services designed for specific workflows (e.g., data training, cloud-based deployment, or analytics monitoring). They are often aligned with annual budgets for more reliable cost control but can also mask the actual opportunity cost of alternative or in-house solutions.

*Pay-as-you-go (PAYG) Model*

The Pay-As-You-Go model is a flexible framework that links costs directly to the actual use of resources, eliminating the need for fixed commitments. While this adaptability makes it particularly valuable for organizations with variable or unpredictable consumption patterns, such as startups and SMEs, it also raises critical questions about long-term economic sustainability for both providers and users. This model allows costs to be dynamically aligned with real-time usage but can also create financial uncertainty and difficulty in long-term strategic planning. While its strengths include transparency, cost efficiency, and alignment with user behavior, challenges like revenue unpredictability, administrative complexity, and risks of over-fragmentation can hinder scalability. Furthermore, this model can incentivize a suboptimal use of computational resources, where short-term convenience outweighs long-term sustainable value creation.

| Characteristic / Model | 1. Usage-Based Credit Model | 2. Tiered Quota-Based Model | 3. Pay-As-You-Go Model |
|---|---|---|---|
| **Primary Objective** | Maximize adoption and foster ecosystem growth | Serve large enterprise clients with high predictability and scalability needs | Offer ultimate flexibility to users based on actual consumption, aligning costs precisely with usage |
| **AI Innovation Mechanisms** | **Scalability**: Facilitate wide adoption with low initial costs | **Modularity**: Provide tailored service bundles to match enterprise workflows | **Consumption Optimization**: Dynamically align resource allocation to actual usage patterns and fluctuations |
| **Customer Engagement Strategies** | **Usage-Based Incentives**: Introduce credits to ease entry and encourage experimentation | **User Feedback Loops**: Adapt tiered offerings based on user feedback and stable demand patterns | **Pricing Flexibility**: Allow payments based only on resource consumption without upfront or fixed commitments |
| **Value Capture Approaches** | **Maximizing ROI**: Incentivize rapid onboarding while creating future upselling opportunities | **Dynamic Tiers**: Scale revenues based on service volume and enterprise requirements | **Direct Revenue Alignment**: Achieve revenue precision by capturing payment directly correlated with actual usage |
| **Target User Base** | SMEs, and developers with experimental or variable usage | Large enterprises with predictable and high-volume operational demands | Users in industries with uncertain or irregular consumption patterns |
| **Key Advantages** | Provides flexibility to users with limited budgets, fosters exploration | Ensures cost predictability, retains large-scale enterprise users | Offers ultimate alignment with user behavior, eliminates unnecessary cost burdens, supports niche and irregular user cases |
| **Challenges/Disadvantages** | Risk of commoditization, overuse of free/low tiers, stagnation at lower levels | Rigidity for SMBs and users with sporadic or inconsistent needs | Difficulty achieving predictable revenue streams, administrative complexity of tracking small-scale, granular payments |
| **Differentiating Variables** | Token/credit models, flexible multi-tier usability | Fixed quotas, workflow bundles, guaranteed service levels | Real-time usage metering, variable payments without fixed contractual obligations |
| **Critical Implications** | Risk of progressive dependency and technological lock-in | Potential exclusion of organizations with limited resources and market concentration | Financial uncertainty and potential suboptimal use of computational resources |

**Table 1:** AI-Driven Business Model Innovations

## 6. Conclusions

This study explored how innovation in business models driven by advanced computational systems manifests through different business models. It revealed the dynamic capabilities

that enable companies to sense, seize, and transform opportunities in rapidly evolving markets, and the critical implications for the distribution of power, equity of access, and the sustainability of the competitive ecosystem.

This research advances the understanding of dynamic capabilities by demonstrating how these computational systems enhance firms' abilities to perceive market changes, seize emerging opportunities, and transform operational structures. While existing literature predominantly emphasizes the benefits of innovation driven by these systems, this research sheds light on the "dark sides" of such transformations, including the risks of technological lock-in, the concentration of power in the hands of a few dominant players, and the potential negative externalities for the most vulnerable stakeholders in the ecosystem.

From a managerial perspective, the research underscores the importance of matching business models to organizational goals and user needs. It also highlights the need for policies and governance mechanisms that prevent the abuse of dominant positions and ensure a more equitable distribution of the benefits of innovation driven by these systems. Modular credit systems present opportunities for smaller organizations to access advanced computational capabilities without high initial investments. However, they also require safeguards to prevent predatory pricing mechanisms and technological dependency.

Finally, this research opens opportunities for further critical exploration. Future studies should expand the analysis of how these business models evolve across different sectors and stages of company development, including longitudinal assessments of redistributive effects and social justice implications. Comparative analyses of companies in different industrial and regulatory environments could also deepen insights into the scalability and adaptability of these innovations, contributing to the development of more effective regulatory frameworks for governing the platform economy that uses advanced computational systems.

# Turning Cellulose into Circularity: Sustainable Approaches in the B2B Paper Industry

Matteo Dominidiato[1],*, and Mirko Olivieri[1]

[1] Università Cattolica del Sacro Cuore, Milan, Italy

* Corresponding author: matteo.dominidiato@unicatt.it

## Abstract

As sustainability becomes increasingly central to both academic research and industrial strategy, B2B firms are under pressure to reshape their innovation processes to align with circular economy principles. This paper explores how companies in the paper industry develop and deploy sustainability-oriented innovations, with a specific focus on the interplay between endogenous and exogenous sources of innovation. Endogenous innovations stem from internal capabilities such as R&D and strategic vision, while exogenous innovations emerge through interactions with external actors across the business ecosystem.

Grounded in the Industrial Marketing and Purchasing (IMP) perspective, the study adopts a comparative case analysis of two paper companies operating in different geographical and organizational contexts. Data were collected through interviews and company documents between 2023 and 2024. The analysis highlights how circularity is not achieved in isolation but through evolving interdependencies among firms, requiring coordination, mutual adaptation, and co-development.

The findings reveal that advancing circularity demands both internal innovation dynamics and active engagement in collaborative networks. Sustainability is thus framed not as a fixed blueprint, but as a process shaped by the firm's capacity to mobilize resources and align with broader systemic efforts. This research contributes to understanding circular innovation as a relational and context-sensitive phenomenon in B2B settings.

*Keywords: circular economy, sustainability, business networks, endogenous innovation*

## 1. Introduction

Nowadays, sustainability is a cornerstone of academic and applied discourse on recent socio-economic and environmental transformations posing challenges for business-to-business (B2B) enterprises. In this scenario, sustainable development paradigms provide conceptual and operational frameworks for rethinking production systems, including established ones (Elkington, 2018; Ferro et al., 2019).

In the academic literature, there are multiple approaches to pursuing sustainability, each reflecting different priorities (Esteban-Amaro et al., 2024). Specifically, in the Industrial Marketing and Purchasing (IMP) thinking, some studies focus on specific capabilities, such as network vision, orchestration and the ability to perceive other actors as partners, to create new business relationships which give meaning to sustainability contexts (Ryan et al., 2012). In this research stream, Dessaigne (2024) analysed the interaction processes between companies highlighting the centrality of sharing meaning in the process of (sustainable) network change, also by adopting innovative solutions to minimise environmental impact. Moreover, there are perspectives that consider sustainability in a systemic dimension, requiring coordination between different actors to develop circular economy models and shared value paths.

Furthermore, IMP scholars emphasize the embeddedness of business practices within complex interaction patterns, where sustainability—and more recently circularity—is not pursued in isolation, but through evolving interdependencies among actors. Circular economy initiatives are thus interpreted not merely as operational innovations, but as relational and systemic transformations, requiring coordinated efforts across networks to reconfigure resource flows, product life cycles, and value creation logics. This perspective resonates with the IMP view of business networks as arenas of joint sense-making, adaptation, and co-development, where circularity emerges through mutual adjustments, negotiated commitments, and the alignment of heterogeneous interests (Håkansson & Waluszewski, 2007). Consequently, the transition towards circular business models depends on the capacity of actors to mobilize and reconfigure network resources, develop shared visions, and sustain long-term interaction processes that challenge traditional linear models of production and consumption.

The B2B paper industry emerges as an emblematic sector for analysing sustainability due to its intrinsic connection with the management of renewable resources and circular processes. Paper production, based on the use of natural raw materials such as wood from which to obtain cellulose, is already a virtuous reference model in terms of the circular economy. Despite these common characteristics, the ways in which sustainability is implemented vary significantly between companies in the sector. These differences result from a variety of factors, including internal innovative capacity, organisational characteristics and market conditions. Some companies enhance energy efficiency and the use of renewable energy, while others focus on reducing waste and developing recycling. These distinct approaches reflect the specificities of the internal and external contexts in which companies operate, shaping a variety of strategies for sustainable value creation.

From this perspective, sustainability is not a uniform concept, but a dynamic and contextualized approach (Marinina et al., 2022; Triguero et al., 2022; Wade et al., 2022). Each company, acting within a shared framework of principles, adapts sustainability strategies to its own operational needs and external stimuli. This process of strategic "customization" is particularly evident in the paper industry, where network dynamics and the capacity for collaborative learning play a crucial role in the development of innovative practices.

Indeed, this study questions how companies in the paper sector adopt and deploy sustainability and circularity strategies. In particular, the investigation aims to understand

whether these innovations are predominantly the result of endogenous processes, i.e. linked to internal research and development capacity, or whether they arise from exogenous interactions with other actors in the production system, such as suppliers, customers or public and private institutions.

A key element of the analysis concerns the distinction between endogenous and exogenous innovations. Endogenous innovations, often the result of investments in research and development and internal strategic decisions, represent the company's ability to adapt autonomously to environmental and market challenges. Conversely, exogenous innovations emerge through processes of co-creation and exchange with external partners such as industry consortia, research institutions and non-governmental organisations. This dialectic is central to understanding how companies build sustainable and collaborative pathways.

## 2. Methodology

To achieve this research aim, this study adopts a comparative approach which allows for the analysis of two business cases from heterogeneous geographical and organisational contexts. The aim is to identify similarities and differences in sustainability practices, providing a critical understanding of the dynamics underpinning innovation in this area. From November 2023 to September 2024, we collected 6 semi-structured interviews with professionals operating in the two case companies, such as marketing directors, communication managers and marketing specialists. In addition, company documents such as presentations, sustainability reports, press releases and sustainability initiative reports were analyzed by the researchers. This analysis allows to highlight the enabling factors and barriers that condition the adoption of circular business models in the paper industry.

## 3. Results and conclusions

Preliminary results of this study highlight that the case companies focus on continuous improvement and the involvement of the entire production ecosystem, including brands, printers, converters, designers, and suppliers, to promote a responsible and sustainable approach. For example, a case company has developed the "Group Sustainability Decalogue", which establishes rules based on risk assessment, emphasizing attention to detail in production while promoting safety and openness to change among employees. Both the analyzed companies are also working on plastic-to-paper solutions to replace plastic with highly performant paper in terms of strength, water resistance, and hygiene. These solutions are applicable across various sectors such as food & beverage, cosmetics, hospitality, and logistics.

Furthermore, the companies promote sustainable relationships through a distributed governance model that actively involves all business functions to ensure clarity, transparency, accountability, and competence in daily operations. They are committed to fostering interactions and building trust with all actors, including employees, shareholders, customers, suppliers, and local communities. In this regard, a case company has been awarded a platinum medal by EcoVadis, an international sustainability rating agency, recognizing excellence in environmental, social, and ethical practices. These efforts reflect the company's commitment to building and maintaining sustainable relationships with all stakeholders, contributing to a responsible and sustainable approach.

# Does GenAI have a role in the buyer-seller relationship initiation process? A conceptual perspective

Pier Franco Luigi Fraboni[1],* Andrea Sabatini[2], and Gian Luca Gregori[2]

[1] Università Politecnica delle Marche, Dipartimento di Scienze Agrarie, Alimentari e Ambientali, Ancona
[2] Università Politecnica delle Marche, Dipartimento di Management, Ancona, Italy

* Corresponding author: p.f.l.fraboni@staff.univpm.it

## Abstract

This conceptual paper explores the role of Generative AI (GenAI) in reshaping the buyer–seller relationship initiation (BSRI) process by conceptually discussing its role toward both actors across BSRI phases. Adopting the IMP interaction perspective and a model conceptual paper approach, the study maps GenAI's dual role in automating and augmenting interaction, communication, and coordination tasks between buyer and seller during the relationship initiation process. The paper presents a novel perspective on both BSRI and GenAI management literature, contributing to the clarification of GenAI's emerging role as both a tool and an active actor in shaping how business relationships are initiated and developed in B2B contexts.

*Keywords: GenAI, buyer-seller initiation, business relationship, business interactions.*

## 1. Introduction

The rise of generative artificial intelligence (GenAI) is reshaping how firms interact, communicate, and create value in B2B settings (Chen et al., 2021). While existing research has examined AI's role in the customer journey (Rusthollkarhu et al., 2022), procurement (Herold et al., 2025), and sales (Paschen et al., 2020) - emphasising benefits in lead generation, personalisation, and automation - less attention has been given to how GenAI affects the initiation of buyer-seller relationships (BSRI) in the B2B context, a critical and fragile stage (Chang, 2022; Edvardsson et al., 2008). This represents a pivotal research gap, especially as firms face increasing pressure to establish new relationships in digital-first environments. Buyers are now keener to research independently, avoiding human interaction, while sellers seek efficient, cost-effective methods to engage with new buyers (Chang, 2022). Prior studies have explored AI's impact from both the buyer and seller perspectives, focusing on a transactional approach, while overlooking the early-stage dynamics of the business relationship (Chang, 2022; Herold et al., 2025). This study addresses the gap by answering the following research question: *how does GenAI influence the BSRI process?* The study unfolds according to the Industrial Marketing and Purchasing (IMP) Group theoretical lens (Håkansson & Snehota, 1995), which views interaction as a co-evolving process within business networks. The paper develops a conceptual framework to explain how GenAI reshapes interaction, communication, and coordination between actors, highlighting its relational impact and how it might transform the way B2B relationships begin and evolve.

## 2. Literature background

*Buyer-seller relationship initiation (BSRI): an overview*

According to Håkansson and Snehota (1995, p. 25), a business relationship is a "mutually oriented interaction between two reciprocally committed parties," developing through various episodes and interaction processes. The BSRI marks the beginning of this development (Wadell & Bengtson, 2024). Although scholars have tried to define BSRI, its boundaries remain unclear, as the process is difficult to capture (Perna et al., 2015; Valtakoski, 2015). Still, it is commonly understood to begin when unknown actors coexist in space and time, proceed through mutual recognition, and ideally end with a business agreement (Mandják et al., 2015). This study adopts Dwyer et al.'s (1987) two-phase model of BSRI: awareness and exploration. In the awareness phase, parties engage in unilateral positioning without direct interaction. The exploration phase begins with initial contact and serves as a trial period for evaluating mutual compatibility, value, and obligations (Dwyer et al., 1987). This phase entails five sub-phases: attraction, communication and bargaining, power and justice, norm development, and expectation development. Although this phase allows actors to align and define relationship boundaries, it remains unstable (Edvardsson et al., 2008). Thus, early communication and trust-building are critical for relationship formation (Mandják et al., 2015; Valtakoski, 2015).

*Preliminary evidence of GenAI for buyers and sellers*

Artificial intelligence (AI) refers to systems that interpret, learn and use data to perform tasks through flexible adaptation (Chang, 2022). GenAI can produce new content that is human-likely, becoming mainstream in business due to the spread of accessible and intuitive tools (e.g. ChatGPT). It automates tasks and supports decision-making by complementing human reasoning (Paschen et al., 2020). In B2B settings, GenAI is addressed to reshape the procurement and sales processes. Buyers use GenAI to access and analyse product and market information, enabling independent decision-making without human sales intervention (Chang, 2022). Sellers employ GenAI to identify, qualify, and engage leads through automated outreach and personalised messaging (Paschen et al., 2020). AI supports negotiation and communication, shaping outcomes (Herold et al., 2025; Rusthollkarhu et al., 2022). However, challenges include reduced human involvement, emotional disconnect, and the need for digital skills. While GenAI offers strong potential in BSRI, its integration must preserve relational depth and trust (Keegan et al., 2023).

## 3. Methodology

Following Jaakkola (2020) and MacInnis (2011), this study adopts a conceptual approach to explore the role of GenAI in the BSRI process. While prior research has examined GenAI in procurement, sales, and the B2B customer journey, this study argues for revisiting these insights through the IMP interaction perspective, which focuses on reciprocal interactions in business networks. The study follows a "delineating" conceptual goal (MacInnis, 2011), aiming to map and explain GenAI's influence on BSRI using deductive reasoning. Consistent with Jaakkola's (2020) model paper approach, it defines the focal phenomenon, reviews relevant B2B AI literature, and integrates practical insights from industry reports. The IMP framework (Håkansson & Snehota, 1995) is used as the "method theory" to organise findings within Dwyer et al.'s (1987) BSRI framework. The study develops a theoretical framework that requires empirical testing (Figure 1), offering a structured model of GenAI's relational impact.

## 4. Preliminary findings

Figure 1 below provides preliminary insights by conceptually framing the use of GenAI by buyers and sellers within the BSRI process. The figure also entails which of the described tasks are automated and which are augmented, according to the GenAI paradigm.

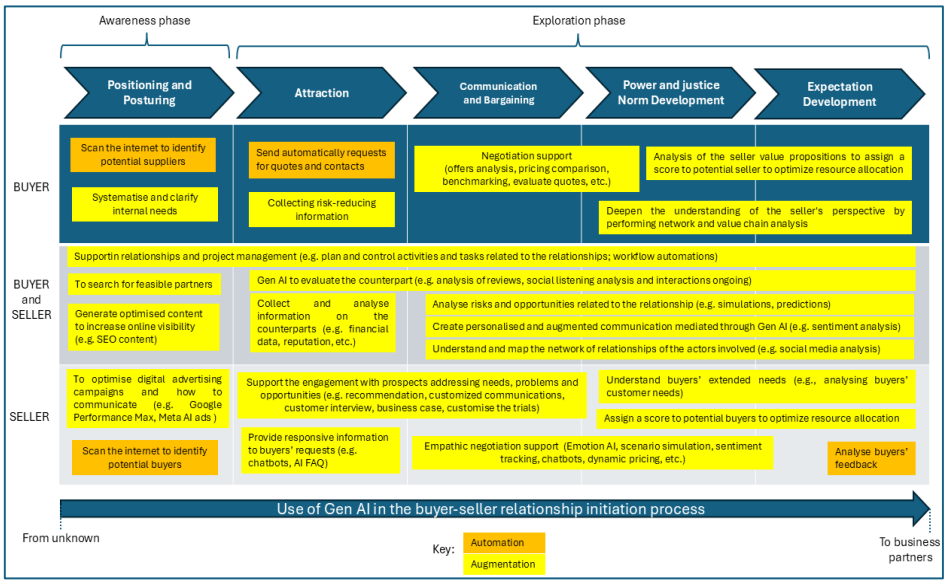

**Figure 1:** BSRI process and GenAI impact according to phases and actors (our elaboration)

## 5. Preliminary theoretical implications and conclusions

The study suggests that GenAI is increasingly adopted to enhance BSRI processes from both buyers and sellers (Rusthollkarhu et al., 2022). The study also suggests that GenAI unfolds through all the phases of the BSRI process (Chang, 2022). The study highlights that GenAI contribute to both automation and augmentation of the tasks within the BSRI process for both buyers and sellers (Chang, 2022). Therefore, the study posits that GenAI is emerging as software capable of improving the ability of buyers and sellers to initiate new business relationships (Herold et al., 2025), emphasising how it is becoming a new "player" in the dyad (Keegan et al., 2023). GenAI's capabilities improve mutual recognition, interaction, and adaptation between buyers and sellers during the BSRI process, potentially leading to a more fluid, effective, and efficient BSRI process (Chang, 2022; Herold et al., 2025; Paschen et al., 2020)

However, the effects of GenAI on BSRI also have dark sides. In particular, the study highlights how both buyers and sellers are at risk of alienation, a lack of critical analysis, developing weaker business relationships, and delegating decisions to machines, thereby being subjected to black-boxed decision-making processes when creating new business relationships (Keegan et al., 2023).

## 6. Implications for managers

Since GenAI act as a new tool for BSRI, managers are called to acknowledge where the potential lies for better contributions in initiating new business relationships. While the role of GenAI unfolds in several aspects of the process (e.g. data collection, analysis, content and document creation, suggestions, evaluations and comparisons), it is clearly influencing how

buyers and sellers perceive each other. Therefore, above the opportunities related to GenAI, which can be addressed to an effective and efficient BSRI process, managers should be aware of the potential risks associated with its misuse.

## 7. Conclusion

The present study is one of the first to attempt to conceptualise the role of GenAI in the BSRI process. This early study suggests that GenAI unfolds widely within the process and is potentially adopted by both buyers and sellers. The study presents a conceptual framework to clearly identify how GenAI unfolds and what roles it plays within the BSRI process according to each phase and each actor (e.g., buyers and sellers). In addition to the benefits and aforementioned mechanisms, the study also briefly outlines potential drawbacks associated with the use of GenAI for BSRI.

The study is not without limitations, as it is still ongoing and underdeveloped, and attempts to provide preliminary results on a complex and multifaceted phenomenon that still requires further investigation. However, the study took the opportunity to suggest further studies to advance the research on GenAI and BSRI. In particular, empirical studies (e.g. case studies, Delphi) are suggested to deepen the understanding of how buyers and sellers use GenAI in a real-world setting for initiating new business relationships. A further dynamic that needs to be understood is how firms might develop capabilities and competencies to exploit GenAI safely and how GenAI is useful in coping with the existing context-related factors that usually affect the BSRI process.

## Abstract

Artificial intelligence (AI) continues to transform industrial exchange, yet the skills required to orchestrate machine–human partnership in business-to-business (B2B) relationship marketing remain poorly specified. To close this gap, we conduct a systematic literature review of 419 peer-reviewed articles published between 1995 and 2024. After PRISMA screening, we apply a hybrid text-analytics pipeline like Guided Latent Dirichlet Allocation, lexicon matching and dependency parsing to surface thematic structures and extract competence terms from full texts.

Six research clusters dominate the corpus: (1) AI strategy and business analytics, (2) machine-learning modelling, (3) AI-enabled education and skills development, (4) AI-mediated customer engagement, (5) sentiment and user experience, and (6) adoption of AI analytics and firm performance. Only Cluster 6 treats B2B relationship management systematically, revealing a persistent focus on data infrastructures and decision analytics rather than on boundary-spanning work itself. Skill extraction confirms the bias: technical capabilities (e.g., classification, regression) outweigh marketing-specific (e.g., CRM analytics) and soft skills (e.g., critical thinking) by an order of magnitude.

We synthesise these findings into an integrative capability framework that couples data-engineering competences with interactional, sense-making and ethical competences – elements largely absent from extant studies. The article closes with a research agenda that redirects B2B scholarship from algorithmic optimisation to relational orchestration in AI-augmented networks, and offers managers a checklist for recruiting, up-skilling and governing human–AI frontline coalitions.

*Keywords: artificial intelligence; relational capability; competencies; systematic review; B2B marketing; AI-CRM*

## 1. Introduction

Industrial marketers operate in value chains increasingly punctuated by cognitive automation. Conversational agents negotiate order specifications, predictive engines trigger replenishment, and AI-embedded customer-relationship-management suites curate partner interactions at scale. Yet less than one per cent of firms report having exhausted AI

deployment potential, suggesting that human competences constitute the binding constraint, not the hardware.

While early commentaries portrayed AI as a back-office optimisation tool, newer studies implicate it in core relational processes: opportunity recognition, trust calibration and value co-creation (Saura et al., 2021; Gaczek et al., 2023). Still, the scholarly conversation is fragmented. Technical papers refine algorithms; sociotechnical papers debate job displacement; marketing work investigates consumer chatbots more than inter-firm interfaces. As a result, B2B marketing lacks a consolidated view of what people must know, feel and do to partner productively with AI. This paper responds to this gap. Anchored in competence-based theory, we ask:

RQ1: How has academic research conceptualised AI-enabled work in marketing? RQ2: Which competences are ascribed to marketers, specifically in B2B relationship contexts?

RQ3: Where do conceptual and empirical gaps remain?

By integrating topic modelling with context-sensitive skill extraction, we map the intellectual terrain and derive an actionable capability set for academics and practitioners.

## 2. Theoretical background

Business-to-business (B2B) marketing scholars have long framed competitive advantage in terms of organizational competences, bundles of knowledge, skills and routines that enable firms to create and appropriate value (Prahalad, 1993). Recent work extends this lens to dynamic capabilities, i.e., the capacity to sense, seize and reconfigure resources under turbulence (Teece, 2007). Yet the arrival of artificial intelligence (AI) complicates both ideas, because machine agents now participate directly in sensing (e.g., anomaly detection), seizing (e.g., dynamic pricing) and even reconfiguring (e.g., autonomous supply-chain optimisation). Understanding how human actors develop relational capabilities that integrate AI agents into inter-firm exchange therefore demands a more granular theoretical scaffolding.

### 2.1 From technical resources to relational capabilities

In the competence-based tradition, technologies are usually treated as operand resources, i.e. tools that humans deploy (Huang & Rust, 2021). However, service-dominant logic asserts that when technologies possess agency (predict, adapt, converse) they become operant resources capable of co-acting with humans in value creation. In B2B networks, where transactions are high stakes, information is often private, and coordination routines are negotiated rather than scripted, AI systems alter both task and relational architectures. They offload prediction but also raise novel demands for interpretation, justification and trust calibration.

Research on AI acceptance provides the first layer of insight. Studies show that explainability, transparency and error controllability drive adoption of AI-CRM analytics among industrial sellers (Gaczek et al., 2023), echoing Technology Acceptance Model antecedents but adding relational risk as a salient construct. Yet acceptance studies seldom address how marketers mobilise AI insights within boundary-spanning dialogues that involve political manoeuvring, sensemaking and joint problem solving.

IMP research characterises exchange relationships as socio-technical networks governed by interaction episodes and adaptations. Boundary spanners translate organisational logics, build trust and manage power asymmetries. When AI enters the scene, translation becomes two-fold: actors must interpret algorithmic outputs and repackage them for partners whose

own data and models remain opaque. Literature on managerial sense-making (Maitlis & Sonenshein, 2010) suggests that credible narratives reduce ambiguity and enable collective action. We therefore posit that interpretive competence (the ability to embed AI signals in persuasive, partner-oriented stories) is a missing but critical micro-foundation of dynamic capability in AI-rich B2B markets.

Sociomateriality argues that social practices and material artefacts are entangled. AI systems not only assist tasks; they shape who speaks, when, and on what evidentiary basis. Early ethnographies of AI-integrated sales teams reveal role renegotiation: account managers cede routine forecasting to machines but invest more effort in stewardship and escalation tasks (Koponen et al., 2025). This redistribution of labour foregrounds ethical and political competences (e.g., recognising bias, defending human discretion, and orchestrating escalation when models mis-perform). Yet only 4 % of competence mentions in our corpus concern such "soft" skills indicating a theoretical blind spot.

Synthesising the above streams, we conceptualise human-AI relational capability as a triad:

- Data-engineering capability: proficiency in collecting, cleaning and modelling data, long emphasised in digital-marketing research.
- Interpretive capability: cognitive and rhetorical skills that transform algorithmic output into actionable, partner-specific narratives.
- Relational-orchestration capability: communicative, ethical and political skills that embed AI recommendations into joint routines, manage divergence, and renegotiate expectations when algorithms err.

Dynamic-capability theory locates these competences within higher-order processes of sensing (data mining and environmental scanning), seizing (resource allocation and proposal framing) and reconfiguring (governance redesign and capability retraining). Our review reveals that extant B2B scholarship richly treats the first layer but sparsely theorises layers two and three.

## 3. Data and method

Following PRISMA guidelines, we queried Scopus and Web of Science for English peer-reviewed articles that mention marketing × AI × human terms (e.g., marketer, manager, staff) between 1995 and 2024. After removing 651 duplicates and applying a machine-assisted screening validated by expert raters (inter-rater consistency 86– 100 %), 419 articles remained.

We formulated an analytical pipeline covering three meta steps

Step 1: Topic modelling. Guided LDA with six seed-anchored topics captured latent thematic structure; model fit peaked at k = 6.

Step 2: Skill extraction. We built a 210-term competence lexicon spanning technical, marketing, tool and soft skills. Using spaCy dependency parsing, we filtered out purely methodological mentions and retained context-valid skills.

Step 3: Synthesis. Topic proportions and skill frequencies were cross-tabulated to identify competence emphases per research cluster.

We also carried out reliability checks throughout the process by including independent evaluation of performed by human investigators. A grey-zone resample (probability 0.4–0.5) was re-coded by five experts (85 % agreement); a high-confidence subsample (< 0.25) yielded 93 % algorithm–human congruence.

## 4. Findings

### 4.1 Research landscape

Clusters 0–5 reproduce the six-topic solution. Two observations stand out. First, technical machine-learning work (Cluster 1) has ceded dominance to strategy-analytics (Cluster 0) and adoption-performance studies (Cluster 5) over the past decade. Second, only Cluster 5 embeds a distinct B2B lens, foregrounding AI-CRM roll-outs, data-quality governance and decision rights in supplier–buyer dyads.

### 4.2 Competence spotlight

Across the corpus we retrieved 1 145 unique skill mentions; 68 % fell into the technical bucket, 19 % tool-based, 9 % marketing-specific, and only 4 % soft skills. The top five competences were regression, classification, NLP, AWS and SEO. Relational capabilities such as negotiation, trust-building or ethical judgement registered fewer than ten mentions each.

Mapping skills onto topics reveals a capability mis-alignment: B2B-oriented Cluster 5 discusses decision analytics and data stewardship but rarely cites interpersonal competences. Conversely, customer-engagement clusters emphasise affective understanding yet are situated in B2C contexts.

## 5. Discussion

Our review paints an uneven capability landscape. Algorithmic muscle has out-run relational sinew. Nearly seven in ten competence mentions concern data wrangling, modelling or cloud tooling, whereas explicitly marketing and soft competences together account for less than one-quarter of the discourse. Even within the only research cluster that consistently adopts a B2B lens (Topic 5, Adoption of AI analytics & performance) scholars dwell on data infrastructures, explainability dashboards and decision rights, yet seldom theorise how boundary spanners translate algorithmic output into credible promises, renegotiate expectations with partners or heal relationship ruptures when AI misfires.

Building on competence-based theory, we contend that AI capability in industrial markets is best conceived as a triadic bundle:

- Data-engineering capability: the hard core of ingestion, modelling and deployment.
- Interpretive capability: managerial cognition that renders opaque predictions actionable.
- Relational orchestration capability: the communicative, ethical and political work required to embed AI recommendations in inter-firm routines.

While the first pillar dominates Clusters 0 and 1, our findings show the second and third pillars are conceptually thin, particularly in B2B scholarship that privileges efficiency metrics over social glue. Without interpretive and orchestration competences, firms risk becoming

digital alchemists—able to churn insights yet unable to transmute them into durable exchange value.

Extending Teece's sensing–seizing–reconfiguring sequence, we propose that AI-enabled B2B marketers must add two micro-foundations:

- Sense-making loops that align model salience with customer priorities. This entails narrative framing, counter-argument anticipation and collaborative scenario building and these skills are barely visible in the current corpus.
- Ethical guardrails that manage bias, privacy and autonomy concerns. Only scattered studies mention algorithmic fairness or relational ethics, despite mounting regulatory pressure and partner scrutiny.

Integrating these elements reframes AI not as a plug-and-play optimiser but as a negotiated actor in industrial networks.

Our synthesis invites business-marketing theory to move beyond the technology acceptance paradigm towards a capability-interaction perspective. Doing so positions AI as both resource and relationship participant, whose productive potential hinges on marketers' ability to craft credible narratives, negotiate algorithmic authority and steward ethical engagement. Only by cultivating this expanded competence set can B2B firms convert predictive horsepower into relational advantage. The gaps surfaced suggest fertile avenues for B2B marketing scholars:

- Competence-bundle experiments that manipulate combinations of technical, interpretive and orchestration skills to isolate their causal impact on trust and financial outcomes.
- Network-level analyses exploring whether AI adoption amplifies or dampens power asymmetries between large system integrators and smaller suppliers, and how orchestration competences mediate these effects.
- Longitudinal studies tracking competence evolution across AI maturity stages to test whether relational orchestration lags technical deployment by predictable intervals, echoing the topic-shift from modelling to strategy we observe in the literature timeline.

## 6. Conclusions and future research

AI's diffusion in industrial markets is no longer a technology question but a capability puzzle. By mapping 30 years of scholarship, we show that B2B research has privileged data-centric competences while neglecting interactional work at the human–AI–partner nexus. Future studies should: (1) ethnographically trace how marketers negotiate AI advice with key accounts; (2) test how competence bundles influence relational and financial outcomes; and (3) explore governance mechanisms that balance algorithmic authority with human agency. Addressing these questions will help B2B firms move from using AI to partnering with it and thus unlock relational advantage in intelligent value chains.

# Organizing the Marketing Function for Public–Private Interaction: The Case of Pharmaceutical Companies

Matilde Milanesi[1],*, Orazio Vella[1], and Gerta Luga[1]

[1] University of Florence, Department of Economics and Management, Florence, Italy

* Corresponding author: matilde.milanesi@unifi.it

## Abstract

This contribution explores the role of Market Access (MA) and marketing functions within pharmaceutical companies, with particular reference to pricing—an element subject to strict regulatory oversight in the pharmaceutical sector. The study focuses on the negotiation process between pharmaceutical companies and the Italian Medicines Agency (AIFA), as well as the evolving role played by Regional Health Authorities in determining market access. Employing a qualitative methodology, the paper presents evidence drawn from in-depth interviews with pharmaceutical companies operating in the Italian market. The paper discusses intra-organizational issues and the interaction between pharmaceutical companies and other private and public actors for market access purpose.

*Keywords: market access, pharmaceutical marketing, pricing, regulation, public-private interaction*

## 1.Framing of the research

Pricing constitutes one of the most strategic levers of the marketing mix, as it is the primary element that generates revenue. Moreover, it is the most readily adjustable element in many sectors. However, in certain highly regulated industries, such as the pharmaceutical industry, price setting is not a matter of corporate discretion. For istance, in Italy, the Agenzia Italiana del Farmaco (AIFA) determines drug prices both at the time of market authorization and throughout the patent life of a product. Regulatory intervention is primarily aimed at patented, innovative drugs sold on prescription and often extends to off-patent prescription medications (Galliverti, Saraceni, & Lega, 2023). The rationale for pharmaceutical price regulation lies in a delicate balance among competing goals: public health protection, equitable access to medicines, cost containment, and industrial competitiveness. Governments often pursue multiple policy objectives through price control mechanisms, seeking to promote social welfare, economic efficiency, and universal access to care, regardless of income disparities. Pharmaceutical companies, on the other hand, must take economic sustainability into account and therefore effectively manage complex interactive processes with public (and other) stakeholders in order to reach a negotiated price that considers their need to generate profit (Runfola et al., 2021).

In Italy, where the public sector is the primary purchaser of medicines, price regulation frequently overlaps with reimbursement decisions, creating an intricate interplay between pricing policy and healthcare financing (Puig-Junoy, 2005).

Despite the sustained interest of marketing and management scholars in the pharmaceutical industry, the process through which new ethical drugs gain market access at a negotiated price —an issue of significant marketing relevance— remains largely overlooked and under-researched. The limited body of marketing and management literature on the topic has highlighted how pharmaceutical companies structure themselves and the actions they undertake to achieve market access (Schiavone and Simoni, 2019). Scholars have underscored the importance of viewing market access not merely as a negotiation phase between pharmaceutical companies and regulatory authorities, but as a broader process involving a network of interactions with multiple stakeholders (Guercini et al., 2020).

Building on this background, the paper aims to analyze two crucial aspects of market access for new drugs: the interactive processes between pharmaceutical companies and various public and private actors within the healthcare system aimed at price determination, and the underlying intra-organizational dynamics within pharmaceutical companies.

## 2. Research method

Given that the topic under study is current, rapidly evolving, and insufficiently studied, we adopted an exploratory research approach (Eisenhardt and Graebner, 2007). In particular, we employed a qualitative interpretivist methodology, relying primarily on interviews for data collection. The selection criteria for interview participants included: over a decade of experience in pharmaceutical or related sectors—such as consulting firms, governmental bodies, or public institutions; direct or indirect involvement in market access functions and activities; and senior-level roles in management or business consulting. Based on these criteria, a purposive sampling strategy was employed to identify suitable candidates, resulting in the selection of 9 key informants (interviews are still in progress). Due to the sensitivity of the topic, participant availability played a crucial role in the selection process. Each interview ranged in duration from 45 to 70 minutes. Interviewers took detailed notes throughout the sessions, all of which were audio-recorded and subsequently transcribed. Preliminary findings are now presented based on a content analysis.

## 3. Preliminary findings

Prices for reimbursable drugs are determined through a structured negotiation between AIFA and pharmaceutical companies. The process is managed by AIFA's Scientific and Economic Commission for Drugs (CSE), which has subsumed the roles of the former Technical Scientific Committee (CTS) and Pricing and Reimbursement Committee (CPR). CSE assesses the cost-effectiveness of new medicines and their therapeutic innovation. It considers whether the drug addresses unmet medical needs or outperforms existing alternatives, both in terms of efficacy and risk-benefit profile.

Negotiations generally unfold through a four-stage Corresponding author-based process: (i) submission of a comprehensive dossier by the pharmaceutical company to AIFA's Pricing and Reimbursement Unit; (ii) evaluation by CTS of the clinical value and incremental benefit of the drug over existing comparators; (iii) review by CPR and subsequent initiation of price negotiations; (iv) final appraisal and ratification by AIFA's Board of Directors.

Contracts typically last 24 months and renew automatically unless renegotiated at least 60 days before expiry. In case of market developments that significantly deviate from original assumptions, price renegotiation may occur—though only downward adjustments have historically been observed. With the corporatization of Italy's National Health Service (SSN) in the late 1990s, Regions and regional procurement agencies (e.g., ESTAR in Tuscany) have become key actors. Regions assess therapeutic innovation and regulate drug access within their specific Regional Health Systems (SSR). They often limit prescription eligibility to well-

defined patient cohorts and collaborate with purchasing centers to maximize economies of scale.

At the heart of these interactions lies the Market Access (MA) function—a relatively recent addition to pharmaceutical corporate structures in Italy, with no equivalent in other industries. MA serves as the organizational linchpin interfacing regulatory authorities, healthcare stakeholders, and internal departments (medical, marketing, sales).

Interviews conducted to date reveal a consistent organizational pattern across companies: MA typically reports directly to the General Manager, alongside Marketing, Medical Affairs, and Sales. In some companies, MA holds even greater hierarchical prominence, reporting directly to the CEO.

MA is tasked with six core responsibilities: market access strategy; health economic evaluations; pricing and reimbursement strategy; stakeholder engagement; regulatory landscape analysis; real-world evidence and outcome assessments

Pharmaceutical marketing, meanwhile, is distinct from its counterparts in other sectors due to its scientific complexity, regulatory constraints, and the indirect nature of demand. The connection between MA and marketing is strong and spans all key stages of the product lifecycle—from pre-negotiation strategy to post-launch brand development.

During pre-negotiation, marketing helps shape the Value Dossier with insights on market dynamics and therapeutic positioning. It also participates in meetings during clinical Phase II trials, gearing up for the pricing negotiation and commercialization phases. Once national and regional access is secured, marketing takes the lead in driving uptake, developing promotional materials in alignment with MA, and ensuring consistent corporate messaging.

All interviewed companies adopt a "pricing corridor" strategy—setting upper and lower reimbursement thresholds prior to negotiation with AIFA. Most prepare for a conservative outcome, assuming that price concessions will be substantial. Target prices are often aligned with the average of prior negotiations. Post-launch, both MA and marketing remain actively involved to monitor long-term drug safety, effectiveness, and market performance.

## 4. Conclusion

This paper, still a work in progress, aims to offer an initial exploration of the connection between intra-organizational and inter-organizational aspects. At the intra-organizational level, it highlights the relationship between two functions—marketing and market access—which, although seemingly interconnected within companies operating in regulated markets such as the pharmaceutical industry, often lack effective cross-functional coordination. This misalignment can potentially generate critical issues in the market access process of a new drug. Such challenges may also extend to the inter-organizational level, particularly in the interactive processes between pharmaceutical companies and public actors. This relationship should be interpreted beyond a purely transactional logic, embracing instead an interactive perspective that calls for a deeper investigation of public–private interaction within industrial marketing, specifically in relation to the pricing of new products

Il marketing distributivo e le relazioni verticali di filiera affrontano oggi le sfide di mercati sempre più competitivi e di traiettorie tecnologiche sempre meno prevedibili. Se a questo si affianca l'evoluzione dell'ambiente normativo e socio-demografico, si comprende la forte discontinuità in atto che richiede rinnovate pratiche manageriali e nuove prospettive di riflessione teorica.

Il focus della Sezione è, da un lato, l'impresa commerciale che crea valore gestendo le relazioni con il mercato finale e con i produttori industriali e, dall'altro, il go-to-market delle imprese industriali e le strategie di trade marketing. A tematiche più consolidate si affiancano quelle più di frontiera legate all'abbattimento dei confini tra dimensione fisica e digitale.

Aspetti di particolare interesse sono le relazioni industria-distribuzione, le strategie di trade/shopper marketing industriali, le dimensioni della competizione inter-intratype tra i retailers, il fenomeno della multi-omnicanalità, le logiche di supply chain management, i modelli di internazionalizzazione dei distributori, l'evoluzione dei comportamenti di acquisto, le dimensioni della store loyalty e le politiche di CRM, le strategie assortimentali, le politiche di retail branding e le forme di interbrand competition, le scelte di pricing distributivo, l'innovazione e la digitalizzazione degli store format, i driver di sviluppo dell'e-commerce. L'attività della Sezione è aperta agli accademici e ai practitioners interessati a proporre analisi rigorose ed innovative allo scopo di stimolare un ampio dibattito sui risvolti teorici e sulle implicazioni manageriali dei risultati di ricerca ottenuti.

Distributive marketing and vertical supply-chain relationships face increasing competitive pressure, rapid technological shifts, and changing regulatory and socio-demographic environments. This discontinuity demands renewed managerial practices and updated theoretical perspectives.

The Section focuses on retail firms that create value through relationships with both final markets and industrial producers, as well as on industrial firms' go-to-market strategies and trade marketing. Alongside established topics, it addresses frontier issues arising from the blurring of physical and digital channels.

Key areas include manufacturer–retailer relationships, trade and shopper marketing, inter- and intra-type retail competition, multi- and omnichannel models, supply-chain management, internationalization of retailers, evolving shopping behaviors, store loyalty and CRM, assortment and pricing strategies, retail branding, store-format innovation and digitalization, and e-commerce development. The Section welcomes rigorous and innovative contributions from academics and practitioners to stimulate debate on theoretical and managerial implications.

## Abstract

This research adopts an Empirics First approach to examine whether integrating in-store sensor data with traditional scanner data improves demand forecasting in retail environments. Using motion-detection cameras and AI-based computer vision systems, we track customers' in-store movements and dwell times while preserving GDPR compliance. These behavioral data are aligned with planograms and POS records to model the probability that a customer purchases a given SKU, based on both their path and the shelf layout. Leveraging deep learning methods, we build a predictive model capable of estimating a conversion rate of the shelf similarly to the approach typically adopted in the field of digital advertising. This approach represents a novel contribution to retail analytics by combining behavioral signals with sales data to forecast demand more accurately. The proposed system enhances resource allocation, inventory management, and customer satisfaction—ultimately supporting both firm profitability and public accessibility to goods.

*Keywords: retail analytics, in-store sensors, shelf layout, machine learning, shopper behavior.*

## 1. Introduction

Modern retailers are facing a growing pressure to improve demand forecasting precision (Hoeltgebaum et al. 2021), particularly during periods of volatility when traditional sales models fail to respond quickly to shifting consumer behavior (Kamran-Disfani & Mantrala 2024). While scanner data and time-series methods have long served as the backbone of retail analytics, their retrospective nature and limited ability to capture in-store behavior hinder their effectiveness (Wolters & Huchzermeier 2021). In parallel, the growing availability of in-store technologies is generating multiple opportunities to observe and model customers' behaviors, and recent literature has underlined the potential of predictive analytics to profitably exploit the huge amount of customer data which can be collected in-store (Bradlow et al. 2017). Prior studies have modeled customers' in-store movements and purchase behaviors by relying on multiple data sources, such as RFID tags (Larson et al. 2005), 3D depth sensors (Knof et al. 2024), etc. Similarly, a potentially fruitful avenue is given by the combination of different sources of behavioral information such as POS and in-store sensors' data (Inman & Nikolova 2017) to support retailers' informed decisions to forecast store visits and sales. However, to the best of our knowledge, there are no studies modelling consumers' presence and movements inside a store in order to enable retailers to estimate a) the number of customers patronizing the store at each time frame of the day, b) the path followed by customers during their shopping experience, and c) the customer behavior in

front of the shelf in terms of which and how many products will be purchased. In this research, we take an Empirics First approach (Golder et al. 2023) to explore whether combining scanner data with in-store sensor tracking can significantly improve demand prediction, thus contributing to retailing research and practice.

## 2. Theoretical Background

Retail demand forecasting has traditionally been driven by scanner data and time-series models such as ARIMA, exponential smoothing, and seasonal decompositions (Tsay 2010). While robust under stable conditions, these models often fail in high-variability or data-sparse settings—especially for new SKUs or during demand shocks. Machine learning has shown promise in capturing complex, nonlinear relationships in transactional data (Fildes et al. 2008), but is rarely applied in-store.
The second stream focuses on shopper behavior. With these regards, prior literature has documented that both store layout and shelf layout qualify as relevant leverages for retailers to affect consumers' in-store behaviors (Garaus et al. 2015). A typical and basic measure of retail space productivity is sales per square meter (Page et al. 2019) which was found to effectively capture the extent to which product placement on shelves and organization of the shelves within the store contribute to generating sales (Bezawada et al. 2009). Traditional research and practice in retailing have widely relied on checkout data to identify the "hot" and "cold" store areas in terms of customer density (Pantano et al 2021). The underlying assumption is that the higher the number of products in customers' baskets – as revealed by checkout data – the higher the density of customers in the area of the store where the product is shelved. In the present study, we challenge this assumption as there might be a store area with a huge level of customer crowding, but with very low levels of demand for the products shelved in that area. Checkout data would erroneously lead to label that area as "cold", failing to capture the high levels of customers' passage. By analogy, this situation can be reconducted to a very common situation in digital advertising: the conversion rate of an ad hosted on a webpage is not given merely by the number of clicks on the ad, but by the ratio between the number of clicks and the number of impressions (Haans et al. 2013). In the context of retail stores, the conversion rate of a shelf might be expressed as the ratio between the number of times a product is put on the shelf and the number of people who stopped in front of the product. The contribution of AI and computer vision lies exactly here, since they provide the unprecedented opportunity to obtain very precise estimates about the number of customers exposed to each single portion of the shelf at any point in time (Guha et al 2021).
Early retail analytics relied on manual observation, but modern research has turned to computer vision, RFID, and sensor technologies to track in-store paths, dwell time, and shelf interaction (Hui et al. 2013). These behaviors signal consideration and interest, even when they do not lead to purchase—offering a more complete picture of demand. Yet, most studies fall short on the integration of these data into formal predictive systems. Nonetheless, an estimate of retailer shelves' conversion rate as well as detailed trajectory data would provide very relevant indications to support retail managers in the design of the store and shelf layout. An appropriate store layout does not fulfill only customers' utilitarian needs, such as assisting them to purchase more efficiently (Morales et al. 2005) or exploring the store more in depth (Mohan et al. 2012), but it extends also to the experiential side of shopping triggering positive emotions and satisfaction (Terblanche 2018). Accordingly, consumer demand in a retail setting can be forecasted starting from the observation of how consumers behave within a given store and shelf layout.

## 3. Methodology

We collected data for this study from October 2024 to March 2025 in two large-format supermarkets (each exceeding 1,000 square meters) located in Italy. Our proposed system

used motion-detection cameras installed across a store's ceiling together with mobile antennas to detect customer paths and dwell times, all while ensuring compliance with GDPR privacy standards. The cameras recorded anonymized data on the presence, walking paths, and stopping behavior of customers across different store zones and directly in front of shelves. Meanwhile, the antennas captured signals from mobile devices to validate footfall estimates and enrich trajectory tracking. This multi-sensor infrastructure produced spatiotemporal datasets indicating how many customers entered the store, how they navigated the aisles, where they paused, and for how long.

These behavioral data streams were then integrated with planogram layouts and point-of-sale (POS) transaction data, enabling us to link customer paths and dwell instances to specific shelf areas and SKUs.

The resulting dataset serves as the foundation for training deep learning models to forecast demand, leveraging both traditional sales inputs and rich in-store behavioral signals.

## 4. Future Analyses

With this integrated behavioral and transactional dataset, we plan to perform different types of analyses. First, beyond predicting individual SKU demand, these data allow for the direct computation of a shelf conversion rate. This metric can help retailers more precisely evaluate the effectiveness of shelf layouts and optimize planogram strategies.

Second, detailed trajectory data captured via mobile antennas allow to perform unsupervised machine learning clustering of customer paths within the store. Such an approach would identify distinct shopping patterns or missions (e.g., quick grab-and-go vs. exploratory shopping). By probabilistically linking these clusters to checkout baskets, we could assess how different in-store movement behaviors translate into purchasing outcomes, offering deeper insights into the interplay between navigation and conversion.

Finally, integrating data on shopping carts—when available through cart-mounted sensors—with point-of-sale receipts would enable us to study not only where and how long customers dwell, but also what items they actively carry before final purchase.

Altogether, these opportunities highlight how the fusion of in-store sensor data with traditional sales records can drive a new generation of analytics to support store design, category management, and personalized marketing interventions.

## Abstract

Retail-media networks (RMNs) are quickly expanding their inventory to include nonendemic advertisers—brands that lack a direct merchandising relationship with the host retailer. While industry spending on these out-of-category placements is increasing, there is limited academic understanding of the managerial motives and success metrics behind such investments. This study tries to fill this gap through an exploratory, qualitative approach based on semi-structured interviews with brand decision-makers. Guided by schema congruity and halo-effect theories, the study intends to contribute to extant literature by offering insights into the strategic reasons for allocating budget to non-endemic placements and the key performance indicators (KPIs) managers aim to influence.

### 1. Introduction

Retailers have always been advertisers, but recently, owing to their ability to collect valuable data about customers' characteristics and preferences when customers visit a retailer's store (both digital and physical), they are expanding their advertising efforts to deliver more personalized content and communication. In this scenario, retailers are evolving into retail media networks (RMNs) by monetizing their customer data and offering new advertising platforms. Retail media network refers to advertising on a retailer's owned and operated assets, third-party publishers' properties, and other media content powered by the retailer's first-party shopper data (eMarketer, 2023). Statista (2024) confirms the increasing importance of retail media networks in the advertising market: considering only digital retail media advertising, worldwide expenditure grew from 103,3 billion dollars in 2021 to over 150 billion in 2024. From a brand perspective, retail media provides new ways to connect and engage with customers in a contextually relevant environment using trusted customers' data. Within the personalization paradigm, brands strive to deliver "the right message to the right consumer at the right moment" (Aguirre et al., 2016). They have rapidly integrated retail media into their marketing mix strategy to accomplish this. Decades of research show that endemic advertising, messages placed in content environments thematically related to the product, facilitates processing, heightens visual attention, and boosts attitudinal as well as behavioral responses (Goodstein, 1993; Janssens et al., 2012; Peters & Leshner, 2013; Rieger et al., 2015; Segev et al., 2014). However, a rapid shift in brand communication strategy is taking place. Today, RMNs are moving beyond endemic logic. Major platforms (e.g., Walmart Connect, Amazon) have begun selling ADV inventory to non-endemic advertisers such as automotive, financial services, or travel brands with no direct merchandising

Proceedings XXII SIM Conference 2025 – The Marketing–Innovation Nexus: Past Insights for Future Challenges. Società Italiana Marketing. ISBN 978-88-947829-3-6

relationship with the retailer (Donnelly, 2025; eMarketer, 2024). Also, brands have begun placing their ads in non-endemic category RMNs to leverage retailer data and achieve priority customers wherever they shop, banking on their attention gains and incremental reach. Despite its growing prevalence, non-endemic RMN advertising remains an under-examined topic in academic literature, especially regarding brand choices and customers' responses. On the one hand, few studies have investigated why brands deliberately opt for non-endemic placements at the point of sale, or which performance metrics they expect to influence (Huettermann et al., 2023); on the other hand, the results on the exposure to nonendemic ads on customers' responses are mixed, showing a negative effect on customers' cognitive effort and decision-making process (Kwon et al., 2019). To address this gap, the present study adopts an exploratory qualitative design, based on semi-structured executive interviews, to better understand the motives that drive brands toward non-endemic ADV inventory, the performance and benefits they obtained, and their customers' responses in a new ad context, that is, RMNs. Accordingly, our guiding research questions are:

RQ1: Why do brands invest in non-endemic advertising within retail-media networks? RQ2: Which performance outcomes do they seek to achieve?

RQ3: What are the main effects of non-endemic advertising within retail-media networks on customers' behavioral response?

The study provides valuable insights into theory and practice by shedding light on how brands approach non-endemic placements by analyzing customer attitudes and behavioral intention, as well as performance metrics results.

## 2. Theoretical background

### 2.1 Ad-context endemicity and congruence theory

As Germelmann et al. (2020) state, ad-context endemicity describes the connection between advertising and media concerning content themes. In literature, endemicity embraces relevancy and expectancy. The first concerns the similarities between ad and media content, while expectancy refers to the anticipated relationship between ad and media content based on previously formed schemas (Goodman, 1980; Heckler & Childers, 1992). Bartlett (1932) defined schema as the mental connections formed in the brain while making meaning. People rely on their cognitive schemas to process, retain, and interpret the numerous advertisements they are exposed to daily (Anderson, 1988). If newly encountered cues fit smoothly with existing mental frameworks, they are considered schema-endemic (e.g., a baby model in a diaper ad). Conversely, cues are regarded as schema-non-endemic when they do not easily mesh with the established semantic network (Mandler, 1982). Based on this theory, schema-endemicity plays a pivotal role in the processing and evaluation of advertising messages, influencing the success or failure of an advertisement (Heckler & Childers, 1992; Goodstein, 1993). When an individual encounters endemic advertising, it is immediately integrated into existing schemas and does not require further elaboration (Halkias & Kokkinaki, 2011). In contrast, exposure to a non-endemic message can trigger one of two responses: viewers may simply dismiss it, choosing to attend only to information that already fits their schema (Lee & Schumann, 2004; Lee & Mason, 1999); alternatively, they may engage in extra processing to reconcile the mismatch, which requires cognitive effort. Thus, audiences are typically more comfortable with endemic advertisements (Beals, 1998). Thematic endemicity has been found to produce stronger target associations and more positive evaluations than non-endemic ones (Dahlen, 2005). The positive impact of endemic advertising has been frequently documented in different formats. Studies have found that endemicity increased visual attention, favorable attitudes, and behavioral intentions toward digital ads (Janssens et al., 2012; Jeong & King, 2010; Kim & Sundar, 2010; Peters & Leshner, 2013; Rieger et al.,

2015; Segev et al., 2014). Another evidence showed that audiences feel more comfortable with endemic ads because details about the brand are already stored in their memory (Moorman et al., 2002). This aligns with the literature on endemicity, which suggests that an endemic context facilitates comprehension of advertising (Goodstein, 1993; Kamins et al., 1991). Nevertheless, non-endemic stimuli can also positively affect customers' behavior (Heckler & Childers, 1992; Mandler, 1982). In fact, Lee (2000) found that non-endemic advertising can encourage people to pay more attention to and process information more carefully, leading to increased viewing time compared to a typical advertisement (Halkias & Kokkinaki, 2011). However, when a non-endemic placement pushes the brand–message link so far that the incongruity becomes unresolvable, viewers feel frustration, which then results in negative evaluations and reduces advertising effectiveness (Mandler, 1982; Alina & Ioan, 2013; Fleck & Maille, 2010).

### 2.2 The halo effect

The halo effect comes from social psychology. It is defined as a mental bias where people use well-known traits of a person to make judgments about unknown qualities. It occurs when an overall impression created by a single prominent trait influences how other traits are evaluated (Hickman & Lawrence, 2010; Gräf & Unkelbach, 2016). According to Gräf & Unkelbach (2016), the halo effect works in two ways: first, positive information leads to a favorable view of traits; second, negative information results in a negative view. The halo effect has become a key concept in marketing, as it can boost the perceived value and attractiveness of products and services, helping them stand out in the minds of consumers (Rosenzweig, 2007). When adapted to endemic and non-endemic communication activities, brands can obtain a "halo" effect when they opt for endemic ads because their customers are mainly driven by previous judgements about those brands and their traditional placements. On the contrary, when brands opt for non-endemic ads, they can alter their audience's perceptions because they are not able to see the congruence with the out-of-category placement immediately (Rogers et al., 2020).

### 2.3 Endemic and non-endemic retail media networks

Retail media network refers to advertising on a retailer's owned and operated assets, third-party publishers' properties, and other media content powered by the retailer's first-party shopper data (eMarketer, 2023). In other words, a retail media network can be defined as an advertising platform provided by retailers that allows brands to show advertising on owned retailers' touchpoints (Choi et al., 2024). In this vein, a retail media network can be conceived as a complementary platform to traditional advertising through which brands can better reach and engage with new audiences in a relevant context for customers, such as the point of sale. Retail media networks provide brands with new marketing opportunities, harnessing endemic and non-endemic advertising placements (eMarketer, 2024). In this context, brands are struggling to understand how to allocate their ad budgets between endemic and non-endemic since endemic advertising may not be noticed, while non-endemic advertising may be perceived as an intruder (Rogers et al., 2020). Retail media is an emergent area with limited research. As a result, this study represents a step forward by empirically analyzing the decisionmaking process of brands towards retail media networks. Indeed, while the literature explains how consumers cognitively and emotionally respond to endemic versus nonendemic cues, it provides little insight into why brand managers increasingly select non-endemic placements, especially within retail media networks (RMNs). Therefore, drawing from the congruence theory and the halo effect theory, this study explores the drivers, the effects, and the customers' behavioral responses to brands' non-endemic communication by adopting a managerial perspective.

## 3. Research design

This research aims to uncover non-endemic advertising in retail media, highlighting (i) the reasons that lead firms to allocate budget for non-endemic advertising within RMNs and (ii) the key performance indicators (KPIs) managers expect to influence through such initiatives, and (iii) the consumers' behavioral responses toward non-endemic brand advertising. To achieve these results, an exploratory qualitative research design will be used. This study is exploratory in nature (Stake, 1995) and adopts a managerial perspective, as managers, due to the nascent stage of non-endemic advertising in the retail media context, have a comprehensive view and can provide valuable insights into this emerging phenomenon. Interviews, as a strategy of inquiry (Creswell, 2008), are adopted to gain a deeper understanding of the scarcely investigated phenomenon of non-endemic advertising in RMNs. In-depth interviews are the most suitable data collection method for this research because of their flexibility and exploratory capacity (Maxwell, 2005). Interview transcripts will be uploaded to NVivo and subjected to a systematic qualitative content analysis. A structural coding will be performed (Krippendorff & Bock, 2010). The brand managers we are planning to interview will be identified following successful brand case studies that employed non-endemic advertising within their communication strategy. Moreover, we intend to apply snowball sampling, starting from retailers who already provide both endemic and nonendemic media, and brands that leverage RMNs for advertising. The gathering data process will end up with the saturation of the collected data.

## 4. Expected results

Through this qualitative explanatory research, we expect the interviews to generate broad insights. First, it is expected that the reasons that lead brands to allocating spend to non-endemic placements are: (a) incremental reach and new customer acquisition enabled by retailer data; (b) higher attention and recall created by a moderate nonendemic communication that helps the message stand out; and (c) positive halo transfer from the trusted retailer environment that offsets placement mismatch and reduces brand image concerns. Second, it is supposed that the interviews will reveal the set of KPI that brands set to assess the performance of both endemic and non-endemic ad investments. In this perspective, it is expected to uncover contingency conditions (e.g., platform characteristics, creative guidelines, and targeting rules) that are useful to turn non-endemic exposure into effective outcomes. These contingencies should clarify when the benefits of non-endemic cues outweigh the cognitive costs predicted by schema theory. Overall, the study is expected to explain why brands see non-endemic retail-media advertising as a viable growth lever and how they balance its benefits against the risks of thematic incongruence. Third, the study is expected to shed light on customers' behavioral response toward non-endemic ads. In particular, it is presumed that non-endemic ads could capture consumers' attention and activate the memorability of the ad. In addition, non-endemic ads could activate associations in consumers' minds between judgments and attitudes toward retail and brands, promoting favorable behaviors toward the brand. Finally, the findings will offer practical guidance for practitioners who must decide whether to opt for or avoid non-endemic ads within retail media networks.

## Abstract

Questo studio analizza i fattori che influenzano le scelte dei consumatori all'interno dei punti vendita, con un focus sui prodotti per la prima colazione. Utilizzando l'Analisi delle Componenti Principali (PCA) e la cluster analysis su un campione di 473 rispondenti, sono stati identificati cinque cluster di consumatori in base alle loro preferenze e comportamenti d'acquisto. I fattori di scelta considerati includono promozioni, visibilità a scaffale, comunicazione, prezzo, qualità, familiarità con il brand, packaging, sostenibilità, gusto, etichetta nutrizionale, ingredienti e benefici specifici come controllo del peso, riduzione dello stress, miglioramento dell'umore e esigenze dietetiche. I cinque cluster identificati sono: (1) i *Fedeli risparmiatori*, (2) i *Nomadi di prodotto*, (3) i *Paladini della nutrizione*, (4) gli *Esploratori del benessere* e (5) gli *Ottimizzatori*. Per ciascun cluster vengono delineate le caratteristiche distintive e le implicazioni per strategie di micro-marketing nutrizionale. Tuttavia, lo studio presenta limitazioni legate alla raccolta dati in un'area geografica specifica e su una singola categoria di prodotto. Future ricerche potrebbero estendere il campione a livello nazionale o internazionale e ad altre categorie alimentari per verificarne la replicabilità. Inoltre, si suggerisce l'integrazione di metodi di osservazione indiretta per superare i limiti dei dati auto-riportati e approfondire le motivazioni dei consumatori attraverso metodi qualitativi.

*Keywords: micro-marketing nutrizionale; in store communication; fattori di scelta; cluster analysis; analisi delle componenti principali.*

## 1. Introduzione

L'efficacia di strategie di micro-marketing nutrizionale all'interno del punto vendita dipende in larga misura dalla comprensione approfondita dei molteplici fattori che influenzano le scelte alimentari dei consumatori. Una volta all'interno del supermercato, infatti, gli individui sono esposti a un ambiente complesso, ricco di stimoli visivi, informativi ed emozionali, che contribuiscono a modellare il comportamento d'acquisto. Le decisioni vengono spesso prese in modo rapido e sotto l'influenza simultanea di fattori economici, percettivi, informativi e motivazionali. In questo contesto, diventa fondamentale analizzare nel dettaglio le leve che guidano le preferenze individuali per poter sviluppare strategie di comunicazione e posizionamento realmente efficaci Fra queste, si citano ad esempio il prezzo e le promozioni. Il prezzo continua ad essere uno dei driver più importanti nelle scelte d'acquisto (es. Levrini & Jeffman Dos Santos, 2021; Steenhuis et al., 2011), mentre le promozioni influiscono sulle abitudini di acquisto dei consumatori, in quanto incentivano sia la scelta di cibi scontati, sia l'acquisto ripetuto dei prodotti che rientrano in tali iniziative (es. Vigna & Mainardes, 2019).

Anche la visibilità di un prodotto all'interno dello scaffale è un fattore razionale importante: la visibilità, infatti, aumenta le probabilità di scelta del prodotto (Foster et al., 2014; Glanz et al., 2020). Un'altra leva capace di influenzare le scelte del consumatore è quella dell'in-store communication (es. Chitty et al., 2017), guidandolo verso scelte alimentare più consapevoli (es. Sutton et al., 2019).

Tra i driver di scelta di un prodotto, vi sono ovviamente anche le caratteristiche intrinseche del prodotto stesso, come il gusto, la qualità e la composizione degli ingredienti. Nel contesto delle scelte alimentari, infatti, è stato dimostrato che le aspettative dei consumatori riguardo al gusto di un prodotto influenzano i processi decisionali (Saba et al., 2019) e prevedono i livelli di consumo di cibo (Roininen et al., 1999). Inoltre, Grunert (2005) suggerisce che la qualità percepita è una costruzione multidimensionale che guida le preferenze e le intenzioni di acquisto. Uno studio condotto da Verbeke (2005) mostra che la trasparenza sulla lista ingredienti aumenta la fiducia e l'intenzione d'acquisto. La lettura dell'etichetta nutrizionale (FOP) è inoltre associata a scelte alimentari più sane (Campos et al., 2011) e funge da facilitatore per decisioni rapide e consapevoli (Hodgkins et al., 2012). Infatti, anche il packaging di un prodotto è uno dei fattori di scelta, sia a livello di comunicazione che del materiale stesso di cui è composto. Quest'ultimo, infatti è un vettore comunicativo per le percezioni ambientali e di salubrità: Ampuero & Vila (2006) hanno dimostrano che i packaging sostenibili migliorano la percezione del brand, mentre Piqueras-Fiszman & Spence (2012) sottolineano che l'effetto tattile e visivo dei materiali ha un impatto sull'apprezzamento del prodotto. Difatti, l'interesse dei consumatori per la sostenibilità è in costante crescita: secondo Aschemann-Witzel & Zielke (2017), i consumatori sono disposti a pagare di più per prodotti percepiti come sostenibili. Inoltre, anche la familiarità con il brand risulta essere un driver di scelta di un prodotto, in quanto aumenta la fiducia e riduce il rischio percepito dell'acquisto (Jacoby et al., 1971; Keller, 1993). Oltre ai fattori intrinsechi di prodotto, vi sono anche i benefici che il prodotto può portare ai consumatori. Ad esempio, Lowe et al. (2006) evidenziano che i consumatori orientati al controllo del peso preferiscono prodotti a basso contenuto calorico, con claim specifici legati peso; questo accade anche con i consumatori che seguono un regime alimentare specifico (es. celiaci, vegetariani, vegani, etc.), che risultano sono più attenti agli ingredienti e più inclini a leggere le etichette (Lea et al., 2006). Altri consumatori, invece, utilizzano il cibo per ottenere un effetto di "comfort" e vengono scelti per il loro effetto rilassante, soprattutto in situazioni emotivamente cariche (Macht, 2008). Infatti, il cibo può influenzare l'umore attraverso meccanismi biochimici e psicologici: Steenhuis et al. (2009) hanno dimostrato che la ricerca di gratificazione immediata, guida spesso l'acquisto di determinati alimenti, soprattutto i più indulgenti.

## 2. Inquadramento teorico

Negli studi di marketing e comportamento del consumatore, l'analisi degli Stili Decisionali dei Consumatori (Consumer Decision-Making Styles, CDM) si è affermata come un approccio teorico consolidato per interpretare le modalità attraverso cui gli individui effettuano scelte d'acquisto. Questo quadro interpretativo consente di identificare pattern ricorrenti di comportamento, che riflettono preferenze, attitudini e strategie decisionali distintive e si è dimostrato estremamente efficace nell'analisi del comportamento d'acquisto in una varietà di contesti di retail (es. Cowart & Goldsmith, 2007; Bakewell & Mitchell, 2003). Ricerche precedenti li hanno applicati con successo al fine di comprendere come i consumatori effettuano scelte in diversi ambiti, dall'abbigliamento (es. Thangavel et al., 2022; Walsh et al., 2001) al settore dell'auomotive (es. Nayeem & Marie-IpSooching, 2022). Nel contesto del grocery, i CDM sono stati utilizzati per studiare gli acquisti di prodotti alimentari (Anić et al., 2014, 2015; Thomas et al., 2013), ma anche prodotti per il benessere (es. Maggioni et al., 2019) e biologici (es. Prakash et al., 2018). In particolare, dallo studio di Maggioni et al. (2019) è emerso che l'ambiente di vendita incide sul benessere associato allo shopping, ma in

modo significativamente diverso tra i diversi profili di consumatori. Prakash et al. (2018) hanno riscontrato cinque stili decisionali che influenzato l'intenzione all'acquisto di prodotti biologici. Un filone crescente della letteratura supporta l'idea che degli interventi micro-targettizzati possano incrementare la probabilità di scelta di prodotti salutari (es. Bedard & Kuhn, 2015; Langen & Huber, 2022; John et al., 2024). Ad esempio, Langen & Huber (2022) hanno dimostrato che una campagna di couponing personalizzata per prodotti a basso contenuto di zuccheri ha incrementato le vendite rispetto al gruppo di controllo. Analogamente, John et al. (2024) hanno applicato un clustering algoritmico al fine di sviluppare profili comportamentali in un supermercato, mostrando che la promozione di snack salutari era significativamente più efficace nei cluster identificati come "consapevoli nutrizionalmente". Dunque, in questa prospettiva, il "micro-marketing nutrizionale" si propone come una leva d'intervento che ha lo scopo di raggiungere gruppi di consumatori specifici. Vi è dunque una forte connessione tra il micro-marketing e la segmentazione comportamentale, in quanto la possibilità di personalizzare campagne di marketing in funzione delle caratteristiche latenti dei consumatori permette non solo di incrementare l'efficacia comunicativa, ma anche di ottimizzare il rapporto costo/beneficio degli interventi (Reutterer et al., 2006). Il micro-marketing è nato al fine di raggiungere i consumatori con accurata precisione (Zhang, 2019). Oggi, le aziende creano e sviluppano campagne di marketing personalizzate al fine di raggiungi segmenti target di clienti (Dobson, 2006; Kotler e Armstrong, 2010), considerandola la strategia più efficace per far crescere il proprio brand e la propria impresa (Anyadighibe et al., 2014). L'obiettivo che si pongono è infatti quello di ottenere il maggior valore possibile da ciascun consumatore (Dobson, 2006). Infatti, le aziende sono capaci di influenzare le intenzioni di acquisto dei consumatori personalizzando le strategie di marketing, allineandole agli interessi e alle preferenze dei clienti (Tuan et al., 2025).

In questo contesto, la cluster analysis risulta essere una metodologia atta a identificare gruppi omogenei (es. Ngai & Wu, 2022). L'applicazione di tecniche di cluster analysis è già stata sperimentata in questi contesti, con risultati incoraggianti, in studi di network-based marketing (es. Hill et al., 2006) e targeting predittivo con modelli bayesiani (es. Braun & Bonfrer, 2010).

Nonostante l'ampia adozione di strategie di micro-marketing nel contesto del retail (es. Ali & Rao, 2001; Ziliani, 2000), vi sono ancora pochi contributi relativi alla sua applicazione nel contesto del marketing nutrizionale in-store. Il presente studio mira ad arricchire la letteratura esistente, attraverso un approccio di natura empirica, basato su metodi robusti quali l'Analisi delle Componenti Principali (PCA) e la cluster analysis, con l'obiettivo di identificare gruppi di consumatori in base ai fattori di scelta del prodotto all'interno del punto vendita. Il contributo è duplice: da un lato, si propone un framework operativo replicabile per l'analisi sulle preferenze legate ai prodotti sani; dall'altro, si suggerisce l'applicazione dei risultati in chiave di strategie micro-marketing che mirano a incentivare l'acquisto di prodotti sani.

## 3. Metodologia

In occasione di un esperimento di marketing nutrizionale in ambiente reale nella categoria della prima colazione (biscotti, cereali, merendine), sono stati condotti dei questionari ai consumatori davanti allo scaffale. I dati sono stati raccolti in due punti vendita di due città del nord Italia, che fanno parte di una grande catena della GDO italiana. L'esperimento implementato in punto vendita riguardava un'iniziativa di comunicazione in-store che, attraverso stopper, crowner, calpestabili e bandiere, ha avuto l'obiettivo di spingere i consumatori a comprare prodotti sani facendo leva sui benefici fisici e psicofisici che essi potevano apportare al benessere dell'individuo.

Il campione consta di 473 rispondenti. Il 66% è composto da donne, il 34% da uomini. L'età media è di 51 anni (mediana: 52), mentre il livello di istruzione è abbastanza eterogeneo: il 17% ha la terza media, il 45% ha il diploma e il 38% ha la laurea.

Ai rispondenti è stato chiesto, attraverso delle scale Likert a 7 punti, di valutare l'importanza di diversi fattori al momento della scelta di un prodotto. Sulla base di questi fattori (riportati in Tabella 1) è stata condotta una cluster analysis k-medie. Infatti, è stato dimostrato come la cluster analysis consenta di individuare segmenti omogenei rispetto a variabili psicografiche, attitudinali e comportamentali (Punj & Stewart, 1983; Gorton et al., 2013) e come svolgerla sia utile in contesti nel campo del retail alimentare (es. Mazanec, 1999; Reutterer & Dan, 2021).

| FATTORI DI SCELTA | ID VARIABILE |
|---|---|
| Promozioni e offerte | *promotions* |
| Visibilità a scaffale | *shelf_visibility* |
| Comunicazione | *communication* |
| Prezzo | *price* |
| Qualità complessiva | *quality* |
| Familiarità con il brand | *brand_knowledge* |
| Packaging (materiale) | *packaging_material* |
| Packaging (informazioni) | *fop_information* |
| Sostenibilità | *sustainability* |
| Gusto | *taste* |
| Etichetta nutrizionale | *nutritional_label;* |
| Ingredienti | *ingredients* |
| Controllo del peso | *weight* |
| Ridurre lo stress | *stress_reduction* |
| Migliorare l'umore | *mood* |
| Dieta/regime alimentare particolare | *diet* |

**Tabella 3:** I fattori di scelta di un prodotto

Al fine di gestire la multicollinearità e di ridurre la complessità degli indicatori (Barbaranelli, 2007), è stata svolta l'Analisi delle Componenti Principali (PCA) con rotazione Varimax (KMO = .685; Barlett <.001). A seguito della PCA, le 16 variabili sono state ridotte a 5 fattori (Tabella 2).

| FATTORE | VARIABILI |
|---|---|
| Attributi nutrizionali | nutritional_label; ingredients; fop_infomation; sustainability |
| Packaging | communication; packaging_material; fop_information; sustainability; shelf_visibility |
| Ricerca benefici | diet; weight; stress_reduction; mood |
| Convenienza | price; promotions |
| Soddisfazione attesa | taste; brand_knowledge; quality |

**Tabella 4:** Fattori derivati dalla PCA

## 4. Risultati

Sono stati individuati 5 cluster distribuiti come in Tabella 3. Il numero di cluster è stato scelto in base all'Indice di Calinski-Harabasz (Caliński & Harabasz, 1974), all'interpretabilità dei cluster sulla base dei centri finali, all'omogeneità nei cluster e ai Test F delle ANOVA.

La cluster analysis è stata sottoposta a test di validazione dividendo il campione in due sottocampioni (Lattin et al., 2003): *calibration sample S1* (che ricopre il 70% del campione) e il *validation sample S2* (che ricopre il 30% del campione). Infine, è stato calcolato il Rand Index (=0.917), ovvero il rapporto tra il numero di coppie di soggetti per le quali le soluzioni S1 e S2 coincidono rispetto al totale delle possibili coppie di soggetti (Rand, 1971).

| FATTORI DI SCELTA | CLUSTER 1 | CLUSTER 2 | CLUSTER 3 | CLUSTER 4 | CLUSTER 5 |
|---|---|---|---|---|---|
| *numerosità* | 124 | 62 | 75 | 137 | 75 |
| *% rispetto al campione* | *26%* | *13%* | *16%* | *29%* | *16%* |

**Tabella 5:** Distribuzione del campione all'interno dei cluster

Una volta clusterizzato il campione, sono state condotte delle analisi ANCOVA, tenendo come coviariate le variabili: *pl_attitude, banner_attitude; banner_health_commitment*. Ciascuna variabile (Tabella 4) è stata misurata attraverso delle scale Likert a 7 punti.

| Variabile | Reference | Alpha |
|---|---|---|
| HEALTH | Roininen et al., 1999 | .675 |
| SELF_EFFICACY | Armitage & Conner, 1999 | .909 |
| HEALTHINESS_PRODUCT | Bui et al., 2013 | .565 |
| FAMILIARITY | Heinberg et al., 2020 | .894 |

**Tabella 6:** Variabili misurate

### Cluster 1 - Fedeli risparmiatori

Il cluster 1 (Grafico 1) rappresenta un gruppo di consumatori che cercano principalmente la convenienza nei loro acquisti. La loro attenzione è focalizzata sul prezzo e sulle promozioni, tendendo a preferire brand e prodotti a loro familiari. Nonostante si definiscano parzialmente interessati allo stato di salute generale, acquistano prodotti salutari abbastanza spesso. L'80% del cluster acquista prodotti salutari per un'attenzione al proprio benessere psico-fisico, il 9% per perdita di peso o mantenimento della forma fisica, l'8% per ragioni di salute, difatti solo il 12% di loro soffre di allergie. Conoscono parzialmente la categoria di prodotti della prima colazione, ma consumano raramente merendine e qualche volta a settimana cereali e biscotti. Rimangono indifferenti riguardo la qualità nutrizionale dei display della prima colazione. Si sono sentiti molto liberi nella scelta dei prodotti. Il 28% di loro ha notato l'iniziativa dell'in-store communication e il 38% di loro ha acquistato almeno un prodotto che fa parte dell'iniziativa. Tuttavia, si sono sentiti poco influenzati dalla comunicazione e rimangono neutrali a un possibile cambiamento del comportamento. L'efficacia dell'iniziativa per loro è parziale. Il 29% del cluster aveva pianificato il proprio acquisto a livello di segmento, il 27% a livello dello specifico prodotto e il 13% a livello solo di marca. La restante parte ha agito d'impulso, ricordandosi solo una volta aver visto il prodotto in punto vendita (17%) o totalmente d'impulso (14%). Questo rientra in linea con il profilo del cluster, in quanto più attenti al prezzo e al fatto di conoscere il prodotto.

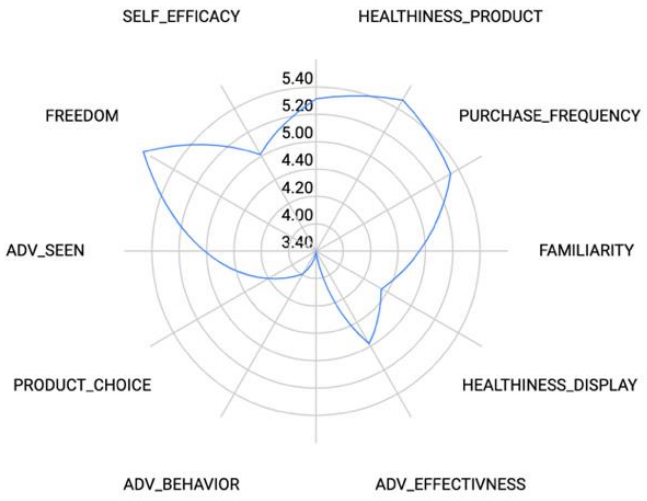

**Grafico 1:** Radiale riassuntivo del Cluster 1 - Elaborazione degli autori

L'età media del cluster è di 51.92 anni (età minima = 18; età massima più elevata = 92). Circa la metà (51%) del cluster ha solo il diploma di scuola superiore, mentre circa il 33% ha almeno la laurea. Il 16% invece ha conseguito solo la terza media. Più del 61% è impiegato presso un'azienda pubblica o privata, il 10% è studente e il 19% è in pensione. Inoltre, il 32% ha 2 componenti familiari, il 30% ne ha 3 e il 24% ne ha 4. Il 7% del cluster è monocomponente.

### Cluster 2 - Nomadi di prodotto

Il cluster 2 (Grafico 1) rappresenta un gruppo di consumatori giovani e sperimentatori attratti principalmente dalle novità. Infatti, la loro motivazione d'acquisto è fortemente orientata alla sperimentazione di nuovi prodotti, con una bassa fedeltà al marchio e una bassa considerazione per la convenienza e il packaging. Sono parzialmente interessati alla salute, tuttavia acquistano prodotti salutari abbastanza spesso. Il 66% del cluster li acquista per un'attenzione al proprio benessere psico-fisico, il 13% per perdita di peso o mantenimento della forma fisica, l'11 % per ragioni di salute e il 5% per prescrizione di un regime alimentare particolare. L'8% circa del cluster soffre di allergie o di malattie. Non conoscono molto la categoria della prima colazione, infatti consumano raramente merendine e occasionalmente biscotti e cereali. Rimangono indifferenti riguardo la qualità nutrizionale dei display della prima colazione. Si sono sentiti molto liberi nella scelta dei prodotti. Si ritengono indifferenti all'efficacia della comunicazione e poco influenzati. Ritengono che la possibilità che l'iniziativa possa far cambiare il loro comportamento è bassa. Tuttavia, il 32% di loro ha acquistato almeno un prodotto che faceva parte dell'iniziativa e il 29% di loro aveva notato la comunicazione. Il 39% aveva pianificato l'acquisto dello specifico prodotto, il 31% dello specifico segmento. Solo il 3% della specifica marca, questo a conferma che non rientra fra i loro fattori di scelta. La restante parte ha agito d'impulso, ricordandosi solo una volta aver visto il prodotto in punto vendita (13%) o totalmente d'impulso (14%). Questo a conferma che, nonostante si ritengano poco influenzati, subiscano comunque un'influenza da parte

della comunicazione, tanto che il, il 32% di loro ha acquistato almeno un prodotto che faceva parte dell'iniziativa.

**Grafico 2:** Radiale riassuntivo del Cluster 2 - Elaborazione degli autori

Il cluster 2 è il più giovane, con un'età media di 45.15 anni (età minima = 18; età massima = 84). Poco meno della metà (48%) del cluster ha solo il diploma di scuola superiore, mentre il 39% ha almeno la laurea. Il 24% è ancora studente, mentre il 37% è impiegato presso un'azienda pubblica o privata, e circa il 21% è in pensione. Inoltre, il 31% ha 2 componenti familiari, il 24% ne ha 3 e il 23% ne ha 4. Il 15% del cluster è monocomponente.

### Cluster 3 - Paladini della nutrizione

Il cluster 3 (Grafico 3) si distingue per essere composto da consumatori maturi e consapevoli. La loro priorità è la qualità e la salubrità dei prodotti, ma anche il prezzo e le caratteristiche del packaging. Sono consumatori fedeli al marchio e abitudinari nell'acquisto di specifici prodotti. Hanno un forte interesse per la salute, acquistano spesso prodotti salutari e conoscono abbastanza i prodotti della prima colazione. Il 61% del cluster acquista prodotti salutari per un'attenzione al proprio benessere psico-fisico, il 16% per perdita di peso o mantenimento della forma fisica, il 16% per ragioni di salute e circa 3% per prescrizione di un regime alimentare particolare. Circa l'11% di loro soffre di allergie o malattie. Consumano qualche volta a settimana cereali e biscotti, mentre molto raramente le merendine. A loro avviso, i display della prima colazione hanno una salubrità parziale. Si sono sentiti molto liberi nella scelta dei prodotti. L'efficacia dell'iniziativa di in-store comunication è parziale, mentre sono rimasti indifferenti riguardo l'influenza della comunicazione sulla scelta del loro prodotto, tanto da essere indifferenti anche rispetto a un eventuale cambiamento di comportamento. Nonostante ciò, è il cluster che ha acquistato maggiormente i prodotti che fanno parte dell'iniziativa (41%). Tuttavia, solo il 27% di loro l'aveva notata. Il 55% aveva pianificato l'acquisto dello specifico prodotto, l'11% dello specifico segmento e sempre l'11% dello specifico brand. Questo conferma l'attenzione alla soddisfazione attesa del prodotto. Tuttavia, il 24% del cluster ha agito d'impulso, di cui solo il 7% perché si è ricordato dell'acquisto in punto vendita. Il 18% ha agito invece totalmente d'impulso. Questo in parte

può spiegare che il 41% del cluster ha acquistato almeno un prodotto che fa parte dell'iniziativa.

**Grafico 3**: Radiale riassuntivo del Cluster 3 - Elaborazione degli autori

È il cluster con l'età media più alta (56.16, con l'età minima più elevata = 21; età massima = 84). Circa la metà (45%) del cluster ha solo il diploma di scuola superiore, mentre il 32% ha almeno la laurea. Tuttavia, è giusto sottolineare che è il cluster con il livello di istruzione minore (terza media) più elevato (23%). Il 20% svolge un lavoro autonomo, il 39% è impiegato e il 35% è in pensione. Inoltre, il 36 % ha 2 componenti familiari, il 23% ne ha 3 e il 24% ne ha 4. Il 15% del cluster è monocomponente.

### Cluster 4 - Esploratori del benessere

Il cluster 4 (Grafico 4) rappresenta un gruppo di consumatori che uniscono consapevolezza nutrizionale al desiderio di sperimentazione. I consumatori di questo cluster cercano infatti prodotti che offrano benefici e che siano convenienti, ma allo stesso tempo sono aperti a provare novità. Il comportamento di acquisto è caratterizzato da una buona consapevolezza nutrizionale e dalla ricerca di benefici specifici nei prodotti. Sono attenti al packaging e al prezzo, ma non sono fedeli a un singolo marchio o prodotto, preferendo variare le loro scelte. Hanno un discreto interesse generale verso la salute, tuttavia acquistano spesso prodotti salutari. Il 54% del cluster acquista prodotti salutari per un'attenzione al proprio benessere psico-fisico, il 26% per perdita di peso o mantenimento della forma fisica, il 13% per ragioni di salute e il 6% per prescrizione di un regime alimentare particolare, difatti è il cluster che soffre di allergie o malattie in percentuale più elevata (15%). Conoscono abbastanza bene i prodotti della prima colazione. Consumano biscotti quasi ogni giorno e occasionalmente cereali e merendine. Secondo loro, i display della prima colazione hanno una salubrità parziale. Si sono sentiti molto liberi nella scelta dei prodotti. L'efficacia dell'iniziativa di in-store comunication è parziale, mentre sono rimasti indifferenti riguardo l'influenza della comunicazione sulla scelta del loro prodotto, tanto da essere indifferenti anche rispetto a un eventuale cambiamento di comportamento. Il 37% di loro aveva visto la comunicazione (il cluster che l'ha notata di più fra tutti) e il 36% di loro ha acquistato prodotti che fanno parte dell'iniziativa. Il 34% del cluster aveva pianificato il proprio acquisto livello dello specifico prodotto, il 29% a livello di segmento, e solo il 10% a livello di marca. Questo conferma la loro caratteristica di voler sperimentare. La restante parte (27%) ha agito d'impulso, ricordandosi solo una volta aver visto il prodotto in punto vendita (15%) o totalmente

d'impulso (12%). Questo in parte può spiegare che il 36% del cluster ha acquistato almeno un prodotto che fa parte dell'iniziativa e che sia stato il cluster ad averla maggiormente notata.

**Grafico 4:** Radiale riassuntivo del Cluster 4 - Elaborazione degli autori

L'età media del cluster è di 50.28 (età minima = 18; età massima = 85). Circa la metà (49%) del cluster ha almeno la laura, mentre il 39% ha il diploma di scuola superiore, e il 21% ha solo la terza media. Circa il 50% è impiegato presso un'azienda pubblica o privata, il 9% è studente e il 27% è in pensione. Inoltre, il 29% ha 4 componenti familiari, il 26% ne ha 3 e il 27% ne ha 2. Il 16% del cluster è monocomponente.

### Cluster 5 – Ottimizzatori

Il cluster 5 (Grafico 5) rappresenta un gruppo di consumatori abitudinari e orientati al prezzo, con una bassa attenzione alla salute e agli attributi nutrizionali del prodotto, ma con un'elevata tendenza a ricercare benefici all'interno del prodotto. Il comportamento d'acquisto caratterizzato dalla ricerca della convenienza e dalla fedeltà al marchio. Sono quasi indifferenti alla salute in senso generale, difatti non acquistano prodotti salutari.

Il 65% del cluster acquista prodotti salutari per un'attenzione al proprio benessere psico-fisico, il 15% per perdita di peso o mantenimento della forma fisica, il 4% per ragioni di salute e meno del 2% per prescrizione di un regime particolare, difatti solo l'11 % di loro soffre di allergie o malattie. Non conoscono bene la categoria della prima colazione, ma consumano cereali e biscotti quasi ogni giorno, occasionalmente le merendine. Rimangono indifferenti riguardo la qualità nutrizionale dei display della prima colazione. Si sono sentiti molto liberi nella scelta dei prodotti e poco influenzati dalla comunicazione (meno rispetto a tutti gli altri cluster). Si ritengono indifferenti all'efficacia della comunicazione e rispetto a un eventuale cambiamento di comportamento (meno rispetto a tutti gli altri cluster). Difatti, solo il 20% di loro ha notato la comunicazione e sempre solo il 20% di loro ha acquistato uno dei prodotti comunicati. Il 34% aveva pianificato l'acquisto dello specifico prodotto, il 15% a livello di segmento e sempre il 15% a livello di marca. Il 36% restante ha acquistato d'impulso, di cui il 19% perché si è ricordato del prodotto in punto vendita e il 17% per impulso puro. Tuttavia, dato che si tratta di consumatori indifferenti agli attributi nutrizionali dei prodotti, l'iniziativa di comunicazione può non aver sortito un grande effetto. Nonostante ciò, il 20% di loro ha notato la comunicazione il 20% ha acquistato almeno un prodotto comunicato, questo potrebbe essere dovuto al fatto che è un tipo di consumatori che comunque ricerca i benefici nel prodotto. Dato che l'iniziativa di comunicazione faceva leva proprio su questi,

probabilmente avrà avuto effetto su quella parte di consumatori che ricerca benessere fisico o psicofisico.

**Grafico 5:** Radiale riassuntivo del Cluster 5 - Elaborazione degli autori

È il cluster con una delle età medie più basse (età minima = 18; età massima più bassa = 80). Il 41% del cluster ha solo il diploma di scuola superiore, l'11% ha la terza media, mentre circa il 14% ha almeno la laurea. Circa il 45% è impiegato presso un'azienda pubblica o privata, l'11% è studente e il 19% è in pensione. Inoltre, circa il 24% ha 4 componenti familiari, circa il 29% ne ha 3 e circa il 25% ne ha 2. Il 16% del cluster è monocomponente.

## 5. Conclusioni e Implicazioni Manageriali

Questa ricerca si è posta l'obiettivo di arricchire la letteratura esistente, attraverso un approccio di natura empirica, basato su metodi robusti, con l'obiettivo di identificare gruppi di consumatori in base ai fattori di scelta del prodotto all'interno del punto vendita. Di conseguenza, una volta segmentati i consumatori, è possibile pensare a delle strategie di micro-marketing utili alla promozione e all'acquisto di prodotti sani.

I consumatori del cluster *"Fedeli risparmiatori"* ricercano la convenienza e la familiarità con il brand. Potrebbero essere spinti all'acquisto di prodotti più sani facendo leva sulle promozioni. I marketer potrebbero pensare a sconti sui prodotti sani e implementare programmi fedeltà che premiano l'acquisto di tali prodotti. Inoltre, si potrebbe sfruttare il concetto di familiarità, proponendo versioni più sane di prodotti già leader di linea.

Il cluster dei *"Nomadi di prodotto"* è composto da consumatori giovani e sperimentatori attratti dalle novità. Per spingerli all'acquisto di prodotti più sani, bisogna puntare sull'effetto novità. Probabilmente, potrebbero ricoprire una fetta di consumatori che acquista il prodotto non appena viene lanciato sul mercato, ma difficilmente saranno fidelizzati. Tuttavia, essendo un cluster più giovane, nelle strategie di lancio potrebbero influire maggiormente le campagne pubblicitarie sui social media.

Il cluster dei "*Paladini della nutrizione*" si distinguono per l'attenzione alla qualità e salubrità dei prodotti, al prezzo e al packaging e per la fedeltà al marchio. In questo caso, le strategie di marketing dovranno concentrarsi soprattutto verso la promozione degli attributi nutrizionali

del prodotto. È un gruppo di consumatori che si fida del brand che sono soliti acquistare, quindi bisogna puntare sulla trasparenza della comunicazione. Probabilmente inserire informazioni sugli ingredienti, sulla provenienza e sui processi di produzione, potrebbe essere molto apprezzato. Fra le strategie di marketing, sia l'industria che la distribuzione potrebbero integrare anche programmi fedeltà, con premi inerenti a iniziative di un corretto stile di vita.

Il cluster degli *"Esploratori del benessere"* uniscono alla consapevolezza nutrizionale il desiderio di sperimentazione, cercando prodotti benefici e convenienti, ma sono aperti a provare novità. Per loro, la strategia più efficace per spingerli verso acquisti più salutari, potrebbe essere quella di comunicare i benefici nutrizionali dei prodotti, evidenziando gli attributi nutrizionali dello stesso. In secondo luogo, si potrebbe pensare a proporre prodotti sani innovativi e a iniziative per farli provare. Bisogna tenere in considerazione anche la loro attenzione al prezzo, magari attivando delle iniziative di couponing.

Il cluster degli *"Ottimizzatori"* è composto da consumatori abitudinari e orientati al prezzo con bassa attenzione agli attributi nutrizionali ma elevata tendenza a ricercare benefici. Analogamente alla strategia pensata per il cluster 4, per il cluster 5 potrebbe risultare efficace da un lato mettere in evidenza i benefici più "pratici" del prodotto, magari mettendo in luce attributi legati al gusto, essendo meno interessati agli attributi nutrizionali. Inoltre, sfruttando la predisposizione a scegliere prodotti conosciuti e ad affidarsi al brand, optare per una line extension verso prodotti più salutari potrebbe portarli all'acquisto di prodotti più salutari proposti dal loro brand preferito. Data l'attenzione al prezzo, sicuramente una strategia promozionale potrebbe risultare efficace.

## 6. Limiti e Future Ricerche

Questo studio non è privo di limiti. In primo luogo, i dati sono stati raccolti in due punti vendita di due città del Nord Italia, con il naturale limite di non poter generalizzare i risultati all'intero territorio nazionale o in altri contesti culturali e geografici. Sarebbe interessante che studi futuri potessero estendere il campione a un maggior numero di punti vendita e/o a altre regioni o anche in altri Paesi, per verificare se i cluster e le implicazioni di marketing individuate sono replicabili. Inoltre, l'esperimento ha riguardato la categoria della prima colazione (biscotti, cereali, merendine). Sebbene questa categoria sia un riferimento nelle abitudini alimentari degli italiani, l'estensione dei risultati ad altre categorie di prodotti alimentari sani potrebbe richiedere ulteriori indagini. Sarebbe interessante verificare se i cluster individuati presentano le stesse peculiarità o se emergono nuovi profili di consumatori al variare della categoria di prodotti, ad esempio, se si considerasse la categoria dei prodotti freschi o di frutta e verdura. Un'altra limitazione è rappresentata dalla natura auto-riportata dei dati, raccolti mediante scale Likert a 7 punti. Ciò che è auto-rapportato, difatti, non sempre corrisponde a reali comportamenti. Studi futuri potrebbero, quindi, integrare metodi di osservazione indiretta o indagare i dati di acquisto (es. scontrini, dati di carte fedeltà) per avere un'immagine più dettagliata del comportamento d'acquisto reale. Infine, lo studio ha individuato cinque principali cluster. Approfondire ulteriormente i fenomeni all'interno di ciascun cluster, attraverso metodi qualitativi, come focus group e interviste, potrebbe aiutare ad acquisire una comprensione ancora più ricca delle motivazioni e del processo decisionale da parte dei consumatori. Potrebbe essere anche interessante indagare la ricaduta a lungo termine delle strategie di micro-marketing proposte sulla salute dei consumatori e sulla qualità nutrizionale delle scelte in punto vendita.

# Exploring Facilitating and Inhibiting Factors in Manufacturer–Retailer Relationships: An Empirical Case Study Within a Category Captainship Context

Marina Gigliotti[1], Sylwia Jastrzebska[1], * and Antonio Picciotti[1]

## Abstract

In recent decades, supplier–retailer relationships have evolved toward more integrated, value-driven collaboration models, moving beyond traditionally divergent perspectives. This paper presents an emblematic case study of the collaboration between Procter & Gamble Italy and Gala Supermarkets, analysing the enablers and barriers in their supplier–retailer relationship within a Category Captainship theoretical framework.

*Keywords: Category Captainship; Category Management; Supplier-Retailer Relationship; Space-allocation; Display; Trade Marketing*

### 1. Introduction And Theoretical Background

Significant transformations in distribution channels have reshaped the relationship between manufacturers and retailers over time (Hibbard et al., 2001). These changes have enhanced the strategic salience of retailers in the value creation process within distribution channels. Consequently, recent decades have witnessed the development of a cooperative paradigm, promoting heightened collaboration and integration between suppliers and retailers (Day, 2000) from a value-centric perspective (Grönroos, 1997). This occurred despite the two parts traditionally holding different viewpoints. The manufacturer views the relationship from a brand-oriented perspective. At the same time, the retailer aims to optimise the whole assortment performance (Bandyopadhyay et al., 2009), or, from a Category Management perspective, to improve the categories' performance (Basuroy et al., 2001). And it is precisely within the literature on category management that the concept of Category Captainship (CC) emerged, serving as the theoretical framework for this paper. CC is defined as *"a practice wherein a retailer relies on a leading manufacturer (often referred to as the category captain) to make strategic recommendations regarding category management decisions"* (Kurtuluş et al., 2014). The existing literature on CC has primarily focused on the efficacy of this approach in addressing context-specific and technical issues. This includes studies on category results in terms of space allocation (Wu et al., 2024), the transmission of information (Timoumi et al., 2023), or the competitive implications among the leading manufacturer, the retailer, and other suppliers in the category (Alan et al., 2017). In most cases, benchmarking models were employed, often drawing on non-managerial literature. Very little attention has been given to this approach in terms of supplier-retailer interaction, delving into the repercussions that the CC can have on their dyadic relationship. Some insight emerged from the existing literature regarding the

effect of the dynamics underlying the relationship. Bandyopadhyay et al. (2009) highlighted how the CC approach is based on an intense exchange of information between the two parties, exposing them to sources of tensions such as information asymmetry or conflict of interest (Kurtulus and Toktay, 2005). No study, however, has specifically explored the factors that can positively impact the supplier-retailer relationship under category captainship, such as trust (Kumar, 1996).

This research aims to explore the factors that facilitate and inhibit the relationship between manufacturers and retailers in the context of applying a CC approach, and whether the perception of these factors creates alignment or misalignment between the two parties (Corsaro and Sneota, 2011).

## 2. Methodology

The methodological approach used in this research is the single case study (Yin, 2014), focusing on a specific supplier-retailer dyad (P&G Italy and Gala Supermarkets). This research design enabled the observation and comprehension of firm behaviour within a real-world setting (Easton, 2010) and the collection of detailed insights into the decisions firms undertook to solve practical issues (Gibbert and Ruigrok, 2010; Siggelkow, 2007). The choice of this specific case stems from a twofold consideration: on one hand the supplier's prominence is broadly acknowledged in the Category Captainship literature (Bandyopadhyay et al., 2009); on the other hand, the innovative nature of the initiative arises from the supplier's willingness to experiment with collaborative projects, even with small or medium-sized retailers. These conditions establish the case as unique and theoretically relevant (Yin, 1994). Furthermore, the study adopted a longitudinal nature, as one of the authors obtained information from the early stages of the project's implementation in stores, capturing all emerging dynamics during the observation period (Aaboen et al., 2012; Leonard-Barton, 1990). In terms of data gathering, the information needed to prepare the business case came from a variety of sources. First, several in-depth interviews were conducted, separately involving managers from both companies (Table 1).

| | **Procter & Gamble Italy** |
|---|---|
| RI | Category Development Manager |
| R2 | In-store Trade Marketing Manager |
| R3 | Trade Marketing Director |
| | **Abbondanza S.r.l. – GALA supermercati** |
| R4 | Category Manager |
| R5 | Category Manager |

**Table 1:** The interviewees' professional roles

Overall, during the two-year period 2024-2025, nine interviews were conducted, four with the supplier and five with the retailer. To address complex topics, a research protocol based on open-ended questions was followed. These questions were based on key themes from

existing literature and on insights from document analysis (Krosnick, 2018). All interviews were conducted face-to-face, recorded and then transcribed in full. The results were subsequently discussed between the authors. In case of uncertainties or missing details, clarifications were sought directly from the interviewees through telephone calls and emails (Dubois and Gadde, 2002). Secondly, two seminars were organised as part of a university course dedicated exclusively to this experience. The frequency of opportunities for discussion and data collection is the result of a decade-long relationship during which numerous initiatives and presentations of the supplier's activities were organised. Finally, the research also included the acquisition of secondary data such as reports, catalogues and company presentations. Another key secondary source was the reports of market research companies, which allowed us to identify the performance achieved by the project. To ensure the rigour of the research, all primary and secondary data that appeared ambiguous or needed clarification were shared with the interviewees for validation (Creswell and Miller, 2000). In the last phase of data analysis, the collected information was organised in a systematic way (Miles and Huberman, 1994). The transcribed interviews and all other data were examined separately by the authors. The main results were then compared to reach a shared perspective. In case of discrepancies, a crosscheck of the primary and secondary data was carried out through triangulation (Yin, 2014). This method, therefore, helped to understand the nature and magnitude of the factors that most influence the supplier-retailer relationship.

## 3. The Case Study

The emblematic case study presented focuses on the strategic collaboration between Procter & Gamble Italy (P&G Italy), the Italian branch of an American multinational consumer goods corporation, and Gala Supermarkets, a regional grocery retail chain belonging to the Abbondanza Group. Abbondanza manages 43 stores under the Gala brand across Central Italy. The group's operations are mainly concentrated in Umbria, with additional presence in the Tuscany and Marche regions. By 2020, Gala experienced a significant decline in sales within the shaving category, with negative trends affecting both the male and female segments. Products were placed near the checkout area, a choice initially driven more by theft prevention logic. To provide more space for impulse purchases in the checkout area (e.g., candy, chocolate, dried fruit), shaving products were relocated to an endcap in front of the checkout barrier. Nevertheless, the endcap end was populated with numerous other products, such as batteries and game cards, resulting in a non-optimal shopping experience.

The data analysis, based on a study of loyalty card data, revealed an opportunity gap. Performance in the shaving category was below the company average and underperformed relative to the market. While Gala's category managers began internally reflecting on potential strategies to improve category performance, they received an email from P&G's Category Manager proposing a joint collaboration. In fact, P&G internally developed a specific unit, namely the Shopper Based Design Team (SBD), dedicated to collaboration with retailers, focusing on category management strategies, implementing customised assortment revisions, planograms, and in-store display solutions. This unit operates independently of marketing and sales teams, often through non-disclosure agreements, helping every customer find the optimal category display solution. The SBD Team, prompted by the Gala's market concerns – despite their dominant position, with Gillette holding 90% of the market share – had initiated an internal reflection on what P&G could do differently or better to strengthen Gala's position and support growth in this key market. This reflection ultimately led to the first contact with Gala and the proposal of a potential solution. What began as a simple email exchange between the P&G and Gala Category Managers quickly evolved into a turning point, marking the beginning of a significant collaboration between the supplier and the retailer.

For nearly a year of negotiations, the two teams engaged in a joint design process that led to the customisation of an innovative and semi-permanent in-store solution, derived from an existing set of tools to support their clients' activities. Specifically, a wooden endcap display featuring the whole shaving category products was tailored to fit the design requirements. Both parties seized the opportunity by working closely together to align and satisfy their respective visions: a brand-oriented vision for P&G Italy and a category-oriented vision for Gala. The project was initially launched in November 2022 in the three top-performing Gala stores, showing trend increases in the shaving category of +37%, +24%, and +35% (source: Circana) after just six months. Following this success, the initiative was expanded to 12 additional stores, resulting in a 29.1% sales increase in the shaving category for Gala over the three years since the project's implementation.

The relationship described follows the principles of Category Captainship, which is applied to the collaboration between supplier and retailer with a focus on shelf-space allocation decisions. Although the project proved highly successful for both parties, it was not without challenges throughout its implementation. The proposed analysis aims to explore the factors that enable or hinder such collaborations, taking into account the perspectives and experiences of both parties.

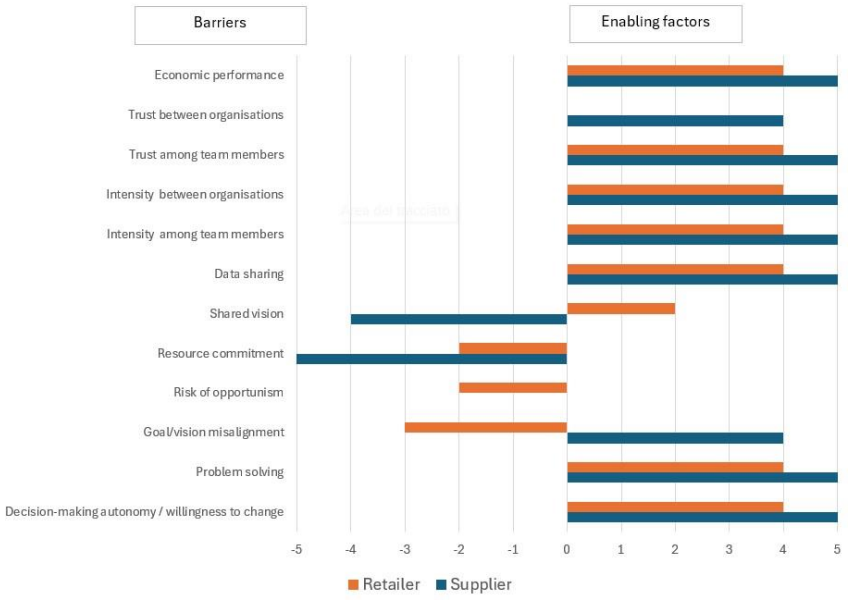

**Figure 1:** Perceived Barriers and Enablers in the Collaboration: Evaluation by Both Parties.

The factors under investigation were identified by reviewing the existing literature and analysing the specific case study. During two separate interviews, representatives from both companies were asked to evaluate each factor, indicating whether it acted as a barrier or an enabler. They were then asked to assign a score on a scale from -5 to +5: negative values (from -5 to 0) represent barriers, positive values (from 0 to +5) represent enabling factors, and a score of 0 indicates that the factor had no significant influence on the collaboration.

Figure 1 visually presents the results of the process, providing initial insights into the main differences and commonalities within the established relationship. The *economic performance*, intended as the expected benefit derived from the collaboration, proved to be a strong enabling element. Both parties identified it as a key starting point for the initiative, driven by the perceived opportunity for category and brand growth, especially considering previously

unsatisfactory sales trends and poor shelf presentation. In this study, *trust* refers to the belief in a partner's reliability, integrity, and consistent fulfilment of obligations (Sheu et al., 2006). This aspect was divided by distinguishing between *trust within the organisations*—P&G Italy and Gala—and *trust among the team members* involved in the project. While both companies consider trust between team members as a driver in the relationship, opinions diverge when it comes to inter-organisational trust: P&G Italy perceives it as a foundational element that later evolved into strong personal relationships, whereas Gala assigns a neutral value, highlighting the limited influence of the respective sales departments on the project's evolution and success. *Intensity*, identified as both the frequency and quality of communication, was also analysed from two different perspectives. The respondents were asked to define the intensity of formal communications between companies and informal ones between team members. The supplier highlighted a growing intensity over time in both dimensions: formal communication was necessary to ensure technical alignment at each stage of the project, while informal interactions among team members became more frequent and routine as the relationship progressed. The retailer rated both aspects positively, emphasising that inter-organisational communication was consistently formal, lean, and precise. Another aspect identified as fundamentally important by both companies is the *sharing of data* and results. Both companies emphasised the exceptional nature and value of data sharing in this project. P&G Italy described it as a rare, deeply collaborative case, defining their role as a knowledge sharer whose expertise was applied to the retailer's data to generate mutual advantage. Gala highlighted how the availability and exchange of objective data (e.g. on economic performance) significantly empowered the project's development. The first major misalignment in the ratings concerns the difficulty perceived by each company at the *intra-organisational* level in gaining *project approval* across different departments. While P&G Italy perceived this as a major challenge, as the relatively small size of the client was seen as insufficient to justify the significant resource investment, Gala stated that, despite the project's complexity, it progressed step by step without major internal obstacles or resistance, aside from some initial scepticism. The *resource commitment* differed between the two parties: the supplier invested financial resources, viewing the need to justify such investment in a complex context as a deterrent, while the retailer's commitment involved time and personnel, with complexity initially acting as a barrier, later overcome, yet still weighing on the relationship. Figure 1 shows that the *risk of opportunism* was perceived only by the retailer, who feared that the leader's strong positioning could steer the project toward a brand-oriented vision. P&G Italy rated this factor as neutral, acknowledging a minor, non-negative form of opportunism, viewed more as a drive for growth and change than as exploitation. The *vision misalignment at an inter-organisational level* received opposing scores: Gala rated it -3, linking the evaluation to the initial deep mediation stage between parties to shift from a supplieroriented to a category-oriented solution. Conversely, P&G Italy rated it +4, considering their brand vision aligned with the category vision due to their leading market share. *Problem-solving*, defined as the ability to effectively address arising issues, was described by both parties as a highly enabling factor in the success of the project. Gala highlighted the mutual determination to overcome obstacles and bring internally negotiated solutions forward, while P&G Italy emphasised their full commitment and availability throughout the process. Finally, *openness to change*, defined here as the internal willingness to embrace change through an entrepreneurial mindset and courage, was positively evaluated by both companies. The deliberate effort to break organisational inertia and challenge the status quo among team members was essential and enabled the project's success, making the experience feel unique and rewarding.

## 4. Conclusions And Implications

The investigation leads to very interesting results related to the differing perceptions of the relationship's nature. While the supplier tends to provide extremely positive evaluations

across most of the considered dimensions, the retailer, by contrast, highlights several critical issues. This misalignment in perception and assessments reveals a difference in the parties' attitudes: the supplier, backed by a stronger bargaining power, appears to take a somewhat "paternalistic" role, while the retailer, characterised by its minor dimensions, tries to "elevate" its own importance within the relationship. Although this overall dynamic supports the functioning of the commercial partnership, evident "areas of conflict" remain, considered as dimensions that are perceived in a diametrically opposed way (such as shared vision and goal/vision misalignment). This grey area is particularly intriguing and suggests avenues for future research aimed at understanding the intra-organisational dynamics that shape such decisions.

## Abstract

In recent decades, supplier–retailer relationships have evolved toward more integrated, value-driven collaboration models, moving beyond traditionally divergent perspectives. This paper presents an emblematic case study of the collaboration between Procter & Gamble Italy and Gala Supermarkets, analysing the enablers and barriers in their supplier–retailer relationship within a Category Captainship theoretical framework.

*Keywords: Category Captainship; Category Management; Supplier-Retailer, Relationship; Space-allocation; Display; Trade Marketing*

## 1. Introduction and Theoretical Background

Significant transformations in distribution channels have reshaped the relationship between manufacturers and retailers over time (Hibbard et al., 2001). These changes have enhanced the strategic salience of retailers in the value creation process within distribution channels. Consequently, recent decades have witnessed the development of a cooperative paradigm, promoting heightened collaboration and integration between suppliers and retailers (Day, 2000) from a value-centric perspective (Grönroos, 1997). This occurred despite the two parts traditionally holding different viewpoints. The manufacturer views the relationship from a brand-oriented perspective. At the same time, the retailer aims to optimise the whole assortment performance (Bandyopadhyay et al., 2009), or, from a Category Management perspective, to improve the categories' performance (Basuroy et al., 2001). And it is precisely within the literature on category management that the concept of Category Captainship (CC) emerged, serving as the theoretical framework for this paper. CC is defined as "a practice wherein a retailer relies on a leading manufacturer (often referred to as the category captain) to make strategic recommendations regarding category management decisions" (Kurtuluş et al., 2014). The existing literature on CC has primarily focused on the efficacy of this approach in addressing context-specific and technical issues. This includes studies on category results in terms of space allocation (Wu et al., 2024), the transmission of information (Timoumi et al., 2023), or the competitive implications among the leading manufacturer, the retailer, and other suppliers in the category (Alan et al., 2017). In most cases, benchmarking models were employed, often drawing on non-managerial literature. Very little attention has been given to this approach in terms of supplier-retailer interaction, delving into the repercussions that the CC can have on their dyadic relationship. Some insight emerged from the existing literature regarding the effect of the dynamics underlying the relationship. Bandyopadhyay et al. (2009) highlighted how the CC approach is based on an intense exchange of information between

the two parties, exposing them to sources of tensions such as information asymmetry or conflict of interest (Kurtulus and Toktay, 2005). No study, however, has specifically explored the factors that can positively impact the supplier-retailer relationship under category captainship, such as trust (Kumar, 1996).

This research aims to explore the factors that facilitate and inhibit the relationship between manufacturers and retailers in the context of applying a CC approach, and whether the perception of these factors creates alignment or misalignment between the two parties (Corsaro and Sneota, 2011).

## 2. Methodology

The methodological approach used in this research is the single case study (Yin, 2014), focusing on a specific supplier-retailer dyad (P&G Italy and Gala Supermarkets). This research design enabled the observation and comprehension of firm behaviour within a real-world setting (Easton, 2010) and the collection of detailed insights into the decisions firms undertook to solve practical issues (Gibbert and Ruigrok, 2010; Siggelkow, 2007). The choice of this specific case stems from a twofold consideration: on one hand the supplier's prominence is broadly acknowledged in the Category Captainship literature (Bandyopadhyay et al., 2009); on the other hand, the innovative nature of the initiative arises from the supplier's willingness to experiment with collaborative projects, even with small or medium-sized retailers. These conditions establish the case as unique and theoretically relevant (Yin, 1994). Furthermore, the study adopted a longitudinal nature, as one of the authors obtained information from the early stages of the project's implementation in stores, capturing all emerging dynamics during the observation period (Aaboen et al., 2012; Leonard-Barton, 1990). In terms of data gathering, the information needed to prepare the business case came from a variety of sources. First, several in-depth interviews were conducted, separately involving managers from both companies (Table 1).

| R4 | Category Manager |
| R5 | Category Manager |

**Table 1:** The interviewees' professional roles

Overall, during the two-year period 2024-2025, nine interviews were conducted, four with the supplier and five with the retailer. To address complex topics, a research protocol based on open-ended questions was followed. These questions were based on key themes from existing literature and on insights from document analysis (Krosnick, 2018). All interviews were conducted face-to-face, recorded and then transcribed in full. The results were subsequently discussed between the authors. In case of uncertainties or missing details, clarifications were sought directly from the interviewees through telephone calls and emails (Dubois and Gadde, 2002). Secondly, two seminars were organised as part of a university course dedicated exclusively to this experience. The frequency of opportunities for

discussion and data collection is the result of a decade-long relationship during which numerous initiatives and presentations of the supplier's activities were organised. Finally, the research also included the acquisition of secondary data such as reports, catalogues and company presentations. Another key secondary source was the reports of market research companies, which allowed us to identify the performance achieved by the project. To ensure the rigour of the research, all primary and secondary data that appeared ambiguous or needed clarification were shared with the interviewees for validation (Creswell and Miller, 2000). In the last phase of data analysis, the collected information was organised in a systematic way (Miles and Huberman, 1994). The transcribed interviews and all other data were examined separately by the authors. The main results were then compared to reach a shared perspective. In case of discrepancies, a crosscheck of the primary and secondary data was carried out through triangulation (Yin, 2014). This method, therefore, helped to understand the nature and magnitude of the factors that most influence the supplier-retailer relationship.

## 3. The Case Study

The emblematic case study presented focuses on the strategic collaboration between Procter & Gamble Italy (P&G Italy), the Italian branch of an American multinational consumer goods corporation, and Gala Supermarkets, a regional grocery retail chain belonging to the Abbondanza Group. Abbondanza manages 43 stores under the Gala brand across Central Italy. The group's operations are mainly concentrated in Umbria, with additional presence in the Tuscany and Marche regions. By 2020, Gala experienced a significant decline in sales within the shaving category, with negative trends affecting both the male and female segments. Products were placed near the checkout area, a choice initially driven more by theft prevention logic. To provide more space for impulse purchases in the checkout area (e.g., candy, chocolate, dried fruit), shaving products were relocated to an endcap in front of the checkout barrier. Nevertheless, the endcap end was populated with numerous other products, such as batteries and game cards, resulting in a non-optimal shopping experience.

The data analysis, based on a study of loyalty card data, revealed an opportunity gap. Performance in the shaving category was below the company average and underperformed relative to the market. While Gala's category managers began internally reflecting on potential strategies to improve category performance, they received an email from P&G's Category Manager proposing a joint collaboration. In fact, P&G internally developed a specific unit, namely the Shopper Based Design Team (SBD), dedicated to collaboration with retailers, focusing on category management strategies, implementing customised assortment revisions, planograms, and in-store display solutions. This unit operates independently of marketing and sales teams, often through non-disclosure agreements, helping every customer find the optimal category display solution. The SBD Team, prompted by the Gala's market concerns – despite their dominant position, with Gillette holding 90% of the market share – had initiated an internal reflection on what P&G could do differently or better to strengthen Gala's position and support growth in this key market. This reflection ultimately led to the first contact with Gala and the proposal of a potential solution. What began as a simple email exchange between the P&G and Gala Category Managers quickly evolved into a turning point, marking the beginning of a significant collaboration between the supplier and the retailer.

For nearly a year of negotiations, the two teams engaged in a joint design process that led to the customisation of an innovative and semi-permanent in-store solution, derived from an existing set of tools to support their clients' activities. Specifically, a wooden endcap display featuring the whole shaving category products was tailored to fit the design requirements. Both parties seized the opportunity by working closely together to align and satisfy their respective visions: a brand-oriented vision for P&G Italy and a category-oriented vision for

Gala. The project was initially launched in November 2022 in the three top-performing Gala stores, showing trend increases in the shaving category of +37%, +24%, and +35% (source: Circana) after just six months. Following this success, the initiative was expanded to 12 additional stores, resulting in a 29.1% sales increase in the shaving category for Gala over the three years since the project's implementation.

The relationship described follows the principles of Category Captainship, which is applied to the collaboration between supplier and retailer with a focus on shelf-space allocation decisions. Although the project proved highly successful for both parties, it was not without challenges throughout its implementation. The proposed analysis aims to explore the factors that enable or hinder such collaborations, taking into account the perspectives and experiences of both parties.

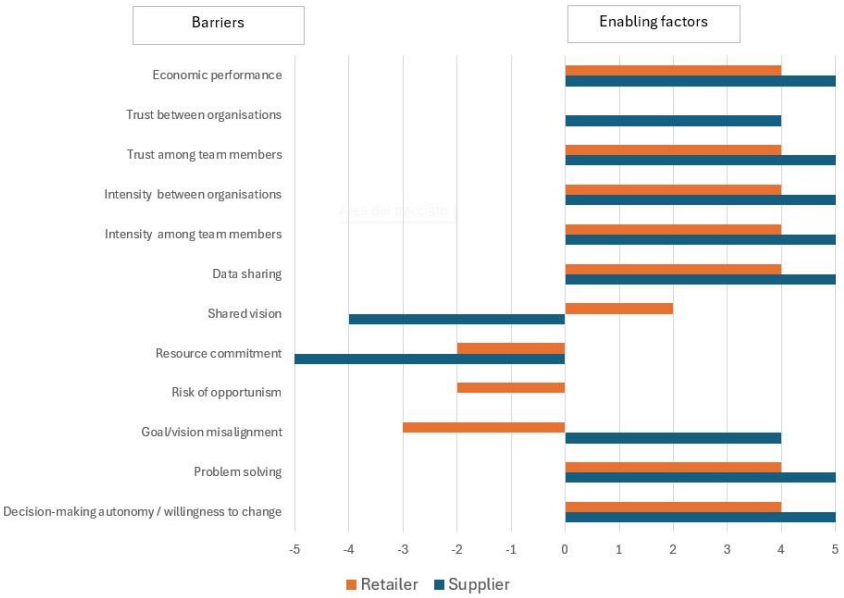

**Figure 1:** Perceived Barriers and Enablers in the Collaboration: Evaluation by Both Parties

The factors under investigation were identified by reviewing the existing literature and analysing the specific case study. During two separate interviews, representatives from both companies were asked to evaluate each factor, indicating whether it acted as a barrier or an enabler. They were then asked to assign a score on a scale from -5 to +5: negative values (from -5 to 0) represent barriers, positive values (from 0 to +5) represent enabling factors, and a score of 0 indicates that the factor had no significant influence on the collaboration.

Figure 1 visually presents the results of the process, providing initial insights into the main differences and commonalities within the established relationship. The economic performance, intended as the expected benefit derived from the collaboration, proved to be a strong enabling element. Both parties identified it as a key starting point for the initiative, driven by the perceived opportunity for category and brand growth, especially considering previously unsatisfactory sales trends and poor shelf presentation. In this study, trust refers to the belief in a partner's reliability, integrity, and consistent fulfilment of obligations (Sheu et al., 2006). This aspect was divided by distinguishing between trust within the organisations—P&G Italy and Gala—and trust among the team members involved in the project. While both companies consider trust between team members as a driver in the

relationship, opinions diverge when it comes to inter-organisational trust: P&G Italy perceives it as a foundational element that later evolved into strong personal relationships, whereas Gala assigns a neutral value, highlighting the limited influence of the respective sales departments on the project's evolution and success. Intensity, identified as both the frequency and quality of communication, was also analysed from two different perspectives. The respondents were asked to define the intensity of formal communications between companies and informal ones between team members. The supplier highlighted a growing intensity over time in both dimensions: formal communication was necessary to ensure technical alignment at each stage of the project, while informal interactions among team members became more frequent and routine as the relationship progressed. The retailer rated both aspects positively, emphasising that inter-organisational communication was consistently formal, lean, and precise. Another aspect identified as fundamentally important by both companies is the sharing of data and results. Both companies emphasised the exceptional nature and value of data sharing in this project. P&G Italy described it as a rare, deeply collaborative case, defining their role as a knowledge sharer whose expertise was applied to the retailer's data to generate mutual advantage. Gala highlighted how the availability and exchange of objective data (e.g. on economic performance) significantly empowered the project's development. The first major misalignment in the ratings concerns the difficulty perceived by each company at the intra-organisational level in gaining project approval across different departments. While P&G Italy perceived this as a major challenge, as the relatively small size of the client was seen as insufficient to justify the significant resource investment, Gala stated that, despite the project's complexity, it progressed step by step without major internal obstacles or resistance, aside from some initial scepticism. The resource commitment differed between the two parties: the supplier invested financial resources, viewing the need to justify such investment in a complex context as a deterrent, while the retailer's commitment involved time and personnel, with complexity initially acting as a barrier, later overcome, yet still weighing on the relationship. Figure 1 shows that the risk of opportunism was perceived only by the retailer, who feared that the leader's strong positioning could steer the project toward a brand-oriented vision. P&G Italy rated this factor as neutral, acknowledging a minor, non-negative form of opportunism, viewed more as a drive for growth and change than as exploitation. The vision misalignment at an inter-organisational level received opposing scores: Gala rated it -3, linking the evaluation to the initial deep mediation stage between parties to shift from a supplieroriented to a category-oriented solution. Conversely, P&G Italy rated it +4, considering their brand vision aligned with the category vision due to their leading market share. Problem-solving, defined as the ability to effectively address arising issues, was described by both parties as a highly enabling factor in the success of the project. Gala highlighted the mutual determination to overcome obstacles and bring internally negotiated solutions forward, while P&G Italy emphasised their full commitment and availability throughout the process. Finally, openness to change, defined here as the internal willingness to embrace change through an entrepreneurial mindset and courage, was positively evaluated by both companies. The deliberate effort to break organisational inertia and challenge the status quo among team members was essential and enabled the project's success, making the experience feel unique and rewarding.

## 4. Conclusions and Implications

The investigation leads to very interesting results related to the differing perceptions of the relationship's nature. While the supplier tends to provide extremely positive evaluations across most of the considered dimensions, the retailer, by contrast, highlights several critical issues. This misalignment in perception and assessments reveals a difference in the parties' attitudes: the supplier, backed by a stronger bargaining power, appears to take a somewhat "paternalistic" role, while the retailer, characterised by its minor dimensions, tries to "elevate" its own importance within the relationship. Although this overall dynamic supports the

functioning of the commercial partnership, evident "areas of conflict" remain, considered as dimensions that are perceived in a diametrically opposed way (such as shared vision and goal/vision misalignment). This grey area is particularly intriguing and suggests avenues for future research aimed at understanding the intra-organisational dynamics that shape such decisions.

## Abstract

Sono molti gli studi che hanno evidenziato come la manovra delle leve dell'in-store marketing da parte dei retailer possa influenzare il comportamento e le scelte d'acquisto dei consumatori. Tuttavia, benché siano stati condotti molteplici esperimenti aventi l'obiettivo di dimostrare quali strategie adottare per raggiungere tale scopo con riferimento ai prodotti a più alta marginalità, lo stesso non accade per la promozione delle alternative più sane. Infatti, gli acquisti delle referenze dal miglior indice nutrizionale vengono considerati a maggior pianificazione e per questo si presuppone siano meno influenzati dall'ambiente di vendita. Questa prospettiva trascura il potenziale della comunicazione in store e delle norme sociali descrittive dinamiche nel modellare le decisioni d'acquisto dei consumatori. Tali norme possono, infatti, fungere da scorciatoie cognitive (euristiche), semplificando il processo decisionale in contesti caratterizzati da sovraccarico informativo come quello del punto vendita grocery. Il presente studio esplora il potenziale delle norme sociali descrittive dinamiche nell'orientare le preferenze alimentari. In particolare, si presentano i risultati di un esperimento condotto per testare l'efficacia di una comunicazione a scaffale basata su messaggi contenenti una norma sociale descrittiva dinamica. Le evidenze empiriche mostrano un aumento significativo nella scelta dei prodotti dal miglior indice nutrizionale comunicati, soprattutto tra i consumatori con basso autocontrollo. Inoltre, si dimostra come questo tipo di comunicazione possa migliorare la percezione di salubrità sia dei prodotti offerti sia dell'assortimento nel suo complesso.

## 1. Introduzione

Negli ultimi 50 anni il fenomeno dell'obesità si è diffuso in misura crescente a livello globale, al punto da essere considerato una vera e propria epidemia (d'Errico et al., 2022). L'adiposità eccessiva rappresenta uno dei principali fattori di rischio per la morbilità e la mortalità per diabete mellito di tipo 2, malattie cardiovascolari, ictus e 13 tipi di cancro (Higgs et al., 2019; Malik et al., 2013; Abbade & Dewes, 2015; World Health Organization, 2022); contribuendo ad una riduzione dell'aspettativa di vita che va dai 5 fino ai 20 anni (d'Errico et al., 2022; Bittner & Kulesz, 2015). È stato stimato che entro il 2030 le malattie non trasmissibili (NCDs) causeranno oltre il 75% di tutti i decessi a livello globale (Doustmohammadian & Bazhan, 2021). Secondo l'OMS (World Health Organization, 2022), se non vi sarà un'inversione di tendenza, i costi globali del sovrappeso e dell'obesità raggiungeranno i 3

trilioni di dollari statunitensi all'anno entro il 2030 e supereranno i 18 trilioni di dollari statunitensi entro il 2060. Dato l'impatto negativo dell'epidemia di obesità sulla salute, sulle finanze pubbliche e sul benessere complessivo della società, è di fondamentale importanza incoraggiare gli individui ad adottare un'alimentazione sana.

È ormai largamente condiviso come una dieta equilibrata promuova la longevità e contribuisca a prevenire malattie croniche e degenerative (Cicero et al., 2023). Sebbene esistano diverse definizioni di "alimentazione sana", in generale, si considerano sani gli alimenti sicuri e nutrienti. Un alimento nutriente "fornisce nutrienti benefici (come proteine, vitamine, minerali, amminoacidi essenziali, acidi grassi essenziali, fibre alimentari) ed è caratterizzato da una minima presenza di elementi potenzialmente dannosi (ad esempio anti-nutrienti, quantità eccessive di sodio, grassi saturi, zuccheri)" (Neufeld et al., 2021, p.24). In particolare, il termine "fibra alimentare" fa riferimento ai carboidrati non digeribili di origine vegetale, che rappresentano uno dei componenti fondamentali di una dieta sana (Abdullah et al., 2015). Un adeguato apporto di fibre comporta molteplici benefici per la salute e riduce significativamente il rischio di sviluppare una condizione di obesità e le malattie non trasmissibili ad essa correlate (Kaczmarczyk et al., 2012; Gouseti et al., 2019). Tuttavia, sia in Italia che negli altri Paesi occidentali, il consumo di fibre - nonostante mostri una tendenza in crescita - rimane comunque al di sotto dei livelli raccomandati (Tao et al., 2023; GS1 Italy, 2022; 2024; AIRC - Fondazione per la Ricerca sul Cancro, 2021). Inoltre, recenti indagini condotte in Italia confermano come il consumo di alimenti ricchi di fibre sia ancora disomogeneo, con frequenze più elevate nelle donne e nei soggetti fisicamente attivi, ma significativamente più basse tra le persone obese o inattive (Galfo et al., 2024).

Alla luce di tali evidenze, appare opportuno definire strategie di marketing mirate, volte a stimolare il consumo di alimenti ricchi di fibre e caratterizzati, in generale, da profili nutrizionali migliori. Tra le principali leve di marketing è ampiamente riconosciuta l'importanza strategica del punto vendita, che funge da media critico, capace - mediante una pluralità di stimoli sensoriali - di riattivare nei consumatori esigenze momentaneamente dimenticate, sollecitare bisogni latenti e orientare i processi decisionali verso comportamenti d'acquisto non pianificati (Bellini et al., 2017). Tuttavia, sebbene il contesto di vendita rappresenti un potente strumento di influenza comportamentale, molti retailer continuano a promuovere prodotti e bevande ad alta densità energetica e poveri di nutrienti, aumentandone visibilità e accessibilità, con il risultato di rendere l'ambiente di acquisto "obesogeno" (Larsen et al., 2022).

Benché numerosi studi abbiano indagato i fattori che promuovono comportamenti alimentari più salutari, relativamente pochi si sono concentrati sul ruolo dei retailer nell'incoraggiare scelte alimentari più sane attraverso strategie di marketing in-store (Escaron et al., 2013; Cameron et al., 2016; Chan et al., 2021). Inoltre, diversi approcci di marketing nutrizionale si basano sull'idea che fare scelte alimentari sane richieda intenzionalità, pianificazione e autocontrollo (Glanz et al., 2012; Karpyn et al., 2020). Questa prospettiva non riconosce il potenziale della comunicazione in-store e delle norme sociali - in particolare delle norme descrittive - nel plasmare le decisioni dei consumatori.

È ampiamente riconosciuto come gli interventi basati sulle norme sociali possano influenzare fortemente il comportamento, specificamente i comportamenti prosociali, inclusi quelli alimentari (Robinson et al., 2014; Cruwys et al., 2015; Higgs et al., 2019). Se intese nella loro dimensione dinamica, queste norme non si limitano a descrivere consuetudini diffuse ma trasmettono l'idea che un cambiamento sia già in atto e socialmente approvato (es. "Negli ultimi anni, i clienti di questo punto vendita hanno consumato più fibre"). Ciò può spingere le persone a rivalutare gli ostacoli percepiti, ritenendoli più gestibili e il cambiamento più desiderabile (Gelfand et al., 2024; Sparkman & Walton, 2017).

Nonostante le prove emergenti sul potere persuasivo delle norme descrittive dinamiche, poche ricerche le hanno applicate direttamente alla comunicazione in punto vendita e, almeno a conoscenza degli autori, è stata riposta minore attenzione su prodotti dal miglior indice nutrizionale. Inoltre, benché la letteratura suggerisca che il gruppo di riferimento (es. "altri clienti") che mette in atto un determinato comportamento – se "vicino" al soggetto esposto alla norma sociale – possa amplificare la conformità ai messaggi normativi (Çoker et al., 2022), non è stato ancora approfondito tale aspetto con riferimento all'utilizzo delle norme sociali descrittive dinamiche per la promozione di opzioni di prodotto più sane in punto vendita.

## 2. Revisione della letteratura

### 2.1. La comunicazione a scaffale come leva di Nutrition Shopper Marketing

Gli studi comportamentali e neuroscientifici che hanno esaminato gli effetti delle promozioni in-store sul comportamento dei consumatori sono concordi nell'affermare che le attività di shopper marketing - definito come "l'utilizzo di stimoli di marketing, sviluppati sulla base di una profonda comprensione del comportamento dell'acquirente, progettati per costruire il valore del marchio, coinvolgere l'acquirente e indurlo ad effettuare un acquisto" (GMA e Deloitte, 2007) - aumentano la salienza degli stimoli sensoriali e contribuiscono alla perdita di autocontrollo da parte dei consumatori che, di conseguenza, attuano comportamenti gratificanti scegliendo referenze ipercaloriche (Labban et al., 2021).

La probabilità di effettuare acquisti non pianificati all'interno dei negozi alimentari è particolarmente elevata (dal 42% al 93%) (Payne et al., 2014), e si stima che un tipico carrello della spesa sia costituito per una percentuale che va dal 20% al 60% da prodotti non presenti sulla lista della spesa (Adam et al., 2017). Gli acquisti d'impulso, nonostante generino maggiori profitti per i retailer spesso hanno un impatto negativo sulla salute dei consumatori, contribuendo ad aumentare il rischio che questi ultimi sviluppino una condizione di obesità e malattie croniche ad essa connesse (Thorndike, 2020; Grandi et al., 2019).

Dunque, in quanto punto diretto di contatto tra domanda e offerta, i retailer possono svolgere un ruolo strategico nell'orientare le scelte dei consumatori verso prodotti più salutari e nel migliorare la qualità complessiva della dieta attraverso l'implementazione di strategie di 'Nutrition Shopper Marketing' (Grandi & Cardinali, 2021a). Il Nutrition Shopper Marketing attribuisce una propria dimensione al comportamento d'acquisto, riconosce la complessità dell'ambiente di vendita e non presuppone la razionalità dei processi decisionali. Secondo tale prospettiva le attività e gli stimoli dell'in-store marketing possono essere utilizzati in chiave salutistica per orientare le scelte verso prodotti dal miglior indice nutrizionale (Grandi & Cardinali, 2021a).

Tuttavia, è importante notare come nel contesto della GDO, la promozione di scelte alimentari salutari debba confrontarsi con vincoli economici e operativi che rendono difficile l'adozione di interventi strutturali permanenti (Gupta et al., 2022). In questo scenario, la comunicazione a scaffale rappresenta una leva d'intervento economica, flessibile e facilmente replicabile (Hobin et al., 2017). Messaggi visivi - come stopper o banner - possono essere inseriti senza modificare l'organizzazione dello scaffale e, se ben progettati, possono influenzare efficacemente le preferenze dei consumatori (Cadario & Chandon, 2020; Slapø et al., 2021; Wolgast et al., 2022). La comunicazione a scaffale può, pertanto, fungere da veicolo ideale per messaggi comportamentali ispirati alla psicologia sociale. In particolare, l'inserimento di messaggi contenenti norme sociali descrittive nella comunicazione a scaffale potrebbe configurarsi come una strategia ad alto potenziale persuasivo, in grado di orientare il comportamento dei consumatori senza ricorrere a restrizioni o incentivi economici diretti.

## 2.2. Le norme sociali descrittive dinamiche per scelte più sane

Numerosi studi hanno evidenziato come le decisioni individuali siano fortemente influenzate dal comportamento degli altri, soprattutto di persone percepite come simili o appartenenti allo stesso gruppo di riferimento (Farrow et al., 2017). In questo contesto, i concetti di *riprova sociale* ed *effetto gregge* descrivono due dinamiche distinte ma complementari: la prima si riferisce alla percezione di un comportamento come appropriato perché ampiamente diffuso, la seconda alla tendenza a conformarsi al comportamento altrui (Begho & Liu, 2024). Questi meccanismi contribuiscono a definire quanto viene comunemente inteso come *norma sociale*. Le norme sociali sono regole o aspettative condivise che orientano il comportamento degli individui all'interno di un gruppo, anche in assenza di obblighi formali o coercizione. Esse operano come guide vincolanti che definiscono ciò che è appropriato o atteso in un determinato contesto sociale (Cialdini & Trost, 1998).

Anche il comportamento alimentare viene influenzato da dinamiche ambientali esogene e, di conseguenza, dal contesto sociale (Ball et al., 2010; Abbade & Dewes, 2015). Infatti, un'ampia letteratura ha dimostrato come le persone tendano a imitare i propri pari nel momento in cui devono prendere decisioni relative alla scelta del cibo (Farrow et al., 2017; Cruwys et al., 2015). Questo fenomeno è noto come *modelling* e si riferisce alla tendenza degli individui a modellare le proprie scelte alimentari osservando quelle altrui. Il comportamento dei membri del gruppo di riferimento può così trasformarsi in una norma implicita, che fornisce indicazioni su ciò che è considerato socialmente appropriato in ambito alimentare. Poiché l'essere umano è, per sua natura, un animale sociale, tende a conformarsi a tali norme anche per ricavarne approvazione e gratificazione (Higgs et al., 2019).

In particolare, la Focus Theory of Normative Conduct (Cialdini et al., 1990) distingue tra norme ingiuntive (comportamenti socialmente approvati o disapprovati) e norme descrittive (comportamenti comunemente attuati). Le norme descrittive influenzano il comportamento attraverso un meccanismo di prova sociale implicita. L'osservazione del comportamento altrui, infatti, fornisce informazioni presuntivamente corrette sull'azione da intraprendere, contribuendo a soddisfare il bisogno di agire in modo adeguato (Mollen et al., 2021; Cialdini & Trost, 1998). In contesti di scelta caratterizzati da incertezza o sovraccarico informativo - come nel caso dei punti vendita grocery - le norme sociali descrittive possono fungere da scorciatoie cognitive (o euristiche) per semplificare il processo decisionale (Higgs, 2015). Infatti, affinché le informazioni nutrizionali possano essere incorporate nel processo decisionale dei consumatori , queste non dovrebbero essere solo disponibili al momento dell'acquisto, ma anche facilmente "elaborabili" (Grandi et al., 2021b).

L'efficacia di tali norme nel promuovere scelte alimentari salutari è stata confermata da numerosi studi condotti in contesti sperimentali e reali, come mense scolastiche e ristoranti (Mollen et al., 2013; Higgs et al., 2019; Robinson et al., 2014). Oltre a influenzare direttamente il comportamento alimentare, le norme sociali descrittive possono modificare il modo in cui le persone percepiscono le caratteristiche qualitative dei cibi. Infatti, quando un alimento è presentato come scelto dalla maggioranza, può essere considerato più sano o appetibile (Drolet-Labelle et al., 2025; Maldoy et al., 2021; Higgs, 2015; Templeton et al., 2016)

Le norme descrittive appaiono maggiormente efficaci quando i consumatori si identificano con il gruppo di riferimento che attua un determinato comportamento (Chung & Rimal, 2016). Tale efficacia risulta ancora più marcata quando il gruppo è percepito come socialmente vicino, rilevante e saliente, ad esempio nel caso di una comunità locale rispetto a una nazionale (Lapinski & Rimal, 2005). Studi sperimentali hanno dimostrato che riferimenti normativi a gruppi percepiti come prossimi (es. ospiti della stessa stanza o residenti locali) risultano più persuasivi rispetto a quelli rivolti a gruppi distanti o generalizzati

(Goldstein et al., 2008), suggerendo come sia proprio la vicinanza sociale e identitaria del gruppo di riferimento a rafforzare la pressione normativa e, di conseguenza, la probabilità di conformarsi. Nel contesto del comportamento alimentare, gli studi hanno trovato prove di come il gruppo di riferimento presentato nel messaggio contenente una norma sociale sia in grado di moderare il livello di influenza delle norme sociali nel consumo o nell'evitamento di determinati alimenti dimostrando, anche in questo caso, come una maggiore identificazione con il gruppo di riferimento sia in grado di aumentare la conformità alla norma (Stok et al., 2012; Çoker et al., 2022; Sharps & Robinson, 2016)

È importante notare come le norme sociali non siano statiche ma, piuttosto, evolvano continuamente. In particolare, l'allineamento con le tendenze sociali più ampie può favorire l'adozione di nuove norme. Infatti, le persone sono più propense a cambiare i propri comportamenti se percepiscono il cambiamento in linea con un trend generale. Dunque, le norme dinamiche possono portare le persone a rivalutare gli ostacoli al cambiamento e a percepirli come meno significativi rispetto a quanto inizialmente previsto (Gelfand et al., 2024). Di conseguenza, i messaggi contenenti una norma sociale descrittiva dinamica si rivelano, talvolta, più efficaci di quelli statici nel modificare comportamenti prosociali e sostenibili (Sparkman & Walton, 2017; Sparkman et al., 2020; Carfora et al., 2022).

Nel contesto della necessità di aumentare il consumo di fibre, il comportamento au- spicabile di scegliere alimenti che contribuiscano ad un maggiore apporto di tale nutriente nella dieta non rappresenta la norma. Di conseguenza, fare riferimento ad una norma descrittiva statica implicherebbe comunicare che solo una minoranza della popolazione consuma alimenti ricchi di fibre, con il rischio di demotivare i destinatari dall'adottare tale comportamento; dunque, ricorrere ad una norma descrittiva dinamica permetterebbe di superare tale limite. Sulla base di queste evidenze, sono state formulate le seguenti ipotesi:

- H1: la presenza di una comunicazione di marketing nutrizionale a scaffale, che fa ricorso ad un messaggio basato su una norma sociale descrittiva dinamica, aumenta la scelta di prodotti dal miglior indice nutrizionale (ricchi di fibre).
- H2: la presenza di una comunicazione di marketing nutrizionale a scaffale, che fa ricorso ad un messaggio basato su una norma sociale descrittiva dinamica, migliora la percezione di salubrità dei prodotti scelti e dell'assortimento presente a scaffale.
- H3: l'efficacia della comunicazione di marketing nutrizionale a scaffale, che fa ricorso ad un messaggio basato su una norma sociale descrittiva dinamica, è influenzata dal gruppo di riferimento.

Le norme sociali descrittive operano come scorciatoie cognitive e permettono agli individui di basarsi su modelli sociali osservati piuttosto che su ragionamenti deliberati. Di conseguenza, la loro efficacia tende ad aumentare in contesti caratterizzati da carichi cognitivi elevati o da situazioni in cui le risorse attentive e di autocontrollo sono limitate (Mollen et al., 2013). Alla luce di tali evidenze, il presente studio intende anche dimostrare come i consumatori con basso autocontrollo - che, secondo la letteratura, può essere misurato attraverso, ad esempio, il livello di fame (Cheung et al., 2017) o il 'Need for Cognition' (NFC) (Cacioppo & Petty., 1982) - siano più propensi a scegliere prodotti contrassegnati da una comunicazione basata su norme sociali in circostanze in cui l'impegno cognitivo richiesto è maggiore come in un contesto di vendita. In particolare, secondo la concettualizzazione di Cacioppo e Petty (1982), il NFC indica la misura in cui gli individui differiscono nella loro propensione a impegnarsi e a provare piacere nelle attività cognitive che richiedono uno sforzo. Alcune persone manifestano una motivazione relativamente bassa per compiti che implicano un notevole impegno mentale, mentre altre si dedicano con costanza e apprezzamento ad attività cognitivamente impegnative (Petty et al., 2009). Ne consegue la definizione di una quarta ed ultima ipotesi:

- H4: **a**: I consumatori in condizioni di basso autocontrollo, misurato tramite il livello di fame, sono più inclini a scegliere prodotti salutari in presenza di una comunicazione normativa. **b**: I consumatori con basso Need for Cognition (NFC) sono più inclini a scegliere prodotti salutari in presenza di una comunicazione normativa.

## 3. Metodologia

Con l'obiettivo di implementare un esperimento in ambiente reale, in due punti vendita di una grande catena della GDO italiana, è stato preliminarmente condotto un pre-test in ambiente simulato, su un campione di 200 partecipanti (Tabella A in Appendice). Il pre-test ha seguito un disegno sperimentale misto 3 (categoria merceologica) × 2 (gruppo di riferimento nella comunicazione) con componenti between e within-subjects. In particolare, è stato testato l'effetto della comunicazione a scaffale contenente un messaggio basato su norme sociali descrittive dinamiche sulla scelta di prodotti a marchio del distributore ricchi di fibre, appartenenti alla categoria della prima colazione. Ogni partecipante è stato esposto a tutte le condizioni sperimentali previste (within-subjects), ma assegnato casualmente a uno dei tre scaffali virtuali (biscotti, cereali o merendine) e a una delle due versioni del messaggio normativo (gruppo di riferimento locale vs nazionale) secondo uno schema between-subjects.

### 3.1. Procedura e stimoli sperimentali

Dopo il reclutamento, i partecipanti hanno compilato un questionario di profilazione per raccogliere informazioni socio-demografiche, psicografiche e comportamentali. Successivamente, ogni soggetto riceveva un codice alfanumerico indicante la condizione sperimentale assegnata (tipo di comunicazione, categoria merceologica) e l'ordine di convocazione individuale, utile alla randomizzazione complessiva del campione. Il compito consisteva nello svolgere una shopping mission simulata finalizzata a rilevare cambiamenti nella percezione dell'assortimento presente a scaffale e dei prodotti sani scelti e nella scelta di tre referenze per il proprio benessere prima e dopo l'esposizione al messaggio (Tabella 1). I dati venivano raccolti tramite questionari somministrati dallo sperimentatore (Tabella B. in Appendice per scale utilizzate).

| Fase | Condizione di scelta | Stimolo visivo | Compito del partecipante | Misure raccolte |
|---|---|---|---|---|
| Prima scelta | Libera, senza indicazioni specifiche | Scaffale con prodotti appartenenti a una delle tre categorie oggetto dello studio | Scegliere 3 referenze immaginando di fare la spesa | Livello di fame (scala Likert 1-7) |
| Seconda scelta | Condizionata al benessere personale | Stesso scaffale della prima scelta | Scegliere 3 referenze immaginando di fare la spesa, pensando al proprio | Grado di accordo/disaccordo su affermazioni relative alla scelta effettuata e alla percezione dell'assortimento presente a scaffale |

| | | | | |
|---|---|---|---|---|
| | | | benessere personale | |
| Terza scelta | Condizionata al benessere personale, con comunicazione normativa | Scaffale con banner normativo (inizio/fine scaffale) e reglette sotto i prodotti salutari | Scegliere 3 referenze immaginando di fare la spesa, pensando al proprio benessere personale | Grado di accordo/disaccordo su affermazioni relative alla scelta effettuata e alla percezione dell'assortimento presente a scaffale |

**Tabella 1:** Descrizione delle tre fasi di scelta nel protocollo sperimentale

Il test è avvenuto proiettando la ricostruzione in scala degli scaffali contenenti le categorie d'interesse realizzata attraverso il programma di grafica "Canva". La riproduzione degli scaffali consisteva in un video che permetteva al partecipante di osservare l'intero scaffale nel verso di percorrenza e nel verso opposto, per tentare di smorzare l'effetto di tale variabile.

Per quanto riguarda gli stimoli sperimentali, è stato scelto di cambiare la fonte del messaggio e di presentare il comportamento di differenti gruppi di riferimento nella comunicazione a inizio scaffale. Infatti, quando il gruppo di riferimento è rappresentato dai clienti del punto vendita la fonte del messaggio è il retailer stesso; mentre nel caso in cui il gruppo di riferimento è costituito dalla popolazione italiana, la fonte del messaggio è un osservatorio specializzato su etichette e consumi nella GDO italiana. La comunicazione è stata presentata su banner posti all'inizio e alla fine dello scaffale e richiamata da stopper di prodotto. Più nel dettaglio:

- Messaggio con gruppo di riferimento locale: "negli ultimi anni, i clienti di questo negozio hanno consumato più fibre"
- Messaggio con gruppo di riferimento nazionale: "negli ultimi anni, gli italiani hanno consumato più fibre"

## 4. Analisi e Risultati

Le analisi statistiche sono state condotte utilizzando il software IBM SPSS Statistics, con l'obiettivo di verificare le ipotesi sperimentali e valutare l'efficacia della comunicazione a scaffale basata su norme sociali descrittive dinamiche. Sono stati impiegati modelli di ANOVA a misure ripetute, test t a campioni indipendenti e regressioni logistiche, in base alla natura delle ipotesi, per analizzare sia gli effetti principali che le interazioni tra le variabili sperimentali.

L'ipotesi H1 ("La presenza di una comunicazione di marketing nutrizionale a scaffale, che fa ricorso ad un messaggio basato su una norma sociale descrittiva dinamica, aumenta la scelta di prodotti dal miglior indice nutrizionale") è stata verificata attraverso un'ANOVA a misure ripetute sulla variabile dipendente "numero di prodotti ricchi di fibre comunicati selezionati" (range: 0–3), confrontando le scelte effettuate prima e dopo l'esposizione al messaggio normativo nella seconda e terza fase della procedura sperimentale (Tabella 1). Le variabili indipendenti between-subjects erano la tipologia di comunicazione (gruppo di riferimento locale vs. gruppo di riferimento nazionale) e la categoria merceologica (biscotti, cereali, merendine). L'analisi ha evidenziato un effetto principale significativo del tempo ($F = 53.046$, $p < 0.001$, $\eta^2 = 0.215$), indicando un incremento delle scelte salutari a seguito dell'esposizione alla comunicazione, in linea con l'ipotesi H1 come mostrato anche dalla Tabella 2. Tuttavia, le interazioni tra tempo e stimolo ($p = 0.779$), tempo e categoria ($p = 0.365$) e l'interazione a tre vie ($p = 0.222$) non sono risultate significative. Ciò suggerisce che l'incremento nelle

scelte salutari è indipendente dalla tipologia di messaggio mostrato (gruppo di riferimento nazionale vs. gruppo di riferimento locale) e dalla categoria di prodotto presente a scaffale. Infine, l'analisi tra soggetti ha evidenziato un effetto significativo della categoria di prodotto sulla scelta di alimenti sani ($F = 26.115$, $p < 0.001$). In particolare, i test post-hoc indicano che i cereali sono stati scelti significativamente più spesso rispetto a biscotti e merendine ($p < 0.001$).

In generale, i partecipanti hanno selezionato più prodotti dal miglior indice nutrizionale dallo scaffale dei cereali, indipendentemente dalla condizione di esposizione alla comunicazione, probabilmente anche per via della maggiore disponibilità di referenze ricche di fibre in tale categoria.

| | Gruppo riferimento "locale" | | | Gruppo riferimento "nazionale" | | |
|---|---|---|---|---|---|---|
| Categorie | N° di prodotti sani selezionati | | | N° di prodotti sani selezionati | | |
| | 1ª scelta | 2ª scelta | 3ª scelta | 1ª scelta | 2ª scelta | 3ª scelta |
| Biscotti | 0 | 4 | 20 | 0 | 1 | 25 |
| Cereali | 11 | 29 | 40 | 15 | 27 | 44 |
| Merendine | 7 | 12 | 30 | 3 | 4 | 12 |
| **TOT.** | **18** | **45** | **90** | **18** | **32** | **81** |

**Tabella 2:** Statistiche descrittive

La seconda ipotesi H2 ("La presenza di una comunicazione di marketing nutrizionale a scaffale, che fa ricorso ad un messaggio basato su una norma sociale descrittiva dinamica, migliora la percezione di salubrità dei prodotti scelti e dell'assortimento presente a scaffale") è stata verificata attraverso due ANOVA a misure ripetute, con le variabili dipendenti "salubrità dello scaffale" e "salubrità percepita dei prodotti scelti" (Tabella B. in Appendice). Anche in questo caso le variabili between-subjects incluse nell'analisi erano la tipologia di comunicazione e la categoria di prodotto. Entrambe le analisi hanno rivelato un effetto principale significativo del tempo: $F = 79.204$, $p < 0.001$, $\eta^2 = 0.290$ per lo scaffale; $F = 24.435$, $p < 0.001$, $\eta^2 = 0.112$ per i prodotti, confermando un miglioramento nella percezione di salubrità in seguito all'esposizione al messaggio normativo. Le interazioni tra tempo e stimolo, tempo e categoria, e l'interazione a tre vie non sono risultate significative, suggerendo che l'effetto della comunicazione è indipendente sia dal tipo di messaggio sia dalla categoria merceologica.

Tuttavia, i test post-hoc hanno evidenziato differenze significative tra le categorie: la salubrità percepita dell'assortimento presente a scaffale e dei prodotti scelti è risultata significativamente più alta per la categoria dei cereali rispetto a biscotti e merendine, mentre non sono emerse differenze significative tra le categorie dei biscotti e delle merendine.

L'ipotesi H3 ("L'efficacia della comunicazione di marketing nutrizionale a scaffale, che fa ricorso ad un messaggio basato su una norma sociale descrittiva dinamica, è influenzata dal gruppo di riferimento") è stata testata attraverso un Test-T a campioni indipendenti sulle valutazioni medie relative alla comunicazione normativa tra i due gruppi sperimentali: comunicazione con gruppo di riferimento locale (i clienti di questo punto vendita) vs. comunicazione con gruppo di riferimento nazionale (gli italiani). L'analisi, tuttavia, non ha mostrato differenze statisticamente significative tra i due gruppi.

Infine, la quarta ipotesi H4 ("I consumatori con basso autocontrollo – misurato tramite livello di fame o NFC – sono più inclini a scegliere prodotti sani in presenza di comunicazione normativa") è stata verificata tramite un approccio misto. Una regressione

logistica ha rilevato un effetto significativo del livello di fame (B = 0.190, p = 0.023), indicando un incremento del 20.8% nella probabilità di selezionare il prodotto comunicato per ogni unità di aumento nel punteggio di fame. Il NFC non ha prodotto effetti significativi. Successivamente, sono state condotte due ANOVA a misure ripetute, con gruppi suddivisi tramite median split per livello di fame e NFC, al fine di indagare le interazioni tra tempo (pre/post comunicazione) e livello di autocontrollo. Anche in questo caso, il NFC non ha generato effetti significativi, mentre l'analisi relativa alla fame ha mostrato un'interazione significativa (F = 4.078, p = 0.045): i partecipanti con un livello elevato di fame hanno selezionato un numero significativamente maggiore di prodotti ricchi di fibre dopo l'introduzione della comunicazione normativa. Questi risultati suggeriscono che, in condizioni di basso autocontrollo, i consumatori tendono a fare maggiore affidamento su euristiche normative - cioè scorciatoie decisionali basate sul comportamento osservato degli altri - nel guidare le proprie scelte alimentari.

## 5. Discussione

I risultati ottenuti dalla ricerca confermano che il ricorso ad un messaggio a scaffale basato su una norma sociale descrittiva dinamica può facilitare la selezione di prodotti dal miglior indice nutrizionale, in particolare per i consumatori in condizioni di basso autocontrollo, misurato attraverso il livello di fame.

L'analisi ha evidenziato un aumento significativo nel numero medio di prodotti sani selezionati dopo l'esposizione alla comunicazione, senza differenze rilevanti tra le categorie merceologiche considerate. Tale incremento è stato più marcato tra i partecipanti con un livello di fame elevato, suggerendo che, in condizioni di vulnerabilità decisionale, l'euristica della norma sociale può fungere da guida utile per effettuare scelte salutari coerentemente con quanto dimostrato da altri studi (Cheung et al., 2017). Al contrario, il livello di Need for Cognition (NFC) non ha mostrato un effetto significativo sul comportamento d'acquisto, in parziale contrasto con quanto ipotizzato. Ciò potrebbe essere dovuto al fatto che il livello di fame, a differenza del Need for Cognition, permette di misurare la mancanza di autocontrollo nel momento stesso in cui viene effettuata la scelta mentre, al contrario, il Need for Cognition è una misura di un'attitudine (Cacioppo & Petty, 1982). In linea con le aspettative, la comunicazione ha migliorato la percezione di salubrità sia dell'assortimento presente a scaffale sia dei prodotti scelti. Tuttavia, si è osservato che la categoria merceologica influisce in modo indipendente sulla percezione di salubrità, con i cereali percepiti come significativamente più sani rispetto a biscotti e merendine. Tale effetto non interagisce con la presenza della comunicazione, indicando che l'efficacia del messaggio normativo si distribuisce uniformemente tra le categorie analizzate.

Per quanto riguarda l'effetto della fonte e del gruppo di riferimento del messaggio, non sono emerse differenze significative nell'efficacia delle due diverse modalità di comunicazione (gruppo di riferimento locale vs. gruppo di riferimento nazionale). Sebbene si ipotizzasse una maggiore efficacia della comunicazione locale, i dati non hanno supportato tale previsione. È plausibile che la comunicazione basata sul comportamento attuato da un gruppo di riferimento locale non abbia influenzato significativamente le scelte dei partecipanti, in quanto la vicinanza del gruppo potrebbe non essere stata percepita come rilevante o significativa in assenza di un contesto sociale reale o di elementi che attivassero un senso di appartenenza. Nel complesso, la comunicazione normativa ha mostrato effetti significativi sul comportamento di scelta dei prodotti, soprattutto in condizioni di scarso autocontrollo, e sulla percezione di salubrità. Al contrario, l'influenza del gruppo di riferimento e della fonte, pur teoricamente fondata, non ha trovato riscontro empirico in questo contesto sperimentale.

## 6. Limiti della ricerca

La ricerca condotta presenta diversi limiti. Innanzitutto, non è stato possibile valutare correttamente le scelte sane effettuate dai partecipanti dal momento che non si era a conoscenza di quali fossero le referenze dal miglior indice nutrizionale tra quelle a marchio industriale ma solo tra quelle a marchio commerciale. Inoltre, il questionario è stato sottoposto ai partecipanti da un intervistatore, dunque, non è possibile non considerare gli eventuali bias legati alla sua presenza. È importante notare come il campione fosse omogeneo con riferimento alle variabili socio-demografiche considerate e ,di conseguenza, non rappresentativo della popolazione, restringendo la generalizzabilità dei risultati a contesti reali di consumo. Una limitazione importante è rappresentata dal contesto di scelta in quanto la simulazione dello scaffale proiettata non permetteva una visione realistica del contesto di scelta. Infine, le scale impiegate per rilevare la percezione di salubrità dello scaffale e del prodotto hanno mostrato livelli di affidabilità moderati nella prima misurazione (rispettivamente $\alpha = 0.632$ e $\alpha = 0.686$) e solo accettabili nella seconda ($\alpha = 0.756$ e $\alpha = 0.765$), suggerendo una coerenza interna non pienamente soddisfacente, che potrebbe aver influenzato la solidità delle analisi svolte.

## 7. Conclusioni e considerazioni per la ricerca futura

Per concludere, possiamo affermare che la comunicazione a scaffale che fa ricorso ad un messaggio basato su una norma sociale descrittiva dinamica potrebbe avere un effetto positivo sulla promozione delle opzioni più sane in un contesto come quello del punto vendita, in cui spesso le scelte vengono effettuate in condizioni di basso autocontrollo. Tuttavia, contrariamente rispetto a quanto ipotizzato, l'efficacia del messaggio non è risultata influenzata dal gruppo di riferimento, suggerendo che la percezione di vicinanza sociale potrebbe non attivarsi automaticamente in un contesto di acquisto simulato. Alla luce di tali evidenze, risulta necessario testare la validità della comunicazione normativa in contesti reali di acquisto e approfondire le modalità più efficaci di presentazione del messaggio, anche in funzione delle caratteristiche e delle specifiche esigenze dei diversi segmenti di consumatori.

## Abstract

This study explores the strategic role of Customer Relationship Management (CRM) in reactivating dormant customer relationships, an area often overlooked compared to acquisition and retention. Drawing on a mixed-methods experimental approach, the research examines a customer recovery initiative implemented in Leroy Merlin's garden department. The intervention combined CRM systems, predictive analytics, and personalized outreach targeting 37 high-value inactive customers. Results show a conversion rate of 29.73%, with over €60,000 in recovered orders and positive engagement from 75% of the sample. These findings highlight that proactive recovery, supported by segmentation and tailored incentives, can generate immediate economic returns and foster long-term loyalty. The study contributes to CRM literature by framing recovery not as a reactive response but as a strategic pillar capable of sustaining profitability and customer lifetime value. Implications for practice include the need to integrate recovery protocols within broader CRM strategies and to leverage automation and personalization to maximize impact.

*Keywords: Customer Relationship Management (CRM); Customer Recovery; Customer Lifetime Value (CLV), Retail Management.*

## 1. Introduction

Customer Relationship Management (CRM) has evolved into a strategic discipline focused on maximizing customer lifetime value through personalized, data-driven engagement (Guerola-Navarro *et al.*, 2024; Ledro *et al.*, 2022). While extensive research has examined customer acquisition and retention, an essential phase of the customer lifecycle remains underexplored: customer recovery. This concept refers to systematic initiatives aimed at re-engaging dormant or inactive customers and restoring their contribution to firm profitability (Kotler *et al.*, 2014).

Despite growing interest in churn—the rate at which customers stop doing business with a company—and efforts to prevent it, recovery is still commonly treated as a reactive response to dissatisfaction or service failures (Nowak *et al.*, 2023), rather than as a proactive, strategic pillar of CRM (Devriendt *et al.*, 2021). This gap is particularly relevant in mature markets where the cost of acquiring new customers often exceeds the cost of reactivating existing ones.

This study seeks to address this gap by examining the case of Leroy Merlin, a major European home improvement retailer that developed and tested a structured recovery protocol integrating segmentation, digital CRM systems, and tailored engagement practices. The paper contributes to CRM scholarship by positioning customer recovery as a strategic lever to enhance long-term relationship value. It also provides empirical evidence on the operational and economic outcomes of a proactive recovery approach.

## 2. Theoretical background

### 2.1 Customer Relationship Management

CRM has evolved from a purely operational tool to a strategic framework that combines technology, behavioral insights, and organizational processes to support personalized engagement throughout the customer lifecycle (Khashab *et al.*, 2022; Prior *et al.*, 2024; Sun *et al.*, 2022). Recent studies highlight the shift from transactional logic to customer-centric strategies that leverage predictive analytics and Big Data to sustain loyalty and profitability (Hossain *et al.*, 2024; Rosário, 2025; Sestino *et al.*, 2020). However, while acquisition and retention have received extensive attention, systematic recovery of inactive customers remains less explored, suggesting the need to integrate proactive re-engagement into CRM strategies.

### 2.2 Customer Lifetime Value and Churn Management

CLV is a cornerstone of CRM, informing resource allocation and prioritization of high-potential customers (Onifade *et al.*, 2024; Potla & Pottla, 2024). CLV-oriented approaches emphasize understanding long-term contributions to guide personalized engagement and recovery initiatives (Ali & Shabn, 2024; Antonakakis, 2025). Although churn prevention strategies such as loyalty programs and early warning systems are widely applied, they often fail to identify segments most responsive to reactivation (Devriendt *et al.*, 2021; Hossain *et al.*, 2023). Integrating uplift modeling and predictive analytics into CRM systems is increasingly recognized as essential for sustaining customer value (Rosário, 2025).

### 2.3 From Complaint Handling to Strategic Customer Recovery

While service recovery practices after failures are well documented (Nowak *et al.*, 2023), broader proactive recovery efforts remain marginal in CRM literature. Most contributions focus on dissatisfaction resolution, overlooking cases of silent disengagement (Honora *et al.*, 2022). Reframing recovery as a deliberate relational investment—rather than a reactive measure—can help firms rebuild trust and re-integrate dormant customers into profitable segments (Devriendt *et al.*, 2021; Kotler *et al.*, 2014). This study contributes to this perspective by empirically examining a structured recovery process in the home improvement sector.

## 3. Methodology

This study employed an experimental mixed-methods approach to evaluate the effectiveness of a structured customer recovery strategy implemented in Leroy Merlin's garden department. The objective was to assess the impact of CRM-driven reactivation initiatives on customer engagement and economic performance over a defined period (Creswell & Plano Clark, 2017).

Data were collected from two main sources. First, the CRM systems Pyxis and Elo were used to analyze customer profiles, track purchasing histories, and estimate Customer Lifetime Value. Pyxis – a platform supporting sales force automation – facilitated customer interactions, while Elo – focused on segmentation capabilities – enabled the identification of high-potential dormant customers (Guerola-Navarro *et al.*, 2024). Internal records and

analytics dashboards were also reviewed to document transactions, recovery outcomes, and customer contacts.

The intervention began by identifying customers who had interrupted their purchasing journeys. Based on CRM data, a sample was selected, characterized by high historical spend and an estimated CLV exceeding €5,000. Personalized outreach was conducted by the sales team through phone calls, emails, and WhatsApp messages, combining promotional incentives with tailored recommendations to address individual needs.

To assess outcomes, both quantitative and qualitative indicators were collected. Quantitative measures included – conversion rate after contact, re-engagement rate, repurchase rate, Customer Lifetime Value (CLV), historical spend, and ROI of recovery actions – while qualitative observations focused on – customer response categories and observed motivations and barriers.

This design enabled a comprehensive evaluation of behavioral outcomes and operational effectiveness within a strategic CRM framework, offering insights into the potential scalability of structured recovery protocols.

## 4. Results and discussions

The experimental intervention targeted 37 dormant customers with high economic potential and an average relationship duration of 7.9 years. This profile suggests that their inactivity was situational rather than indicative of weak prior engagement, consistent with evidence highlighting the value of reactivating loyal segments (Kotler *et al.*, 2014).

As shown in Table 1, the recovery strategy achieved a conversion rate of 29.73%, with 11 customers placing orders and 45.94% re-engaging for future follow-up. Overall, more than 75% of the sample responded positively, demonstrating that structured, personalized outreach can effectively rekindle interest and engagement.

Economically, the initiative generated €60,100 in recovered orders versus an estimated potential of €108,086. While this gap highlights opportunities for optimization, capturing over one-third of the forecasted value in an initial test confirms the approach's profitability. The average actual order value (€1,581), though lower than the theoretical potential (€2,844), underscores the importance of refining incentive structures and addressing residual barriers. For example, the partial gap between estimated and actual spending suggests that even highly engaged dormant customers may require more substantial or customized incentives to reactivate fully. In addition, the timing of outreach and the perceived relevance of offers likely influenced conversion rates, as observed in qualitative feedback.

Notably, 45% of converted customers made subsequent purchases, reinforcing the idea that recovery initiatives can create relational momentum beyond immediate transactions. Compared to previous studies reporting reactivation rates below 20% (Devriendt *et al.*, 2021), these results demonstrate the effectiveness of structured recovery protocols supported by CRM analytics. The estimated ROI of 17–31% is significant for a pilot program, suggesting that such strategies can sustainably complement acquisition efforts. Collectively, these findings provide a robust empirical foundation for discussing managerial implications and opportunities for future development of recovery strategies.

| Category | Indicator | Result |
|---|---|---|
| **Quantitative** | Conversion rate after contact | 29.73% (11 customers converted) |
| | Re-engagement rate | 45.94% (17 customers re-engaged) |
| | Repurchase rate | 45% of converted customers |
| | Customer Lifetime Value (CLV) | €1,136,062 total (€30,704 per customer) |
| | Historical spend | €141,354 total (€3,820 per customer) |
| | ROI of recovery actions | Estimated 17–31% |
| **Qualitative** | Customer response categories | Converted, Re-engaged, Not responsive |
| | Observed motivations and barriers | Price sensitivity, timing, need for tailored offers |

**Table 1:** Main Results

## 5. Managerial Implications and Future Research

Managerially, these findings confirm that dormant high-value customers can be profitably reactivated through segmentation, tailored outreach, and integrated CRM tools. More broadly, the results illustrate how recovery initiatives can play a crucial role in mature retail environments, where the incremental cost of customer acquisition continues to rise and lifetime value optimization becomes a competitive necessity. To maximize outcomes, continuous adjustments in offer design, messaging, and incentives remain essential. Future research could explore how automation, dynamic personalization, and cross-channel integration further enhance recovery effectiveness over time.

# Beyond the Dyad: Exploring Sales Interactions Across Multiple Buying-Center Roles in the Professional Imaging Sector

## Abstract

In business-to-business (B2B) markets, the interaction between salespeople and buying organizations has changed markedly (Ahearne et al., 2022); recent studies show that the growing complexity of both selling and buying processes (Jalkala & Salminen, 2010) makes commercial activity increasingly demanding. Despite the extensive interest in B2B selling, two gaps persist. First, literature tends to examine research streams such as salesperson activities, buying centers and business relationships in isolation. Second, it often focuses on dyadic, "one-to-one" interactions or treats the customer firm as a single, homogeneous entity, thereby overlooking the heterogeneous needs of the individual actors who compose today's buying centers.

This study addresses these deficiencies by adopting a Social Network Theory lens—combined with insights from the complex-sales and buying-center literatures—to investigate how salespeople sequentially orchestrate different typologies of interactions (RQ1); which competencies they deploy and adapt along the way (RQ2); how they reallocate time and resources as the process unfolds (RQ3); and how these choices influence overall sales-cycle effectiveness (RQ4), while also identifying the main challenges encountered and the coping strategies employed (RQ5). Evidence comes from an in-depth dyadic case study in the professional-imaging sector, emblematic of complex selling, which serves as the empirical setting for exploring these questions. Results indicate a three-gate choreography—clinician validation, engineering reliability, procurement economics—sustained by modular resource orchestration and the KAM's positional centrality. Sequencing interactions in this order shortens the negotiation by about one-third, while an "impact × influence" approach mobilizes specialists on demand, shifts the conversation from price to life-cycle value, and resolves role conflicts through a single commercial owner and early service-uptime proofs.

## 1. Theoretical Background

### 1.2 Complexity in b2b sales and Buying centre

In business-to-business (B2B) marketing, a complex sale denotes a sales process that is highly demanding and protracted, involving multiple actors and resources on both the supplier and customer sides (Rangarajan et al., 2022). Scholars have converged on several hallmark features of such sales (Arndt & Harkins, 2013; Delpechitre et al., 2020). First, complex sales mobilise numerous individuals and organisational functions in both firms: the seller typically operates in teams and interfaces with an articulated buying centre that comprises, on average, six or seven members of the decision-making unit, each with distinct needs (Toman et al., 2017).

A second defining element is the length and structure of the sales cycle. Negotiations for complex solutions unfold over extended pre-sale, bargaining and implementation phases (Rodriguez et al., 2020). Lastly, these transactions are usually high-value and strategically significant; they involve infrequent purchase decisions that absorb considerable resources and entail long-term consequences for both parties (Ulaga & Sharma, 2001).

Research also identifies several drivers of complexity that act singly or in combination and originate inside and outside the selling organisation. Internal organisational complexity stems from supplier-side factors that obstruct sales efforts (Schmitz & Ganesan, 2014), whereas external market complexity reflects customer and environmental conditions (Ingram, 2004; Jones et al., 2005). In addition, relational complexity concerns the multiplicity and management of ties during the sales process (Jones et al., 2005). More specific forms include cognitive complexity, the information load a salesperson must process (Jones et al., 2005), and technological complexity, referring both to the sophistication of the offering and to the technologies deployed in selling (Srinivasan et al., 2020).

Confronted with these complexities, contemporary B2B salespeople play increasingly varied roles from resource orchestrator (Weitz & Bradford, 1999) to relational facilitator, cognitive navigator and portfolio/solution innovator (Jones et al., 2005). These roles must be viewed against the backdrop of organisational buying behaviour, which is inherently more complex than consumer purchasing. Foundational models (Robinson et al., 1967) portray organisational buying as a need-recognition, search and evaluation process that often culminates in a "satisficing" rather than optimal choice. Salespeople interact with multiple individuals who jointly influence the decision (Johnston & Bonoma, 1981) and the multifaceted nature of organisational buying thus emerges from factors extending beyond individual actors (Weigand, 1968). As Hartmann, Wieland and Vargo (2018) emphasise, salespeople must coordinate with diverse stakeholders inside the customer firm and with third-party partners to co-create value-driving solutions.

### 1.2 Social network theory in sale

Social Network Theory (SNT) conceptualises markets as webs of actors linked by ties (Borgatti & Foster, 2003). In sales research this relational lens explains why some salespeople convert opportunities more effectively than others (Van den Bulte & Wuyts, 2007). Two structural metrics matter most: centrality, a node's prominence, and density, the overall interconnectedness that shapes information flow. Bolander et al. (2015) distinguish relational centrality—ties to well-connected stakeholders—from positional centrality, where the salesperson bridges otherwise disconnected actors.

Recent work shifts attention from static attributes to network choreography. Forkmann et al. (2022) show that dynamically adjusting the frequency and functional mix of visits across the buying centre raises win rates, echoing Villena et al. (2011). SNT also informs partner selection. Homophily encourages functionally similar "matching" ties, yet cross-functional "more-than-matching" ties broaden influence and buffer turnover risk (Murtha et al., 2014). This overlapping is named "relationship multiplexity", linking multiple tie types to more

stable sales (Tuli et al., 2010). Extending these insights, a recent work (Burchett et al.,2024) introduces thin crossing points: critical interfaces where resources are exchanged. Optimising such crossings—by engaging high-eigenvector actors while diversifying contacts—emerges as a core competence in complex B2B selling.

## 2. Methodology

We conducted a qualitative single-case study centered on a dyadic relationship between a multinational supplier in the professional-imaging sector and a large Italian healthcare organization. This dyad, emblematic of complex B2B exchange, served as the unit of analysis and was examined from both seller and customer perspectives. Data were gathered between January and March 2025 through semi-structured interviews: on the seller side, informants represented key account management, area/sales manager and product-marketing specialist; on the customer side, respondents covered procurement, clinical engineering, end-user leadership (director of imaging) and operations (chief operating officer).

The interview guide probed concrete interaction episodes, practices of resource orchestration and network positioning, with particular attention to how these dimensions shift when the salesperson engages each specific role within the buying centre. Sessions lasted 60–90 minutes, were recorded, transcribed verbatim and anonymised.

Data analysis adhered to the Gioia methodology and was conducted in NVivo, enabling inductive code development and constant comparison across informants.

## 3. Results

Regarding RQ1, interview evidence shows that in the dyad, commercial adaptation is not episodic; rather, it unfolds through a sequential choreography of three distinct, interactive acts that mirror the buying-centre hierarchy. In the first act the emphasis is on clinician buy-in: roughly two-thirds of the initial selling time is invested in in-room demonstrations and image trials for radiologists and radiography technicians, jointly conducted by the Key Account Manager (KAM) and the product specialist to ensure real-time technical answers. Once diagnostic validation is secured, the second act engages Clinical Engineering; here the salesperson brings in the Service Manager and reframes the offer around reliability, presenting uptime metrics and maintenance plans. The third act introduces Procurement: the salesperson discusses cost-related aspects (e.g. TCO, leasing options) deliberately avoiding price-only bargaining. Should the price be raised before technical sign-off, the entire process is cancelled and restarted, prolonging the cycle. Across all three acts, content, tone, channel and timing are rigorously tailored to the focal actor— "one talks clinical with physicians, technology with engineers, and numbers with purchasing." (quote from Sales Area Manager). This progressive orchestration reduces intra-functional conflict, preserves message coherence and shortens the overall negotiation, converting multi-actor complexity into a stepwise consensus path.

Turning to RQ2, cross-interview analysis reveals several capabilities sets. First, both the KAM and Sales Area Manager practise modular resource orchestration, informally applying an "impact × influence" grid to decide whom to involve and when (e.g., product specialist for clinicians, in-house counsel for procurement), thereby cutting redundant meetings and maximising the "time invested/value perceived" ratio. Second, they retain sufficient technical–clinical vocabulary to converse with radiologists, physicians and technicians, while delegating deep dives to the specialist. Third, they demonstrate political–organizational brokerage rooted in their positional centrality: acting as a unified interface, the salesperson aligns internal voices from marketing, service, and finance, while also mediating conflicts among clinicians, engineers, and procurement. The remaining two competences are service

& uptime literacy where Operations notes that "two days of downtime equal thirty lost patients," ( quote form CPO) so the salesperson converts this sensitivity into uptime KPIs, shifting the focus from price to total value—and contractual–financial agility, as procurement "wants interlocutors able to model TCO and service bundles, not merely discounts" (quote from Procurement Director).

For RQ3 (time and resource allocation), the criterion is binary, combining product complexity and the decision weight of the current stakeholder; the KAM adjusts meeting frequency by revisiting the "impact × influence" grid after each touch-point. Findings from RQ4 shows that relationships shape the sales cycle in three concentric rings. In the personal ring, one-to-one ties with end-users and clinical engineers hinge on technical credibility and rapid follow-up. Success there unlocks the functional ring, where the seller mediates among clinicians, engineering and procurement, translating clinical value into reliability KPIs and total-cost logic. Only after this alignment does the process reach the institutional ring, where C-suite actors legitimize the deal; engaging highly connected executives' triggers endorsement cascades that speed approval. Progression must be sequential: skipping a ring reopens specifications and prolongs negotiation, while orderly movement shortens the cycle. Finally, for RQ5, the structural conflict between performance-oriented clinicians and budget-driven procurement is mitigated by postponing economic issues: technical approval first, then life-cycle-cost scenarios, leasing and service bundles, thus avoiding reopening clinical debates. To prevent information short-circuits, both firms agree on a single commercial point of contact who circulates shared minutes; legal back-and-forth is shortened by involving the supplier's legal counsel before the final draft, halving signature time. When a dissenting clinician temporarily stalls the purchase, the sales team reallocates effort to less controversial equipment while preparing additional clinical evidence, thereby avoiding unproductive visits and sustaining team morale.

## 4. Theoretical and managerial contributions

From a theoretical standpoint, the findings first refine the literature on B2B sales complexity showing that the key driver of complexity is not merely the absolute number of actors but the sequence in which each actor is engaged. This insight extends the set of complexity drivers identified by Schmitz and Ganesan (2014), introducing a new dimension—procedural complexity—that can be mitigated by choreographing contacts in the clinical-technical-economic order observed in the case.

Second, the study advances Social Network Theory in sales. KAM's positional centrality operates as a resource-orchestration mechanism that activates matching and more-than-matching ties at different moments, turning multiplexity (Tuli et al., 2010) into a dynamic process rather than a static configuration. Moreover, the uptime proofs presented to the buyer function as thin crossing points (Burchett et al., 2024)—critical interfaces where high-reputation resources are exchanged, thereby reinforcing network density and trust. From a managerial perspective, the findings call for an institutionalised, three-gate sales discipline. First, roughly two-thirds of the initial effort should be devoted to the clinical cluster, securing diagnostic endorsement before any economic negotiation. Only after this green light should the salesperson co-translate clinical value into reliability KPIs together with clinical engineering. Cost-related aspects must be introduced exclusively once the technical sign-off has been obtained. Secondly, resource deployment should follow the impact-by-influence logic observed in the case: whenever deeper technical expertise is required, the specialist must flank the salesperson, thereby maximizing the competence perceived by the stakeholder in question. Finally, if a dissenting clinician within the buying center stalls progress, redirecting effort toward less controversial equipment—while simultaneously assembling new clinical evidence—preserves team morale and keeps the account alive.

## 5. Limitations and Future Research

This exploratory study is the first to frame complex B2B selling through a sequential choreography lens, grounded in Social Network Theory and integrating positional centrality, resource orchestration and buying-center dynamics. The case findings suggest that commercial success hinges on the orderly sequencing of clinical, technical and economic interactions rather than on episodic adaptations. As the inquiry relies on a single dyadic case, its generalizability is limited. Future research could strengthen external validity through multi-case comparisons—juxtaposing the focal dyad with other complex B2B relationships in different sectors—or by analyzing a second dyadic engagement involving the same selling organization and a different customer, to assess whether the findings and managerial insights hold or diverge from this case.

## Abstract

The work herein deals with the impact of display share as a driver for private label sales in the online grocery retail setting. The research is motivated by preliminary evidence from QBerg, an Italian market intelligence firm specializing in online retail analytics, whose data reveal that although national brands largely outnumber private labels also in online assortments, private labels receive significantly higher average display visibility per brand.

This suggests that online retailers may deliberately enhance the digital visibility of PLs, prompting the question of whether greater and deeper PL assortment share translates into higher PL sales share in the online environment, as established in traditional "brick-and-mortar" retailers. Starting from the well-documented assumption that an increase in assortment share drives higher sales share in physical stores, we empirically test whether the same effect applies in the online channel. Our study uses a cross-sectional analysis based on secondary scanner data provided by Circana in Italy across 190 food and beverage categories and confirms the existence of a direct and robust relationship between private label online assortment and its sales share. Additionally, this relationship is found to be positively influenced by category assortment depth (used as a proxy for display share), a moderating factor that does not hold significance in the offline channel.

*Keywords: display visibility, private label, online grocery retail, assortment*

## 1. Introduction

"*If I can't see it, I won't buy it*". This principle, acknowledged in traditional retailing, holds even greater relevance in the digital sphere, where online visibility becomes a critical determinant of sales performance.

This research is grounded in an empirical observation derived from data collected by QBerg, a leading Italian market intelligence company specializing in online retail analytics. QBerg operates as a digital shelf monitoring platform, systematically scraping and aggregating data from grocery retailers' e-commerce websites to capture the full scope of online assortment, pricing, promotional activities, and product visibility. Their proprietary data provide granular insights into how products are displayed and prioritized on digital shelves, offering a unique lens into the competitive dynamics of online grocery retailing.

According to QBerg's 2023 data on the Italian online grocery market, a striking asymmetry emerges between national brands (NBs) and private labels (PLs) in both assortment breadth and online display visibility. Despite the fact that the number of national brands available online vastly exceeds that of private labels (71938 NBs versus 2424 PL brands), the average display share allocated to each private label brand within individual categories (0.0063%) is markedly higher than that for national brands (0.0012%). Yet, in aggregate terms, national brands collectively occupy the majority of total digital shelf space (84.57%), while private labels account for only 15.32%.

This apparent contradiction highlights a strategic insight: although NBs dominate the overall shelf purely due to their numerical breadth, retailers deliberately allocate disproportionately greater online visibility to PLs on a per-brand basis, thereby leveraging the digital shelf as a strategic tool to amplify PL presence and salience. This pattern suggests that in digital environments, where physical shelf constraints are absent, product visibility is the critical lever through which retailers drive private label performance and differentiation.

QBerg managers attribute this greater visibility of PLs online to two primary factors: (i) the flexibility of e-commerce platforms to host a broader array of products without physical space limitations, and (ii) comparatively lower investment and strategic focus from national brands in the online channel relative to traditional brick-andmortar retail environments. Furthermore, PLs offer comparatively smaller average discounts online than national brands, suggesting that PLs rely more on inherent price competitiveness rather than promotional tactics in the digital environment. These empirical insights serve as robust empirical foundation for investigating how assortment strategies and specifically PL assortment share influence PL sales performance in online grocery retailing, forming the foundation of the present study's research objectives.

Motivated by these first insights, the present study adopts an Empirics First approach, which emphasizes grounding research questions in observed market phenomena before moving to theoretical modeling and hypothesis testing (Golder et al. 2023).

It focuses on understanding whether greater PL assortment share contributes to higher PL sales share in online grocery retailing, and how this relationship is moderated by assortment depth - a variable serving as a proxy for display visibility and digital shelf allocation (i.e. display share). To this extent, we conducted an empirical analysis on secondary scanner data provided by Circana, in controls for online versus offline FMCG channels, to test whether the positive relationship between assortment share and PL sales established in brick-and-mortar settings also holds online.

Our findings indicate that while assortment depth amplifies the positive impact of PL assortment share on PL sales in the online channel, it exerts a diminishing effect in physical stores, where excessive assortment may induce choice overload and reduce purchasing efficiency (Sethuraman et al. 2022; Chernev et al. 2015). Thus, the empirical starting point provided by QBerg's data not only reveals significant retailer strategies in online environments but also underscores the necessity of incorporating assortment dynamics into models when analyzing private label performance.

The work is structured as follows: a brief literature review is provided, theoretical framework and research hypotheses are formulated, the method of analysis of the two studies is explained. Lastly, results are presented and discussed.

## 2. Literature review and research hypotheses

In the last decade, private label sales have significantly increased globally[11]. Initially seen as a cheaper but inferior alternative to national brands, retailers have progressively enhanced PL's quality, making it more attractive and competitive through "smarter" strategies of development (Brüggemann et al., 2020; Gielens et al., 2021). This resulted in a 19.4% global market share in the Fast-Moving Consumer Goods (FMCG) sector in 2022, with even higher shares in Europe and North America[12]. In Europe, the overall private label share touched 36% in 2022 (Statista 2024). According to Verstraeten et al. (2023), online grocery shopping has not only normalized but also facilitated private label purchases: grocery digitalization is growing, with online sales increasing globally from less than 3.5% in 2019 to 7.2% in 2022 (Verstraeten et al., 2023).

Previous research indicates that consumers view online shopping as riskier than the offline one, leading to a preference for established national brands over lesser-known ones, such as PL, when they buy in the virtual channel (Bezes, 2016). On the contrary, other research suggests that the less vivid product presentation online (Huyghe et al., 2017) could boost PL sales to the detriment of national brands, since choices are made upon easier price and characteristics comparisons. This is especially true because of smart characteristics filtering and price sorting options that prioritize specific product features (Turri and Watson, 2023), raising questions about the impact of assortment strategies on PL sales within the online grocery retail setting. Nevertheless, consensus is reached when it comes to the role of product range, as empirical research on physical stores proving a strong positive effect of assortment on PL's sales (Fornari et al., 2013).

### 2.1 Shelf space allocation (assortment share) in online and offline retail settings

Shelf space is a critical asset for retailers, representing a finite resource that requires strategic allocation across various product categories, brands, and channels. The topic of how shelf space is distributed and its consequential effects on inter-brand competition is thus well-established in retail marketing literature (Amrouche and Zaccour, 2007; Sethuraman et al., 2022). In the offline channel, the allocation strategy impacts product/brand visibility, shopper's choice, and, ultimately, sales performance. In this regard, numerous studies indicate that both the purchase intent and market share of PL increase with more dedicated shelf space (Fornari et al., 2013). This relationship between shelf space and each brand's sales, though diminishing over time, is linked to reduced perceived risk associated with lesser-known brands as items and facing numbers grow. High shelf visibility serves as a decisive lever of advertisement for PL, compensating for its lower media exposure compared to national brands (Nenycz-Thiel et al., 2016).

Additionally, brand visibility is crucial to a retailer's assortment strategy, impacting store image and positioning. Recent research highlights the importance of range variety in consumers' perception of a grocery store's assortment quality, with the inclusion of private label products in various categories enhancing this perception, thereby boosting consumer loyalty, sales, and profits (Arce-Urriza and Cebollada, 2012).

The impact of online and offline channels on consumer purchasing behaviour, particularly in relation to private labels and national brands, has been a topic largely discussed in literature. Prior studies examining the shopping channel effect on PL (vs. NB) choices reveal contradictory evidence, with some documenting more PL purchases online than offline

11 Living with and responding to uncertainty. State of grocery retail, 2023, McKinsey and Company, April 2023.

12 How inflation is impacting private label sales trends globally, NIQ, 16 September 2022.

(Arce-Urriza and Cebollada 2012; Cebollada, Chu, and Jiang 2019; Nenycz-Thiel, Romaniuk, and Dawes 2016), others the opposite (van Herpen et al. 2016), and others found no effect (Dawes and Nenycz-Thiel 2014). Generally, private labels tend to be more affordable (Steenkamp & Geyskens 2014; Gielens et al., 2021) because retailers invest less in advertising and marketing for PLs, and often have less elaborate packaging (McKinsey & Company 2020), making them more appealing in the online shopping environment where these factors are less critical.

Several studies have shown that the channel through which consumers shop can significantly influence their product choices. Research by Brüggemann and Pauwels (2022) emphasizes differences in product purchase share between online and offline grocery shoppers, suggesting that the composition of the assortment, including private label products, influence consumer preferences and consequently impacts sales across both retail channels. Verstraeten et al. (2023) argue that the degree to which consumers rely on external cues to assess product quality - such as price, brand, and product appearance - varies depending on whether they shop online or offline. For instance, factual information (e.g., ingredients, nutritional information) has a stronger impact in online shopping, while visual cues (e.g., attractive packaging) have a greater influence in the offline setting (Degeratu, Rangaswamy, & Wu, 2000). Additionally, the online environment lacks sensory stimuli, store atmospherics (Spence et al. 2014), the touchand-feel dimension (Gielens et al., 2021) and, social interactions (Ramus and Nielsen, 2005), which can reduce cognitive fatigue for consumers when shopping online (Benn et al. 2015). The symbolic presentation of products online, such as product images, reduces product vividness, which in turn diminishes affective responses like instant gratification. As a result, online shoppers are less likely to rely on affective responses, which are typically triggered by the vividness of physical products (Huyghe et al., 2017). However, the convenience of online shopping, including easy access to product information, faster price comparisons (Ramus and Nielsen 2005), and reduced search costs (Chintagunta, Chu and Cebollada 2012; Chu et al. 2008), represents distinct advantages of online shopping.

These distinctions between the two retail channels suggest that consumers are less dependent on external factors when shopping online (vs. offline). In the context of grocery shopping, where internal product attributes cannot be directly evaluated, external cues such as price, brand name, and packaging visibility become relevant for consumers to infer product quality (Dick, Jain & Richardson, 1996) and make purchasing decisions. This is in line with the findings of Verstraeten et al. (2023) who demonstrated that consumers rely less on external cue heuristics to infer product quality when shopping online (compared to offline), thus perceiving a smaller quality gap between private labels and national brands, which leads to an increase in private label purchases compared to national brands in the grocery retail.

Thus, we formulate the following hypotheses:

**$H_{1A}$**: an increase in online PL assortment share drives directly to an increase in online PL sales share.

**$H_{1B}$**: an increase in offline PL assortment share drives directly to an increase in offline PL sales share.

## 2.2 Display visibility (assortment depth and breadth)

Broniarczyk, Hoyer, and McAlister (1998) found that consumer assortment perceptions are significantly influenced by the amount of space devoted to the category. In categories with a smaller display, a change might be more visible than in categories with a larger display.

Products on a shelf are arranged next to one another at different height levels and with a different number of facings. The number of facings indicates the number of units visible to the customer, and it has been proven that the number of shelf facings strongly influences consumers' visual attention (Chandon et al. 2009). External factors may also influence visual attention, suggesting that a product has a better chance of being noticed when it occupies a bigger portion of consumers' visual space (Chandon et al. 2009).

Visual attention has a fundamental role in consumers' purchasing decisions about what to buy within a retail environment (Gidlöf et al. 2017). It is an essential step in the purchase process, which is the mechanism by which individuals select a particular piece or a subset of the available information for further processing.

In a grocery retail setting, visual attention refers to anything that captures customer's sight when they are navigating the shelf or browsing an online shopping platform. This is one of the first actions taken by a customer when entering the store or when starting browsing in the online platform. Before choosing a product, consumer attention usually shifts among different products during the decision-making process. This phenomenon has been defined in literature as the "gaze-cascade effect", indicating that consumer behaviour is significantly influenced by their visual attention (Gidlöf et al. 2017; Atalay, Bodur and Rasolofoarison 2012). Products that fail to attract consumers' visual attention are usually not purchased, evidencing the importance for a retailer to capture customer interest (Olson 1972).

For these reasons, the attributes of assortment depth (i.e., the total number of SKUs presented in the display for each brand) and breadth (i.e., the total number of brands per each product category) are used as a proxy for display visibility, representing a crucial category-specific attribute that can have an impact on the influence of visibility and visual attention on sales per each brand type (Broniarczyk and Hoyer 2009). Their work emphasizes that increased shelf space for a product in bricks-and-mortars can amplify the effect of visibility (i.e. display share) on sales thanks to the presence of "brand blocks" or number of facings of the same brand's items, streamlining the decision-making process.

However, relevant studies suggest that larger assortments in the physical store could create issues such as information overload and customer confusion, resulting in choice inaccuracy or deferral, search difficulty and complexity (Sethuraman et al. 2022). When consumers face an overwhelming variety of alternatives can incur in the phenomenon of "choice overload" (Chernev et al. 2015). Furthermore, Hamilton and Richards (2009) found a negative relationship between assortment depth and sales in categories with more differentiated product variants in the offline channel.

In essence, building on previous research that has established a strong association between shelf facings and visual attention – showing that increased number of facings enhance product visibility on the shelf and subsequently drives sales (Chandon et al., 2009) – our study adopts assortment depth and/or breadth as a proxy for display visibility.

Our study seeks to investigate whether this relationship still holds in the physical retail setting and whether it also applies within the online retail environment.

Thus, we formulate the following hypotheses:

**$H_{2A}$**: an increase in the total category assortment depth/breadth reinforces the positive impact of online PL assortment share on its sales share.

**$H_{2B}$**: an increase in the total category assortment depth/breadth reinforces the positive impact of offline PL assortment share on its sales share.

Building on these insights and considering both online and offline grocery retail contexts, our study aims to examine whether a greater assortment share of PLs contributes to increasing PL sales. Specifically, this study investigates whether the relationship between PL assortment share and PL sales observed in physical stores persists also in the online channel. Furthermore, we hypothesize that category assortment depth serving as a proxy for display visibility positively moderates the relationship between PL assortment share and PL sales in both offline and online settings. To guide this inquiry, we present the research framework depicted in Figure 1.

Based on what we observe in the real world of retailing (Van Heerde et al. 2021) and inspired by an empirics-first approach (Golder et al. 2023), the study employs IRI scanner data on 190 food and beverage categories from the Italian grocery retail to test the proposed hypotheses.

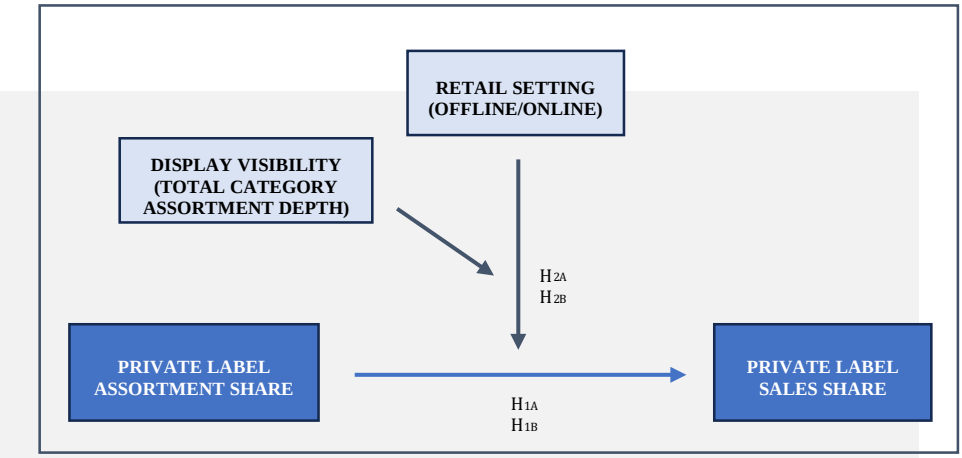

**Figure 1**: Research framework of study 1

## 3. Methodology

The present study is based on secondary data sourced from Circana, including a range of 190 FMCG categories throughout the full year of 2023[13]. The analysis employs a three-way interaction (i.e., moderated and moderation) test to investigate the relationship between PL assortment share and its sales share across both online and offline channels within the Italian food and beverage retail sector (Hayes, 2018);

The study focuses on two primary retail platforms: online grocery retailers, which collectively account for 2.1% of the overall FMCG turnover in Italy, and conventional supermarkets,

13 The total number of FMCG categories monitored by Circana is 467. However, to make the dataset as robust as possible, we cleaned it up excluding from analysis: (i) 69 personal care categories, (ii) 50 home care categories, (iii) 8 pet care categories, (iv) 57 fresh fruit & veg categories, (v) 6 fresh meat categories, (vi) 87 categories in which online PL sales in 2023 were lower than 50,000 euros, the minimum threshold to consider them statistically significant.

representing the predominant offline grocery retail type, with a substantial market share of 52.2%.

### 3.1 Operationalization of variables

In the model, we calculate the following variables for each of the 190 considered categories, examining both online and offline channels, for the entire year of 2023 (Tab. 1).

| Variables | Operationalization | |
|---|---|---|
| Private Label (PL) sales share | % of PL value sales on total value sales (online/offline) | Dependent variable (Y) |
| Private Label (PL) assortment share | % of PL items on total items listed (average per month) in each store (online/offline) | Independent variable (X) |
| Total category assortment depth | Total number of items listed (average per month) in each store (online/offline) | Moderator (W) |
| Retail setting | Dummy variable, coded 0 for offline and 1 for online retail | Moderator (Z) |

**Table 1**: Operationalization of variables

Online PL sales share is the dependent variable, while online PL assortment share is the independent variable. Total category assortment depth is a moderator, which has been hypothesized as variable that can mitigate the magnitude of the effect of the relationship between PL assortment share and PL sales share, both in the online and in the offline settings.

### 3.2 Model estimation

| | Min | Max | Mean | Std. Dev. | Variance | Skewness | Kurtosis |
|---|---|---|---|---|---|---|---|
| PL assortment share online | .2 | 72.3 | 15.68 | 12.34 | 152.38 | 1.56 | 3.94 |
| PL assortment share offline | 1.2 | 55.7 | 22.34 | 10.02 | 100.57 | .395 | .032 |
| Total category assortment depth online | .7 | 224.9 | 25.57 | 31.20 | 973.87 | 3.10 | 12.83 |
| Total category assortment depth offline | 1.4 | 200.0 | 34.67 | 34.36 | 1180.76 | 2.16 | 5.96 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| PL sales share online | .4 | 85.6 | 25.05 | 16.95 | 287.52 | .808 | .36 |
| PL sales share offline | 1.5 | 72.1 | 25.01 | 13.53 | 183.23 | .426 | -.15 |

***Table 2**: Descriptive statistics table*

After performing the descriptive statistics (Tab. 2), the impact of PL assortment share on PL sales share sales, moderated by the total category assortment depth, has been analysed formulating the following model:

$$Y = \beta_0 + \beta_1 X + \beta_2 W + \beta_3 Z + \beta_4 XW + \beta_5 XZ + \beta_6 WZ + \beta_7 XWZ + \varepsilon$$

so, in our analysis, we have that:

$$Private\ Label\ (PL)\ Sales\ Share\ (Y)_i = \beta_0 + \beta_1 PLAssortmentShare_i + \beta_2 AssortmentDepth_i + \beta_3 RetailSettingi + \beta_4 (PLAssortmentSharei * AssortmentDepth_i) + \beta_5 (PLAssortmentShare_i * RetailSetting_i) + \beta_6 (RetailSetting_i * AssortmentDepth_i) + \beta_7 (PLAssortmentShare_i * RetailSetting_i * AssortmentDepth_i) + \varepsilon_i$$

This specification enables testing not only the direct effect of PL assortment share on PL sales share but also how this relationship is conditioned by assortment depth and retail setting.

## 4. Results

*Direct relationship*. Firstly, we examine the direct and linear relationship between PL assortment share and PL sales share across both online and offline channels. Both relationships have been found to be significant, with positive coefficients, indicating that PL sales share is positively influenced by its assortment share.

The R-squared value for the online channel is 36.3%, implying the potential presence of additional variables that could further explain the model. The R-squared value for the offline channel is considerably higher at 82%, suggesting that the direct relationship explains a substantial part of the model. Results have been summarized in Table 3. Thus, $H_{1A}$ and $H_{1B}$ are both verified.

| | R-sq | Coef. | P>\|t\| |
|---|---|---|---|
| **Online channel** PL assortment share | .363 | .828 | .000 |
| **Offline channel** PL assortment share | .820 | 1.223 | .000 |

Outcome variable: Online/Offline PL sales share

**Table 3**: Summary table of the direct relationships

*Three-way interaction effect*. In the online channel, the interaction effect (Tab. 4) among the three independent variables (PL assortment share, retail setting, and assortment depth) is statistically significant (p = 0.0145) with a positive coefficient (0.0096), indicating that the moderating effect of assortment depth differs by channel. This validates the inclusion of moderated moderation in the model and allow us to further explore the effect of the moderator.

| | coeff. | se | t | p | LLCI | ULCI |
|---|---|---|---|---|---|---|
| constant | -2.7570 | 2.5255 | -0.9407 | 0.3475 | -7.3417 | 2.5902 |
| SKUSHARE | 1.2513 | 0.1043 | 11.9964 | 0.0000 | 1.0462 | 1.4564 |
| DUMMY_OF | 18.4235 | 2.9666 | 6.2104 | 0.0000 | 12.5902 | 24.2568 |
| Int_1 | -0.5952 | 0.1271 | -4.6848 | 0.0000 | -0.8450 | -0.3454 |
| AVGSKUST | 0.0096 | 0.0442 | 0.2162 | 0.8290 | -0.0774 | 0.0966 |
| Int_2 | -0.0013 | 0.0096 | -0.5553 | 0.5790 | -0.0059 | 0.0033 |
| Int_3 | -0.1473 | 0.0536 | -2.7470 | 0.0063 | -0.2527 | -0.0418 |
| Int_4 | 0.0096 | 0.0039 | 2.4557 | 0.0145 | 0.0019 | 0.0172 |

Outcome variable: online PL sales share

**Tab. 4**. Results of the three-way interaction

Table 5 reports the conditional effects of PL assortment share on PL sales share in the offline setting, evaluated at three representative values of assortment depth:

- At low assortment depth (56352 SKUs), the relationship is negative and significant (effect = -0.5413, p < 0.0001).
- At moderate assortment depth (210499 SKUs), the relationship remains negative and significant (effect = -0.3937, p < 0.0002).
- At high assortment depth (517428 SKUs), the relationship becomes non-significant (effect = -0.0999, p = 0.5538). this suggests that the presence of too many SKUs may overwhelm or dilute PL impact in the physical retail setting.

| Assort. depth | Effect | F | df1 | df2 | p |
|---|---|---|---|---|---|
| 5.6352 | -0.5413 | 21.6518 | 1 | 372 | 0.0000 |
| 21.0499 | -0.3937 | 13.6942 | 1 | 372 | 0.0002 |

| | | | | | |
|---|---|---|---|---|---|
| 51.7428 | -0.0999 | 0.3511 | 1 | 372 | 0.5538 |

**Table 5**: Results of the conditional interaction between assortment share and the offline setting at value(s) of assortment depth

These findings suggest that while increasing PL assortment share can enhance PL sales share, this effect diminishes or even turns negative in physical stores as assortment depth grows, potentially due to consumer choice overload or brand loyalty effects. Therefore, hypothesis $H_{2B}$ is not supported. Finally, Table 6 shows the conditional effects of PL assortment share on PL sales share across both channels, evaluated at different levels of assortment depth.

| Retail setting | Assort. depth | Effect | se | t | p |
|---|---|---|---|---|---|
| offline | 5.6352 | 1.2439 | 0.0957 | 12.9922 | <0.001*** |
| | 21.0499 | 1.2237 | 0.0793 | 15.4333 | <0.001*** |
| | 51.7428 | 1.1835 | 0.0918 | 12.8909 | <0.001*** |
| online | 5.6352 | 0.7027 | 0.0661 | 10.6365 | <0.001*** |
| | 21.0499 | 0.8300 | 0.0709 | 11.701 | <0.001*** |
| | 51.7428 | 1.0836 | 0.1414 | 7.6645 | <0.001*** |

**Table 6**. Results of testing the conditional effects of the focal predictor at values of the moderator(s)

These results show that in the offline setting there is a decreasing effect. When PL assortment depth increases, the effect of PL assortment share on PL sales share decreases; while in the online setting there is an increasing effect, meaning that when PL assortment depth increases, the effect of PL assortment share on PL sales share increases too. Thus, hypothesis $2_A$ is supported.

In sum, these results confirm that while a broader PL assortment consistently benefits PL sales share, the impact of assortment depth differs significantly between online and offline settings. In the online environment display visibility reinforces PL performance, supporting richer navigation and discovery without physical constraints, while in the physical store excessive depth may dilute PL effectiveness due to choice overload or strong national brand loyalty.

## 5. Managerial implications

The results of this study offer significant managerial insights for grocery retail managers aiming to strategically optimize private label performance across online and offline channels.

First, the evidence that PL assortment share exerts a positive effect on PL sales share across both channels highlights the importance of actively managing the depth and/or breadth of PL assortments. Managers should therefore prioritize expanding the proportion of PL items within categories to capture higher sales shares, leveraging PL as a strategic asset for margin

improvement and differentiation from competitors. This is particularly relevant in contexts where price-sensitive consumers perceive a broader PL presence as a signal of retailer quality and value positioning. Retailers can select categories in which to expand PL assortment and ensure consistent visibility of these products.

Second, the evidence that assortment depth moderates the impact of PL assortment share, albeit differently by channel, has relevant operational consequence for managers. In the online channel, the positive moderation effect indicates that increasing total assortment depth amplifies the beneficial impact of PL assortment share on PL sales share. Practically, this means that online retailers should not only expand their PL ranges but also ensure that categories are deep enough to support consumer exploration and discovery without triggering overload. The flexibility of digital shelves enables retailers to present broad and deep assortments without physical constraints, allowing for richer navigation experiences, greater online visibility, and improved cross-selling opportunities. Managers should therefore invest in website architecture, filtering tools, and personalized recommendations that help consumers efficiently navigate extensive assortments and locate PL options, thereby converting visibility into purchase.

Conversely, the offline environment seems to be more characterized by stronger consumer loyalty toward NBs. This is because we found that increasing the depth of PL assortment in the physical store attenuates the impact of PL assortment share on its sales share. This means that an excessively broad PL assortment could potentially alienate NB-loyal shoppers, who might perceive the overwhelming PL presence as a reduction in quality or as a deviation from trusted NB offerings. This suggests that physical retailers should pursue a curated PL strategy to expand PL assortments selectively in categories where consumer acceptance is high, while maintaining balanced shelf space for prominent NBs to retain loyal NB shoppers.

In sum, these insights emphasize that PL assortment strategies should be channelspecific. While online retailers can exploit greater assortment breadth as a lever to enhance PL performance, offline retailers should focus on optimizing shelf space and assortment simplicity. Retail managers can thus deploy tailored assortment strategies that align with the unique dynamics of each channel, ultimately improving PL sales outcomes and competitive positioning in an increasingly omnichannel grocery market.

## 6. Discussion and conclusion

The paper provides empirical evidence about the existence of a direct and positive relationship between PL assortment and PL sales in the FMCG industry, both offline and online, although the same relationship is stronger in "bricks-and-mortar" stores than in the e-commerce channel. Likewise, the research conducted by Brüggemann and Pauwels (2022) highlights differences in the purchase share of products between online and offline grocery shoppers. This suggests that assortment composition, including PL products, plays a role in shaping consumer preferences and, consequently, impacts sales across both online and offline retail channels.

The findings thus confirm the significant role of assortment as a key-driver for PL sales in the online retailer setting as well as in the offline one. This is due to an enhanced level of PL visibility/exposure, which induces an increase in the willingness-to-buy PL items by e-shoppers.

Moreover, the study reveals that the total category assortment depth moderates the above positive impact of assortment share on sales share online only, while offline this category-specific attribute results to be not significative. This means that if in the offline retail setting a higher assortment share always drives PL to a higher sales share, independently from the

total number of items listed in each food and beverage category, in the online retail setting the same effect is differentiated according to the magnitude of the category's range. The higher the number of items listed in the category online, the higher the importance of online assortment share as a key driver to online sales share for PL.

This evidence opens field for further research within the online channel, where one of the biggest retail marketing issues lies in the limited visibility given to each brand/item compared to what happens in the offline channel. While online each single item typically occupies only one virtual "facing", thereby reducing the opportunity for prominent visibility, offline the same item can be strategically presented multiple times on the shelf, increasing its in-store visibility. Nevertheless, the online environment is characterized by potentially infinite shelves, allowing for the presence of a wider range, but this must be combined with solutions that are able to offer a user-friendly navigation experience. All the above drives to the need for innovative merchandising management practices for e-tailers, based on the manoeuvring of brands' visibility levers more in *qualitative* terms (i.e. working on the algorithm determining the ranking of items showed in each category, as well as on smart characteristics filtering and price sorting options) than in offline-typical *quantitative* terms (i.e. number of facing allocated to each item listed in the same category).

The limitations of this work are threefold. First, it is limited in time, as it focuses on one year only (2023); a longitudinal analysis including a wider timespan would surely enrich and reinforce the analysis. Second, it is based on a dataset regarding the whole retailing industry, while an analysis comparing different players through elaboration of firm-specific data would give interesting insights related to various business models co-existing in the same competitive arena. Lastly, we consider one moderator only (i.e. total category assortment depth); controlling for other potential moderator would enrich the analysis. According to the extant literature, national brands sales share and SB price gap vs. national brands appear to be particularly promising moderators to be tested.

# Nonlinear trade-offs in customer acquisition and retention

Leopoldo Trieste[1],*, and Giuseppe Turchetti[1]

## Abstract

The nonlinear trade-off between customer acquisition and retention presents a critical challenge in marketing strategy. While both are essential for sustained business growth, they draw on shared, limited resources and influence growth trajectories in distinct—and often nonlinear—ways. Overinvesting in customer acquisition can lead to churn-heavy expansion, resulting in high costs and unsustainable growth. Conversely, overemphasizing retention may constrain short-term expansion but can paradoxically strengthen acquisition through improved brand reputation and customer advocacy. These nonlinear interdependencies mean that small imbalances in resource allocation can produce disproportionately large outcomes, including volatile or even chaotic growth dynamics. As a result, marketers must continuously recalibrate their acquisition–retention strategies, guided by data-driven insights, contextual awareness, and long-term objectives. However, this process must be approached with caution: even minor adjustments or prudent, incremental refinements can introduce deterministic chaos, leading to instability and unpredictability in acquisition and retention dynamics. Understanding these nonlinear effects, and their potential, such as chaos being a necessary condition for ontogeny and innovation, is crucial for designing sustainable marketing strategies.

*Keyword: Customer Acquisition, Customer Retention, Nonlinear Trade-offs, Deterministic Chaos*

## 1. Introduction

Customer acquisition and customer retention (AR) are both fundamental pillars of business growth and sustainability (Reinartz & Cumar, 2003; Lianos & Sloev, 2016, Voss & Voss, 2008). However, they compete for limited resources: budget, time, talent, and attention (Kumar &, Reinartz, 2016; Livne et al., 2011; Min et al., 2016). This trade-off is not simply a matter of dividing efforts evenly—it is inherently nonlinear. Investing more in one area does not result in proportional gains. We will demonstrate that, under specific conditions, the evolution of new customer acquisition and the retention of existing customers can transition into deterministic chaos. As a result, the system may exhibit long-term unpredictability, where small differences in initial conditions lead to drastically different long-run outcomes.

## 2. Understanding the trade-off

Customer acquisition refers to the strategies and efforts made to attract new customers to a business. We refer to marketing activities such as digital advertising, search engine marketing, influencer partnerships, public relations, and product trials. On the other hand, customer

retention refers to the strategies used to keep existing customers engaged, satisfied, and loyal over time. These include email marketing, loyalty programs, personalized experiences, exceptional customer support, and post-purchase engagement.

In theory, a business would do well to invest equally in both. However, in practice, budgets are limited, and marketing teams must prioritize. This forces a trade-off: investing more in customer acquisition typically means less resources in retention—and vice versa (Tsao, 2013). This trade-off becomes particularly important in highly competitive markets, earlystage startups with a finite runway, or during economic downturns when efficiency becomes paramount.

The consequence is a nonlinear co-evolution of the number of new and retained consumers. Retention has a compounding effect that makes it disproportionately impactful over time. Loyal customers (Nasir, 2017) tend to make repeat purchases, refer others, and cost less to serve. As a result, even small improvements in retention can have a significant impact on long-term profitability. Conversely, neglecting retention may not immediately affect revenue, but it creates a leaky bucket scenario in which acquisition spending is wasted, as new customers churn out as quickly as they arrive. This creates a nonlinear risk: even minimal underinvestment in retention can drastically erode the value of otherwise effective acquisition efforts.

At the same time, over-investing in acquisition can inadvertently harm retention. For instance, aggressive promotional offers aimed at attracting new customers might alienate loyal customers who previously paid full price. A sudden influx of new users may also overload customer service teams, degrading the overall experience and prompting existing users to leave. This implies that the cost of acquisition goes beyond monetary investment—it also affects organizational focus and the quality of customer experience—introducing additional layers of nonlinearity (Reichheld, 1996).

Given the nonlinear nature of the acquisition–retention trade-off, there is no one-size-fits-all solution for optimal resource allocation. The right balance depends on several dynamic and context-specific factors (King et al., 2016). Startups and early-stage companies tend to prioritize acquisition as they seek product–market fit and aim to grow their customer base rapidly. In contrast, mature companies in saturated markets often shift their focus toward retention, especially as the cost of acquiring new customers rises.

Business models also shape strategic emphasis. In subscription-based models such as Netflix, retention is typically more critical, as recurring revenue drives customer lifetime value. In transactional models like e-commerce, acquisition may initially appear more important, but strategies such as loyalty programs and customer lifetime value optimization remain essential for profitability (Kvíčala et al., 2024). Industry dynamics play a role as well: sectors characterized by high switching costs or strong brand loyalty (e.g., financial services, luxury goods) can afford to concentrate more on retention, while commoditized markets (e.g., fast fashion, consumer electronics) may need to maintain a steady focus on acquisition to stay competitive.

Despite the intuitive appeal and apparent success of many strategies for managing the acquisition–retention trade-off (Farquhar et al., 2008), significant challenges arise from the uncertainty inherent in their implementation. This uncertainty is not limited to time lags between strategic actions and observable results, or the constantly shifting nature of market environments. It also stems from a deeper, intrinsic uncertainty rooted in the nonlinear evolution of customer dynamics. In this context, the interaction between acquisition and retention can exhibit chaotic behavior (Strogatz, 2024), in which outcomes become highly sensitive to initial conditions. This chaos renders future performance difficult to predict and

manage, challenging more deterministic approaches (e.g., Fader & Hardie, 2007; Ovchinnikov et al., 2014) and calling for new frameworks that can account for the complexity and instability of these systems.

## 3. The model

We model the nonlinear trade-off evolution between customer acquisition and retention through the following discrete system:

$$R_{t+1} = a - bA_t \qquad (1)$$

$$A_{t+1} = -cR_t + dR_t^2 \qquad (2)$$

with not negative coefficients. A and R may represent the number of newly acquired and retained customers, respectively. They can also be interpreted as the corresponding growth rates. The coefficients b and c represent the proportion of resources allocated to acquisition (A) and retention (R), respectively. Since the total resource allocation is fixed, we can assume $b + c = 1$, and therefore $c = 1 - b$.

The parameter a represents the number of retained customers at time $t + 1$ when $A_t = 0$. It can be considered an intrinsic property of the product or service that drives customer loyalty. The parameter $d$ captures the nonlinear effect of investments in retention—and the resulting number of retained customers—on the number of new acquisitions.

At time t+1, customer retention (i.e., the number of retained customers) negatively depends on the resources allocated to customer acquisition (or the number of new customers). This reflects a kind of "jealousy" among existing customers: when companies focus heavily on attracting new customers, current customers may perceive this as a loss of exclusivity or reduced attention. As a result, the perceived value of being a client may decrease (see Equation 1).

Customer acquisition $A_{t+1}$ at time t+1 also negatively depends on customer retention $R_t$, reflecting the inherent trade-off between acquisition and retention. However, beyond this linear relationship, a high $R_t$ can have a positive, nonlinear effect on acquisition at time t+1. This is because efforts and strategies aimed at retaining existing customers enhance the perceived value of becoming a new customer (see Equation 2), as prospective clients expect to receive consistent and growing benefits.

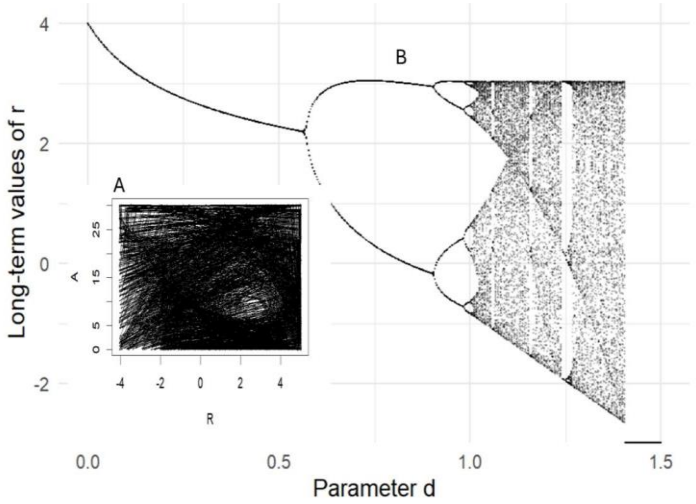

**Figure 1:** A: Dense trajectories of R and A as typical of chaotic behavior, parameters fixed at. a=5, b=0.3, c= 0.5; d= 1.3; initial conditions: R=1.1; A=1.3. B: bifurcation in the long-run values of customer retention as parameter controlling nonlinearity (*d*) changes. The other parameters are fixed at: a=3; b=0.5, initial conditions: A=R=1. System (1-2) may transit to deterministic chaos for some specific values of the model parameters a, b, c, d, e. Nonlinearity controlled by parameter *d* trigger bifurcations in the long-run values of the considered variable, as typical of chaotic behavior (See Fig. 1 B).

## 4. Conclusion

The nonlinear trade-off between customer acquisition and retention is a central issue in both marketing theory and practice. While both are essential, they compete for scarce resources and influence growth in very different—and often nonlinear—ways. Over-investing in acquisition can lead to churn-heavy growth that is costly and unsustainable. Conversely, overinvesting in retention may leave growth opportunities untapped, although, in nonlinear fashion, it can also positively impact acquisition. Understanding the nonlinear dynamics of this trade-off is critical: effects compound over time, and small imbalances can produce outsized consequences, including chaotic behavior. Smart marketers must continually recalibrate their strategies, guided by data, context, and long-term goals. However, this recalibration must be approached with caution, as it may not always increase opportunities and can, under certain conditions, trigger unmanageable and unpredictable outcomes. The identified nonlinear trade-off between Acquisition and Retention may be amplified or diminished depending on the specific industry, business model, or market context. Based on this short contribution a full-length paper investigates the effect of A-R dynamics for different strategies governed by parameter *b*. The full paper identifies conditions for stability, instability, and chaos, and discusses the impact of strategies that are not constant but depend on the observed composition of customers over time.

# Track 6
# Tourism, Culture & Arts Marketing

Coordinators: Marcello Atzeni & Serena Volo

Il turismo, l'arte e la cultura rappresentano asset strategici dell'economia e della società, sia a livello nazionale che internazionale. Questa sezione tematica intende stimolare il dibattito scientifico e manageriale sui temi dell'analisi del comportamento della domanda turistica (nelle sue diverse declinazioni tematiche) e, quindi, sulle strategie di marketing che imprese e intere destinazioni possono attuare, anche come risultato di percorsi di imprenditorialità, per soddisfare i bisogni e le aspettative dei visitatori, stimolarne la fedeltà e rendere memorabili le esperienze vissute. In questa direzione, la sezione tematica intende anche incentivare lo sviluppo di nuova conoscenza in merito alle tematiche del destination marketing e management (network governance, branding, destination smartness, ecc.) e, quindi, all'analisi delle strategie di co-marketing che imprese e organizzazioni possono porre in essere tramite l'attivazione di rapporti di collaborazione orizzontali, verticali e obliqui con l'obiettivo di creare valore a livello economico, socio-culturale e ambientale per i propri stakeholders. Infine, ma non certamente meno importante, l'attenzione è posta all'analisi del contributo di internet e delle nuove tecnologie (robotica, intelligenza artificiale, realtà aumentata e virtuale, big data, ecc.) nella pianificazione e nell'implementazione delle strategie di experience design nel contesto turistico e culturale.

Con l'obiettivo di rendere ancor più visibile la ricerca che nel corso del tempo l'accademia italiana ha prodotto sulle tematiche di riferimento, e con l'obiettivo di favorirne il confronto e l'integrazione con il contesto scientifico internazionale, uno dei propositi chiave di questa sezione è quello di promuovere la partecipazione di studiosi di università straniere, anche allo scopo di incoraggiare la creazione e lo sviluppo di progetti di ricerca transfrontalieri.

Tourism, art, and culture are strategic assets for economies and societies worldwide. This section promotes scientific and managerial debate on tourist demand behavior and on the marketing strategies—often driven by entrepreneurial initiatives—that firms and destinations can adopt to meet visitor needs, build loyalty, and create memorable experiences. It also supports research on destination marketing and management, including governance networks, branding, smart destinations, and co-marketing strategies enabled through horizontal, vertical, and diagonal collaborations that generate economic, socio-cultural, and environmental value.

A further focus is the role of digital technologies—such as robotics, AI, AR/VR, and big data—in planning and implementing experience-design strategies in tourism and cultural contexts. To enhance the visibility of Italian research and strengthen its connection with international scholarship, the section aims to involve foreign academics and encourage the development of cross-border research projects.

# Oltre l'hype: il ruolo dei social media nella formazione degli overtourism hot spots. Un'analisi esplorativa del caso di Roccaraso

Antonio Apicella[1],*, Serena Pelosi[2], Pierluigi Vitale[3], and Alessandro Vollero[4]

## Abstract

Il presente working paper mira ad indagare l'influenza dei social media sulle decisioni di escursione giornaliera e la loro potenziale connessione con fenomeni di overtourism. Sebbene la letteratura accademica riconosca il ruolo dei media digitali nel processo decisionale turistico, permane incertezza circa la loro capacità di generare direttamente forme di pressione turistica "non sostenibile". Seguendo un approccio *mixed method* sequenziale su un caso studio esemplare, la nota "invasione di Roccaraso", il disegno della ricerca si articola in una prima fase esplorativa, qui presentata, di tipo quantitativo che combina tecniche di content analysis automatica e sentiment analysis applicate a contenuti pubblicati sul web e sui social nel periodo compreso tra dicembre 2024 e febbraio 2025. In una seconda fase, si condurranno una serie di interviste semistrutturate, finalizzata ad approfondire le motivazioni che hanno orientato le scelte di visita degli escursionisti interessati. I risultati preliminari indicano che i contenuti generati dagli utenti e l'attività degli influencer sembrano non costituire un driver determinante.

*Keywords: Social media-induced tourism, overtourism, content analysis, sentiment analysis, Roccaraso.*

## 1. Inquadramento della ricerca

La pervasiva diffusione dei social media ha innescato una trasformazione radicale nelle dinamiche di scelta e fruizione delle destinazioni turistiche. Piattaforme quali Instagram, Facebook e, in tempi più recenti, TikTok, sono assurte al ruolo non solo di vetrine globali capaci di generare desiderio e orientare i flussi turistici (Leung, Law, Van Hoof & Buhalis, 2013), ma anche di potenziali catalizzatori di fenomeni complessi quali l'overtourism (Gössling, 2017; Butler & Dodds, 2022). Se da un lato la condivisione di esperienze di viaggio attraverso contenuti generati dagli utenti (UGC) offre prospettive percepite come più autentiche e personali rispetto alle tradizionali forme di comunicazione istituzionale (Lim, Chung & Weaver, 2012), dall'altro solleva interrogativi cruciali sulla sostenibilità di tali dinamiche e sull'impatto che queste esercitano sulle località. Nonostante la letteratura esistente abbia iniziato a esplorare il concetto di "turismo indotto dai social media" e alle scelte determinate dall'"instagrammabilità" delle mete (Siegel, Tussyadiah & Scarleset, 2023), permane un significativo gap di ricerca sulla decisione iniziale di visitare una specifica destinazione per un'escursione breve, a differenza delle decisioni prese relative a singole

componenti dell'esperienza, quali la scelta di un hotel, di un ristorante o un'attrazione da visitare (Varkaris & Neuhofer, 2017).

In questo scenario, emerge la necessità di una più approfondita comprensione della relazione tra l'esposizione ai contenuti dei social media, le motivazioni dei viaggiatori (Xiang & Gretzel, 2010) e le conseguenti pressioni esercitate sulle destinazioni, specialmente quelle che esperiscono picchi di popolarità improvvisi ed intensi (*social media-driven overtourism hotspots*) a seguito di campagne virali su piattaforme digitali, come TikTok (Gretzel, 2019). Le analisi esistenti, pur riconoscendo il problema, non riescono a spiegare in modo esaustivo *come* i social media alimentino concretamente l'overtourism (Alonso-Almeida, Borrajo-Millán & Yi, 2019) o tendono a focalizzarsi su singole piattaforme senza considerare l'ecosistema mediale nel suo complesso (Book, Tanford, Montgomery & Love, 2018). Vi è, inoltre, una limitata comprensione del ruolo specifico di piattaforme emergenti, soprattutto in relazione a fenomeni di sovraffollamento improvviso e alla teoria dell'interazione parasociale con gli influencer (Zhu, Fong, Gao & Liu 2023). Recenti studi hanno persino iniziato a mettere in discussione l'assunto di un'influenza preponderante dei social media sulla scelta iniziale della destinazione, suggerendo un impatto più limitato di quanto comunemente percepito (Song & Wondirad, 2023).

Questo studio intende contribuire a colmare parte di questo vuoto conoscitivo attraverso un'analisi esplorativa focalizzata sul caso studio di Roccaraso, una destinazione turistica montana italiana che, secondo resoconti mediatici, avrebbe esperito un episodio di overtourism, a seguito delle attività di alcuni noti influencer su Tik Tok.

## 2. Metodologia

Il research design adottato in questo studio si fonda un approccio *mixed method* di tipo *sequential explanatory* (Ivankova, Creswell & Stick, 2006), integrando una prima fase di analisi quantitativa e una seconda qualitativa, con l'obiettivo di offrire una comprensione completa del fenomeno analizzato. L'uso combinato di analisi di contenuto e testimonianze dirette consente di superare i limiti intrinseci di ciascun metodo considerato isolatamente. In particolare, la content analysis dei post e commenti raccolti sui social media ha permesso di mappare il sentiment, le narrative prevalenti e le dinamiche discorsive emerse in relazione al "fenomeno" Roccaraso, fornendo indicazioni preziose sulle rappresentazioni digitali della destinazione e sul ruolo degli influencer, che saranno poi usate nella seconda fase.

Il dataset, suddiviso in tre periodi per comprendere meglio le dinamiche pre e postevento, è composto da circa 70.000 contenuti online (3.500 a dicembre 2024; 5.500 dal 1° al 25 gennaio 2025; 61.000 dal 25 gennaio fino alla fine del mese successivo) ed è stato estratto tramite la piattaforma di social listening YouScan. L'analisi tematica, basata su metodi lessicali, è stata condotta in due fasi: un approccio top-down, tramite l'assegnazione automatica di 13 categorie a circa 2.000 indicatori lessicali mediante intelligenza artificiale, e un approccio bottom-up, attraverso l'estrazione delle espressioni più frequenti dal dataset. La sentiment analysis è stata realizzata utilizzando il lessico italiano SentIta (Pelosi, 2015), che comprende oltre 15.000 voci annotate manualmente, con adattamenti specifici al caso di studio.

## 3. Analisi dei risultati preliminari

I risultati preliminari di questa analisi esplorativa evidenziano che l'evento verificatosi a Roccaraso il 26 gennaio non risponde alle dinamiche tipiche dell'overtourism attivato o amplificato dall'azione degli influencer. Contrariamente alle ipotesi iniziali, gli influencer non sembrano aver avuto un ruolo determinante nel generare un afflusso eccessivo di turisti nella località.

Nel Periodo 1 (dicembre 2024), i contenuti si concentrano prevalentemente su Roccaraso come destinazione turistica e sulle condizioni meteo-nevose, temi largamente discussi ma connotati da sentiment misto, oscillante tra l'attesa della neve e alcune delusioni legate alla scarsità di precipitazioni. Emergono in modo significativo anche le esperienze personali e ricordi, spesso legati alla dimensione affettiva delle vacanze natalizie, così come una generale valorizzazione delle attività ricreative, delle infrastrutture locali e delle offerte turistiche. Il tono dei post riflette una narrazione prevalentemente celebrativa o promozionale, con contenuti positivi o neutri. Gli aspetti critici, quali il comportamento dei turisti, l'affollamento, il ruolo degli influencer o l'overtourism, risultano marginali sia in termini quantitativi sia in termini di polarizzazione del sentiment. Si osservano le prime tracce di offerte di viaggio organizzato e promozioni via social, ma non emergono ancora segnali di conflitto o disagio percepito.

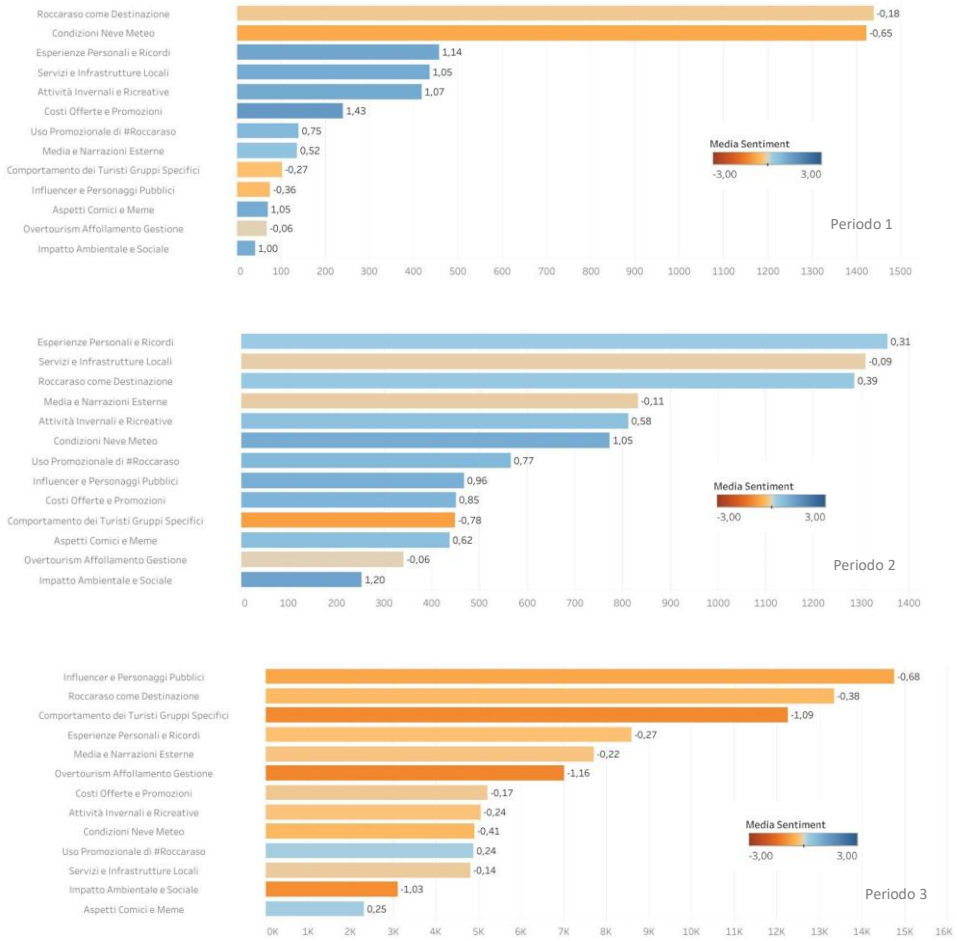

**Figura 1:** Evoluzione del numero di post per categoria tematica e sentiment

Alla luce dei risultati riportati nel grafico per il Periodo 2 (1–25 gennaio), si osserva una situazione ancora marcatamente positiva, sebbene emergano i primi segnali di tensione legati alla crescita della pressione turistica. I contenuti si focalizzano in gran parte su esperienze personali, ricordi legati alla destinazione Roccaraso, con sentiment generalmente favorevole. La narrazione sull'attività ricreativa sulla neve mantiene un tono entusiasta, supportato da condizioni meteo favorevoli. Parallelamente, si rafforzano gli elementi legati alla promozione commerciale, con un alto volume di post su offerte, pacchetti e viaggi organizzati. In questa fase emergono però con maggiore visibilità aspetti problematici, tra cui il comportamento

percepito di gruppi specifici di turisti (sentiment negativo) e le prime menzioni all'overtourism, seppur in forma ancora contenuta.

Nel terzo periodo (26 gennaio – 28 febbraio), si assiste innanzitutto alla crescita esponenziale dei contenuti relativi a Roccaraso determinati dal fenomeno "invasione" del 26 gennaio. La narrazione cambia significativamente rispetto ai periodi precedenti, con un forte aumento di contenuti critici, polemici e satirici. La figura di Rita De Crescenzo e di altri noti TikToker diventa centrale in queste discussioni, così come il dibattito sul comportamento dei turisti (in particolare napoletani) e la gestione dell'overtourism da parte delle autorità locali e dei media. Nonostante ciò, persistono post che celebrano la neve e le attività invernali, sebbene in un contesto più polarizzato.

## 4. Discussione e future ricerche

Dalle prime evidenze del caso di Roccaraso, si evidenzia la complessità del ruolo dei social media nella costruzione delle dinamiche turistiche temporanee. Solo in un momento successivo, la forte copertura mediatica dell'evento, tanto sui media tradizionali quanto su quelli digitali, ha generato un effetto di risonanza sui social network. Influencer locali, micro-influencer e utenti comuni hanno pubblicato contenuti sull'accaduto, impiegando hashtag virali e strategie di visibilità digitale che hanno prodotto livelli di engagement e visualizzazioni particolarmente elevati. L'impatto di questi contenuti appare più di tipo reattivo e amplificativo che causale: la maggior parte degli utenti ha reagito alla notizia e alla visibilità dell'evento piuttosto che averla originata.

Dall'analisi dei contenuti, sembra che un ruolo centrale possa essere stato svolto invece da alcune agenzie di viaggio, che hanno sfruttato in modo strategico i social media per promuovere, in modo capillare, offerte di viaggio organizzato in autobus per trascorrere una giornata a Roccaraso. Attraverso post sponsorizzati, condivisioni virali e l'utilizzo di community digitali, queste agenzie sono riuscite a mobilitare rapidamente un elevato numero di visitatori, rivolgendosi in particolare a un pubblico giovane e sensibile alle proposte low-cost per brevi fughe dalla città.

Emerge la necessità di sviluppare un quadro analitico più ampio per superare il paradigma di turismo indotto dai social media centrato esclusivamente sugli influencer ed abbracciare una lettura più articolata che tenga conto delle diverse logiche di attivazione degli attori commerciali (agenzie), delle piattaforme digitali, degli utenti e dei media nel co-costruire l'esperienza turistica e le relative percezioni di impatto.

Alla luce dei risultati emersi, la fase successiva dello studio permetterà di confrontare le narrazioni online emerse dall'analisi dei contenuti social con le motivazioni individuali degli escursionisti, offrendo così una visione più articolata dei meccanismi.

Al termine di questa fase, si attende di poter fornire indicazioni alle DMO e agli altri enti di governance del territorio per meglio comprendere i meccanismi attraverso i quali i social media plasmano le decisioni dei visitatori, al fine di progettare strategie di marketing territoriale più consapevoli ed efficaci. Questo può tradursi, ad esempio, nella capacità di anticipare picchi di affluenza generati da contenuti virali, come osservato nel caso di Roccaraso, o nella gestione proattiva della reputazione online per mitigare gli effetti negativi di eventuali crisi (Liu, Zhang, & Yao, 2021), dove la reazione negativa sui social media ha costretto le autorità a interventi correttivi.

# From Expectations to Emotions: Are Memorable Tourism Experiences Reshaping the Image of Naples as a Tourist Destination?

Antonio Apicella[1],*, Francesco Sammartino[1], Alfonso Siano[1], and Alessandro Vollero[1]

## Abstract

Historically associated with negative stereotypes such as crime, disorder, and urban decay, Naples has undergone a significant transformation in its perception as a tourist destination. This working paper investigates the role of Memorable Tourism Experiences (MTEs) in reshaping visitors' perceptions of Naples, with particular attention to the influence of social media–mediated imagery and narratives. Grounded in expectancy-(dis)confirmation theory, the research explores how low or ambiguous pre-visit expectations—often rooted in second-hand representations—can be overturned through emotionally salient and meaningful on-site experiences. A qualitative exploratory study was conducted using semi-structured interviews with both domestic and international tourists. The thematic analysis reveals that actual experiences frequently exceeded initial expectations, particularly in relation to local culture, hospitality, food, and urban vitality. These encounters align with core MTE dimensions such as knowledge, novelty, cultural immersion, and meaningfulness, and contribute to an emotional reappraisal of the destination. Furthermore, social media played a mixed yet significant role—both shaping expectations and enhancing postvisit storytelling—thereby amplifying the reach and impact of MTEs within digital ecosystems. While overtourism was not universally perceived as problematic, some respondents highlighted critical thresholds in specific high-density areas, suggesting potential risks for the sustainability of MTEs.

*Keywords: Memorable Tourism Experiences (MTEs), Digital Narratives, Expectancy Theory, Destination Image, Tourist Perception*

## 1. Conceptual background and context of the research

In recent years, tourism has undergone a shift in focus from traditional products and services to the so-called Memorable Tourism Experiences (MTEs)—that is, positive experiences that remain vividly embedded in tourists' long-term memory (Kim, Ritchie, & McCormick, 2012). MTEs are of strategic importance, as existing literature highlights their capacity to directly influence future travel decisions. This is based on the idea that past travel experiences and the associated memories play a key role in shaping the planning of future destinations (Zhang, Wu & Buhalis, 2018). Constitutive elements of MTEs include several aspects such as hedonism, refreshment, local culture, novelty, meaningfulness, involvement and knowledge (Kim et al., 2012). Further studies have broadened these aspects by including relational and environmental dimensions (de Freitas Coelho, de Sevilha Gosling & de Almeida, 2018), also highlighting the importance of personal interaction with locals,

perceived authenticity, and the quality of emotions experienced in shaping MTEs (Chandralal, Rindfleish & Valenzuela, 2015; Rasoolimanesh, Seyfi, Hall & Hatamifar 2021). Moreover, MTEs assume relevance in the current destination marketing landscape not only because they can enhance Destination Image (DI), but also because they reinforce relational bonds between tourists and the destination, while encouraging other positive behavioral outcomes such as revisit intention and positive electronic word-of-mouth (e-WOM) (Cifci, 2022; Zhang et al., 2018).

However, despite the growing interest in the literature on MTEs and the general consensus regarding their influence on DI (Kim, 2018), the potential role of MTEs in reshaping or altering DI within tourists' minds—and vice versa—remains relatively underexplored (Zhang et al., 2018).

This study investigates how tourists' low expectations—shaped by user-generated destination storytelling on social media, which influences DI (Lu and Stepchenkova, 2015)—can be disconfirmed by real-life experiences, favouring the perception of MTEs. It also examines how such experiences may rehabilitate a positive DI and foster favorable behavioral outcomes toward the destination. The analysis focuses on the case of Naples, Italy, a city whose DI has long been shaped by persistent negative stereotypes—such as crime, safety issues, and decay—especially in online narratives (Micera & Crispino, 2017), using as the theoretical framework the ExpectationConfirmation Theory (ECT) (Oliver, 1980). This theory is particularly relevant within the destination marketing literature, as it has been found that when experience exceeds pre-visit expectations, it triggers satisfaction, cognitive dissonance, and a reworking of tourists' perceptions of a destination.

## 2. Methodology

A sequential mixed-method research design combining qualitative and quantitative approaches has been adopted. The qualitative phase (presented hereby) involved semistructured interviews conducted face-to-face in Naples between November and December 2024 with a total of 16 participants, with different gender, occupations, nationalities, and ages. Respondents were selected using purposive, non-probability sampling to ensure a diverse representation in terms of demographics, cultural backgrounds, and travel motivations. The interview guide was structured to investigate several key dimensions: (1) general travel habits, (2) the perception of Naples prior to the visit, (3) the influence of social media and the digital ecosystem in shaping expectations, (4) the extent to which on-site experiences met or exceeded those expectations—both digitally constructed and pre-existing, (5) the memorability of specific experiences (cultural, culinary, interpersonal, etc.), (6) the perception of overtourism and its potential impact on the visitor experience, and (7) future intentions to revisit the city. The qualitative data were analyzed using thematic analysis (Braun and Clarke, 2006; Gioia, Corley & Hamilton, 2013), proceeding from inductive open coding to the development of first-order, second-order themes and finally aggregate theoretical dimensions (see Table 1).

## 3. Preliminary findings

Several interviewees conveyed that their perception of Naples prior to visiting was shaped by prevailing stereotypes, often negative in tone. These were largely informed by media portrayals, second-hand narratives, or warnings from acquaintances.

Concerns about safety, cleanliness, and disorder were recurrent elements in this imaginary ("*Before I came to Naples, my friends all told me to be careful, even my Italian friends said the same*." - Int. 13). These preconceptions act as a cognitive filter through which the destination is

initially approached. However, they are often revised or overturned by the lived experience, highlighting the transformative power of direct encounter with place.

Expectations prior to the visit were, in most cases, met or exceeded, particularly with regard to the atmosphere, hospitality, and vibrancy of the city ("*Naples exceeded my expectations, particularly regarding the care of the places I have visited so far.*" - Int. 8). Nonetheless, some participants reported mismatches, especially concerning the perceived authenticity of the city experience ("*I expected more authenticity... it seemed to me that many shopkeepers behaved that way on purpose for tourists.*" - Int. 15). The influence of social media on destination choice and experience formation appears highly variable and context-dependent. While some respondents consider platforms such as Instagram and TikTok instrumental in inspiring trips or suggesting itineraries, others adopt a more selective and critical approach ("*I use Instagram to find beautiful places... I find social media reliable, yes, but I base it on my own opinion*." - Int. 8). This utilitarian use of social media functions not merely as a source of inspiration but as a mechanism for emotional anticipation and expectation framing, both of which are crucial in shaping MTEs. Visual content—especially reels and short videos—may prime visitors to seek out specific sensory or emotional engagements, thereby influencing the actual experience.

| **Interview excerpts** | **First-order** | **Second-order** | **Aggregate dimensions** |
|---|---|---|---|
| "Before I came to Naples, my friends all told me to be careful…" (Int. 13) | Safety concerns | Negative stereotypes | Pre-visit destination image |
| "Naples exceeded my expectations, particularly regarding the care…" (Int. 8) | Positive surprise | Expectation exceeded | Pre-visit expectations |
| "I use Instagram to find beautiful places… I base it on my own opinion." (Int. 8) | Selective media use | Critical engagement | Social media influence |
| "I loved walking aimlessly, getting lost in the alleys...visiting museums like Capodimonte." (Int. 1) | Cultural exploration | Knowledge | Lived experiences (MTEs) |
| "Anatomical human organs on display...it's my favorite kind of place." (Int. 13) | Unusual attractions | Novelty | Lived experiences (MTEs) |
| "It's the most lively city I've ever visited in Europe…" (Int. 11) | Emotional involvement | Meaningfulness | Lived experiences (MTEs) |
| "The energy, the culture, and the people are amazing…" (Int. 11) | Cultural immersion | Local culture | Lived experiences (MTEs) |
| "Having very narrow main streets, you perceive it more." (Int. 15) | Spatial discomfort | Amplified crowding | Overtourism perception |
| "I would come back with a local person who knows Naples well." (Int. 15) | Conditional return | Need for deeper discovery | Intention to revisit |

**Table 1:** Thematic code analysis – example

Across the interviews, a broad spectrum of MTE components emerged, consistent with the framework by Kim, Ritchie, and McCormick (2012), in the form of novel "food and wine" experience ("*I wanted to try the rough sfogliatelle, 'o pere e 'o musso, and fried pizza*." - Int. 10), local culture ("*The energy, the culture, and the people are amazing... Even with all the poverty and challenges, it has so much life*" - Int. 11;*"the atmosphere at the Maradona mural was my favorite attraction"* - Int. 9), meaningfulness ("*It's the most lively city I've ever visited in Europe […] so much life and warmth"*- Int. 11), knowledge ("*I loved walking aimlessly, getting lost in the alleys...visiting museums like Capodimonte*. – Int. 1) and novelty ("*Anatomical human organs on display...it's my favorite kind of place to visit*." - Int. 13). While not always explicitly labeled as "memorable," many experiences exhibit high emotional salience, uniqueness, and cognitive impact, aligning with the core criteria of MTEs.

Although not uniformly described as problematic, overtourism was frequently noted in specific high-density zones, such as the Historic City Center or popular food districts. The issue appears amplified by the city's spatial morphology, with narrow streets exacerbating the perception of crowding. ("*You couldn't walk... very chaotic, especially in the Spanish Quarters*." - Int. 14; "*Having very narrow main streets, you perceive it more*." - Int. 15). However, respondents often relativized the phenomenon by comparing Naples to other major Italian destinations (e.g., Rome, Venice), concluding that the situation was manageable, yet potentially detrimental to the quality of tourist experiences if not addressed adequately.

A strong intention to return and positive WOM was expressed by the majority of respondents, frequently tied to experiences not yet lived (e.g., the coast, hidden gems), thus indicating that the destination holds latent potential for future MTEs ("*I would come back with a local person who knows Naples well*." - Int. 15). This forward-looking orientation reflects a sense of unfinished narrative and emotional attachment, both of which are known precursors to destination loyalty (Hendler, LaTour & Cotte, 2022).

## 4. Implications and future research directions

Early findings provide valuable insights for the development of future research. The disconfirmation of expectations through tourists' actual experiences points out the potential of MTEs in rehabilitating the destination image, triggering positive WOM and reputational revision. From a methodological perspective, to adequately explore these phenomena, further research could integrate quantitative and qualitative analyses, to gain a deeper and more nuanced understanding of MTEs and expectationdisconfirmation processes. Drawing on the ECT, future studies will integrate these results with a quantitative approach aimed at modeling the relationship between how digital narratives shape expectations and how subsequent MTEs can reshape a DI— either reinforcing a positive perception and encouraging further MTEs through digital storytelling, or rehabilitating a previously negative DI. Future studies could be applied also to other tourism contexts where perceived DI is strongly influenced by biases, stereotypes, or negative media-driven narratives. The cross-context application of the model would allow for testing its validity across different destinations.

Furthermore, the use of multiple measurements (pre-visit, during-visit, and post-visit) would be interesting to allow for tracking the evolution of tourist perceptions in real time, overcoming the limitations of post-experience recall (Kim et al., 2024). Future research could further investigate the extent to which MTEs influence dominant narratives about destinations on social media, as well as the role of these platforms as facilitators in processes of destination image rehabilitation. At the same time, it is crucial to acknowledge that increased attractiveness—if inadequately managed—may result in overtourism, potentially undermining the reputational gains achieved.

## Abstract

This study explores the effectiveness of influencer storytelling in tourism through narrative transportation theory. Using a quantitative approach, we analyse how influencer credibility, narrative coherence, story authenticity, and narrative style (cognitive vs. emotional) influence narrative transportation, and how the latter generates travel inspiration and travel intention. The expected results aim to enrich the literature on narrative persuasion and provide operational implications for the design of digital content capable of inspiring audiences and guiding their travel decisions.

*Keywords: influencer storytelling; travel influencer; narrative transportation; tourism.*

## 1. Introduction

In the contemporary digital communication landscape, storytelling - understood as the communication technique that involves sharing knowledge and experiences through a narrative structure (Kim et al., 2020) - has emerged as a strategic lever for engaging consumers, especially in experiential contexts such as tourism (Woodside et al., 2008). In this context, influencer storytelling is playing an important role, i.e., the use of storytelling through influential figures on social media, such as travel influencers, who recount authentic and emotional experiences, establishing a relationship of trust with their followers (Chong & Gottipati, 2020; Gross et al., 2024). Travel influencers act as co-creators of meaning and destination brand intermediaries, blending emotional engagement with content strategies aimed at fostering parasocial intimacy and perceived authenticity (Sokolova & Kefi, 2020). This evolution has redefined the dynamics of trust and persuasion within social media ecosystems. Travel influencers are storytellers capable of transforming real places into engaging visual narratives, influencing the tourist imagination and travel decisions (Femenia-Serra & Gretzel, 2020). Their communicative effectiveness is based on the process of narrative transportation, i.e., the cognitive-emotional immersion that is activated when the individual becomes completely absorbed in the narrative, temporarily suspending external reality and becoming more receptive to the messages conveyed (Green & Brock, 2000). Although several studies have highlighted the impact of travel influencer storytelling on engagement, trust, and the image of the tourist destination (e.g., Atiq et al., 2022; Sattar & Sfodera, 2025), the phenomenon remains largely unexplored, especially with regard to the psychological mechanisms that determine the effectiveness of influencer storytelling in tourism. In particular, the role of narrative transportation - widely recognized in the literature as a central element in narrative persuasion - has so far been neglected in the context of narratives conveyed by travel influencers. Consequently, there is a lack of clear understanding

of how influencer storytelling activates narrative transportation, inspiring and influencing consumers' behavioural intentions. To fill these gaps, this study explores the emerging topic of influencer storytelling in tourism through the lens of narrative transportation theory, with a twofold objective: to explore the antecedents of transportation - influencer credibility, narrative coherence, story authenticity, and narrative style (cognitive vs. emotional) - and to analyse its consequences on travel inspiration and travel intention. The expected results aim to enrich the theory and provide operational guidance to destinations and marketers on how to design narratives that inspire and guide visit intentions.

## 2. Narrative Transportation Theory

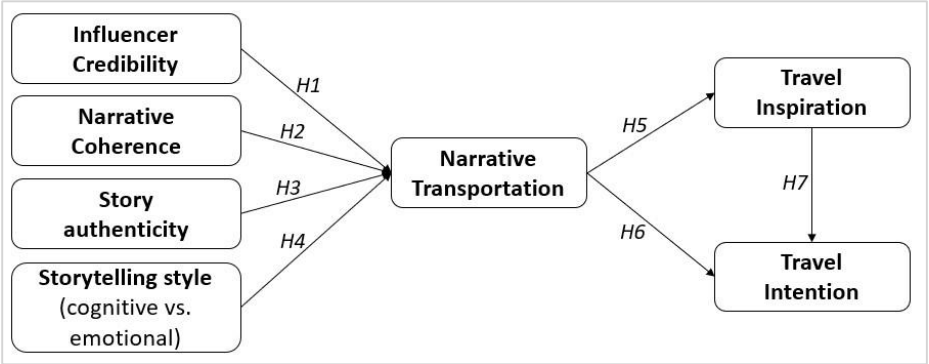
To explain the effectiveness of storytelling in marketing, narrative transportation theory is often used (e.g., Deb et al., 2025), according to which narratives activate a psychological process that mentally and emotionally transports the audience into the story (Choi, 2024). As stated by Green and Brock (2000), when a narrative is built around a coherent plot, the recipient experiences a cognitive-emotional immersion that momentarily suspends contact with external reality. In this state, attention is focused exclusively on the narrated world, favouring openness to persuasive influences. Van Laer et al. (2014) identify three structural antecedents of narrative transport: character, which allows emotional identification with recognizable and consistent figures; narrative structure, that is, the logical and fluid sequence of events capable of activating the imagination; and verisimilitude, which relates to the perceived plausibility and authenticity of the story, an essential element in generating involvement and disbelief. The interaction of these three factors facilitates the immersive experience typical of narrative transportation. Although narrative transportation theory has been widely applied to traditional advertising, its use in the study of influencer storytelling remains limited (Chong & Gottipati, 2020), thus representing a significant theoretical gap.

## 3. Hypothesis development and research model

Based on the model of Van Laer et al. (2014), narrative transportation is influenced by three key elements: characters, narrative structure and verisimilitude. In this study, these dimensions are translated into influencer credibility, narrative coherence, and story authenticity, respectively. The influencer, as the protagonist of the narrative, represents the central character: credibility - based on trust, competence and attractiveness (Ohanian, 1990) - fosters identification and narrative immersion. Narrative coherence reflects the linearity and comprehensibility of the plot, while the perceived authenticity of the story, refers to consistency with real experiences (Chong & Gottipati, 2020). Therefore, based on the theory, in this study we hypothesize that:

*H1. Influencer credibility positively influences narrative transportation;*

*H2. Narrative coherence positively influences narrative transportation; H3. Story authenticity positively influences narrative transportation.*



In addition to the antecedents of narrative transportation identified in the literature (van Laer et al., 2014), in the present study it is hypothesized for the first time that, the narrative style adopted by the influencer may also influence the audience's level of immersion in the narrative. In particular, the distinction between cognitive style and emotional style emerges as relevant in the field of storytelling (Hamelin et al., 2020). Cognitive style is oriented toward the rational and orderly transmission of information, characterized by objective and analytical language, centred on data and explanations. In contrast, the emotional style is based on subjective and engaging language, which enhances personal experiences and affective elements, promoting identification and empathic connection with the audience (Hamelin et al., 2020). Therefore, in this study we hypothesize that:

*H4. Cognitive and emotional style perception influences narrative transportation.*

Immersion in narrative, typical of the narrative transportation process, stimulates imagination and interest in the destination, generating a state of travel inspiration that can be the starting point of travel decision making. In fact, travel inspiration is a temporary psychological condition that is activated in response to stimuli that can evoke desire, imagination and motivation toward travel (Chen et al., 2025). In addition to generating inspiration, narrative transportation can directly influence travel intention: as evidenced in the literature, immersion in the narrative can induce in the recipient a desire to experience the narrated experience first-hand (Wang et al., 2025). However, in this study we also hypothesize that it is the same inspiration generated by the influencers' storytelling that activates a desire to emulate, thus reinforcing the intention to travel the promoted destination. Therefore, in this study we hypothesize that: *H5. Narrative transportation positively influences travel inspiration;*

*H6. Narrative transportation positively influences travel intention; H7. Travel inspiration positively influences travel intention.*

**Fig 1** Research model

## 4. Methodology

The present study adopts a quantitative approach aimed at investigating the psychological and behavioural dynamics that are activated following exposure to narrative content conveyed by travel influencers. Data will be collected through a structured questionnaire, preceded by viewing a video posted on Instagram. Based on the guidance of Hamelin et al. (2020), two narrative styles were selected: cognitive and emotional. Each participant will view only one stimulus. The use of video content will reflect the evolution of digital languages toward short, immersive formats, with Instagram as a key platform for influencer marketing in tourism (Gross et al., 2023). The study will be set in Mallorca, a Spanish tourist destination included in Lonely Planet's "Best in Travel 2025" list. The sample will consist of young Britons from Generation Z (1995-2010), digitally savvy and influenced by social media (Sun & Xing, 2022), chosen because of the strong presence of British tourism on the island (Statista, 2023). Data will be collected through an online questionnaire distributed on Prolific, which will include watching a narrative video of an influencer followed by questions designed to measure model variables. The scales adopted will measure: narrative style (Hamelin et al., 2020), story authenticity (Zniva et al., 2023), narrative coherence (Huang et al., 2025), narrative transportation (Pachucki et al, 2022), influencer credibility (Ohanian, 1990), travel intention (Zhou et al., 2024) and travel inspiration (Chen et al., 2025), with items rated on a Likert scale of 1 (completely disagree) to 7 (completely agree). A structural equation model

(SEM) will be applied to test the internal consistency of the theoretical model and to analyse the causal relationships between the latent constructs.

## 5. Expected results

The study predicts that narrative transportation acts as a key mediator between influencer storytelling characteristics and audience behavioural responses. It is hypothesized that influencer credibility, narrative coherence, and story authenticity positively influence the degree of narrative transportation. In addition, we hypothesize that emotional style may positively influence narrative transportation, while cognitive style may attenuate this effect. In turn, narrative transportation is expected to generate travel inspiration and increase travel intention. In addition, travel inspiration is expected to partially mediate the relationship between narrative transportation and travel intention. The expected results will help clarify the psychological mechanisms that make travel influencers' storytelling effective, filling an important theoretical gap.

## 6. Conclusion

In conclusion, the study aims to clarify how influencer storytelling, through the mechanism of narrative transportation, can inspire and guide consumers' intentions. At the theoretical level, the study explores an as-yet unexplored topic, that of influencer storytelling, and extends the application of narrative transportation theory to this context, introducing narrative style as a new antecedent and travel inspiration as a further consequence of transportation. This allows existing models on narrative persuasion to be expanded. From a managerial perspective, the results will provide practical guidance to tourism promotion boards and marketing professionals on how to structure effective digital narratives. In particular, they will emphasize the importance of paying attention to a multitude of elements to maximize the audience's immersion, inspire them and guide their intention to visit.

## Abstract

This study explores the dynamics of value co-creation within the context of cultural festivals, focusing on the Scottish International Storytelling Festival (SISF) as a single case study. Drawing from the CIF model - Context, Interactions, Feelings - proposed by Alexiou (2019), this research extends the framework by integrating a fourth dimension: Social Media. The objective is to understand how these four variables collectively enable the co-creation of value in a heritage-based festival environment. Data were collected through 60 open-ended questionnaires administered to festival participants and subsequently analyzed using thematic analysis via Leximancer software. The findings confirm that value is co-created not only through the content of the festival but also through affective engagement, social exchanges, and digital interaction. Contextual immersion in tradition, emotional resonance, spontaneous social connections, and user-generated digital narratives all emerged as core mechanisms of co-creation. This study contributes to the broader literature on servicedominant and consumer-dominant logic, experiential marketing, and festival studies, offering both theoretical insights and practical implications for cultural event design in the digital age.

*Keywords: value co-creation, cultural festival, experiential marketing, digital participation*

## 1. Theoretical Background

Cultural festivals are increasingly recognized not only as spaces for leisure and entertainment but as complex cultural systems where value is co-created through emotional engagement, social interaction, and symbolic participation. These events, especially those rooted in intangible heritage such as storytelling, offer attendees the opportunity to act not only as consumers but also as contributors, interpreters, and coauthors of meaning. This aligns with the broader shift in marketing and cultural theory from transactional to experiential paradigms, as outlined by Pine and Gilmore (1998), who argue that economic value increasingly derives from the staging of emotionally resonant and memorable experiences. Despite this theoretical development, existing research on festivals remains largely descriptive (Gyimóthy and Larson, 2015), with limited attention to how value is co-created in such contexts (Chathoth et al., 2013; Crespi-Vallabona and Richards, 2007). While the co-creation of value has been widely explored in sectors like tourism, hospitality, and retail

(Vargo and Lusch, 2008; Zhang et al., 2024), there is a gap in its application to cultural festivals, particularly those emphasizing symbolic interaction, tradition, and narrative performance. Addressing this gap, this study draws on the theoretical lens of Service-Dominant Logic (Vargo and Lusch, 2004) and Consumer-Dominant Logic (Heinonen and Strandvik, 2015), emphasizing value as something emergent from user experience, context, and relational meaning-making.

Concurrently, digital platforms have reshaped how festival experiences unfold and are remembered. Social media not only supports promotion but functions as a co-creative layer where users share impressions, emotions, and narratives in real time and asynchronously (Mangold and Faulds, 2009; Gilstrap et al., 2021). User-generated content - hashtags, images, stories, and reactions - extends the affective and symbolic life of the festival, helping to construct a shared sense of identity and meaning (Kozinets, 2015). However, much of the current literature still treats social media as a marketing tool rather than as a fully integrated space of value co-creation - especially in heritage-based festivals where oral tradition and symbolic immersion play a central role. In response to this theoretical shortcoming, the study proposes an expanded version of Alexiou's CIF model (2019), which originally framed value co-creation through Context, Interactions, and Feelings, by adding Social Media as a transversal and mediating dimension. This CIF+SM model reflects the reality of hybrid cultural experiences and positions digital participation as essential in shaping perceptions, emotions, and community bonds.

Using the Scottish International Storytelling Festival (SISF) as a case study, the research explores how value is co-created through both embodied participation and mediated expression, offering a framework that can help cultural practitioners and scholars understand festivals as emotionally charged, socially negotiated, and digitally extended events. To do so, the study addresses the following research questions:

**RQ1**: How is value co-created in the cultural festival context?

**RQ2**: How does context enable the co-creation of value?

**RQ3**: How does interaction enable value co-creation?

**RQ4**: How do feelings enable value co-creation?

**RQ5**: How does social media enable value co-creation?

By explicitly addressing the under-theorization of value co-creation in the cultural festival domain, this research contributes both conceptually and practically. It offers a multidimensional model that integrates digital and analog layers of participation, and it supports the development of more inclusive, meaningful, and community-driven cultural events in an increasingly hybrid cultural landscape.

## 2. Methodology

This study adopts a qualitative, single case study approach (Yin, 2003), focusing on the Scottish International Storytelling Festival (SISF) as a contemporary and context-rich example of cultural value co-creation. The case study design was chosen for its appropriateness in exploring phenomena in real-life settings, with the aim of generating deep insight into participants' perspectives, rather than statistically generalizable conclusions (Eisenhardt, 1989; Cassell and Symon, 2004). SISF, organized by TRACS (Traditional Arts

and Culture Scotland), is embedded within a broader ecosystem of traditional Scottish arts and offers a fertile ground for studying participatory cultural experiences in both physical and digital environments. Data were collected during the 2022 edition of SISF, held in Edinburgh from October 1st to 15th. A total of 70 questionnaires were distributed among attendees, with 60 completed and deemed valid for analysis. The questionnaire consisted of ten items - nine open-ended - designed to elicit reflections on four core elements of the festival experience: context, interactions, emotions, and social media engagement. The questions were based on Alexiou's (2019) CIF model, with an added focus on the digital dimension to reflect the updated CIF+SM framework. Participants were approached after festival events, primarily at the Scottish Storytelling Centre, and were briefed on the research purpose and provided informed consent prior to participation. In addition to the audience survey, a semi-structured interview was conducted with the Marketing and Communication Manager of TRACS to gain insight into the organization's strategic and communicative vision. The sampling strategy was non-probability and purposive, targeting attendees who were available and willing to contribute, thereby enabling the collection of rich, subjective narratives (Blaikie, 2009). The analysis was carried out using Leximancer, a conceptual mapping software that identifies dominant themes and relationships within qualitative data (Braun and Clarke, 2006; Saldaña, 2009). This inductive method allowed for visualizing and interpreting thematic clusters in the responses, later aligned with the CIF+SM model to answer the five guiding research questions. The automated results were supplemented by a manual thematic review to ensure contextual relevance and theoretical consistency. This triangulation of tools and perspectives strengthened the reliability and depth of the analysis, enabling a nuanced understanding of how value is co-created at SISF through spatial, emotional, relational, and digital dimensions.

## 3. Findings and discussion

The findings of this study, drawn from thematic analysis of participant responses and Leximancer-generated concept maps, confirm the multidimensional nature of value cocreation within the Scottish International Storytelling Festival (SISF). Context played a foundational role, with attendees expressing a strong alignment between their personal interests - particularly in storytelling, folklore, and Scottish culture - and the symbolic, spatial, and atmospheric setting of the festival. The immersive environment of SISF, its historical venues, and cultural specificity created a powerful backdrop for meaningful engagement. Interactions emerged as a second key axis of co-creation, encompassing both formal (performer–audience) and informal (audience–audience) exchanges. These interactions generated shared emotional responses, strengthened a sense of belonging, and allowed attendees to co-author their experience alongside storytellers and fellow participants. Echoing Turner's concept of "communitas," participants described spontaneous conversations, emotional resonance during performances, and a general sense of human connection as essential components of the festival's value. Feelings represented the third pillar of the CIFS model, with participants reporting a wide range of affective responses - from joy, nostalgia, and inspiration to catharsis and introspection. Emotional engagement was not secondary but central to the experience, as attendees frequently connected stories to personal memories and cultural identity, reinforcing the transformative and immersive nature of the event. Finally, social media emerged as a transversal and increasingly integral component of co-creation. Platforms like Instagram and Facebook served not only to document and disseminate the experience, but to extend it - allowing for reflection, community building, and user-generated creativity. Participants used digital platforms to engage with the festival before, during, and after the event, creating a parallel narrative space that amplified symbolic and emotional value. In some cases, attendees even contributed original content or reinterpretations, confirming that co-creation extends beyond physical

presence into the digital sphere. Together, these four dimensions demonstrate that value at SISF is not merely delivered by organizers but emerges through a complex interplay of spatial immersion, social interaction, emotional resonance, and mediated participation - supporting the utility and coherence of the CIFS model in understanding hybrid cultural events.

## 4. Limitations and Conclusion

This study investigated value co-creation within the Scottish International Storytelling Festival (SISF) using the CIF model - Context, Interactions, Feelings - with the addition of Social Media as a fourth dimension. Through qualitative data collection (n = 60), thematic analysis, and Leximancer software, the research confirmed that co-creation in cultural festivals is a complex, multi-layered process rooted in physical, symbolic, and emotional elements. Context fostered immersion in Scottish heritage; interactions created relational value and a sense of belonging; feelings enabled personal reflection and symbolic resonance; and social media extended participation, supporting creative expression and memory sharing. The study contributes to existing literature by enriching the CIF model with digital engagement and offers a framework for designing participatory and emotionally resonant cultural events. Limitations include the single case study, sample size, and reliance on self-reported data. Future research may apply the CIFS model to other festivals, use longitudinal methods, or incorporate quantitative social media analysis. By extending the CIF model, this study offers new analytical tools for understanding hybrid cultural participation and contributes to a more comprehensive theory of value co-creation in narrative-based cultural festivals.

# The Relationship Between User Review Topics and Airbnb Listings' Revenue

Dario Centorame[1],*, and Giovanni Pino[1]

## Abstract

Despite notable advances in extracting insights from peer-to-peer accommodation users' reviews through topic modeling, a gap exists in linking topics with accommodations' economic performance in order to predict their revenue. This study addresses this gap by applying text mining to Airbnb online reviews and integrating it with regression analysis. We collected 538,428 reviews from 30,665 Airbnb listings in a tourist region and employed Supervised Latent Dirichlet Allocation (sLDA) to extract nine distinct topics and then predict the listings' revenue. All topics proved to exert highly significant effects on revenue. The implemented model also confirms the expected effect of relevant covariates, such as coastal proximity and host multi-listing. These findings contribute to the literature on peer-to-peer accommodation by providing a scalable framework for leveraging user-generated content to increase the short-term rental industry's revenue.

*Keywords: Airbnb, Topic modeling, Online Reviews, Tourism, Customer experience*

## 1. Introduction

The continuous growth peer-to-peer platforms like Airbnb in the accommodation service sector has determined a significant increase in User Generated Content (UGC), such as online reviews. With an estimated 80% of this data being unstructured text an important challenge arises, namely the extraction of valuable insights that can reveal antecedents and consequences of consumer behavior and market dynamics (Bi et al. 2024). To effectively extract insights from this abundant data, objective and scalable methods capable to convert textual data into meaningful information are required (Berger et al. 2022). This study attempts to bridge traditional techniques like regression analysis with modern Text Mining approaches to gather useful insights from the UGC data. Despite the significant advancements in extracting meaningful information from online reviews and understanding various facets of the Airbnb guest experience, there is still a notable gap in directly integrating the granular insights from topic modeling into a comprehensive econometric framework for quantitative revenue prediction. While existing studies have identified key themes related to consumer preferences and satisfaction drivers and explored the impact of review volume or sentiment on bookings, there is a lack of systematic research that directly links the semantically derived topics with listings' revenue. By demonstrating that meaningful topics can be derived from

vast collections of unstructured text data, and that these can effectively be transformed into quantitative variables to be fed to a traditional statistical model, the present research attempts to fill in this literature gap.

## 2. Application of topic modeling to guests' reviews

Among the increasing plethora of Text Mining techniques, topic modeling is a powerful technique to extract from a very large corpus of documents hidden conceptual structures, generally in an unsupervised way. Rather than relying on top-down, pre- determined constructs, topic modeling typically uses a bottom-up approach, analyzing words that co-occur within and across texts to identify latent topics. It is typically used to explore, organize, and classify the information embedded in vast collections of documents (Bi et al. 2024; Pandey et al. 2023). Popular topic modeling algorithms include Latent Dirichlet Allocation (LDA) and Structural Topic Modeling (STM), which offer advantages such as automatic topic extraction and reduced subjective bias compared to manual content analysis (Ding et al. 2020; Ding et al. 2024). Available studies have frequently employed topic modeling techniques to identify key drivers of guest satisfaction and experiences in Airbnb accommodation, such as host service, physical aspects of the property, and location (Cavique et al. 2022; Ding et al 2020; Gao et al 2022, Zhang et al 2025). Researchers have also investigated the impact of online reviews on consumer purchasing decisions, booking intentions, and overall sales performance, and highlighted that negative reviews generally exert detrimental effects on sales and brand reputation (Sim et al. 2021). Notably, some scholars have started to integrate textual analysis with relevant quantitative data; for example, Gao et al. (2022) examined how review topic proportions change based on price and property ratings, revealing that topics such as "Host," "Location," and "Facilities" are key factors for high-priced Airbnb listings.

## 3. Data and Methods

We analyzed data obtained from AirDNA, one of the most important providers of data and analytics concerning the short-term rental industry. For each Airbnb listing, AirDNA data covers a wide range of features like Revenues, Occupancy Rates, Location type. To gather reviews, we built a python scraper using *Selenium*, a multilanguage framework that enables and supports the automation of web browsers, which was pivotal for handling dynamic loading of the pages and mimicking user behavior. By running the scraper on each listing URL from the AirDNA dataset collected a total of 538,428 reviews for 30665 listings. Since Airbnb reviews are written in various languages, to homogenize the data we utilized Airbnb's automatic translation feature to obtain a dataset composed solely of English-language comments. The texts were then preprocessed using standard NLP rules: the comments were lowercased and tokenized at the word level. We dealt with contractions such as "don't, can't, wouldn't" leveraging the python package *contractions*. We removed all links, punctuation signs, unusual patterns and words with a length less than two characters. We then removed common English stop words leveraging the python package NLTK. In text mining, reviews often pose challenges due to their varying lengths. Short reviews may lack sufficient information, only adding noise to the dataset. Conversely, long reviews can be computationally taxing to process. We thus decided to consider only reviews whose cleaned texts' length was between the tenth and ninety-fifth quantile of the distribution resulting in

a total of 453132 documents. We employed Supervised Latent Dirichlet Allocation, or sLDA (Mcauliffe & Blei, 2010) which extends the popular Latent Dirichlet Allocation model (Blei et al. 2003) by incorporating a response variable for each document (e.g., star ratings, download counts). It can simultaneously learn latent topics and assign regression coefficients to find the best possible estimate of the response variable. This is possible because sLDA trains a Generalized Linear Regression model of topic proportions in relation to the response variable. Training a topic model requires carefully fine-tuning several important hyperparameters the most important of which is the number $K$ of topics in the corpus. We set $K$ by considering objective measures such as $C_v$ coherence and perplexity but since these values not always result in human-interpretable models, we manually selected the most interpretable model from the list of "objectively best models". To train the model we aggregated reviews for each location and used the yearly revenue as response variable. To enrich the analysis, we have added six additional control variables.

## 4. Results

The resulting model achieved a relatively high Coherence of 0.562 (Martin et al. 2025) and 9 topics as displayed in Table 1. The analysis identified nine distinct topics:

- *Problem Solving*: captures issues related to in-room facilities like bathrooms and beds, often accompanied by complaints;
- *Relaxation and Nature*: reflects rural and peaceful stays with mentions of trulli, pools, and countryside;
- *Accessibility*: focuses on ease of transport and location, referencing train stations and central areas;
- *Amenities*: highlights functional features and recreational aspects, particularly useful for families (e.g., supermarkets, outdoor services, etc.);
- *Comfort*: emphasizes the overall comfort of the accommodation;
- *Hospitality*: captures the hosts' welcoming ability which typically manifests through breakfast offerings;
- *City Centre*: relates to centrally located and historic settings;
- *Sociality*: captures social interactions and local tips shared by hosts; • *Scenery*: describes scenic elements such as sunsets and balcony views.

In a subsequent step, we regressed revenue on the extracted topics. The resulting model (Table 2) revealed significant positive effects of all topics on revenue. In interpreting the results, we must consider that the topics are proportions, hence, their coefficients must be read as if the proportion of the reviews concerning the $i$ host and the $j$ topic increases by 1, the $i$ host's revenue can be expected to increase by $\beta_j$ on average. Out of all the topic variables, *Accessibility* has the strongest positive impact (€ 8,016) and a similarly high value is also found for *City Centre*, which indicates that the spatial location of each listing is a

relevant predictor of revenue. Strong predictors are also *Problem solving* and the *Hospitality* which indicate that the interaction between guests and hosts plays an important impact on revenue. Regarding the covariates, we found that listings near the coast do have a premium over distant ones, as 1 km increase in distance from the coast is expected to determine a €19 decrease in revenue. Consistent with past research (Xie et al. 2021), we also found that the professional management of accommodations, captured by multi-listing, results in higher revenue.

## 5. Conclusions

This study shows that supervised topic modeling can effectively convert Airbnb reviews into meaningful predictors of revenue. Applying supervised LDA to over 450,000 reviews, nine key topics were identified, with *Accessibility* and *City Centre* emerging resulting the strongest revenue drivers, followed by *Problem Solving* and *Hospitality*. The results also highlight the importance of both location and service quality. Methodologically, the study bridges text mining and econometric analysis, offering a scalable approach for turning qualitative user feedback into economic- relevant quantitative insights. Managerially, the study identifies meaningful aspects that might help peer-to-peer accommodation providers improve their economic performance.

# Decoding Sustainability Through Tourist Reviews: A Multimodal Big Data Analysis of User-Generated Content

Ilenia Confente[1],*, Valentina Mazzoli[1], and Sara Migliorini[1]

[1] Università di Verona, Verona, Italy

* Corresponding author: ilenia.confente@univr.it

## Abstract

The aim of this ongoing project is to identify how user-generated content (UGC) related to tourist destinations conveys dimensions of sustainability and how these, in turn, affect recipients' reactions. Adopting a triple bottom line approach to sustainability and leveraging big data analysis techniques, including machine learning and deep learning, to different content (i.e., textual and visual), this work sheds light on how tourists discuss sustainability-related issues online.

By analyzing more than 6,000 texts and over 11,000 image reviews, this research offers a methodological contribution by isolating sustainability-related associations in tourist reviews, providing a useful tool to monitor tourists' behaviors and perceptions concerning sustainability in tourist destinations. Theoretically, it contributes to the literature on sustainable tourism by revealing how tourists articulate sustainability and how this discourse relates to their behavior. From a managerial perspective, it offers destination management organizations and institutions a tool to monitor tourists' perceptions and associations related to sustainability, with the aim of aligning destinations' communication more closely with tourists' discourses.

*Keywords: sustainability; reviews; user-generated content; image analysis, text analysis; triple bottom line*

Sustainability has become one of the most prominent issues on the agenda of tourism policy makers, destination managers, and scientific research. Despite the importance given by the United Nations World Tourism Organization (UNWTO) to sustainable tourism, many studies have demonstrated that tourism is far from reaching its sustainability goals. Only in recent times have researchers begun to include big data analytics from user-generated content (UGC) to capture, describe, and monitor tourists' perceptions and behaviors regarding sustainability (e.g., Confente et al., 2024; Mariani & Borghi, 2021).

This study seeks to 1) define online tourists' sustainability discourse, exploring all sustainability dimensions and identifying topics in each dimension; 2) based on the definitions of presence and depth of sustainability discourse (Mariani & Borghi, 2021),

operationalize these variables and track them in tourists' discourse over an extended period of time, across multimodal types of UGC (i.e., visual and textual).

This approach is guided by the following research question: "*What are the main online tourists' discourses surrounding sustainability dimensions and how are these evolved over time*?" This work makes a relevant contribution to the sustainable tourism research by applying big data analytics employing machine learning and deep learning techniques. The originality of this work stems from its capacity to combine different disciplines, such as destination marketing with data science and data analytics. This allows to track longitudinally both the presence and depth of online tourists' discourse surrounding all sustainability dimensions by using different types of UGC.

The combination of different big data analytics techniques also offers a methodological contribution that paves the way for further research and applications of big data for sustainable tourism. To achieve this, we employ established big data analysis techniques to identify sustainability-related topics and track their evolution over time. Furthermore, the multimodal approach adopted provides a richer characterization of tourists' online discourse around sustainability. From a theoretical perspective, this research contributes to the sustainable tourism literature by capturing actual tourist perceptions and behaviors across the three dimensions of sustainability. This approach helps overcome common limitations in existing research, such as the intention-behavior gap and social desirability bias (Viglia & Acuti, 2022). Methodologically, the study offers a novel approach by integrating textual and visual analysis, addressing a need highlighted in recent tourism studies (Vidaurreta-Apesteguia et al., 2025). From a managerial standpoint, the project provides destination managers and municipalities with a practical tool to monitor tourists' perceptions and behaviors within specific destinations. This is achieved by analyzing diverse content types across multiple online platforms. Finally, the combination of multiple big data analytics techniques paves the way for future research and applications in sustainable tourism, including the integration of social media platforms to capture emerging destination images, not only through textual analysis but also via image-based insights (Acuti et al., 2018).

## Abstract

The objective of this study is to examine the impact of Destination CSR on tourist satisfaction, contingent on the utilitarian or hedonistic attitudes of tourists visiting coastal tourist destinations in Salento. Tourists with hedonistic attitudes may experience a form of dissonance, feeling implicitly judged or limited such as encountering frequent moral reminders or environmental instructions on leisure sites, and consequently less satisfied with their holiday.

### 1. Literature Review

Coastal and maritime tourism is recognised as a pillar of the European blue economy (Philipp et al., 2020). According to the latest European Commission report, this sector accounts for 53% of total employment and 33% of gross value added of the entire EU blue economy (European Commission, 2024). This economic centrality is driving institutions to promote development models that balance profitability with environmental and social sustainability, a crucial balance for the long-term vitality of destinations.

In response to the need for sustainability, the concept of Destination Corporate Social Responsibility (D-CSR) has emerged in the literature. Destination CSR refers to the activities carried out by all stakeholders to protect and improve the social and environmental aspects of an entire destination, beyond the economic interests of individual organisations (Su et al., 2018).

To comprehend the way D-CSR initiatives influence tourists, marketing literature frequently makes use of the theoretical paradigm of Signalling Theory (Chung & Kalnins, 2001; Connelly et al., 2011). As proposed by this theory, in a market characterised by information asymmetry, social responsibility actions function as credible "signals" of a destination's intrinsic quality and values. A visible commitment to sustainable practices (e.g., use of renewable energy, support for local communities) signals to tourists that the destination is well managed, reliable and of high quality, reducing perceived uncertainty and positively influencing their evaluations. Furthermore, the extant literature indicates that the positive impact of CSR signals, in the specific context of D-CSR, is contingent upon their congruence with consumer motivation. When the message appears to be "morally out of place", it has the potential to elicit reactance or negative evaluations (Becker-Olsen et al., 2006). This

phenomenon, occasionally referred to as "moral disruption" in the domain of applied psychology (Bublitz et al., 2010).

A significant corpus of research has demonstrated a positive and direct relationship between the perception of CSR practices and consumer satisfaction (Luo & Bhattacharya, 2006; Martínez García de Leaniz et al., 2025). In the domain of tourism, this relationship is validated by the finding that tourists who perceive a strong commitment by the destination to economic, social and environmental sustainability tend to report higher levels of satisfaction (Martínez & Del Bosque, 2013). Marketing literature has demonstrated that elevated levels of satisfaction are associated with a heightened intention to revisit the destination and the generation of positive word-ofmouth (WOM) (Su et al., 2020), both online and offline. Concurrently, satisfaction contributes to the establishment of a place attachment, defined as an emotional and functional bond between the tourist and the destination (Yuksel et al., 2010). This attachment, in turn, has been demonstrated to engender feelings of loyalty and to increase the probability of a future return (Vada et al., 2019).

The study posits that consumer behaviour is driven by both utilitarian and hedonistic attitudes (Babin et al., 1994). The domain of beach tourism is characterised by a predominant hedonistic orientation, wherein the fundamental objective is the pursuit of pleasure, relaxation, recreation and sensory gratification (Hirschman & Holbrook, 1982). It has been demonstrated that tourists with a strong hedonistic motivation seek an escape from routine and immersion in pleasurable experiences, often with little tolerance for messages that interrupt this state.

The existing literature operates under the assumption of a positive correlation between D-CSR and satisfaction; however, this assumption disregards the fact that tourists are frequently motivated by hedonistic factors. The research gap pertains precisely to this potential friction: namely, the lack of investigation into whether social responsibility signals, when in conflict with the pursuit of pure enjoyment, can generate negative rather than positive reactions. The present study aims to investigate the moderating role of hedonistic motivation in the relationship between D-CSR and tourist satisfaction.

## 2. Conceptual model

To address the research question, this study offers a conceptual framework for understanding the impact of D-CSR on tourist satisfaction, contingent on the utilitarian or hedonistic attitudes of tourists visiting coastal tourist destinations in Salento. All factors were identified by literature. Among those, Destination CSR refer to tourists' perceptions of the activities of all stakeholders that protect and enhance the social and environmental aspects of an entire destination, beyond the economic interests of individual organisations (Su et al., 2018). The preceding variable exerts an influence on satisfaction levels, measured by Tourist Satisfaction (Choong-Ki Lee et al., 2007). The model also incorporates three outcomes resulting from tourist satisfaction: WordOf-Mouth (positive) (Arnet et al., 2003), Place Attachment (Vada et al., 2019) and Intention to Revisit (Bonn et al. 2007). A salient factor that may act as a moderator pertains to the hedonistic or utilitarian attitudes adopted by tourists. These attitudes are measured using the Hedonic and Utilitarian Consumer Attitudes scale (Batra & Ahtola, 1991). Furthermore, the model will assess the moderating effect of touristic Environmental Consciousness (Kilbourne & Pickett, 2008) on satisfaction acting as a green booster afterward.

## 3. Methodology

The present study will adopt a quantitative approach to empirically verify how tourists' perceptions of D-CSR, depending on their attitudes, influence their satisfaction with the holiday.

The sampling strategy employed is a mixed non-probabilistic type (Etikan et al., 2016), primarily based on convenience sampling, integrated with a heterogeneous sampling component by location. The data will be collected through a structured online questionnaire, distributed via digital channels (e.g. social media, WhatsApp) and at locations with high tourist concentrations, such as municipal information points and accommodation facilities in Salento, with the aim of reaching tourists who have stayed in the region in the last year. Mixed non-probability sampling strategies, which combine convenience with heterogeneity by location, have already been successfully adopted in numerous studies in the field of marketing and tourism (Prayag & Ryan, 2012; Miller et al., 2010), especially in contexts where access to probability samples is limited and the objective is to obtain a broad spectrum of perspectives in an efficient manner. The sampling strategy will ensure the representativeness of the Italian population in terms of gender, age, education and income level.

The survey will include two main sections. The first one will begin with a screening item, enquiring about the respondents' vacationing experiences in Salento within the past one year, followed by the items belonging to the theoretical constructs included in the model. The second section will gather socio-demographic information. Only respondents who pass the attention check question will be included in the core model analysis.

The proposed conceptual model comprises seven latent described in the previous section and two control variables (age and gender). The constructs will be measured by adopting scales well validated in prior literature and adapted to meet the aim of the study. All constructs will be measured using 7-point Likert scales (1= strongly disagree; 7= strongly agree), except Hedonic and Utilitarian consumer attitudes (Batra & Ahtola 1991) and Touristic Satisfaction (Choong-Ki Lee et al., 2007) that will be assessed via a 7-point semantic differential scale.

Collected data will be analysed using SmartPLS software and the methodology will follow two main steps: validation of the measurement model (convergent validity and one-dimensionality), and test of the structural model using Partial Least Squares Structural Equation Modelling (PLS-SEM) using a 5,000 bootstrap resamples verifying the significance of the relationships (Sarstedt et al., 2021).

## 4. Expected results

For tourists with strong hedonistic attitudes, high levels of perceived D-CSR could lead to a reduction in holiday enjoyment, lowering touristic satisfaction levels (red mood). This could consequently have a negative impact on the intention to return, place attachment and positive word of mouth. Conversely, tourists with utilitarian attitudes would be positively influenced by D-CSR claims or other actions, leading to an increase in their level of satisfaction with their holiday and generating positive effects on word of mouth, attachment to Salento's coastal tourist destinations and intention to return to the destination. Finally, environmental consciousness could play a moderating role in the relationship between D-CSR and touristic satisfaction, generating an effect known as the "green boost". It is hypothesised that tourists who claim to be particularly sensitive to environmental issues would experience heightened levels of satisfaction if they encountered claims or other indications of D-CSR during their holiday.

## 5. Expected Contribution

This study makes a significant contribution to the theoretical debate on the role of Corporate Social Responsibility (CSR) in the tourism context, extending the literature traditionally focused on private companies. The expected results suggest that the perception of CSR practices by a tourist destination can generate significant effects on tourists' cognitive and emotional evaluations, influencing key behaviours such as the intention to return and positive word of mouth.

The most salient theoretical contribution of this study resides in the incorporation of the tourist's hedonistic/utilitarian attitude construct as a moderating variable into the model. The expected results could show that the effectiveness of D-CSR communication varies significantly according to the attitudes inherent in tourists. This would serve to enhance the necessity to consider individual differences in theoretical models of response to CSR, thereby establishing the foundation for future investigations into the personalisation of the value experience in tourism.

Furthermore, this work offers an original contribution to the emerging literature on the Blue Economy, with reference to sustainable coastal tourism. By setting the analysis in coastal locations in Salento, the model could explore the potential of D-CSR as a tool for promoting responsible tourist behaviour and generating shared value at an environmental, social and economic level. In this sense, the study proposes an integrated reading of tourism marketing, sustainable marketing, sustainable marine resource management and tourist loyalty strategies in the context of coastal economies.

From an empirical perspective, the expected results would provide relevant data for destination managers (DMOs) and operators in the sector. Firstly, it is important to emphasise the value of D-CSR as a strategic tool for enhancing tourist loyalty and fostering positive word-of-mouth communication, especially among visitors who express sensitivity to environmental and social issues. However, the effectiveness of DCSR communication is not universal: for tourists with predominantly hedonistic attitudes, exposure to D-CSR messages that are overly explicit or not harmoniously integrated into the holiday experience may be dissonant or even counterproductive. Finally, it is suggested that tourism staff be trained in the consistent and contextual communication of the D-CSR values, with the aim of transforming every touchpoint of the experience into an opportunity for value-based engagement which is tailored to the type of tourist. This implies the need to tailor CSR communication to match not only the content but also the emotional climate of the tourist experience.

# Can a Training Course Foster Value Co-Creation in Rural Tourism? An Exploratory Study of a Local Community Initiative

Fabio Corona[1],*, and Giuseppe Melis[1]

[1] University of Cagliari, Cagliari, Italy

* Corresponding author: fabio.corona96@unica.it

## Abstract

This study investigates whether a structured training course can serve as a platform for value co-creation in the context of rural tourism development. Grounded in the DART model of value co-creation and the concept of sense of community, the research examines changes in participants' perceptions of collaboration, value co-creation perceptions and sense of community. Adopting a simple pre-post design, the study revealed a significant decrease in perceived collaboration and a moderate but not significant improvement in perceived dialogue. These findings suggest that training initiatives can enhance awareness of co-creation mechanisms but can also reveal existing relational and structural limits within local communities. The study contributes to the limited literature on educational platforms for value co-creation in rural tourism contexts and offers practical insights for strengthening cooperation among local stakeholders in tourism development.

*Keywords: value co-creation platform, sense of community, rural tourism, training*

## 1. Framing of the research

Value co-creation is a foundational concept in tourism and service marketing, initially understood as an interaction between firms and customers (Prahalad & Ramaswamy, 2004) and later expanded to a broader perspective, considering Actor-to-Actor (A2A) relationships (Vargo & Lusch, 2011). One of the main models of value co-creation is represented by the DART model (Prahalad & Ramaswamy, 2004), which defines value co-creation through the dimensions of Dialogue, Accessibility, Risk assessment, and Transparency, defining the ways that firms should adopt to interact with customers. These dimensions particularly represent the interactive nature of the value co-creation process (Taghizadeh et al., 2016). While co-creation in tourism has traditionally focused on tourists and businesses, recent research has highlighted the importance of other stakeholders, like residents and local communities (Ribeiro et al., 2023; John & Supramaniam, 2024). Some studies highlighted how value co-creation processes can occur between residents and tourists and are influenced by the perception of potential economic and social benefits for the community (Lin et al., 2017). Moreover, Chen and colleagues (2020) highlighted that residents-tourists value co-creation is associated with residents' well-being (Chen et al., 2020). In general terms, residents' participation (and more broadly local community participation) represents an important element in determining the success of tourism initiatives, and the success of value co-creation processes (Presenza et al., 2013; Del Chiappa et al., 2018). A notable concept that is associated to both civic and political participation, as well as to community involvement is

the sense of community (McMillan & Chavis, 1986; Talò, 2018), which is a psychological construct referring to individuals' perception of community quality and belonging. It represents a concept that has been understudied in tourism literature. Cai and colleagues (2024) demonstrated that there is a relationship between residents' sense of community and their well-being, thus representing an important resource. So, the involvement of local communities in tourism initiatives and their capacity to co-create value represents an important challenge for tourism literature. In this light, platforms for value co-creation can be considered critical tools. Although often digital, such platforms can also be physical and context-based, where actors can interact directly and with a collaborative attitude (Ramaswamy & Ozcan, 2018). In rural settings with limited digital infrastructure, physical platforms—such as structured training—may offer more effective opportunities for interaction and learning how to collaborate and co-create value. Also, a structured training dedicated to local community members can help them gain useful knowledge and skills, thereby making it easier for them to overcome limitations related to insufficient competencies that can represent an obstacle to community participation (Tosun, 2000). Based on these premises, this study explores whether a local training course can act as a value co-creation platform by stimulating learning, cooperation, and shared purpose among participants. The following research questions guided the study:

**RQ1**: Can a training course in a rural context be considered a value co-creation platform?
**RQ2**: What are its short-term effects in terms of perceived collaboration and value co-creation?

## 2. Methodology

This study adopted a simple pre-post design with a mixed-method approach. The independent variable was participation in the training course described above. The course was implemented as a part of a broader tourism development project carried out in the town. Its main objective was to give residents and local stakeholders the knowledge and skills needed to support local tourism initiatives and to promote an understanding of entrepreneurial and collaborative dynamics. It was held from March 21 to May 17, 2025, with weekend sessions scheduled on Friday evenings and Saturday mornings. Each session lasted three hours and was characterized by the combination of a theoretical part with practical group activities, for a total of 36 training hours. Each session was led by professionals—including university professors, technical experts, and entrepreneurs—following a learning-by-doing approach and adopting an interactive methodology that encouraged active collaboration and critical thinking, by also considering real-world examples of tourism projects. The course concluded with a group project in which each participant collaborated to design and present a guided tour showcasing elements of their town. Three outcome variables were measured before and after the course: (1) participants' perception of value co-creation, especially in their relationships with local operators and other stakeholders; (2) their sense of community; and (3) their perceived potential for collaboration within the local context. A custom questionnaire was developed to assess these variables. No socio-demographic data was collected to guarantee anonymity, as the small sample and close-knit community made participants easily identifiable. The questionnaire included italian-adapted items from the DART model scale (Taghizadeh et al., 2016) and the Sense of Community Scale (McMillan & Chavis, 1986). Four custom items assessed participants' willingness to collaborate in local initiatives, rated on a 5-point Likert scale. An open-ended section allowed participants to share additional reflections and ideas related to the project. To integrate the questionnaire measures, also participatory observation was employed. A researcher attended all course sessions, annotating group interactions and behavioral changes throughout the program. These qualitative notes were used to enrich and contextualize the quantitative findings. The initial sample included 17 participants; however, only 11 completed both the

pre- and post-course questionnaires. All participants were current or aspiring entrepreneurs with an interest in developing tourism-related activities. Quantitative data were analyzed using descriptive statistics and a Mann-Whitney U test to compare pre- and post-intervention responses. This non-parametric test was chosen due to the small sample size, the non-normal distribution of the data, and due to the inability to match individual pre- and post-responses anonymously. For these reasons, an independent samples test was considered as more suitable (Siegel & Castellan, 1988).

## 3. Results

Results showed no statistically significant differences across most outcome dimensions. However, two exceptions emerged. First, a significant decrease was found in the perception of collaboration within the community ($U = 51$, $p < .05$; $r$[14] $= –0.45$). In other words, participants perceived fewer opportunities for collaboration after the course. Observational data support this finding, highlighting concerns expressed by some participants regarding limited engagement from other attendees and community members more broadly. and suggesting a greater awareness of structural and relational barriers within the local context. The second exception concerned the Dialogue dimension of the DART model. Although the observed difference was not statistically significant ($U = 52.5$, $p = .054$), the effect size was moderate and positive ($r = 0.44$), indicating a slight improvement in participants' perception of dialogue. Observational notes confirm this trend, showing increased active participation and openness during the seminars. For the remaining DART dimensions, no significant changes were found. Regarding sense of community, overall perceptions were positive. However, the "Influence" sub-dimension showed the lowest scores, suggesting that, while participants felt a sense of belonging and emotional connection to the community, they perceive a low capacity to influence other actors and to be influenced. This was further supported by observational data, with some participants expressing concern that other important local actors (e.g., local administration) scarcely participated in the course and the project, even knowing that it existed. Moreover, one participant expressed this in the open-ended box section: "*Especially in rural contexts like this, it's crucial the participation of local actors — municipal administrators, associations and operators such as restaurateurs, bar owners, and shopkeepers — because they can truly benefit from these training opportunities. After all, there's always something new to learn*". This reflection highlights a perceived "disconnection" between community members and different stakeholders, consequently mining the chance to (positively) influence themselves.

## 4. Discussion and Implications

Although statistical evidence was limited, the study can offer some valuable insights. From a theoretical perspective, it presents a case study of a training course in a small rural tourism context—an area still underexplored in the literature. Given the scarcity of research on the role of education in empowering residents and communities to support sustainable tourism development, these findings contribute to addressing this gap. The study highlights participants' reactions and perceptions, offering insights into how training initiatives like the one presented can influence community perceptions, value co-creation perceptions and cooperation perceptions. The results and the participants' feedback suggest that initiatives like the one presented can function as value co-creation platforms. Specifically, they offer participants an opportunity to understand and practice value co-creation processes. In this case, the course culminated in a collaboratively developed tourism product, created by participants using shared resources (e.g. historical and environmental places of the town) and cooperation, demonstrating how—apart from the measured perceptions—such a platform can foster genuine co-creation. This is particularly relevant in contexts where common digital

[14] Here, *r* refers to the rank-biserial correlation coefficient, considered as the effect size of the test

co-creation platforms are less applicable. This study contributes to rethinking training as a tangible, analogic platform for value co-creation—especially in rural areas where digital infrastructures are often lacking. Unlike virtual platforms, in-person training enables embodied dialogue, direct peer interaction, and situated learning. Such analogic platforms not only convey knowledge but also generate the relational conditions necessary for co-creation: mutual trust, shared purpose, and local agency. In this regard, training initiatives act as systemic interfaces that activate latent resources within the community. From a practical standpoint, the initiative serves as a replicable model for similar rural destinations. It provides a model that can be adapted by policymakers or tourism professionals aiming to foster local engagement. Considering the importance of local entrepreneurs within a systemic approach to territorial marketing, and the key role of residents in value co-creation (Golinelli et al., 2006; Ribeiro et al., 2023; John & Supramaniam, 2024), offering structured opportunities for learning and collaboration emerges as a crucial strategy.

## 5. Limitations and Future Research

This study presents several limitations, primarily related to the research design adopted. The absence of a control group prevents establishing a causal link between participation in the course and the observed outcomes. Additionally, the small sample size limits the statistical power of the findings, reducing their generalizability and making it difficult to draw broad conclusions. It is important to note that this short paper represents a preliminary account within a broader research project. The same participant group will be monitored over time to assess longer-term changes, both in the dimensions already explored and through the inclusion of additional indicators (e.g. economic indicators) to evaluate the overall impact of the initiative more comprehensively. Future studies can adopt more rigorous and robust research designs, such as randomized controlled trials or mixed method approaches to strengthen the validity of the findings and to explore actual relationships between the considered variables. Moreover, subsequent research could explore alternative impact variables, while maintaining the same teaching and engagement framework. Finally, future research could compare similar contexts, distinguishing between those exposed to training interventions like the one presented and those not exposed, to try and assess differential impacts on value co-creation capacity, sense of community and collaboration willingness.

# Pursuing Authenticity: Tourists' and Residents' Perceptions of the Impact of Overtourism in Venice

## Abstract

The consequences of overtourism are becoming an increasingly relevant issue in the European public debate. The growing accessibility of tourist destinations, facilitated by low-cost travel options, prompts a shift in the dominant paradigm—from destinations as mere commodities to destinations as communities of residents who host tourists. This research responds to this call, designing a theoretical model to examine the impact of overtourism in Venice, considering both tourists' and residents' perspectives. Specifically, the study assesses how the city's level of adaptation to tourists influences the authenticity of experiences and how these relate to satisfaction, as well as the likelihood of revisiting or recommending the destination. Based on recent literature, the proposed model presents an innovative approach to identifying differences and similarities between residents and tourists, offering promising insights for future researchers and policymakers.

*Keywords: overtourism, Venice, authenticity, gastronomy, touristification*

## 1. Introduction

The term "overtourism" has gained increasing popularity, entering the popular debate surrounding mass tourism and its consequences (Papadopoulou et al., 2023). The complexity of the problem is reflected in its visible consequences. Besides the physical obstruction caused by the mass of tourists in major hotspots (Oklevik et al., 2019), overtourism is also pushing the proliferation of short-term stays, driving residents out of the housing market (Santos-Rojo et al., 2023). Moreover, it is affecting the local gastronomic scene, with new businesses designed for tourists displacing local shops (Freire Varela, 2025; Şengül et al., 2024). Additionally, overcrowding affects cultural venues, disrupting the quality of experience and heritage preservation (Adie et al., 2020). The manifestation of these negative consequences impacts the authenticity of the tourist experience and the quality of life for residents (Díaz-Parra & Jover, 2021).

These challenges, fueled by the increasing accessibility of destinations through low-cost travel and accommodation, and the influence of social media (Papadopoulou et al., 2023), have led scholars to consider new paradigms for guiding tourist conceptualisation. From the traditional view of destinations as commodities towards focusing on the destination's local communities hosting tourists (Higgins-Desbiolles et al., 2019). However, empirical research remains scattered, often focusing on either tourists or residents, or specific consequences of overtourism, such as gastronomy (e.g., Freire Varela, 2025; Şengül et al., 2024), cultural heritage (e.g., Adie et al., 2020), or destination attractiveness (Jacobsen et al., 2019). In light of these considerations, this research attempts to disentangle the complexity of the

experience in a touristic destination from both tourist and resident perspectives, aiming at addressing the following research questions:

RQ1: How do tourists and residents perceive a destination's adaptation to the tourist flow? Are there any differences in how these perceptions affect the perceived authenticity?

RQ2: Are there any differences in how authenticity is perceived based on the different attractions/activities at the site?

RQ3: How do these perceptions affect satisfaction and the intention to revisit or recommend?

## 2. Theoretical Background

To answer the proposed research question, a theoretical model was developed (Figure 1). Specifically, the model builds upon the one proposed by Papadopoulou et al. (2023), introducing the concept of perceived authenticity. Moreover, instead of considering the overall experience as in previous studies (e.g., Jopp et al. 2015) without distinguishing the type of experience tourists and residents look for we analyse authenticity they perceive across the two categories of experiences offered by the city: touristic (i.e., sightseeing, which for residents was adapted as "moving around the city", and the visit to buildings and museums), and gastronomic. The same design is applied to both tourists and residents.

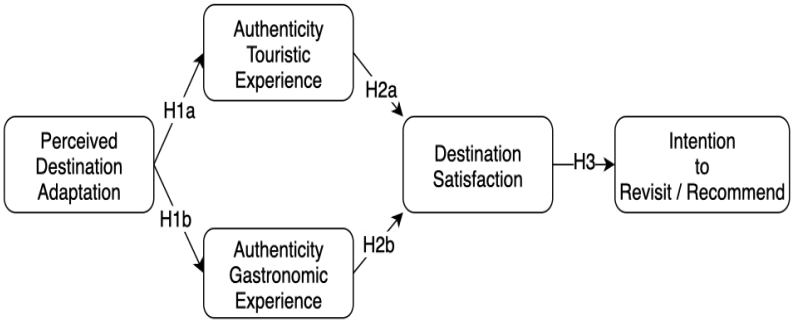

**Figure 1:** The theoretical model.

The model is grounded in expectancy-disconfirmation theory (EDT), stimulus-overload theory (SOT), and social interference theory (SIT). These three theories are frequently used in research on overtourism and crowding at destinations. EDT assesses how perceptions of a destination's adaptation influence tourists' satisfaction (e.g., Neuts & Nijkamp, 2012). SOT was utilised to examine residents' opinions regarding overtourism in Barcelona (e.g., González-Reverté, 2022), and SIT was employed to explain low tourist satisfaction at world heritage sites (e.g., Phi et al., 2024). Based on this foundation and following Papadopoulou et al.'s (2023) framework, our research examines how the perceived level of a city's adaptation to tourism influences tourists' and residents' perceptions of authenticity. However, the presence and perception of crowds can vary across different areas of the destination and depend on the type of experience an individual is having. In other words, a crowded square might be viewed differently from a crowded restaurant or museum, hence:

H1: High perceived destination adaptation (pda) negatively influences the perceived authenticity of the touristic (au_turexp; H1a) and gastronomic (au_gasexp; H1b) experiences.

In turn, authenticity was found to be positively associated with satisfaction in tourist destinations (Park et al., 2019); therefore:

H2: au_turexp (H2a) and au_gasexp (H2b) experiences positively influence destination satisfaction (sat).

Consequently, satisfaction will influence intention to revisit and recommend (Papadopoulou et al., 2023); thus:

H3: High sat will positively influence the intention to revisit and recommend (int).

## 3. Methodological Design

A 40-item survey was designed to represent the various groups of people who visit Venice daily, including tourists, residents and commuters. To facilitate understanding among respondents of different nationalities, the questionnaire was produced in both Italian and English. To better organise the design of the theoretical model and the questionnaire, the research team also conducted interviews with a group of 21 Venetian restaurateurs regarding overtourism in the city and its effects. From these discussions with practitioners, the need for a clearer understanding of overtourism emerged, breaking it down into the two main types of experiences the city offers. Specifically, restaurateurs argue that most tourists visit Venice mainly for sightseeing, without a clear motivation to explore the city's gastronomic and cultural offerings. This shared opinion prompted the research team to investigate tourists' relationship with the city's experience offerings, further supporting the proposed theoretical model. 26 individuals have tested the questionnaire in both Italian and English versions, and the first data collection granted 155 valid answers. Data analysis was conducted applying multi-group structural equation modelling (SEM) to account for differences between residents and tourists.

## 4. Preliminary Findings

Table 1 displays the results of the SEM depicted in Figure 1, considering the entire sample of tourists and residents (No MG), and accounting for group differences based on their interest in gastronomy (1st MG) and their relationship with the city (tourists vs. non-tourists; 2nd MG). The analysis, conducted after confirmatory factor analysis, depicts how pda negatively affects au_turexp when analysing the whole sample. On the other hand, it does not have a significant effect on au_gasexp. Moreover, au_turexp positively influences sat and, in turn, sat influences int. Hence, H1a, H2a and H3 are confirmed, while there is not enough statistical evidence to confirm H1b and H2b. To dig deep into the differences among groups of people spending time in Venice, once metric invariance was established (Chen, 2007), two multi-group SEM were conducted. The 1st MG accounted for people who signalled in the questionnaire their interest in the gastronomy offer of the city, against those who did not share the same interest. The analysis confirmed the findings of the first analysis in the group of respondents who did not show interest in gastronomy. However, no significant relationships were found in the other group. The 2nd MG analysis highlights how, for residents, au_turexp (which for them was interpreted as moving around the city) has a greater influence on sat than it does for tourists. For tourists, au_gasexp has a significant impact on sat, while the relationship is not deemed significant for residents.

**Note:** significant relationships in bold. Group invariance was established following Chen (2007) recommendations. All $X^2$ were found significant.

**Table 1:** Preliminary results.

## 5. Discussion and Implications

From the analysis, it emerged that pda negatively affects perceived authenticity. However, due to the policies designed to protect the architectural heritage, Venice does not alter its physical attributes to accommodate tourists. Hence, adaptations are more likely perceived through "soft" elements (e.g., shops, restaurants and queues in venues) rather than "hard" aspects like the city's architecture. Moreover, considering authenticity perception related to specific experiences allows for a more comprehensive understanding of the drivers of satisfaction. Hence, future research in this field should investigate the interplay between the soft and hard elements of adaptations in accordance with the experiences they impact, employing a qualitative or mixed-methods study.

The focus on different types of experiences allowed the research to highlight that gastronomic offer significantly influences tourists' satisfaction, but not the residents'. The soft elements of adaptations may have caused this, which only residents (or loyal tourists) can depict. Hence, in the over-touristed destination, pda is not an antecedent of authenticity: tourists can find a gastronomic offer designed for them, which is perceived as authentic and triggers satisfaction. On the other hand, residents may take for granted the less-touristic establishments. Another possible explanation, also considering the non-significant relationship in G1 of the 1st MG, is that interest in authentic gastronomic offer is not a crucial factor in influencing tourists' and residents' satisfaction. However, qualitative studies (Cunico et al., 2025) and research on social media (Ganzaroli et al., 2021) point out the relevant role played by authentic gastronomy offerings in maintaining a destination's identity. In light of these considerations, future research may apply a measure of involvement connected to gastronomy to better explore the impact of pda on gastronomic experience in Venice.

## 6. Limitations and future developments

The research design has some limitations. First, self-reported questionnaires may be biased, particularly concerning differences between reported behaviour on paper and actual behaviour of people in the city, especially when they are part of a larger group, where some diffusion of responsibility may occur. Future research could explore this aspect by comparing survey data with big data analytics on people's behaviour in cities affected by overtourism. Additionally, for respondents who are non-native speakers of one of the two languages used in the questionnaire, specific linguistic barriers that were not apparent in initial tests may arise. Finally, to promote further progress towards more inclusive research on overtouristed destinations, studies could consider residents in vulnerable situations, creating opportunities for social marketing-based research and policies.

## Abstract

Generative AI has shifted from novelty to mainstream production tool in barely three years. Generative language models led by OpenAI's ChatGPT have reached a level of syntactic fluency and topical breadth that allows them to draft destination stories in seconds. Yet marketers still lack evidence about how real readers respond to machine prose once its origin is revealed. This study compares a human-written travel blog about the picturesque destination of Dürnstein, Austria, with an AI remake produced through few-shot prompting, focussing on three perceptual constructs, i.e., trustworthiness, empathy, and intention to visit, and examines how revealing AI authorship alters those constructs. Two randomly assigned groups of international students (N = 176) read one version and rated such constructs; the AI group repeated the battery after being told that ChatGPT was the author. Before disclosure, the machine text matched the human article on perceived informativeness but evoked lower empathy and slightly weaker behavioural intent. After disclosure, trust, empathy, and intention all fell sharply. The results extend credibility research from newsrooms to tourism storytelling, refine technology-acceptance models by foregrounding narrative empathy, and argue for transparent "AI-assisted, human-edited" workflows. The study further examined how disclosing AI authorship affected perceptions, thereby offering timely guidance for tourism marketers considering generative AI for routine content production.

*Keywords: AI-generated content; tourism blogs; human vs. AI; credibility*

## 1. Introduction

Travel blogs first emerged as a form of electronic word-of-mouth two decades ago when Pan, MacLaurin and Crotts (2007) showed that peer narratives influence destination image and trip choice. Their persuasive power depends on vivid, first-person description, what Staff and George (2017) call the "show, don't tell" ethic—and on emotional contagion transmitted through story. The Cambridge Dictionary (2024) now defines a blog as a frequently updated record of ideas, underscoring its conversational lineage.

At the same time, transformer-based language models have taken centre stage in AI research. Brown et al. (2020) demonstrated that such models perform "few-shot" learning, reproducing style from minimal cues. Tourism scholars quickly framed the opportunity. Buhalis (2020) portrayed AI as the next stage of ambient-intelligence tourism, while Carvalho and Ivanov (2023) described use-cases ranging from automated translation to rapid blog drafting. In practice, industry surveys already show bloggers who deploy AI save up to half the drafting time and reported early search-engine gains when ChatGPT writes product snippets (Maglione, 2023). However, caution accompanies enthusiasm. Borji (2023) catalogued hallucinations that undermine factual reliability. Aydın and Karaarslan (2023) warned that media hype may outrun technical reality, while professional authors interviewed by Davis and Grierson (2022) expressed ambivalence about losing an authentic voice.

Credibility experiments intensify such concerns. Clerwall (2014) found that algorithmic news receives lower quality ratings; Jakesch et al. (2019) showed that disclosure of machine authorship reduces trust even in otherwise human texts; Tewari et al. (2021) reported similar scepticism in general news. In the travel domain empathy is pivotal. Clark (1980) defined empathy as vicarious experience, Escalas and Stern (2003) operationalised it for advertising, and Hsiao, Lu and Lan (2013) confirmed its role in motivating travel planning, a result echoed by Akgün et al. (2015). Trustworthiness exerts an equally decisive influence; Gursoy et al. (2019) showed that perceived reliability shapes acceptance of AI devices, and Tourimpampa et al. (2018) linked comprehension ease to credibility. Against this backdrop the current study asks whether an AI-generated travel blog can match a human blog on empathy, trust and persuasion and how authorship disclosure alters perceptions. By embedding narrative empathy into technology-acceptance thinking and by offering guidance for hybrid workflows, the present work addresses both theory and managerial practice.

## 2. Theoretical background

Technical capability, organisational adoption and user response provide a helpful analytic triad. On capability, Liu et al. (2023) surveyed prompting techniques that allow precise style transfer, while Kutela et al. (2023) documented a burgeoning labour market for "prompt engineers." Harahap et al. (2023) noted that tourism chatbots already offer multilingual, round-the-clock assistance. Adoption studies mirror this trajectory as Huang, De La Mora Velasco, Haney and Alvarez (2022) mapped how destination-marketing organisations (DMOs) integrate AI analytics into strategy, whereas Huang, Yung and Yang (2011) showed that agencies leverage blogs for competitive advantage. Neuburger, Barbe and Fedeli (2024) added that social-media influencers are now rival information sources, raising the stakes for professional DMO storytelling.

User-response research remains more ambivalent. Beyond the newsroom work already cited, Borji's (2023) taxonomy of chatbot failures underscores reputational risk. Dwivedi et al. (2023) argued that policy must evolve to manage generative-AI ethics. McKinsey & Company (2023) nevertheless projected up to USD 4.4 trillion in annual productivity upside, with marketing content among the largest beneficiaries. Yang, Yang, Jansen and Lalmas (2017) located this projection within a broader shift toward computational advertising. Collectively, the literature predicts that AI copy will score well on surface coherence yet lag on empathy; that source disclosure will magnify any deficits; and that hybrid "AI-assisted, human-edited" workflows may offer the best balance, a stance consistent with Grundner and Neuhofer's (2021) bright–dark AI futures.

## 3. Methods

Following Field and Hole's (2003) design principles, a true experimental, between-subjects design was employed and hosted in Qualtrics. One hundred and seventy-six international

bachelor and master students (age 18-27) at universities in Lower Austria were randomly assigned to two equal groups (n = 88 each). The human stimulus was an 800-word extract from Rhonda Krause's Dürnstein article (Krause, 2015b). Two earlier posts from the same author set in Salzburg and the Wachau Valley (Krause, 2014; 2015a) served as style seeds. Guided by Ellis's (2023) and McNulty's (n.d.) prompting advice, ChatGPT-3.5 was instructed to mimic tone, narrative structure and sensory richness, producing an AI blog of identical length. Photographs and layout were held constant thus duplicated to control visual variables in line with well-accepted SEO guidance (see Semrush.com). Group 1 read an 800-word blog written by a professional travel writer; Group 2 read an 800-word piece on the identical topic generated by ChatGPT-3.5-turbo using few-shot prompts that mimicked the human author's style.

After reading, participants completed a five-point Likert questionnaire measuring trustworthiness (four items adapted from Tewari et al., 2019), empathy (two items from Escalas & Stern, 2003) and intention to visit (three items from Cheng, Wei and Zhang, 2020). Because normality assumptions were violated, the study used Mann-Whitney U tests for between-group comparisons and Wilcoxon signed-rank tests for within-group changes after authorship disclosure. Independent t tests and Mann–Whitney U tests compared groups before disclosure; paired t tests and Wilcoxon tests assessed change after disclosure.

## 4. Findings and analysis

Random assignment produced two demographically comparable groups: the 176 international students retained after quality checks averaged 22.4 years old (SD = 2.0), with 53 percent identifying as female. Prior visits to Dürnstein, frequency of online trip planning and leisure-travel frequency did not differ significantly between groups (all $p > .40$), confirming that any perceptual differences can be attributed to the blog condition rather than to background factors.

Table 1 summarises the pre-disclosure comparison. Despite close parity in perceived writing quality, the human narrative elicited higher trust, stronger empathy and a greater intention to visit. Mann–Whitney U tests rejected the null hypothesis for all three constructs, and the associated effect sizes ranged from medium ($d \approx 0.4$ for visit intention) to large ($d \approx 1.1$ for empathy). Only 31 percent of the AI group correctly guessed the blog's machine origin, indicating that stylistic imitation was broadly convincing; nevertheless, readers responded to it less favourably, particularly at the emotional level.

| Construct | Human blog (n = 88) M ± SD | AI blog (n = 88) M ± SD | U | *p* |
|---|---|---|---|---|
| **Trustworthiness** | 4.37 ± 0.75 | 4.00 ± 0.83 | 2 838 | .002 |
| **Empathy** | 3.31 ± 1.05 | 2.83 ± 1.06 | 2 899 | .004 |
| **Intention to visit** | 3.60 ± 0.90 | 3.42 ± 0.89 | 3 195 | .043 |

**Table 1:** Pre-disclosure scores (5-point scales)

Immediately after completing the first questionnaire, participants in the AI condition were told that the article they had evaluated had been produced with ChatGPT. A second, identical scale followed. Wilcoxon signed-rank tests (Table 2) show significant declines on every construct: trustworthiness fell by 18 percent, empathy by 15 percent and behavioural intention by 11 percent (all $p < .001$). Seventy-five of the 88 respondents reduced their trust rating, confirming a pronounced "replicant effect."

| Construct | Pre M ± SD | Post M ± SD | Z | *p* |
|---|---|---|---|---|
| **Trustworthiness** | 4.00 ± 0.83 | 3.29 ± 0.94 | −7.51 | < .001 |
| **Empathy** | 2.83 ± 1.06 | 2.41 ± 1.10 | −5.00 | < .001 |
| **Intention to visit** | 3.42 ± 0.89 | 3.04 ± 0.95 | −5.03 | < .001 |

**Table 2:** Post-disclosure change in the AI group (n = 88)

Several robustness checks support these findings. Re-running the analyses with bootstrap confidence intervals yielded identical significance patterns. Switching to parametric *t*-tests for the near-normal trust scores did not alter conclusions. Finally, the drop in perceptions after disclosure cannot be explained by pre-existing suspicion: most participants originally believed the text was human-authored, so the observed decline represents a genuine reaction to explicit AI labelling. Together, the data demonstrate that while ChatGPT can approximate human style, its narratives generate weaker affective and persuasive responses, and transparency about authorship magnifies the gap.

## 5. Discussion

A carefully prompted ChatGPT can craft destination prose that two-thirds of readers do not recognise as machine written, confirming Kutela et al.'s (2023) argument that prompt engineering is a crucial skill. Yet even without disclosure the AI text delivered weaker empathy, echoing Clark's (1980) view that true empathy draws on lived experience and Akgün et al.'s (2015) evidence that authentic narrative voice drives travel planning. Once authorship was revealed, trust collapsed in line with the Replicant effect documented by Clerwall (2014), Jakesch et al. (2019) and Tewari et al. (2021). These findings suggest that the perceived usefulness highlighted by Gursoy et al. (2019) is not sufficient; narrative affect moderates the path from information to intention.

Managerially, DMOs can still profit from AI speed. Brown et al. (2020) showed that few-shot learning enables rapid drafting; Liu et al. (2023) detailed prompting methods for style fidelity. Human editors should then inject personal anecdote, perform fact-checks to mitigate hallucinations (Borji, 2023) and ensure conformity with brand values, addressing the expectations gap warned by Aydın and Karaarslan (2023). Transparent labelling such as "AI-assisted and human-approved" may ease ethical concerns raised by Dwivedi et al. (2023) while preserving authenticity.

## 6. Conclusion

This study provides novel controlled evidence on how AI-authored travel blogs compare with human narratives in evoking empathy, trust and behavioural intent and on how disclosure reshapes those perceptions. Contributions include an expanded technology-acceptance model that embeds narrative empathy, a replicable few-shot prompting protocol and actionable guidance for hybrid content strategies. Limitations concern the student sample, single-story stimulus and self-reported outcomes. Future research should test broader audiences, integrate multimodal AI storytelling as anticipated by Yuan et al. (2022) and follow behavioural data such as click-through and booking rates. Despite these caveats, the message is clear: generative AI is a potent co-author but cannot yet replace the human storyteller whose lived perspective sustains empathy and trust, the emotional currencies of destination persuasion.

# Transformative Tourism: Insights from Online Narratives of Italian Route Walkers

Fabio Forlani[1], Simone Splendiani[1],*, and Sofia Rita Di Blasi[1]

[1] Università degli Studi di Perugia, Perugia, Italy

* Corresponding author: simone.splendiani@unipg.it

## Abstract

This study explores the transformative potential of route-based tourism by analysing online comments related to Italian trails. The research is based on theories of transformative tourism and Maslow's concept of peak experiences. Building on the work of Kirillova et al. (2017), we identify the presence of triggering episodes during long-distance walks.

This paper adopts an asynchronous netnographic approach supported by software (TLab 10). The study was conducted on a database consisting of 759 reviews left by walkers of four Italian Routes. The results highlight the ability of route-based tourism to promote personal growth and provide insights for designing travel experiences that deeply resonate with individuals.

*Keyword: Transformative tourism, route-based tourism, travel experience, netnography, transformation economy*

## 1. Introduction

Transformative tourism, defined by Christie and Mason (2003, p.9) as "the practice of organized tourism that leads to a positive change in attitudes and values among those who participate in tourist experience" represents a significant area of study within tourism research. This concept builds upon earlier psychological frameworks, notably Maslow's (1965) introduction of "peak experiences." Maslow described these as moments of profound happiness and fulfilment, enabling individuals to feel truly "alive." Such experiences are characterized by heightened perception, temporal and spatial disorientation, and a temporary release from fear and inhibition.

The capacity of travel to induce personal change and transformation is well-established in the existing literature (Decrop et al., 2018; Pung et al., 2020; Robledo, Batle, 2017**).** This body of work signifies a shift in research focus from traditional tourism outcomes like satisfaction, behavioural intentions, and positive emotions, towards deeper outcomes related to personal growth (Chhabra, 2021; Teoh et al., 2021; Pung, Del Chiappa, 2020).

According to Kirillova et al. (2017, p.12), who studied transformative tourism through the lens of existential-humanistic philosophy, 'a peak tourism experience can become transformative when the triggering episodes are made sense in a way that is personally meaningful'. Through a deeper analysis of literature, the authors identified seven types of transformation triggers: Introspection, Unity with nature, Unity with others, Spontaneity and Novelty, Aesthetic experience, and Self-development.

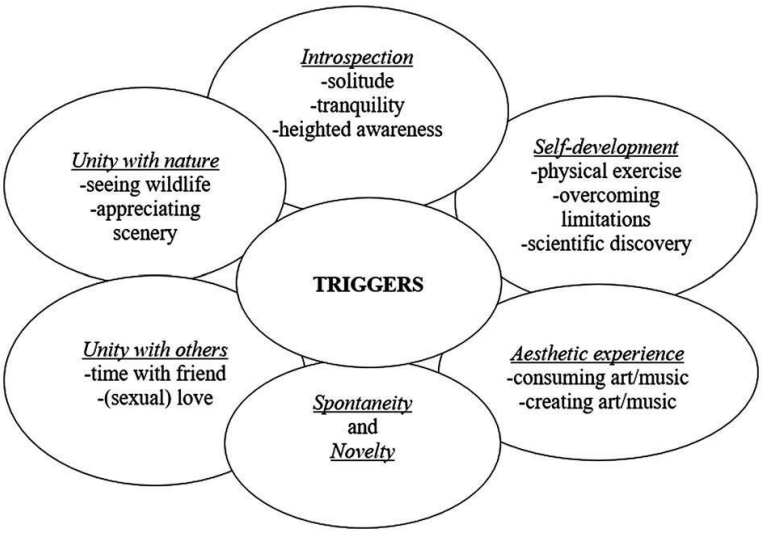

**Figure 1:** Triggers of 'peak' experience (Source: Kirillova et al., 2017)

While various travel categories are recognized for their potential to foster change (Reisinger, 2013; Kirillova et al., 2017; Robledo & Batle, 2017; Soulard et al., 2019; Fu et al., 2022; Pung et al., 2020; Wolf et al., 2017), including independent travel, ecotourism, spiritual tourism, and volunteer tourism, route-based tourism possesses a hybrid nature encompassing elements of these categories.

Indeed, its inherent characteristics makes walking tourism a particularly compelling subject for investigating its transformative potential (Forlani & Splendiani, 2023). This paper analyses tourists' spontaneous comments regarding their walking experiences to identify whether these comments contain the elements highlighted by Kirillova et al. (2017) as triggers of a transformation process. The purpose of this article is therefore to answer the following research question: does route-based tourism provide potentially transformative episodes?

## 2. Methodology

Methodologically, experience-design research must be grounded in tourists' perceptions. Tussyadiah (2014) acknowledges the value of naturalistic inquiries, employing researcher-led or tourist self-observation across social, environmental and temporal contexts (Stienmetz et al., 2021). Whilst most of these methodologies depend on primary data, the advent of digital platforms has paved the way for netnography, which involves the analysis of blogs, social media posts and online reviews, to provide a robust, non-intrusive, efficient and cost-effective means of studying experiences (Heinonen & Medberg, 2018; Costello et al., 2017; Whalen, 2018). Indeed, given the proliferation of user-generated content (USG), netnography is a promising approach for tourism studies, given that its passive, asynchronous nature is aligned with research objectives and is optimally supported by qualitative data analysis software (Whalen, 2018). For these reasons, the present research adopts an exploratory approach, utilising a netnographic method (on Facebook, Instagram and Tripadvisor, relating to four Italian routes.

Specifically:

- Via Francigena (368 comments);
- Via degli Dei (229 comments);
- Cammino dei Borghi Silenti (99 comments); -

- Via di Francesco (63 comments).

The so-created Excel database was analysed through T-Lab10 software, an approach that ensures the analysis is objective, verifiable and replicable (McGinley et al., 2021). The first step is text cleaning: the software removes stop words and performs lemmatisation, reducing inflected forms to their dictionary form.

This process standardises the text and identifies basic codes (King et al., 2018), which can be used as the fundamental unit of analysis for subsequent steps.

The software conducted a word frequency analysis to determine the absolute occurrence of each lemma. Subsequently, authors followed Kirillova et al. (2017) framework to codify each lemma, assigning it to a different category of trigger:

- 'Introspection' includes words related to solitude, tranquillity, heightened cognition;
- 'Self-development' includes words related to physical exercise, overcoming limitations and difficulties in general
- 'Aesthetic experience' includes words related to the actions of admiring and listening
- 'Spontaneity and novelty' includes words related to adventure and diversity;
- 'Unity with others' includes words related to socialization;
- 'Unity with nature' includes words related to natural elements such as weather conditions.

## 3. Results

Through the analysis of absolute occurrences and the aforementioned codification, we found that in 759 comments, 4087 words were related to potentially triggering elements.

| Category | Occurency |
|---|---|
| Introspection | 842 |
| Self-development | 1628 |
| Aesthetic experience | 23 |
| Spontaneity and novelty | 357 |
| Unity with others | 977 |
| Unity with nature | 259 |
| Total | 4086 |

**Table 1:** Word analysis (Source: Our elaboration)

Our empirical analysis confirms the presence of transformative process activators identified by Kirillova et al. (2017): introspection, unity with nature, unity with others, spontaneity and novelty, aesthetic experience, and personal development.

Figure 2 provides a visual representation of the results, presenting them in a synthetic and graphical format.

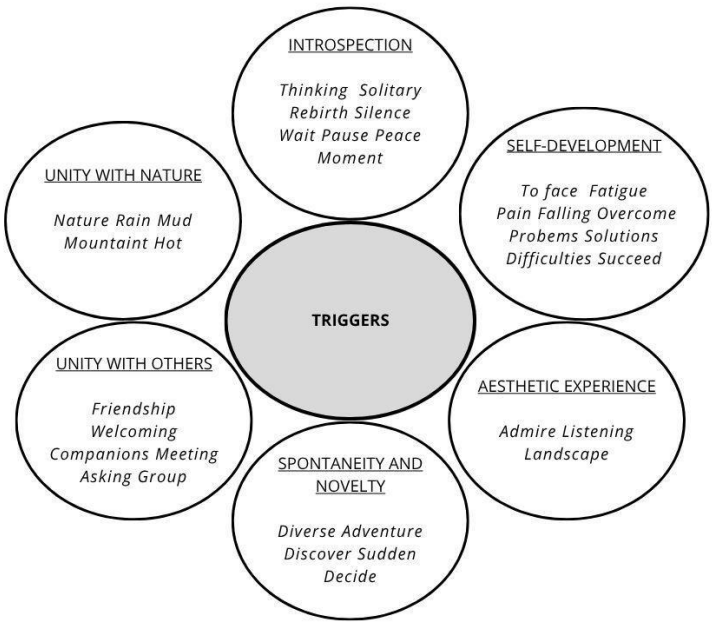

**Figure 2:** Words related to transformation triggers. (Source: Our elaboration)

## 4. Conclusions e implications

Tourists increasingly seek meaningful and fulfilling experiences (Pung et al., 2020; Sheldon, 2020), embracing change during travel as a way to cope with daily challenges and uncertainties (Fu et al., 2015; Soulard et al., 2020).

Despite the recent growth in interest in transformative tourism (Rus et al., 2022), the existing literature is still limited and unanimous in emphasizing the need for further empirical studies (Amaro et al., 2023; Rus et al., 2022; Pung et al., 2020). This study aligns with this trend, analysing the transformative capacity of route-based tourism in Italy through direct testimonials from pilgrims.

Our findings suggest that walking routes may have a transformative effect on participants, therefore it is worthwhile t**o** further study this type of travel, both through qualitative and quantitative studies, to test the actual transformative impact of walking experiences on tourists' values, attitudes, and behaviours.

# Corporate Museums as Tourist Experiences: A Transformative Theory Perspective

Paola Gioia[1],*, Cecilia Pasquinelli[1], and Maria Rosaria Napolitano[1]

[1] University of Naples "Parthenope", Department of Business and Quantitative Studies (DISAQ), Palazzo Pacanowski, Via Generale Parisi 13, 80132 Naples, Italy

## Abstract

Corporate museums can play an increasingly relevant role within the contemporary tourism landscape, where tourism experiences are expected to co-create personal and social meanings through cognitive, emotional, and sensory engagement. Corporate museums are hybrid spaces that combine industrial heritage, brand identity, and historical values and narratives, with significant potential to foster visitors' engagement, memories, values, and identity through a mix of educational, emotional, and symbolic stimuli. This paper aims to shed light on the corporate museum visit as a tourist experience by examining its cognitive, emotional, and behavioral dimensions and conceptually framing its impact on tourists. Drawing on explorative insights from the Grand Tour dei Musei d'Impresa, a coordinated itinerary of four corporate museums in Southern Italy, this study proposes conceptualising the corporate museum visit as a transformative tourist experience, acting as a lever for cognitive, emotional, and behavioral change in visitors. The paper outlines four dimensions through which corporate heritage spaces may act as catalysts for transformative experience: restructuring of meanings and understandings related to everyday products and places; activation of reflection on consumption practices and ethical values; stimulation of emotional resonance and self-reflection through sensory and affective engagement; and promotion of social interaction and identification through embodied and relational experiences. Based on these emerging research hypotheses, the paper outlines future research directions aimed at theory-building and empirical validation, calling for a rethinking of corporate museums not merely as communication tools or repositories of memory but as experiential arenas where learning, identity negotiation, and transformation can unfold.

Keyword: Transformative Tourism; Tourism Experience; Corporate Museums; Corporate Heritage

## 1. Introduction

Tourism is a complex phenomenon driven by motivations such as leisure, discovery, and personal or cultural growth. The tourism experience goes beyond place consumption, involving the co-creation of meaning through cognitive, emotional, and sensory engagement (Sugathan & Ranjan, 2019). It is a subjective, relational process shaped by expectations and individual interpretation (Volo, 2013). Corporate museums have gained visibility as spaces where industrial memory, brand identity, and historical narratives converge (Piątkowska, 2014; Riviezzo et al., 2021). Contributing to the global rise of museums as cultural formats and place branding tools (Heidenreich & Plaza, 2015; Pasquinelli, 2017), they function as

cultural actors shaping values and identity (Kirchberg, 2015). They combine educational, emotional, and symbolic dimensions (Negri, 2003), offering immersive experiences that link corporate heritage (Balmer & Burghausen, 2019) to visitors' personal trajectories (Garofano et al., 2022b). Through storytelling and interactive displays, they foster informal learning and collective sensemaking (Riviezzo et al., 2021). Despite growing interest, there is still limited reflection on corporate museums as tourism experiences (Dalle Nogare & Murzyn-Kupisz, 2024). This paper addresses this gap by proposing a conceptualization of the corporate museum visit as a transformative tourism experience and by outlining directions for future research.

## 2. The museum experience

Heritage and cultural consumption are at the core of tourists' lived experiences. Recent studies highlight how memorable experiences in the heritage context significantly influence tourists' behavioral intentions, promoting strong place attachment and loyalty over time (Rasoolimanesh et al., 2021). At the heart of this dynamic is emotional engagement, fostering belonging and meaning beyond mere enjoyment (Smith, 2020). This process is particularly evident in pilgrimage experiences and heritage sites, offering tourists opportunities for deep reflection and identity renewal (Collins-Kreiner, 2010), but is also increasingly significant in museum contexts (Del Chiappa et al., 2014). Museums today are experiential settings that stimulate visitors on an emotional, sensory, and cognitive level and environments that promote active participation and agency. Visitors are not merely recipients of curated content but co-producers of meaning through interactive, hands-on, and reflective engagement (Šveb Dragija et al., 2024; Black, 2012). Activities such as tasting products, manipulating materials, participating in workshops, or co-creating content with other visitors or staff activate deeper forms of learning and engagement that contribute to eudaimonic well-being, a sense of purpose, self-realization, and inner enrichment (Falk, 2021).

The museum experience is increasingly seen as an interaction between space, discourse, and biography, highlighting the visitor's active role. This transformation reflects a broader shift from a learning-centered paradigm to one of meaning-making. The museum becomes a space of relational and transformative encounters, where the emotional and affective dimensions intertwine with the cognitive, and the traces of the past stimulate critical reflection on the self and the world (Packer, 2008).

Museums thus emerge as fertile grounds for co-creative and immersive practices. Tourists can develop personalized and emotionally resonant narratives through meaningful interaction with place, culture, and others. Multisensory engagement helps transform tourism into an experience of personal development, emotional growth, and renewed connection to place and culture (Steriopoulos et al., 2024).

## 3. The value of corporate museums

Within this framework, corporate museums represent an emerging form of thematic museum created by companies that decide to preserve and communicate their cultural-historical and production heritage (Ramshaw, 2016). Unlike traditional museums, which are typically focused on preserving and disseminating cultural heritage from a "neutral" standpoint, corporate museums are deeply rooted in the identity and narrative of a specific company (Nissley & Casey, 2002). Corporate museums are places where corporate heritage can be enhanced and transmitted to stakeholders (Riviezzo et al., 2021). They are often deeply interwoven with the local area's history and community, acting as custodians of shared memory (Riviezzo et al., 2022). Moreover, corporate museums are designed by members of the organization to revisit history in light of the present and to inspire the future (Ravasi et al., 2019). As such, corporate museums take on a dual role: on the one hand, they strengthen

the company's identity and its strategic market positioning by reinforcing brand authenticity and organizational identity (Carù et al., 2017; Riviezzo et al. 2021); on the other hand, they serve as cultural infrastructures that contribute to heritage enhancement and territorial competitiveness (Alberti & Giusti, 2012), often acting as bridges between company and community (Garofano et al., 2022a; Garofano et al., 2022b).

Corporate museums do not limit themselves to narrating the company history but offer a broader narrative framework encompassing places, people, production techniques, and the system of values underpinning the territorial identity (Bonfanti et al., 2015; Garofano et al., 2017). They stage corporate heritage as a performative and experiential construct (Napolitano et al., 2018), often embedded in immersive and sensorially rich displays that combine tradition and innovation (Hudson, 2016). By entering the domain of industrial and cultural tourism (Otgaar, 2012), these museums attract a growing number of visitors seeking meaningful and authentic experiences beyond conventional tourist routes (Garofano et al., 2022a; Mason et al., 2022). As sites of experiential intensity, they enable opportunities for reflection, learning, and emotional engagement (Bertoli et al., 2016), offering what Ossorio (2022) defines as "experiential gateways," especially within sectors like enogastronomy, fashion, and design. Corporate museums have a potential role in the enhancement of the tourist attractiveness of the area (Riviezzo et al, 2021) as they encourage encounters with often forgotten knowledge systems and nurture a deeper understanding of the relationships between individuals, communities, and territories (Garofano et al., 2022b). Even without explicit educational aims, these spaces facilitate processes of personal meaning-making, allowing visitors to engage critically and emotionally with corporate heritage (Garofano et al., 2017).

## 4. Towards a transformative tourism conceptualization: Explorative insights from the Grand Tour dei Musei d'Impresa

In the context of corporate museum experiences, the Grand Tour dei Musei d'Impresa exemplifies how the integration of memory, organizational culture, and territorial identity can engage both communities and visitors. By promoting industrial tourism in Southern Italy, the Grand Tour dei Musei d'Impresa offers diversified sensory experiences that foster education, enjoyment, reflection, and the shared appreciation of local companies and their heritage. The initiative includes four museums rooted in local heritage: Essenza Lucano (Pisticci), Giorgio Amarelli Liquorice (Rossano), Vito Forte Bread (Altamura), and Giovanni Mucci Confetto (Andria). Promoted by Welcome Lucania Tour Operator under the patronage of Museimpresa , the project offers a replicable model of cultural and local development through multisensory and integrated experiences. Table 1 summarizes the main features of the participating museums.

| Museum | Location | Setting | Core Themes | Visitor Experience |
|---|---|---|---|---|
| Essenza Lucano Museum | Pisticci, Basilicata | Historic plant | Lucania region, iconic product Amaro Lucano, family history, Pacchiana figure | A multisensory and narrative journey combining guided storytelling with tasting sessions, olfactory interaction, and live observation of the production process. The visitor is immersed in a narrative blending local identity, herbal knowledge, and product innovation. |
| Giorgio Amarelli Licorice Museum | Rossano, Calabria | 18th-century Concio building | Licorice heritage, family history, production engineering innovation | An emotional and cultural experience centered on memory and family continuity. Visitors engage with the centuries-old company<br><br>history through guided storytelling and authentic settings. |
| Vito Forte Bread Museum | Altamura, Puglia | Medieval community bakery | Bread-making tradition, founder's story, territorial identity | An immersive, five-sense experience exploring bread as both tangible and intangible heritage. The path through the historic bakery reveals artisanal practices, original environments, and biographical testimonies. |
| Giovanni Mucci Confetto Museum | Andria, Puglia | Historic confectionery shop | Confectionery heritage, family history, product innovation | A sensory and affective experience where history, taste, and design intersect. Visitors rediscover confectionery tradition in elegant, memory-rich rooms, connecting palate pleasure with family, aesthetic, and territorial values. |

**Table 1:** Key features of the Grand Tour dei Musei d'Impresa

Drawing on museum and tourism studies, the concept of transformative tourism offers a valuable lens to examine how corporate museum visits may support meaningful personal change. This form of tourism involves experiences that lead to positive shifts in travelers' values, beliefs, behaviors, or self-perception (Sheldon, 2020; Kirillova et al., 2017a), engaging both cognitive and emotional or existential dimensions (Everett & Parakoottathil, 2018). D'Amaro et al. (2025) identify two main research directions: a managerial perspective, focused on designing experiences aligned with the shift from the Experience to the Transformative Economy (Pine & Gilmore, 2013); and a visitor-centered approach, examining how individuals internalize experiences and generate new meanings (Robledo & Batle, 2017). Much of this literature builds on Transformative Learning Theory (Mezirow, 1997), which sees "disorienting dilemmas" as triggers for critical reflection and identity change (Reisinger, 2013; Kirillova et al., 2017b). While research often targets niche contexts, such as couchsurfing, pilgrimage, or study abroad (Decrop et al., 2018; Nikjoo et al., 2020; Cavender et al., 2020), heritage tourism, especially in corporate contexts, remains underexplored. Yet heritage sites can foster introspection and value shifts (Magee & Gilmore, 2015), with museums acting as liminal spaces for affective engagement and identity work (Garner et al., 2016; Hetherington, 2014; Wu et al., 2025). Corporate museums, where

personal and collective narratives converge with material heritage and sensory stimuli, offer fertile ground for investigation.

First, insights from the Grand Tour suggest that corporate museums can reshape understandings of products, production, and place-based histories. Embedding familiar goods like bread, liqueur, licorice, or confectionery in broader cultural and environmental narratives may challenge visitors' perceptions. At the Amarelli Museum, for instance, the wild licorice root is revalorized as a symbol of local heritage. Similarly, the Essenza Lucano Museum presents Amaro Lucano as a product of regional herbalist traditions, prompting a deeper cultural appreciation of everyday goods.

Second, corporate museums may encourage mindful consumption by highlighting values tied to local economies. At the Vito Forte Bread Museum, visitors encounter stories of sustainable supply chains, ethical labor, and artisanal practice. Experiences such as workshops with retired bakers and immersive exhibits in the original bakery foster reflection on food origins and responsible choices. The Amarelli and Mucci museums likewise showcase the transformation of raw materials into iconic products, linking tradition with innovation and environmental awareness.

Third, affective and psychological engagement is central. All four museums incorporate sensory brand stimuli that promote emotional resonance: the scent of licorice at Amarelli, multisensory displays at Lucano, nostalgic interiors at Mucci, and tactile experiences at Forte. These elements evoke memory, emotion, and identification, supporting introspection and identity reorientation.

Fourth, relational and spatial immersion can serve as a lever of transformation. All museums are housed in historically significant buildings, maintaining authentic atmospheres. Visitors walk through former production spaces now repurposed as cultural venues, reinforcing continuity and heritage. Exhibits include tools, documents, and audiovisual narratives that link corporate and territorial histories. Tours often involve narrators with personal ties to the enterprise, e.g., Forte's former bakers, sharing lived values beyond corporate messaging. Group activities, like tastings, further enhance social interaction and co-interpretation, fostering dialogue, identity reflection, and belonging. To fully explore these transformative potentials, future research should adopt multi-method and longitudinal designs. The emotional, cognitive, sensory, and social complexity of corporate museum experiences calls for integrated approaches. Qualitative methods such as ethnography, narrative analysis, in-situ interviews (Carù & Cova, 2007), shadowing, or autoethnography, can capture how visitors process meaning over time. User-generated content (e.g., reviews, social media) also provides rich data on emotions and value attribution (Gretzel & Yoo, 2008; Volo & Irimiás, 2018). These should be paired with quantitative tools adapted from validated scales on transformative travel and cultural tourism (Soulard et al., 2021; Pung et al., 2024; Zheng et al., 2025), measuring emotional activation, value change, or shifts in consumption attitudes. In conclusion, studying transformative processes in corporate museums advances tourism theory and repositions businesses as cultural institutions: not merely spaces of preservation or entertainment, but arenas for learning, meaning-making, and identity negotiation.

# Visitors' Representation of Glacier Tourism: Interplay Between Visuals and Text

Lingling Huang[1],*, Irene Pinto[1], and Serena Volo[1]

* Corresponding author: Lihuang@unibz.it

## Abstract

Glacier tourism has emerged as a form of nature-based tourism that is particularly vulnerable to the accelerating impacts of climate change. This study aims to explore how visual content of glacier tourism interacts with user engagement in accompanying textual captions on Instagram. Drawing on the multimodal discourse analysis, this study examines the meaning of images and their iconographical aspects, the cognitive, affective, and behavioural dimensions of user engagement in text, and finally assesses the alignment or misalignment of the images and text in the messages they convey. The insights from this research contribute to both sustainability and visual communication studies in tourism.

*Keywords: glacier tourism, visual representation, multimodal discourse analysis, visual-verbal redundancy*

## 1. Introduction

Glacier tourism, as a form of nature-based travel, has gained increasing attention in recent years and become an indicator of climate change. Typically referring to destinations where glaciers serve as key attractions or settings for leisure, educational, or scientific activities, this form of tourism is especially vulnerable due to its dependence on fragile high-altitude environments (Welling et al., 2015). As glaciers retreat, they become powerful symbols of environmental urgency, offering visitors a direct and emotional encounter with climate change.

Social media such as Instagram with both visual and textual elements provide a ground to explore glacier visitors' personal and affective representations of their experiences. While text is often privileged as the primary mode of communication, images have been recognised as a powerful means of shaping perceptions of issues and can significantly influence emotional responses and behavioural intentions. Visuals play a powerful role in shaping perceptions of issues and can significantly influence behavioural intentions. They have the capacity to deliver impactful messages, convey ideas instantly, and evoke strong emotional responses. As for the textual element, customer engagement (CE) theories allow for a comprehensive analysis of user engagement, including its cognitive, affective and behavioural dimensions. However, CE literature addressing the social media context, also including the tourism context, mainly

encompasses quantitative approaches and focused on the "brand" perspective – customer brand engagement - while little attention has been dedicated to the user engagement.

Although text and images occur simultaneously in Instagram post, they do not always align; instead, they can sometimes present multiple or even conflicting narratives. This mismatch is captured by the concept of visual-verbal redundancy, which refers to the extent to which visual and verbal elements in a message overlap in communicating the same idea. Besides, there is a spatial gap in academic research on glacier tourism within the European Alps – an area that continues to host some of the most important and popular glacier tourism destinations. Therefore, this study explores how visual representations of glacier tourism on Instagram interact with user engagement in accompanying textual captions.

## 2. Literature Review

Glacier tourism refers to destinations where glaciers serve as the major attraction or as settings for a range of leisure, educational, and scientific activities. As glaciers are widely recognised indicators of climate change, glacier tourism—being highly dependent on these fragile environments—is especially vulnerable to its impacts (Welling et al., 2015). Ongoing glacier retreat potentially cuts visitor numbers, alters tourist experiences and generates economic losses for destination communities (Purdie, 2013). Furthermore, glacier degradation introduces new hazards, reduces accessibility, and transforms the scenic and recreational value of glacial landscapes (Welling et al., 2015). Due to the environmental changes in glaciated landscape, research on glacier tourism has mainly focused on tourist adaptation strategies (Salim et al., 2021). A high level of awareness of changes encourages tourists to adopt adaptive and pro-environmental behaviours such as temporal, activity and spatial substitution (Salim et al., 2023). One of the most discussed themes in the literature concerns tourists' perceptions and values related to glacial landscapes (Garavaglia et al., 2012). These include an awareness of glacial change and the aesthetic and emotional responses it provokes—factors that may influence future tourist behaviour (Welling et al., 2015; Salim et al., 2021). Notably, a study by Dannevig and Rusdal (2023) demonstrated the specific relevance of visual elements in building place attachment feelings, nostalgia, and emotional connection in the context of glacier tourism, although referring to the tourism operators' side.

Visual imagery is a promising avenue for raising public awareness and engagement (Chapman et al., 2016). Images have capacity to convey strong messages and communicate ideas in an instant, making them easy to remember. Visualisations are influential in determining people's perceptions of an issue, which have strong bearings on their behavioural choices (Nicholson-Cole, 2005). To assess people's engagement, CE theories have served to identify cognitive, affective and behavioural components towards a certain brand (Hollebeeck et al., 2016). Cognitive engagement refers to the way consumers actively think about and process information related to a brand; affective engagement encompasses emotional responses and attachments; behavioural engagement involves energy, time, and participation devoted to brand-related activities. The level of alignment between text and images is associated with the concept of verbal-visual redundancy (VVR), defined as the degree to which a message contains an informational overlap between the visual and verbal contents with both elements communicating the same key point (Cappella et al., 2007).

## 3. Methodology

Given the limited research on glacier tourism in the European Alps, the Aletsch Glacier in Switzerland was selected as a representative case. Aletsch is the largest glacier in the Alpine region, located in the Bernese Alps in the canton of Valais. Most importantly, it is part of the UNESCO World Heritage Site recognised as Swiss Alps Jungfrau-Aletsch. The glacier has recently gained increased media attention due to the inevitable effects of climate change on the glacier's progressive retreat. The press has defined it as the "vanishing giant of the Alps" and referred to it as an example of "last-chance tourism". To explore how visitors engage with and represent glacier tourism experiences, selected Instagram posts with image and text were collected and analysed in depth. Although limited in number, these posts offer diverse perspectives on how the glacier is represented by visitors on social media.

Based on the interpretative stance, this qualitative study employed multimodal discourse analysis. Multimodal discourse analysis extends this to non-verbal elements like images and music. This study adopts a digital multimodal perspective to explore the interplay between images and text on Instagram. Firstly, images were classified according to the three functions of visual communication by Kress and van Leeuwen (2006): representational, interactional and compositional. Following this, an iconographic analysis of the images was conducted, by identifying symbolic elements and cultural meanings to make sense of the depicted subjects (Panofsky, 1955). This analytical lens was adapted to Instagram posts' visual content, reinterpreting it according to iconic references or symbolic codes (Drainville, 2018). After that, the textual elements (captions and hashtags) were analysed, paying attention to three dimensions of customer engagement (Hollebeek et al., 2016) applied to the social media context and in the users' perspective. Each post was finally analysed for how visual and textual elements represented glacier tourism experiences, with a focus on visual-verbal redundancy.

## 4. Results

In all selected posts, the participant is placed on a rock, with the glacier as the dominant natural feature. The subject in most posts shows back to the viewer and looks out into the glacier. This is a classic "offer" image, inviting viewers to contemplate rather than interact. On the contrary, in another postsza, the participant looks at the viewer, creating direct interaction known as a "demand' image. The distant view of the glacier and the smallness of the person suggest that the pictures were taken from a long distance. In most cases, the angle is from behind and slightly above the person. The image of another post was shot at a high angle with viewers looking down at the human figure. As for the iconographic layer, one recurring reference point in the selected posts is the Romantic iconography of Caspar David Friedrich's Wanderer above the Sea of Fog, a symbol of the Sturm und Drang aesthetic in which nature is represented as sublime and overpowering, and the human figure as contemplative and small. In the context of climate change, this composition is reactivated with new meanings: the glacier becomes not just a sublime landscape, but also a symbol of ecological loss and helplessness.

One post includes a relatively extensive caption, effectively reflecting all three dimensions of customer engagement. It begins with an informative description of the main features of the

Aletsch Glacier, engaging the cognitive dimension by prompting reflection and knowledge acquisition. This is followed by the word "sadly" and the expression "This fact combined with its stunning beauty just breaks my heart," which clearly conveys the user's emotional response and attachment to the glacier, illustrating the affective dimension. Finally, the post concludes with a call to action – "eat less meat, eat local, use less, conserve more, be more mindful of the choices you make in your daily life" - inviting followers to adopt more sustainable behaviours, therefore activating the behavioural component of engagement. Other posts, instead, feature quite brief captions that exclusively engage in the cognitive dimension of customer engagement, as they provide basic information such as remarking Aletsch Glacier to be the largest glacier in Europe.

Finally, some posts exhibit visual-verbal redundancy, as the messages conveyed through both the captions and the images are closely aligned. For instance, it is frequent that the textual descriptions narrate the striking features of the Aletsch Glacier, with the visuals depicting the glacier's landscape, thereby reinforcing each other's meaning. Other posts demonstrate a lack of redundancy, with the text addressing different topics that are not connected to the visual's dimensions. In such cases, the image and caption communicate different discourses, resulting in a non-redundant relationship between visual and verbal modes.

## 5. Discussion

This study analyses the visual and textual elements present in the selected Instagram posts, shared by visitors at the Aletsch Glacier in Switzerland. Overall, the study highlights the potential of social media content, especially when analysed through the multimodal discourse approach, to understand how people perceive, interpret, and emotionally relate to glacial environments under threat. The findings reveal that visual-verbal combinations in user-generated content not only reflect personal experiences but also shape public awareness and emotional responses to glacier retreat. The study has implications for tourism policymakers and destination managers to foster ecological awareness, encourage more sustainable behaviours among glacier tourists and promote narratives that blend personal experience with environmental reflection.

# "Summer in the Mountains": Insights on the Design of Coherent Agritourism Narratives

Serena Lonardi[1],*, Giulia Grillini[1], and Serena Volo[1]

[1] Libera Università di Bolzano, Bolzano, Italy

* Corresponding author: serena.lonardi@unibz.it

## Abstract

Tourism narratives play an increasingly significant role in shaping destination image. However, there is limited understanding of how stakeholders coordinate to create coherent narratives, an issue that is especially challenging in a sector characterized by a diverse and fragmented landscape of SMEs, like agritourism. This research aims to fill this gap through a qualitative content analysis of selected agritourism Instagram accounts to examine how agritourism narratives in South-Tyrol (Italy) are constructed. Preliminary findings suggest that agritourism narratives prominently feature rural and unique elements, including farm work, nature, animals, and heritage. These are often framed within the seasonal rhythms that are central to agricultural life. This research contributes to the literature on agritourism narratives, destination image, and the role of narratives in tourism by highlighting how narrative coherence is negotiated in a fragmented sector.

*Keywords: narratives, destination image, agritourism, rural tourism*

## 1. Introduction

Destination narratives have become essential to shape tourists' perceptions and guide their choices, as they influence tourists' emotions, expectations, and satisfaction, playing a key role in building destination image (Youssef et al., 2019), and fostering emotional connections with potential visitors (Ferdinand et al., 2024). Thus, narratives have been increasingly adopted as a strategic approach in destination marketing to reinforce unique identities through compelling content (Grillini & Volo, 2024; Hartman et al., 2019). Beyond promotion, narratives also strengthen collaboration among tourism stakeholders by providing a shared framework for identity and coordination (Hartman et al., 2019). However, there is still a limited understanding of how coherent narratives that reflect multiple actors' voices while maintaining a unified destination image are constructed.

This gap is particularly evident in rural and nature-based tourism. Agritourism, in particular, is characterized by micro-SMEs and family-run enterprises, with uneven digital and communication skills (Eller et al., 2025), thus exemplifying a fragmented landscape where narrative coherence is difficult to achieve (Joyner et al., 2018). Given these dynamics, rural and agritourism contexts offer a fertile ground for investigating how destination narratives are shaped. This paper focuses on what and how selected agritourism structures narrate through a qualitative content analysis (Camprubi & Coromina, 2016).

## 2. Literature background

### 2.1 Narratives in tourism

Narratives have become a central concept in tourism research (Grillini & Volo, 2024) and they serve several functions: they help individuals make sense of experiences, shape memory and identity, and support communication and social belonging (Pearce & Moscardo, 2020). In tourism, these functions are reflected both in consumer narratives and in organizational storytelling, where destination managers and stakeholders craft messages to promote places and experiences (Pachucki et al., 2022). Narratives actively shape destination image, rejuvenate place identity, reinforce consumer-brand relationships (Pachucki et al., 2022), and influence tourists' behavioral intentions (Moin et al., 2020). Research has also highlighted the significant impact of how narratives are delivered. For example, first-person narration increases engagement, enhances brand perception, and reduces psychological distance between the tourist and the destination (Pachucki et al., 2022). Additionally, visual narratives play a crucial role; techniques like low-angle shots or positioning subjects in the foreground amplify the narrative impact of the story (Michelini et al., 2020).

However, narrative design is a complex process involving multiple actors. DMOs, tourism businesses, residents, and tourists all contribute to narrating a destination's story (Pachucki et al., 2022). This multiplicity of voices makes it challenging to construct coherent and consistent narratives, particularly in fragmented contexts with diverse stakeholders and uneven communication capacities. Thus, aligning these narratives into a cohesive destination image remains a key challenge in tourism marketing (Hartman et al., 2019).

### 2.2 Agritourism experiences

Agritourism is commonly understood as tourism activities occurring on working farms, closely tied to agricultural production and rural life. Agritourism diversifies farmers income while preserving the agricultural character of land and farm experiences (Barbieri, 2016). Philipp (2010) emphasizes the importance of the agricultural setting and farmer involvement, distinguishing agritourism from other forms of rural tourism. In Italy, Law no. 96/2006 reinforces this definition by mandating that agriculture must remain the primary activity of the farm in terms of labor input.

The destination image of agritourism is shaped by a tension between its traditional rural character and increasing associations with luxury and comfort (Streifeneder et al., 2023; Dubois, 2017). While some visitors are drawn to high-end amenities, many seek typical agricultural landscapes (Dat et al., 2024) and authentic agricultural experiences, including farm animals, cultural heritage and locally sourced products (Joyner et al., 2018). Indeed, country-of-origin narratives influence agritourism experiences (Andéhn et al., 2021; Martinus et al., 2024) with consequences on future food purchasing patterns (Kim et al., 2019). Finally, agricultural experiences are particularly valued when they are both enjoyable and educational, often involving hands-on activities like interacting with animals, or picking fruits and vegetables (Rong-Da Liang, 2017; RongDa Liang et al., 2020).

## 3. Methodology

### 3.1 Context of the research

South Tyrol is an autonomous province in northern Italy, located in the Alps and sharing borders with Austria and Switzerland. In 2024, agritourism in the province were 3.061, with the majority being members of the local agritourism association *Gallo Rosso* ("Red Rooster"). These figures reflect a landscape characterized by a high density of micro and SMEs. Arrivals in agritourism structures in 2024 were 638.797 and the total number of presences was

3.722.130. Most agritourism farms (84%) provide accommodation, with an average of 9,4 beds per farm. Restaurant services are available at 605 farms (20%). In addition, 1.039 farms (30%) offer other activities, such as hiking, guided tours, and product tastings (Agritourism census, ISTAT, 2024).

This research will adopt a qualitative content analysis (CA) to examine the Instagram narratives of agritourism businesses. CA is recognized as "an observational research method that is used to systematically evaluate the symbolic content of all forms of recorded communications" (Kolbe & Burnett, 1991). CA involves a careful, detailed, and systematic interpretation of a specific body of content with the aim of uncovering patterns, themes, meanings, and potential biases (Berg, 2009). Within tourism research, it is frequently adopted as a qualitative approach to explore the symbolic and narrative dimensions of tourism phenomena (Camprubí & Coromina, 2016).

The data set consists of Instagram posts published in 2024 by *Gallo Rosso*-affiliated agritourism businesses operating in the Dolomites—a region selected for its strong visual identity and relevance in place branding. Instagram was chosen as the primary platform due to its central role in visual tourism communication (Volo & Irimias, 2021). Selection criteria for accounts included: affiliation with Gallo Rosso, an Instagram account and at least 24 posts published in 2024 to ensure active participation in narrative construction. For a preliminary analysis, 5 accounts were selected, resulting in 79 posts and 114 images that were examined with the software MaxQDA.

## 4. Preliminary findings

### 4.1 What is narrated

Previous results show that agritourism narratives in South-Tyrol primarily emphasize agricultural and farm-related activities. These narratives often highlight farm animals, nature, farm activities, and Alpine heritage and traditions. Many posts showcase the mountains and forests in the surroundings, and frequently share stories centered on farm work and harvest. For example, one post featuring a young calf reads: "*Once again, there's a new arrival in the pasture. Welcome small Kawasaki*". Stories about heritage include narratives of both tangible and intangible heritage, with for instance references to local food, festivals, and traditional architecture. For instance, one post shows a picture of the traditional barn and says in the caption: "*The barn, built in 1928, stands proudly next to the residential house. The dark wood, refined architecture, and imposing size give it a very special charm."*

In addition to farm life, some posts also promote mountain and outdoor sports such as skiing, hiking, or cycling. One example is the following post that reads: "*Cycling South Tyrol – enjoy those warm days in the mountains, the long and sunny days – exploring the #dolomites region during your stay*".

Furthermore, a reference to the place where the agritourism is located was also frequently noticed, especially with reference to South-Tyrol and the Dolomites. These place-based mentions often appeared in hashtags, intended to increase the visibility of the posts and accounts, as in the following post: *"Golden autumn in the #dolomites"*. Interestingly, references to luxury amenities—such as pools, saunas, or massages— were relatively rare, suggesting that agritourism narratives in South Tyrol prioritize rustic and authentic experiences over upscale comfort.

### 4.2 How it is narrated

A second part of the preliminary analysis was dedicated to examining how agritourism structures narrate the previously identified elements. Both the visual and textual design of

Instagram posts reflect varying levels of confidence in using the platform, with accounts sharing professionally shot images and long captions, while others post casual phone pictures accompanied by a simple list of hashtags.

A notable finding was the frequent emphasis on the cyclical nature of time, with repeated references to seasons and times of day—such as morning, evening, sunset, or sunrise. Common examples include brief captions like: "*Summer in the mountain*", "*Spring vibes*", "*Evenings in the mountains*", "*autumn hike*". Particularly striking is the redundancy between visual and textual elements: for instance, posts depicting snowcovered landscapes often include verbal texts in the captions explicitly referring to winter. One post, captioned "*Winter is back*", shows blossoms covered in snow, illustrating the unexpected overlap of spring and winter.

Moreover, the seasonal and temporal references are frequently integrated into the elements mentioned in the previous paragraph. Indeed, posts about sports in winter often feature images of people skiing or snowshoeing, while those centered on agricultural and farm activities—such as the apple harvest—are accompanied by captions like "*Autumn activities*," reinforcing the seasonal context through both the visual and textual elements.

## 5. Discussion and conclusions

Preliminary findings reveal a narrative coherence between different agritourism structures, with differences in how the platform is used. Findings show a strong presence of key elements that define and differentiate agritourism landscapes, including a strong sense of place (Dat et al., 2024), and agritourism experiences, such as nature, farm animals, Alpine heritage and agricultural work activities (Rong-Da Liang et al., 2020). This contrasts with previous research that emphasized a growing association between agritourism and luxury (Streifeneder et al., 2023).

A particularly novel finding concerns the prominent role of seasonality and the cyclical nature of time—historically central to agricultural life—which is clearly reflected in agritourism narratives. These temporal markers, such as references to specific seasons or times of day, are often embedded in both visual and textual narratives.

This research contributes to the literature on rural and agritourism by identifying the most frequently shared content on the Instagram accounts of selected agritourism businesses in South-Tyrol. Moreover, it will also contribute to literature on tourism narratives and destination image, by examining how coherent narratives in a fragmented sector are constructed.

This research is not without limitations. The analysis of a selected area with a high concentration of agritourism structures could have influenced the results. Future research should focus on areas with different characteristics to capture a more diverse range of agritourism communication strategies. Moreover, this study does not include the tourists' perspective on how they interpret and evaluate the coherence of agritourism narratives. Future research should incorporate tourists' viewpoint to better understand how these narratives are received.

## Abstract

The growing body of literature on city branding and place marketing reveals a complex field in which cities function both as subjects and objects of branding. They are framed through logos, slogans, campaigns, and policy narratives—yet at the same time, they are lived spaces influenced by multiple stakeholders and layered identities (Lucarelli & Berg, 2011; Zenker & Braun, 2017).
Branding is not only about goods and services; organizations and cities can be promoted similarly (De Chernatony and McDonald, 1992:3) . This review of the city branding literature aims to assist tourism researchers and those conducting studies in this area.

City branding is a centuries-old practice (Goodwin, 1993; Papadopoulos, 2004; Kavaratzis and Ashworth, 2005; Ashworth, 2009, p. 10) and today has global relevance in promoting the theory and practice of urban branding for multiple purposes, including tourism, economic development, and international relations (Dinnie, 2011b; Lucarelli & Berg, 2011; Oguztimur & Akturan, 2015; Kavaratzis et al., 2015b).

The analysis of the phenomenon is based on the literature available regarding city brand strategies and techniques, and on the evolution of the concept of city as a competitive actor in the global panorama.

Significantly in recent years, it remains theoretically fragmented. In particular, the conceptual boundaries between these two fields are often blurred or used interchangeably, leading to inconsistencies in both analytical frameworks and empirical applications. This paper aims to define and critically examine the gap between city branding and place branding, especially in light of their respective roles in sustainable marketing strategies.

The present study is intended as a preliminary investigation, laying the theoretical groundwork for a subsequent case study. By identifying the key divergences and overlaps in the literature, this review provides the conceptual necessary for conducting grounded research on city branding practices.

*Keywords: branding, place branding, city branding, review*

## 1. Introduction

The evaluation is based on the city's brand and the availability of literature on strategies and techniques. Since 2000, the 'branding' of the city has become increasingly studied throughout the Western world (Dinnie, 2011b; De Eugenio Vela, 2013; Giovanardi et al, 2013; Brown and Campelo, 2014). It is also important to focus on a literature review and a theoretical approach in the destination branding context. The focus is also on the synthesis of studies published on 'city branding' and "place branding", thus providing a valuable contribution to the public interested in the theme of the target brand, and more specifically, its urban sub-area. In light of the review, it was found that the research field of city branding is still in its infancy, suggesting that there is still room for further research in this field. Since 1998, the first articles on destination branding have begun to flourish, and the interest of scholars in the concept of destination branding has grown (Pilke, 2008). The best-known and cited definition proposed by the American Marketing Association (1960) is "A name, term, sign, symbol, or design, or a combination of them, intended to identify the goods or services of one seller or group of sellers and to differentiate them from those of competitors" (Wood, 2000).

The important contribution of various studies (Morgan and Pritchard, 1998; Hankinson, 2004; Trueman et al., 2004; Merrilees et al., 2005; Balakrishnan, 2009; Pike, 2008) on the themes of 'destination branding' or 'place branding' and their position in marketing literature, is not very clear. About this, scholars argue that a 'destination brand' represents the tourist dimension of a place, the 'place brand' umbrella (Hanna and Rowley, 2012, p. 104).

## 2. Literature review

City branding is growing, but can strategic branding models be useful for studying cities? Many studies have examined branded products (Aaker, 1996; Keller, 2001, 2003; Kotler et al., 1993; Matson, 1994). City Branding is driven by diversification of tourism attractions and inward investment. The strategic branding of cities is characterised by complexity and constrained by the political dimension (Parkerson et Saunders, 2014).

This paper is based on a literature review ( Fink, 1998; Thorpe et al., 2005; Tranfield et al., 2003) and evaluates the extent to which the process can be applied to the sustainability field to produce a reliable knowledge stock and enhanced practice by developing context-sensitive research.

Branding includes a variety of interrelated issues. City Branding has become a pillar of the tourism strategy.

There is an important correlation between city branding and place branding.

The term city branding refers to the set of strategies and activities aimed at building, managing, and communicating the identity and image of a city, to make it attractive to various audiences, including tourists, investors, residents, and talent (Anholt, 2007).

City branding increasingly includes marketing techniques and methods in the administration practice and the governing philosophy, and a way to describe and implement city marketing( Kavaratzis, 2004).

For this reason, it is important to try to define the various aspects of city branding in different years.

## 2. Metodology

Methodology. This paper is based on a systematic literature review (Fink, 1998; Thorpe et al., 2005) a methodology which differs from conventional reviews in that it aims at "synthesizing research in a systematic, transparent, and reproducible manner" (Tranfield et al.,2003: 207) and kept the first algorithm in the analysis.

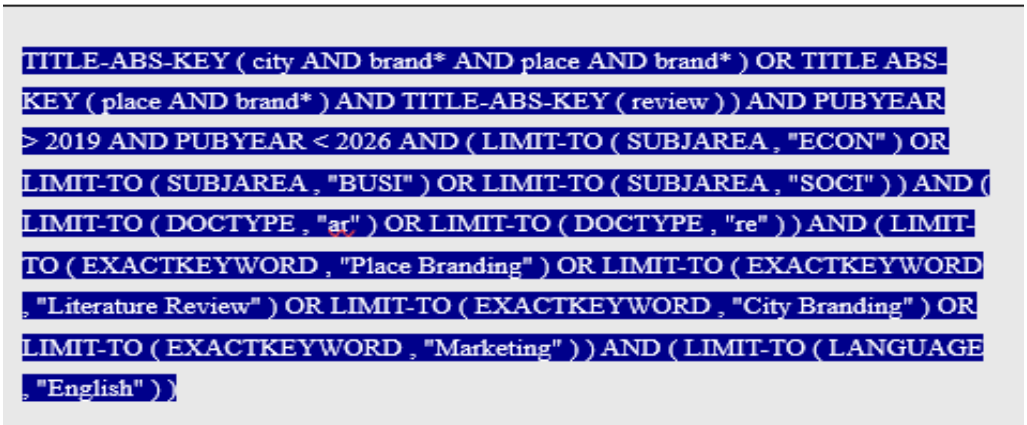

**Figure 1:** Literature Analysis

This study is based on data collected from 2020 to 2025, and it includes a comprehensive review of academic articles, policy documents, and case studies related to city and place branding. The selected sources were analyzed using a systematic literature review methodology, focusing on peer-reviewed publications indexed in major databases such as ScopusAfter emerging, the results carried out the first screening by analyzing the title, journal, and abstract of the articles and considered relevant papers with the classification about ABDC Journal Quality Guide Australian Business Deans Council, which increased rapidly over recent years (Azar and Brock 2008). ABDC was compiled using elements of the methods used in institutional lists, peer surveys, and citation studies (Morris et.al, 2009).

Journal quality was operationalised based on the classification ABDC ranks journals based upon an A*, A, B, and C classification scheme; A* in the ranking is considered "highest quality". This research focused on the approach using Management and Marketing journals. The quality assessment of journals is carried out by panels of experts and there are internationally recognized and externally validated journal classification lists on appropriate metrics selected for citation.

Journal quality has been an important component of performance and the evaluation of results.

After merging the results, the first screening selected all the documents reviewed, presented in Fig. 1, adapted from the PRISMA flow diagram template (Page et al., 2021).

**Table 1:** Classification 34 articles

## 3. Risultati

The practical gap is that divergence in scale, stakeholders, goals, and methods leads to fragmented branding efforts and sometimes contradictory messages. It is particularly compelling to observe how *place branding* and *city branding,* although grounded in distinct conceptual traditions, reveal numerous points of convergence, especially in the analysis of urban case studies. Branding practices implemented by cities often operate along a continuum that encompasses both the symbolic and experiential dimensions of place and the administrative or institutional identity of the city.

This overlap positions urban contexts as ideal empirical grounds to explore the integration of branding models, also about sustainability, territorial identity, and stakeholder engagement. In previous literature (Kavaratzis and Ashworth, 2010), the debate on blurred boundaries between place and *city branding* was opened, recognizing that *'city branding* has been practiced ... until cities competed'. They choose a geographic scale of the case studies that is primarily urban or regional, focusing on branding and their effectiveness in cities such as Berlin, Madrid, and Aalborg, or regions such as Tuscany and Catalonia.

The elaboration of it is in Table 2. It would be important to understand which authors and scholars make up this definition, and it is certainly the approach to work in the next phase.

| Dimension | Place Branding | City Branding | Gap/Issue |
|---|---|---|---|
| **Scale & Scope** | National or regional scale | Urban/local scale | Strategies often **mismatch** in scale, governance, and stakeholders |
| **Stakeholders** | Governments, national agencies | City councils, local businesses, citizens | Misalignment between national and local priorities |
| **Identity Complexity** | Broader, more abstract identities | More concrete, shaped by urban life and services | City branding can be **overlooked** in national place brand strategies |
| **Audience** | Often international (tourists, investors) | Mixed: citizens, regional users, visitors | City branding requires more **community involvement** |
| **Policy Integration** | Linked to national economic or cultural policy | Tied to urban planning, sustainability, smart cities | Lack of integration with **urban development policy** |
| **Measurement** | Macroeconomic indicators, global indices | Quality of life, citizen satisfaction, livability rankings | Few **shared metrics** across levels |

**Table 2:** Elab. Auth. Rif. Anholt (*Place branding* pioneer), Kavaratzis (*City branding* frameworks), Dinnie (*Place branding* theory), Florek (Branding small and medium-sized cities).

Outlining the philosophies and hypotheses that determine the evolution and advancement of research puts divergences in the traditional paths of research on the brand of the city and the place brand. The paper intends to help bridge the gap between theory and practice, with an increase in the number of scholars on city brand management and smart city, and sustainability policies. The analysis of the data reveals an evident mismatch between the two categories listed in the table, indicating a conceptual or application discontinuity between the dynamics of place branding and *city branding*. This misalignment makes it necessary to deepen

further, which will be developed through a comparative analysis of the country image and the case study cities, in order to explore the intersections and the perceived divergences.

## 4. Conclusion

The analysis of the literature on place branding and *city branding* reveals a dual gap that continues to affect both theoretical understanding and practical application: the conceptual gap and the practical gap.

The conceptual gap lies in the differing foundational assumptions between the two approaches. *City branding* tends to focus on the city as a lived space, shaped by culture, identity, community, and social interaction. It emphasizes authenticity, heritage, and the lived experiences of residents. In contrast, place branding often conceptualizes the location more abstractly—as a marketable image—emphasizing design, messaging, and strategic positioning to attract tourists, investors, or talent. This divergence in focus leads to different frameworks and priorities in academic and policy discussions.

The practical gap, on the other hand, emerges from the fragmented and sometimes conflicting objectives among the various stakeholders involved in branding efforts. *City branding* involves actors such as local governments, businesses, residents, and cultural institutions. The lack of alignment in goals—be it economic growth, tourism, social cohesion, or environmental sustainability—often results in inconsistent or even contradictory messages. Furthermore, the scale and scope of implementation strategies vary greatly, which complicates the development of cohesive and measurable branding approaches.

Bridging these gaps requires an integrated perspective that reconciles symbolic representation with lived realities and aligns diverse stakeholder interests under shared branding goals. Future research should explore cross-disciplinary models and comparative case studies to establish a more coherent and actionable framework for both city and place branding.

## Abstract

This research examines the possible motivations underlying the use of virtual reality (VR) in cultural tourism experiences using a mixed-method approach. In the first stage, 10 in-depth interviews led to the identification of nine core motivational factors, which were subsequently operationalized into multi-item scales for a survey administered to 351 participants. Through a two-step cluster analysis, four distinct tourist segments were identified: Immersive Innovators, Informed Explorers, Tech-Oriented Samplers, and Digital Skeptics. These clusters differed significantly in their motivational profiles. Keywords: virtual reality, tourism, cultural tourism, motivation, tourist segmentation.

### 1. Introduction, research aim, and background

In recent years, virtual reality (VR) has rapidly evolved from niche technology to a transformative tool across sectors, including cultural tourism. A report by PwC (2020) forecasted that the global VR and AR markets will deliver a $1.5 trillion boost to the global economy by 2030, with education and cultural applications playing a substantial role in this growth trend (Technavio, 2024). However, while technological potential is apparent, further research is required to shed light on who is actually motivated to use VR in cultural settings and why. To answer this call, we adopted a mixed-method approach – 10 semi-structured interviews and a survey (N=351) – to map motivations and segment prospective users of cultural VR experiences.

Prior literature in the tourism domain has investigated possible motivational factors related to the use of alternative realities in the cultural context. For example, prior work highlighted enjoyment, perceived usefulness, immersion, and novelty as core drivers of cultural VR adoption (e.g. Han et al., 2019; Jiang et al., 2025b; Mavrin et al., 2024). Because VR can shape visit/revisit intentions and word-of-mouth, clarifying why people adopt VR is strategically relevant. However, few studies so far (e.g., Liker et al., 2025; Ren, 2023), segmented prospective cultural-tourism users by underlying motivations rather than usage or behavioral patterns.

### 2. Method and results

To identify the key motivational factors for consumer adoption of VR in cultural tourism, 10 semi-structured interviews were conducted. A thematic template analysis (Brooks et al., 2015) was conducted and responses were grouped into categories reflecting recurring motivations. This process led to the identification of nine main motivational themes

(enjoyment, social interaction, money saving, information, media novelty, customization, interactivity, authenticity, and novelty seeking), which informed the design of the multi-item scales used in the subsequent quantitative phase.

An online survey (N=351) measured the nine motivations on 7-point Likert scales, using pre-validated scales; we also captured VR expertise, cultural-site visit frequency, and sociodemographics.

Composite scores for the nine motivations fed a hierarchical-plus-K-means procedure supporting a four-cluster solution:

• Immersive Innovators (36.8%): highly motivated across all dimensions, particularly information, interactivity, customization, and enjoyment; • Informed Explorers (36.5%): moderately high levels of motivation, especially regarding informational content and novelty seeking;

• Tech-Oriented Samplers (17.9%): low overall motivation except for elevated interest in technological novelty and exploration (novelty seeking); • Digital Skeptics (8.8%): very low motivation across all dimensions, suggesting resistance or disinterest toward VR in cultural contexts.

Clusters were primarily differentiated by age and self-reported VR expertise: Digital Skeptics tended to be older, while Immersive Innovators reported higher expertise. Gender and education did not differentiate clusters.

## 3. Discussion, implications, and conclusions

The two-step analysis revealed four distinct motivational profiles based on users' underlying drivers for engaging with cultural VR experiences – Immersive Innovators, Informed Explorers, Tech-Oriented Samplers, and Digital Skeptics. While these clusters were differentiated in terms of motivational patterns, the analysis of external variables provided a more nuanced picture. Specifically, statistically significant differences emerged only for age and self-reported VR expertise: Digital Skeptics were significantly older than the other groups, and Immersive Innovators reported higher levels of expertise in VR technologies. Conversely, no significant differences were found across clusters with regard to gender, education level, personal income, frequency of cultural site visits, or prior use of VR for cultural purposes. While at first glance this may appear as a limitation (especially for segmentation strategies that rely on demographic markers), the results add to recent segmentation approaches on VR user segmentation (e.g., Liu et al., 2024) underscoring a key insight: motivational orientations toward cultural VR are not strongly bound to gender, cultural site visits, or prior usage patterns. Rather, they represent psychographic dimensions, such as curiosity, the quest for interactivity, or expected enjoyment, that cut across socio demographic boundaries. Hence, institutions should tailor content and messaging to the four profiles and consider basic onboarding to raise VR literacy among less experienced segments.

Limitations include a young-skewed, single-country sample. Overall, the study contributes to a motivation-based segmentation of cultural-VR users and invites cross cultural replication.

## Abstract

I Big Data nel turismo hanno numerose applicazioni e potenzialità e, a livello nazionale, sono promosse azioni per lo sviluppo di innovazioni tecnologiche al fine di diffonderne il loro utilizzo in piattaforme integrate, quali i Data Lake. Tuttavia, mentre il dibattito scientifico ha contribuito alla definizione di concetti e contenuti legati alla raccolta e all'uso dei Big Data in ambito turistico, ancora poco si rinviene per quanto riguarda lo sviluppo di Data Lake per le destinazioni turistiche. Inoltre, anche nella pratica non sono ancora molto diffusi esempi applicati di destinazioni turistiche che adottano tali piattaforme integrate in modo innovativo. L'articolo riporta i risultati di uno studio pilota volto a raccogliere casi di applicazioni di analisi dei Big Data in alcune destinazioni turistiche. I risultati emersi sono stati utili nella realizzazione di una Action Research dedicata alla creazione di un innovativo Data Lake applicato in una città italiana. Lo studio offre così un contributo innovativo, sia a livello teorico sia operativo, per l'evoluzione della gestione data-driven delle destinazioni turistiche.

*Keywords: Data Lake, Big Data, destinazione turistica, case studies, modello 6V+*

## 1. Introduzione

Il turismo è stato inserito come obiettivo strategico nell'ambito della Missione 1 del Piano Nazionale di Ripresa e Resilienza - PNRR (2022), per contribuire con nuovi impulsi al rilancio della competitività e della produttività nazionale. Nello specifico, la Missione 1, componente 3 "Turismo e cultura" aveva l'obiettivo di rilanciare i settori economici della cultura e del turismo, che all'interno del sistema produttivo giocano un ruolo fondamentale, sia in quanto espressione dell'immagine e brand del Paese, sia per il peso che hanno nell'economia nazionale. Secondo i dati forniti dall'Enit (Agenzia Nazionale del Turismo) e diffusi alla BIT 2025 (Borsa Internazionale del Turismo), il comparto del turismo nel 2024 ha contribuito al 10,8% del Pil italiano ed inciso sull'occupazione nazionale per il 13%. Le stime relative ai prossimi anni sono in ulteriore crescita (ENIT, 2025). Per la Missione 1, componente 3 "Turismo e cultura" del PNRR sono stati assegnati nel complesso 2,4 miliardi di euro, che hanno l'obiettivo di incrementare la capacità competitiva delle imprese e promuovere un'offerta turistica basata su sostenibilità ambientale, innovazione e digitalizzazione dei servizi (Ministero del Turismo, 2022). Tra le principali linee di intervento è prevista l'implementazione di un Hub Digitale del Turismo o Tourism Digital Hub (TDH) per la promozione integrata dell'offerta turistica nazionale; fondi per la competitività delle imprese turistiche. Il TDH consiste in una piattaforma condivisa tra gli stakeholder del settore, che si pone l'obiettivo di creare un ecosistema turistico arricchito e migliorato, in grado di fungere da punto d'arrivo per la pianificazione di un viaggio in Italia. L'iniziativa è, quindi, rivolta ad esercizi alberghieri e strutture assimilabili, attività di ristorazione, agenzie di

viaggi e tour operator, coltivazioni agricole, produzioni di prodotti animali e servizi connessi, silvicoltura, pesca e acquacoltura. Per le imprese che vi partecipano, il portale (denominato Italia.it) rappresenterebbe una vetrina internazionale attraverso cui poter condividere, ad un pubblico potenzialmente anche molto ampio, la propria offerta turistica (Camera di Commercio di Genova). All'interno dell'investimento per 114 milioni di euro nel TDH (M1C3 Investimento 4.1) sono definite tre direttrici strategiche che riguardano: la realizzazione di una nuova infrastruttura digitale, che ottimizzi il portale Italia.it per migliorarne l'interfaccia con gli utenti, ampliando al contempo i servizi disponibili; l'adozione di modelli di intelligenza artificiale per analizzare i dati relativi a flussi e comportamenti dei turisti attraverso strumenti quali i Data Lake; e lo sviluppo di un Kit per i servizi digitali di base a supporto degli stessi operatori (Ministero del Turismo, 2022). Questa spinta a livello nazionale è protesa alla riqualificazione e al rinnovamento dell'offerta turistica verso la sostenibilità e l'innovazione con l'impiego delle tecnologie digitali, in particolare introducendo l'approccio del Data Lake. Tuttavia, nonostante i grandi piani nazionali e i relativi investimenti, l'adozione dei Data Lake nel turismo non è ancora diffusa in Italia.

Un Data Lake (Ho et al,, 2023) si può definire come un repository centralizzato e progettato per archiviare, elaborare e proteggere notevoli quantità di dati strutturati, semi-strutturati e non strutturati. Si tratta di uno strumento in grado di archiviare i dati nel loro formato nativo e di elaborare dati di vario tipo per struttura e natura, ignorando i limiti di dimensione. Sebbene siano presenti sul mercato alcune soluzioni tecnologiche definite come Data Lake, non esiste ancora una definizione standard, né un'architettura universalmente riconosciuta anche dal punto di vista gestionale, e soprattutto applicata e utilizzata dalle destinazioni turistiche. Inoltre, vi è da constatare l'estremamente ridotta letteratura scientifica in ambito di Data Lake nel settore turistico. Nondimeno, un Data Lake nazionale completo e disponibile, utile alle diverse necessità delle destinazioni turistiche, non è ancora stato realizzato; pertanto, alcuni destination manager e policy-maker stanno investendo a livello locale. Nasce dunque l'obiettivo del progetto di ricerca di cui fa parte questo studio pilota, che ha cercato di delineare applicazioni e realizzazioni di Data Lake in destinazioni turistiche, e i cui risultati servano quali basi di progettazione per un'amministrazione pubblica locale. L'intero "Progetto SMART Verona" è stato finanziato dal Ministero del Turismo al fine di valorizzare i comuni con siti UNESCO tramite la realizzazione di strumenti di promozione turistica e digitale. Tale progetto ha previsto lo sviluppo di un Data Lake, ovvero una piattaforma di dati aggregati e anonimizzati per monitorare i comportamenti e le esperienze di turisti e visitatori di Verona città UNESCO. L'auspicio è che il Data Lake generato con questo progetto possa essere mantenuto nel tempo come fonte strategica delle decisioni data-driven del turismo locale, condivisa tra i vari stakeholder del territorio, e divenire una best practice diffusa anche in altri Comuni italiani. Questo articolo presenta i risultati dello studio pilota e alcune considerazioni che hanno portato alla sua realizzazione.

## 2. Dalle "V" dei Big Data al Data Lake

Diversi studi (Li et al., 2018; Fan et al., 2015; Oliver et al., 2014) dimostrano come i Big Data permettano una conoscenza più approfondita delle aspettative e delle opinioni del consumatore, utili a migliorare sensibilmente l'offerta turistica. Questa comprensione ha portato un crescente numero di destinazioni turistiche, o singole realtà aziendali del settore, ad investire nella creazione di Data Warehouse sempre più efficienti ed efficaci (Abdulaziz et al,, 2016; Ramos et al,, 2017). I dati disponibili per la creazione di tali Data Warehouse si possono classificare in tre principali tipologie di dati a seconda della loro natura: strutturati, semi-strutturati e non strutturati. Se in passato la maggior parte dei dati si presentava in modo strutturato, tipicamente inserito in tabelle o database relazionali, ora circa l'80% dei dati ha natura non strutturata. Alcune stime riferiscono come già nel 2017 la percentuale dei dati non strutturati rispetto al totale arrivava al 90% (Elia e Solazzo, 2018).

Le fonti dei Big Data sono molto ampie e si possono suddividere in sei principali categorie: search queries; web analytics data; dati georeferenziati (come mobile positions, smart cards, bluetooth tracking); customer reviews e UGC (User Generated Content); transaction data (dati provenienti dalle transazioni economiche); e app logs (dati provenienti dai registri delle applicazioni mobili) (Pan and Yang, 2017). La crescita e la diffusione delle tecnologie digitali hanno favorito la nascita di nuovi modelli di business online e una conseguente proliferazione di dati anche nel turismo (Stefanizzi et al., 2018). I dati vengono raccolti ed elaborati attraverso differenti modalità (Singh, Dayalbagh, 2022; Fauzi et al, 2023), e finalizzati anche alla realizzazione di nuovi servizi e strumenti per la fruizione di servizi turistici (Allheeib, 2022). Si pensi, nello specifico, alle diverse piattaforme sviluppatesi sul web e identificabili come Online Travel Agent (OTA), Metasearch, Multi-sided platforms (MSPs) o UG review system. Si tratta però di classificazioni dai confini piuttosto labili (Kotler et al., 2018) considerata l'estrema dinamicità del settore.

I Big Data sono generalmente intesi come patrimonio informativo, connotato da rilevanti Volumi di dati, elevata Velocità e Varietà, che richiede modalità efficienti ed innovative di elaborazione per migliorare: decision making (Laney, 2001), insight discovery e ottimizzazione di processo (Gärtner e Hiebl, 2017). Gli autori che tecnicamente menzionano il concetto di Big Data fanno riferimento alle proprietà delle "3V", relative alle caratteristiche di questo tipo di dati, ovvero Volume, Varietà e Velocità. Per Volume (data at rest) si fa riferimento all'enorme quantità di dati, provenienti da diverse fonti, che grazie allo sviluppo e al diffondersi delle tecnologie informatiche è possibile filtrare, comprimere, archiviare ed elaborare. La Velocità (data in motion) riguarda la rapidità con cui questi flussi di dati, in entrata ed uscita, vengono prodotti ed elaborati. Infine, la Varietà (data in many forms) riguarda la notevole eterogeneità delle fonti da cui provengono queste informazioni e del modo in cui i dati possono presentarsi, sia dal punto di vista della forma che dei contenuti e del significato. Questa grande quantità di dati si presenta solitamente in una forma non ordinata e senza una struttura fissa. Per descrivere i Big Data gli studi originariamente più citati si focalizzano principalmente sull'attributo della Varietà (Johnson, 2012; Davenport et al., 2012).

Il modello delle "3V" si è successivamente ampliato ad altre due proprietà, relative al Valore e alla Veridicità (Elia and Solazzo, 2018). Riguardo al Valore (data in evidence) si fa riferimento all'obiettivo per cui i Big Data sono utilizzati. I dati vengono, infatti, impiegati per poter creare ed estrarre Valore: informazioni in grado di supportare il processo decisionale, fornire input utili per progettare nuovi prodotti o servizi, creare nuovi modelli e opportunità di business. La Veridicità (data in doubt), riguarda, invece, i concetti di accuratezza, certezza e precisione del dato. Nell'analisi dei Big Data è frequente riscontrare incongruenze, approssimazioni, ambiguità, duplicazioni, incompletezze, spam e latenza. Seppur difficilmente in grado di compromettere i risultati dell'analisi vista la notevole mole di dati solitamente elaborati, eventuali criticità nei dati vanno comunque tenute in considerazione.

Altri esperti hanno attribuito nuove proprietà al concetto di Big Data, tra cui quelle di Variabilità, Volatilità, Visualizzazione e Complessità (Lee, 2017). Allo stesso tempo, nel dibattito sui Big Data sono emerse ulteriori complessità che pongono al centro il rischio di compromettere, rendere più complicate o comunque meno performanti le fasi di creazione, analisi ed eliminazione dei dati. La raccolta di informazioni demografiche e psicografiche relative agli utenti può portare, infatti, a delle problematiche in merito alla disponibilità dei dati e alla privacy (Elia and Solazzo, 2018).

L'analisi presentata in questo studio si basa su un adattamento del modello delle "5V", il quale viene ampliato con l'inclusione di una sesta dimensione utile ai Data Lake (modello

delle "6V+"), ovvero la Visualizzazione. Quest'ultima si riferisce alla capacità di rappresentare i dati in forma simbolica e visiva, con l'obiettivo di individuare pattern e supportare così i processi decisionali (Giulia and Chahal, 2020). Sebbene, come visto, in letteratura vengano proposte molteplici dimensioni integrative (Lee, 2017), la scelta di includere esclusivamente la dimensione della Visualizzazione risponde ad una precisa esigenza metodologica per rendere i Data Lake operativi. L'obiettivo di questo studio, infatti, è di indagare come i Big Data e/o i Data Lake sono creati e utilizzati per i processi decisionali nelle destinazioni turistiche. In tale contesto, la Visualizzazione del dato costituisce un elemento chiave. Si tratta infatti di un elemento abilitante per trasformare i dati grezzi del Data Lake in insights operativi, rendendo il modello più utile e fruibile dai diversi stakeholder coinvolti. Inoltre, nel modello qui presentato (6V+), la Veridicità include il concetto di Validità (Validity), intesa come correttezza del dato (Rahman et al., 2016).

Alla luce di queste conoscenze è possibile qualificare i Data Lake come soluzioni per l'analisi dei Big Data che consentono l'acquisizione di dati grezzi eterogenei, provenienti da diverse fonti, sia interne sia esterne all'organizzazione, in modo da permettere la conservazione di dati aggregati e anonimizzati nel rispetto dei necessari requisiti per la protezione della privacy. Tale architettura consente l'elaborazione dei dati secondo filtri personalizzabili, in modo da rendere accessibili le informazioni a diversi profili di utenti per attività di analisi statistica, Business Intelligence (BI), Machine Learning (ML) e simili. Inoltre, il Data Lake implementa meccanismi di governance dei dati al fine di garantire la qualità, la sicurezza e la corretta gestione del ciclo di vita dei dati stessi (Nambiar and Mundra, 2022). Una prima intuizione rispetto a questo tipo di approccio viene attribuita a Dixon (2010), che semplificava il concetto nei seguenti termini: "Se un Data Warehouse può essere paragonato a un negozio di bottiglie d'acqua – depurata, confezionata e strutturata per un facile consumo – il Data Lake è un grande bacino d'acqua in uno stato più naturale".

Il Data Lake è, dunque, in grado di contribuire in maniera ancora più influente all'analisi dei Big Data in una prospettiva strategica, garantendo la possibilità di tradurre i dati e le elaborazioni più complesse in rappresentazioni grafiche di immediata comprensione (Chessa et al, 2022). Ho et al. (2023) rilevano nello specifico in ambito turistico come i Data Lake, a differenza dei Data Warehouse, permettano l'impiego di tutte le tipologie di dati strutturati, semi-strutturati e non strutturati, i quali costituiscono ormai la quasi totalità delle fonti. Infine, i Data Lake permettono maggiori possibilità di analisi attraverso Machine Learning, Exploratory Analytics, Data Discovery, Streaming, Operational Analytics dei Big Data.

Sebbene in letteratura siano ampiamente riconosciuti il ruolo cruciale dei Data Lake e le potenzialità del loro impiego per il management delle destinazioni turistiche, dal presente studio emergono tre importanti gap:

- limitata letteratura scientifica sulle proprietà chiave di un Data Lake applicato al marketing delle destinazioni turistiche;

- scarsa disponibilità di modelli applicati alla raccolta e all'analisi di Big Data per le destinazioni turistiche;

- assenza significativa di comparazione di casi documentati di applicazioni di Data Lake al servizio delle destinazioni turistiche.

Chiarita la rilevanza dello strumento del Data Lake e delle sue potenzialità, ed evidenziati i gap della letteratura scientifica, le Research Questions (RQ) emerse da questo studio possono essere così declinate:

- "Quali proprietà chiave dei Big Data (e dunque dei Data Lake), sono applicate nel marketing turistico?" (RQ1)

- "Come e a che scopo vengono realizzati i Data Lake a servizio delle destinazioni turistiche?" (RQ2)

## 3. Metodologia

Questa ricerca ha origine dall'esigenza reale di un'amministrazione pubblica di un Comune italiano che intendeva dotarsi di soluzioni tecnologiche innovative, sfruttando al meglio i Big Data, al fine di comprendere in modo approfondito e migliorare le esperienze di visitatori e turisti intorno a siti di particolare interesse storico e culturale.

È nato così un lungo percorso di collaborazione tra amministrazione comunale, Università, partner tecnologici e altri stakeholder del turismo, finalizzato alla progettazione e all'implementazione di un vero e proprio Data Lake a servizio della destinazione turistica. Per attivare tutti gli stakeholder coinvolti si è scelta la metodologia dell'Action Research (AR) applicata al turismo (O'Leary e Coghlan, 2022), con l'obiettivo condiviso di migliorare l'offerta turistica sostenibile del territorio, riorientando il lavoro scientifico dall'identificazione del problema alla sua risoluzione (Dolnicar e Green, 2025). L'AR può contribuire infatti a un duplice scopo, assicurando il rigore teorico e offrendo un contributo manageriale applicato (Erro-Garcés e AlfaroTanco, 2020). Per essere più efficace l'AR richiede uno studio longitudinale pluriennale e implica la collaborazione frequente tra un gruppo di ricercatori e policy-makers, favorendo lo scambio di idee e riflessioni (Näslund et al., 2011), al fine di realizzare e sperimentare nella pratica le soluzioni condivise. Lo scopo principale di questo progetto di ricerca era infatti applicativo, al fine di sviluppare e rendere disponibile al Comune di Verona una piattaforma a supporto di un Data Lake, creata per monitorare e migliorare l'esperienza di turisti e visitatori in alcune aree di interesse turistico, storico e culturale della città. L'iniziativa è parte di un progetto finanziato dal Ministero del Turismo (bando del 4/3/2022) per la valorizzazione dei comuni con siti UNESCO e delle città creative.

Le fasi dell'Action Research sono state quattro: (1) Pre-Step - incontri formali del team misto di ricerca per la definizione degli scopi e dei limiti del progetto; (2) Diagnosis - fase iniziale per la comprensione dei case studies esistenti (Studio Pilota); (3) Proposal – definizione dei dettagli del progetto, condivisi e approvati dagli stakeholder del turismo coinvolti per la realizzazione e l'utilizzo del Data Lake; (4) Implementation and monitoring– per la realizzazione del progetto operativo (realizzazione del Data Lake e della piattaforma per l'analisi dei dati; definizione della strategia di azione data-driven; sperimentazione digitale e monitoraggio continuo).

Questo paper in particolare si limita ad illustrare i risultati dello studio pilota iniziale (fase 2 dell'Action Research), in particolare attraverso l'analisi di 15 case studies, i quali hanno orientato la progettazione e lo sviluppo del Data Lake per il Progetto SMART Verona.

I casi collezionati sono selezionati solo in ambiti di applicazione sviluppati da destinazioni turistiche (vedasi Tabella 1): alcuni sono emersi in fonti accademiche, inclusi gli atti nei convegni, in report istituzionali e in fonti divulgative; altri sono stati suggeriti da esperti intervistati. Ad integrazione, per ogni caso sono state ricercate ulteriori fonti digitali, sia nel web (inclusi i siti di fornitori di soluzioni tecnologiche per l'analisi dei Big Data) che nei social media. I casi sono stati poi classificati in base al tipo di dati utilizzati, agli strumenti/tools applicati, agli ambiti di applicazione, agli scopi, agli stakeholder coinvolti e alle caratteristiche dei Big Data utilizzati (in base al modello delle proprietà "6V+"). Sono stati esclusi i casi non adottati da destinazioni turistiche o dei quali sono state trovate solo superficiali menzioni di

sperimentazioni tecnologiche senza specifiche tecniche o indicazioni di ambiti di applicazione.

## 4. Risultati dello studio pilota

Alcuni autori rilevano come siano stati soprattutto i grandi gruppi multinazionali a utilizzare i Big Data nell'elaborazione delle proprie strategie (Bernabeu et al., 2016). Come anticipato nella descrizione del metodo sono stati esclusi dalla comparazione i casi gestiti e promossi da aziende private, ma essi sono stati comunque studiati. I casi più noti sono: Kayak, Amadeus, MGM Resort, Marriott, Hipmunk, InterContinental Hotels Group e British Airways (Davenport, 2013); Makemytrip, Walt Disney Company, International Hotels Group, NH Hotels, e Airbnb (Presenza et al., 2021). In sostanza, anche altre ricerche sull'hospitality business confermano che tra i fattori digitali abilitanti e più critici vi sono le analisi dei big data e l'applicazione di moderne tecnologie, tra cui anche l'intelligenza artificiale (Del Chiappa e Rashidin, 2024). Restringendo l'analisi, come detto, ad esperienze di destinazioni turistiche, dal nostro studio emergono 15 casi di sperimentazione dei Big Data che sono stati analizzati e classificati in base alle proprietà "6 V+" (vedasi Tabella 1).

Nel primo caso, l'ente turismo austriaco tramite la piattaforma Weblyzard® ha potuto identificare contenuti di interesse e misurare la propria brand reputation, basandosi direttamente sui contenuti condivisi online dagli utenti (Gajdošík, 2019). La piattaforma, nello specifico, utilizza intelligenza artificiale e tecniche di web intelligence per realizzare semantic search, estrazione di conoscenza dai testi, visual analytics e analisi dei media.
Il secondo caso è stato analizzato anche da Sánchez-Franco e Rey-Tienda (2024) sul territorio dell'Andalusia. Gli autori sottolineano come, utilizzando le informazioni condivise online dagli utenti e tramite tecniche di data mining, machine learning e data visualisation, sia stato possibile identificare sia le tematiche di maggior impatto per gli ospiti delle strutture alberghiere (come "presentazione dello staff e della struttura", "problematiche legate al rumore e al comfort", "preoccupazioni degli ospiti e relative soluzioni") sia altre meno rilevanti. Inoltre, tramite un algoritmo di clustering KPrototype, è stato possibile suddividere i turisti in otto segmenti, per ognuno dei quali emergono delle specifiche esigenze (Sánchez-Franco e Rey-Tienda, 2024). La raccolta, l'elaborazione e l'analisi dei Big Data, in questo caso provenienti dagli UGC, possono consentire alle strutture di personalizzare l'offerta turistica in base a diversi segmenti di mercato.

Un terzo caso è rappresentato da Åre, rinomato centro turistico per gli sport invernali in Svezia, dove i Big Data hanno permesso, attraverso uno strumento di Business Intelligence, una conoscenza in real-time dei comportamenti degli utenti online. In tal modo, è stato possibile individuare in maniera più approfondita le aspettative e le esigenze dei clienti, permettendo ai policy makers di soddisfarle al meglio (Fuchs et al., 2014).

Il quarto caso è stato sviluppato in Grecia: attraverso le informazioni raccolte su testi, immagini, reazioni (like, commenti, condivisioni), geolocalizzazioni, date e profili utente sugli UGC dei cosiddetti Location-Based Social Networks (LBSN) – come Instagram, Twitter, Flickr e Foursquare –Vassakis et al. (2019) hanno potuto analizzare i comportamenti dei turisti di Heraklion e Chania, a Creta. Dal loro studio emergono alcuni insight interessanti. Tra questi si delinea il fatto che, se da un lato cibo tradizionale e bellezza dei paesaggi vengono valutati positivamente, dall'altro, aspetti rilevanti come la qualità dei servizi ricevono riscontri meno favorevoli. Avere a disposizione queste informazioni è stato utile per la destinazione turistica nel determinare le più appropriate azioni in grado di soddisfare le esigenze dei visitatori, e nell'implementare le più corrette strategie di branding territoriale.

Il quinto caso (Marine-Roig e Anton Clavé, 2015) è riferito alla destinazione Barcellona, attraverso l'analisi massiva, di contenuti direttamente creati dagli utenti (oltre 100.000 blog di viaggio e recensioni di viaggio online OTR scritti in inglese da turisti che hanno visitato la città negli ultimi 10 anni). Grazie alle informazioni ricavate da questi dati è stato possibile individuare trend, esperienze percepite, fattori di attrazione, sia della città nel suo complesso, che degli specifici punti di interesse della destinazione.

Il sesto caso di destinazione turistica nella quale i Big Data sono stati impiegati con particolare enfasi sulla sostenibilità, è quello di una località della Costa Blanca, la città di Benidorm. Quest'ultima ha ottenuto nel 2025 il riconoscimento di "European Green Pioneer of Smart Tourism" da parte della Commissione Europea, quale migliore esempio a livello continentale di capacità di coniugare conservazione dell'ambiente, stabilità economica e benessere sociale all'interno della propria strategia turistica (European Capital and Green Pioneer of Smart Tourism, 2025). La destinazione aveva vissuto nel corso dei decenni precedenti un lento ma costante decadimento dal punto di vista della percezione della qualità da parte dei consumatori (Femenia-Serra e IvarsBiadal, 2021). Per rivitalizzare la destinazione, i policy maker locali hanno deciso di orientare i propri sforzi per convertire la cittadina da tradizionale località balneare a Smart Tourism Destination (STD). Tra i principi guida dell'implementazione di soluzioni tecnologiche per la trasformazione in STD, l'amministrazione pubblica ha sottolineato l'importanza della capacità della singola applicazione di ottenere dati. Grazie all'integrazione di queste innovazioni tecnologiche si è riscontrato un notevole incremento nella comprensione delle aspettative e dei comportamenti dei visitatori, permettendo ai policy maker di adottare le scelte più corrette per incontrare le loro esigenze e implementare le strategie di marketing più idonee (Femenia-Serra e IvarsBiadal, 2021).

Venezia e Salisburgo (destinazioni posizionate rispettivamente al primo e secondo posto del ranking delle smart cities in base all'attrattiva turistica secondo l'European Smart City Index nel 2014, Buonincontri e Micera, 2016) rappresentano altri due interessanti casi di implementazione di tecnologie, tra cui cloud computing, end-user internet services e IoT, con l'obiettivo di sviluppare soluzioni in grado di incrementare l'esperienza di co-creazione di valore per le due località. Il concetto di co-creazione di valore può essere definito come il processo congiunto, collaborativo, simultaneo e "peer-like" di produzione di nuovo valore, sia materiale che simbolico (Galvagno e Dalli, 2014). Più nel dettaglio, Buonincontri e Micera (2016) rilevano come la DMO di Salisburgo, attraverso lo sviluppo di una strategia smart a 360 gradi, sia riuscita maggiormente nell'intento di coinvolgere i visitatori nella co-creazione di valore dell'esperienza turistica. I vari strumenti utilizzati hanno favorito il contatto diretto del turista con il territorio, stimolando la partecipazione e incoraggiando la condivisione dell'esperienza. L'implicazione pratica suggerita ai policy maker della DMO di Venezia riguarda l'attivazione di maggiori opportunità di condivisione dell'esperienza post travel dei turisti, sia attraverso testi che immagini. In questo modo, si potrebbe acquisire maggiore conoscenza e consapevolezza sui visitatori della città. Attraverso l'analisi dei dati l'organizzazione avrebbe infatti l'opportunità di comprendere in modo più approfondito caratteristiche, aspettative e comportamenti dei turisti, migliorando la propria offerta e la propria comunicazione, anche rispetto ad eventuali aspetti critici.

Nel successivo caso, evidenziato dalla ricerca di Bertocchi et al. (2021), sono stati utilizzati i dati relativi alle telecomunicazioni mobili (telco data) per misurare eventuali fenomeni di overtourism nel territorio delle Dolomiti. La ricerca si è focalizzata, in particolare, sul percorso sito UNESCO delle Tre cime di Lavaredo, in un periodo di 122 giorni da giugno a settembre 2018. Grazie ai dati forniti agli analisti, in formato aggregato e anonimizzato da uno dei maggiori operatori di telecomunicazione in Italia, è stato possibile monitorare in maniera più accurata e granulare i flussi turistici nella zona. In particolare, i dati hanno

consentito di rilevare il numero totale di utenti presenti in una determinata fascia oraria, il tempo complessivo trascorso nel luogo, i comportamenti e i modelli di mobilità dei turisti. Tali informazioni hanno permesso ai ricercatori di classificare i visitatori in "day visitors" o "tourists", oltre che rilevarne cittadinanza e luogo di provenienza. Si tratta di informazioni difficilmente tracciabili attraverso le statistiche ufficiali dei movimenti turistici. Lo studio ha rilevato come anche in queste località, in particolari periodi dell'anno, emergano dei fenomeni di overtourism, con flussi di visitatori molto elevati rispetto ai servizi esistenti. Inoltre, si è messo in luce come solo una parte minoritaria dei turisti (il 13,5%) scelga una modalità di trasporto sostenibile per raggiungere la località. Negli anni seguenti gli amministratori del sito UNESCO hanno provveduto ad implementare provvedimenti orientati ad un approccio più sostenibile in relazione alla visita della destinazione.

Fenomeni di overtourism sono riscontrabili non solo nelle città d'arte (Van der Zeee et al., 2017), ma anche nelle destinazioni turistiche costiere (Femenia-Serra and IvarsBaidal, 2021) e montane (Bertocchi et al. 2021). Secondo Butler (1980) anche le destinazioni turistiche, come succede per qualsiasi altro prodotto, manifestano un ciclo di vita, definito dall'autore Tourist Area Life Cycle (TALC). Le 7 fasi del livello di maturità di una destinazione sono rispettivamente: Esplorazione; Coinvolgimento; Sviluppo; Consolidamento; Stagnazione; Declino; Rinnovamento. I casi di Anversa (Belgio), Cracovia (Polonia), Bolzano (Italia) sono stati analizzati proprio attraverso il modello TALC di Butler (1980).

Tra le principali fonti di raccolta dei Big Data è utile citare anche quelle relative alle tecnologie e ai sensori inseriti nell'ambiente concernenti la sfera del cosiddetto Internet of Things (IoT). Ci si riferisce, in questo caso, a tutti quei contesti in cui la connettività di rete e le capacità computazionali vengono estese a oggetti, sensori e altre tecnologie tradizionalmente non considerate dispositivi informatici, consentendo a tali elementi di generare, scambiare e utilizzare dati (Rose et al., 2015). Grazie alla connessione con il web, oggetti fisici di uso quotidiano vengono collegati fra loro, consentendo agli utenti di svolgere le proprie attività in modo smart (Kotler et al., 2024). L'utilizzo di queste tecnologie non permette solo un'ottimizzazione dell'esperienza degli utenti, ma consente una raccolta massiva di dati e informazioni relativamente ai loro comportamenti. La tecnologia, facilitando la comunicazione e la fruibilità, aiuta ad accrescere e migliorare l'esperienza lato utente. Il management acquisisce informazioni di basilare importanza per la comprensione delle abitudini e dei comportamenti degli utenti. In ambito turistico possiamo rilevare diversi esempi di applicazione di questi strumenti: dall'utilizzo di sensori, QR codes e totem informativi dislocati sul territorio, fino a tutte le possibili soluzioni legate al concetto di realtà aumentata (AR). Gajdošík (2019) riporta una serie di best practices in merito a questa specifica tipologia di Big Data. Ad esempio, a Barcellona si fa ricorso a sensori per il monitoraggio del traffico, per l'illuminazione stradale e per il monitoraggio della qualità dell'aria, ad Amsterdam queste tecnologie vengono utilizzate per la rilevazione della densità dei flussi pedonali e per l'identificazione basata su tecnologia Bluetooth Low Energy (BLE), ad Helsinki per il monitoraggio dei consumi energetici, a Singapore per verificare il grado di pulizia degli ambienti urbani, la densità di persone in determinate aree ed il traffico dei veicoli in generale.

## 5. Discussione

Emerge in molti casi analizzati la rilevanza a livello strategico dell'analisi dei Big Data a servizio delle DMO, come fonte di informazione diretta rispetto alle esigenze e alle aspettative dei visitatori, in vista della realizzazione di una Smart Tourism Destination (STD) (Ardito et al, 2019). La STD è una destinazione in grado di mettere in connessione in modo efficace le diverse comunità di stakeholder attraverso piattaforme tecnologiche, condivisione di conoscenza e sistemi di decision-support evoluti (Buhalis a Amaranggana, 2014). Si tratta,

quindi, di una destinazione innovativa, basata su infrastrutture tecnologiche in grado di garantire lo sviluppo sostenibile del territorio, facilitando l'interazione e l'integrazione dei visitatori nel territorio. Questo approccio tecnologico agevola indirettamente un rafforzamento dell'esperienza turistica a cui si abbina un miglioramento del livello di qualità della vita dei residenti (Del Vecchio et al., 2018). In tale modello i Big Data rivestono un ruolo di fondamentale importanza per le destinazioni turistiche (Bernabeu et al., 2016).

I dati sono dunque indispensabili, in abbinamento alle tecnologie ICT, per la realizzazione di quelle che altri autori definiscono Knowledge-Based Destinations, o KBD (Racherla et al., 2008). Le KBD sono destinazioni dove il requisito strategico fondamentale da cui partire è appunto quella della conoscenza. Utilizzare tutte le diverse forme di Big Data a disposizione, potendo confrontarle, contribuisce a fornire una overview più completa rispetto alle esigenze e ai desideri dei visitatori. I casi analizzati appaiono invece dedicati a specifici problemi e con fonti di dati limitate. Inoltre, in nessun caso si è potuto osservare la realizzazione di un Data Lake completo, al massimo sono stati rinvenuti, più o meno esplicitamente, casi di realizzazione di Data Warehouse. Nel caso della destinazione di Åre, gli studiosi (Höpken et al., 2015) hanno constatato come, fra i fattori determinanti nello sfruttare al meglio i Big Data, vi sia da rilevare in particolare il fondamentale contributo apportato dall'impiego di un Data Warehouse centrale in grado di archiviare informazioni complete ed omogenee. Un Data Warehouse condiviso tra i vari stakeholder ha quindi contribuito a far raggiungere significativi risultati per l'organizzazione, dal punto di vista strategico.

Dalla Tabella 1, che riepiloga le proprietà "6V+" dei progetti analizzati, si nota che i tipi di dati utilizzati sono prevalentemente UGC (User Generated Content) con pochi casi di integrazione con altri tipi di dati, quindi con limitata Varietà. Purtroppo, nella documentazione raccolta, non è stato possibile riscontrare elementi di garanzia rispetto alla Veridicità del dato, forse tale proprietà non era in passato così critica ma rimane comunque preoccupante l'assenza di informazioni in tal senso. Inoltre, dal nostro studio emerge come le DMO tipicamente impieghino in modo separato i dati a disposizione. Ad esempio, relativamente a Benidorm, pur essendo segnalato come uno dei casi più innovativi, sono stati utilizzati separatamente tools di diverso tipo per le analytics, la gestione degli influencers e per le attività di intelligence (Femenia-Serra e Ivars-Biadal,

2021). Impiegare un'unica piattaforma per la raccolta, la gestione e l'elaborazione dei dati, e quindi per agevolare l'implementazione pratica di un Data Lake, potrebbe condurre a importanti miglioramenti verso una comprensione più accurata del problema. Inoltre, pur non riscontrando alcuna menzione nei casi esaminati, sarebbe auspicabile includere anche la conoscenza di aspettative e richieste dei cittadiniresidenti, che spesso convivono con difficoltà nelle zone affollate dai turisti (Biendicho et al., 2022), e le cui istanze talvolta rimangono in secondo piano nei progetti dedicati al target turista.

Come indicato in numerosi contributi scientifici, i responsabili delle DMO dovrebbero cooperare con i diversi stakeholder coinvolti nell'esperienza turistica per trovare in modo sinergico soluzioni ai fenomeni di overtourism, che nel tempo contribuiscono al decadimento della percezione nei consumatori del valore della stessa località (Femenia-Serra and Ivars-Baidal, 2021). A tal fine le DMO dovrebbero, quindi, essere consapevoli del grado di maturità turistico raggiunto dalla destinazione.

## 6. Conclusioni

Oltre alle modalità applicative e gestionali rilevate nei diversi casi, da questo studio pilota emerge quanto i Big Data siano in grado di fornire utili indicazioni ad una DMO. I casi indicano come, sia per quanto riguarda le singole strutture (Sánchez-Franco and Rey-Tienda, 2024) che per le destinazioni (Vassakis et al., 2019) l'analisi dei Big Data può rivelarsi efficace

in una pluralità di applicazioni e per obiettivi molto diversi (Belias et al., 2021; Chareyron et al., 2014). Le risposte alle domande di ricerca sono in parte inaspettate. Per rispondere alla prima domanda di ricerca (RQ1) si può affermare che le proprietà dei Big Data attualmente impiegati per diverse finalità dalle destinazioni turistiche non sono tutte ritenute strategiche, e gli ambiti e i confini applicativi sono abbastanza diversi fra loro. Nei casi esaminati non emergono chiare informazioni sulla proprietà della Veridicità, aprendo una potenziale preoccupazione su accuratezza, certezza, correttezza e precisione del dato. Gli studi analizzati, infatti, si concentrano prevalentemente sulla descrizione dei Big Data e delle loro caratteristiche, oppure, sulle strategie di individuazione, selezione e gestione dei dati finalizzate al decision making. In altre parole, la comunicazione di tali esperienze si focalizza sul contenuto e sull'utilizzo dei dati, piuttosto che sulla loro architettura o infrastruttura. Da questo studio, quindi, emergono una varietà di proprietà, ma anche l'assenza di case study di realizzazione di un Data Lake completo nell'ambito delle destinazioni turistiche. Inoltre, quel che chiaramente si è potuto osservare è che in tutti i casi si tratta di realizzazione di Data Warehouse e non di Data Lake. Il Data Lake invece, come è stato discusso in letteratura, può essere di supporto ad una DMO nel comprendere meglio i propri visitatori partendo da una pluralità di fonti, e quindi implementare strategie in grado di soddisfare al meglio le loro esigenze, aspettative e desideri. Si tratta di uno strumento necessario ai policy maker per orientare le proprie scelte in una maniera datadriven, più analitica e oggettiva. La soluzione permette, inoltre, di personalizzare la piattaforma in modo flessibile per le proprie esigenze conoscitive. Poca attenzione è stata riscontrata anche alle tecniche di Visualizzazione, ritenute fondamentali per semplificare l'analisi dei dati inseriti nei Data Lake. Il Data Lake diviene un prezioso repository di dati da cui estrarre informazioni diverse da poter visualizzare facilmente in base alle esigenze dei destination managers e di tutti gli stakeholder coinvolti. I risultati relativi alla seconda domanda di ricerca (RQ2), fanno emergere l'assenza di case study riguardanti Data Lake completi e applicati a servizio delle destinazioni turistiche.

Questa analisi comparativa risulta assai utile per impostare un progetto innovativo nel suo genere. Inoltre, stando a quanto riscontrato negli scopi e negli ambiti di applicazione dei Big Data per le destinazioni turistiche, tante sono le criticità nascoste e segnalate in letteratura. Infatti, a differenza di tutti gli aspetti positivi nell'uso dei Big Data discussi fino ad ora, nella pratica emergono alcune limitazioni nell'analisi degli stessi Big Data, tali da comportare possibili bias. Si tratta in particolare di distorsioni relative alla proprietà della Veridicità che potrebbero influenzare la capacità dei dati di fornire informazioni attendibili, come i "purchasing bias", "under-reporting bias", "consumer bias" (Hu et al., 2006) o l'estrema polarizzazione delle opinioni espresse online (Schoenmuller et al., 2020). Inoltre, molti contenuti online, grazie allo loro anonimia, possono essere soggetti al fenomeno delle false recensioni (per ragioni di varia natura, in primis competitiva) oppure a quello dei cosiddetti "haters" che a loro volta possono dimostrare la loro ostilità (in questo caso solitamente non di natura economica) verso un singolo brand o struttura oppure essere indirizzate ad una destinazione nel suo complesso. La comprensione delle potenzialità e dei limiti dell'analisi dei Big Data, prima di tutto culturali, è un passaggio importante in fase di progettazione di un nuovo Data Lake. In tal senso, l'attenzione alla proprietà della Veridicità risulta fondamentale.

L'implicazione manageriale più importante di questo studio pilota è l'ambito di applicazione immediata. Seppur molto eterogenei tra loro, l'analisi di questi quindici case studies ha permesso di definire con maggiore precisione i confini dell'Action Research relativa al progetto del Comune di Verona. Con particolare riferimento alla fase 2 dell'AR (diagnosis), questo approccio ha condotto alla definizione e creazione del Data Lake, con la raccolta, la gestione e l'elaborazione di Big Data ad hoc (dati da fonti selezionate e certificate, testuali ed enhance data di social media, recensioni Google, web anaytics, account analytics) integrati con i dati sulla mobilità (aggregati e anonimizzati) di selezionati Points of Interest (POI) della

città, al fine di analizzare i comportamenti dei visitatori e decongestionare le aree più critiche. Nel progetto SMART Verona la Varietà delle fonti dei dati è ampia, così come il relativo Volume (che comprende due anni di tracciamento). Con lo scopo di acquisire una visione d'insieme quanto più rilevante ai fini analitici e decisionali del progetto, è stata creata una piattaforma che analizza i dati integrati nel Data Lake, ove coesistono due macroset di dati: un set relativo ai dati di mobilità, e un altro set relativo ai dati sul parlato digitale. L'utilizzo congiunto dei due set restituisce un quadro integrato e multidimensionale dell'esperienza di visita nelle aree individuate. La piattaforma, inoltre, è stata progettata seguendo un approccio user-friendly, al fine di garantirne un'ottimale Visualizzazione dei dati, con fruizione fluida, intuitiva ed accessibile, anche in assenza di competenze tecniche specifiche. La piattaforma SocialMeter, brevettata dal partner tecnologico Maxfone srl, è stata poi funzionale alla fase di sperimentazione digitale del "Progetto SMART Verona". L'ambito di analisi si è focalizzato su un'area di particolare interesse storico e culturale della città con lo scopo di ridurne i nodi di congestione e promuovere un'esperienza di visita autentica e integrata anche con altri punti di interesse. Per la sperimentazione, quindi, sono state incluse altre aree, chiamate POI (Points Of Interest), fondamentali per comprendere e confrontare i flussi e le visite in arrivo e in partenza del territorio, nonché il parlato digitale relativo a tali punti. Inoltre, la piattaforma viene utilizzata anche come strumento per il monitoraggio dei risultati conseguiti attraverso le azioni di sperimentazione digitale. Questa sperimentazione testa il Valore del Data Lake per ottimizzare le decisioni strategiche dei diversi stakeholder coinvolti nel progetto. Infine, grazie all'aggiornamento in near real-time dei dati (potenziando la Velocità del sistema), è possibile effettuare un'analisi tempestiva e continua degli effetti della sperimentazione, permettendo di valutare l'efficacia degli interventi e di individuare prontamente eventuali criticità. Il real-time perfetto non è praticabile in un Data Lake come questo, in cui il dato deve essere filtrato, accuratamente selezionato, anonimizzato secondo i criteri della privacy, garantendo il requisito della Veridicità. Per limitare i rischi collegati alla privacy, i dati di mobilità raccolti per la specifica finalità sono stati resi anonimi e aggregati (processati secondo le linee guida dell'European Data Protection Board) e non possono essere ricondotti con processi inversi ai diretti interessati (persone fisiche). Tutti i dati sono confluiti in un'unica piattaforma user friendly grazie a tattiche di data visualization, accessibile da diversi stakeholder per l'analisi semplificata dei dati e dei risultati in tempo reale.

La complessità del progetto, la multidisciplinarietà e l'ambizione degli obiettivi hanno reso necessaria l'azione congiunta di più attori. Il progetto SMART Verona è stato realizzato grazie alla fitta rete collaborativa che ha coinvolto enti pubblici, partner privati e stakeholder del territorio, in particolare: il Ministero del Turismo, finanziatore del progetto e il Comune di Verona (Assessorato alla cultura al turismo e ai rapporti con l'UNESCO) promotore dell'iniziativa. Hanno contribuito alla fase di operativa: Maxfone s.r.l, Società Benefit in qualità di partner tecnologico per aver realizzato il Data Lake e la piattaforma SocialMeter; Wind Tre Business in qualità di mobility data provider; il Dipartimento di Management dell'Università di Verona per il supporto al coordinamento scientifico; la Destination Verona & Garda Foundation in qualità di DMO, e i Musei Civici di Verona quali partner della sperimentazione; AMT3 per il supporto di visibilità sui ledwall; e alcuni content creators, tra cui Stefano Cantiero e Matteo Guidotto per la realizzazione della campagna di comunicazione digitale. [Per maggiori informazioni sul progetto si rimanda al sito https://maxfone.it/smart-verona/]

In conclusione, questo articolo riporta i risultati di uno studio pilota volto a raccogliere casi di applicazioni di analisi dei Big Data in alcune destinazioni turistiche, le cui informazioni applicative non sono ancora molto diffuse in letteratura. I risultati emersi sono stati utili per la realizzazione di una Action Research dedicata alla creazione di un innovativo Data Lake applicato in una città italiana. Lo studio offre così un contributo innovativo sia a livello teorico sia operativo, per l'evoluzione della gestione data-driven delle destinazioni turistiche.

## Acknowledgements

Si ringrazia l'Assessorato alla cultura, al turismo e ai rapporti con l'UNESCO del Comune di Verona, promotore dell'iniziativa, e il Ministero del Turismo per il supporto finanziario. Tale finanziamento rientra tra quelli volti alla valorizzazione dei Comuni a vocazione turistico-culturale nei cui territori sono ubicati siti riconosciuti dall'UNESCO patrimonio dell'umanità (bando del 4/3/2022). Questo studio in particolare è parte del Progetto Smart Verona: Città Patrimonio Mondiale UNESCO – intervento 4: Realizzazione di strumenti di valorizzazione e promozione turistica digitale.

# Reimagining Science Communication through Experiential Marketing: Immersion, Emotion, and Co-Creation

Elena Sorba[1], *, Valeria Beccari[1], and Manuele Laghi

[1] Università IULM, Milan, Italy

* Corresponding author: elena.sorba@studenti.iulm.it

## Abstract

Science communication today faces a profound paradox: while scientific knowledge is expanding in complexity and relevance, public engagement often remains superficial, fragmented, or absent. This short paper proposes a conceptual reflection on how experiential marketing can inform a renewed approach to science communication—one that prioritizes immersion, emotional resonance, and co-created meaning. Borrowing tools and principles from experiential marketing—originally developed in consumer and cultural branding—we argue that science communication can be reimagined as an emotionally credible and sensorially rich encounter. Through immersive environments, affective design, and identity-based storytelling, public engagement with science can move beyond information transmission and become a participatory, memorable experience. This vision opens up new possibilities for museums, installations, and festivals, offering an alternative to the linear, deficit-driven communication models still prevalent in institutional contexts.

*Keywords: Science Communication – Experiential Marketing – Immersion – Emotional Engagement – Co-creation – Authenticity*

## 1. Background and Conceptual Positioning

Science communication has long been shaped by a diversity of models—ranging from the deficit model, focused on correcting knowledge gaps, to dialogue and participation-based models that emphasize interaction, reflexivity, and co-production. While the deficit model is often critiqued for assuming passive publics and linear knowledge transfer, it continues to serve useful purposes in certain institutional and educational settings—particularly when clarity, authority, and scientific literacy are required.

Rather than opposing these models in a rigid hierarchy, current scholarship increasingly recognizes their coexistence and contextual validity. Depending on institutional goals, public expectations, and the nature of the scientific topic, different modes of engagement may be more or less appropriate. However, what remains consistent across this spectrum is a growing awareness of the limits of purely cognitive engagement, especially in a media landscape saturated with fragmented information, affective polarization, and declining public trust.

In this evolving scenario, experiential approaches—which incorporate sensory immersion, emotional resonance, and participatory dynamics—are emerging as powerful complements to traditional forms of science communication. Experiential marketing, in particular, offers

conceptual and practical resources to design science engagement formats that are not only informative, but also felt, remembered, and personally meaningful.

## 2. Experiential Marketing as a Lever For Science Communication

Experiential marketing (EM) provides a valuable conceptual and methodological toolkit for rethinking science communication as an immersive and affective encounter. At its core, EM shifts the focus from the transmission of information to the design of memorable, multisensory, and emotionally resonant experiences—intended not merely to inform, but to engage, involve, and transform.

In experiential formats such as science museums, festivals, exhibitions, and installations, audiences are no longer passive recipients of content, but active participants in meaning-making. They connect with scientific knowledge through embodied engagement, emotional resonance, and narrative identification. The objective is not simplification or dramatization, but the activation of cognitive, emotional, and sensory dimensions within a coherent and authentic experience.

This experiential logic is already visible in many science communication contexts, where techniques such as multisensory environments, symbolic storytelling, and scenographic staging are used to translate abstract or technical content into situated, emotionally rich experiences. These are what we refer to as "experience events"—formats that structurally align the goals of science communication with spatial, symbolic, and affective design.

Crucially, we argue that the value of EM in science communication lies not simply in its capacity to capture attention, but in its potential to foster what we define as emotional coherence: a structural alignment between the emotional tone of the experience and the epistemic nature of the content. When this coherence is achieved, it enhances credibility, memorability, and public trust in scientific institutions.

However, this potential must be approached critically. Experiential strategies risk turning science into spectacle or reducing engagement to fleeting emotional reactions if applied without epistemic grounding. To avoid this, EM must be reinterpreted—not as a marketing tactic, but as a design orientation that supports both affective connection and scientific integrity.

This contribution proposes a conceptual reorientation: from a commercially inspired logic of attraction to an epistemically grounded experiential design. We do not call for a general expansion of EM in science communication, but for its careful, situated application in formats where immersion, co-creation, and emotional resonance can meaningfully enhance public engagement. Future research may explore how diverse publics interact with these experiential events, and how such encounters shape trust, learning, and identity in relation to science.

## Abstract

In luxury hospitality, guest satisfaction increasingly depends on personalized, emotionally resonant, and contextually rich experiences. Informed by this trend, the present study examines the Memorable Guest Experience (MGE) at a resort of the Mangia's group—an Italian luxury hospitality brand—by combining Corpus-Assisted Discourse Studies (CADS) and artificial intelligence (AI). Through the analysis of English- and Italian-language online reviews, the study explores the discursive construction of satisfaction and memorability while identifying key experiential themes. The CADS analysis reveals that both English- and Italian-speaking guests focus on core service elements—such as lodging, staff, and dining—but use different evaluative tones: the former tend to express satisfaction and memorability in more moderate and measured terms, while the latter rely on overtly positive appraisals, suggesting different standards of luxury. Furthermore, the AI-assisted classification of the English reviews, based on a seven-dimension MGE framework, indicates that contextual elements, social interaction, and emotional engagement are the most frequently referenced experiential dimensions. The findings confirm the importance of aesthetic environments, meaningful human encounters, and affective responses in luxury hospitality. By drawing on marketing and linguistic perspectives, the study offers insights for both academics and practitioners into how user-generated content (UGC) reflects evolving luxury expectations. This, in turn, underscores the value of UGC as a resource for strategic experience design, brand differentiation, and emotionally intelligent service delivery in the hospitality industry.

*Keywords: Hospitality Marketing, Digital Discourse, UGC, Online Reviews, Tripadvisor*

## 1. Introduction

In luxury consumption, traditional markers of status and exclusivity are increasingly replaced by personalized, meaningful, and accessible experiences. Psychological motivations, such as the pursuit of self-fulfillment and social recognition, remain central to consumer behavior (Dubois et al., 2021), but these are now influenced by broader socio-economic transformations, including those accelerated by the COVID-19 pandemic. Soni & Kumar (2024) describe the emergence of a "new luxury," which prioritizes wellness, authenticity, and sustainable values over material excess. This shift is further reinforced by the rise of the sharing economy, where access-based models of consumption are gaining prominence (Christodoulides et al., 2021; Eckhardt & Bardhi, 2019).

Cultural and religious norms also play a significant role in shaping luxury consumption. For instance, Abalkhail (2020) highlights how in certain societies, aspirations for luxury may conflict with values that emphasize modesty and restraint. Zakaria et al. (2020) further emphasize that emotional and environmental considerations are becoming critical to how luxury is defined and experienced across different markets. At the brand level, it is the emotional resonance of luxury offerings— rather than purely their price or exclusivity—that increasingly drives both initial and repeated consumption (Atkinson & Kang, 2021; Roy et al., 2018).

In the context of luxury hospitality, these evolving expectations manifest in demand for highly personalized services (Panchapakesan et al., 2021), consistent and meaningful staff-guest interactions (Loo & Leung, 2016), and robust employee training programs that support quality delivery and emotional intelligence (Todorović & Ivanović, 2018). Shin & Jeong (2022) demonstrate that while technology can enhance efficiency and convenience, it must be seamlessly integrated with human service to preserve the intimacy and emotional warmth expected in luxury settings. Additionally, digital reputation and green practices have become vital to guest satisfaction, as online reviews and perceived sustainability efforts influence consumer trust and loyalty (Dang et al., 2022; Herstein et al., 2018; Xiang et al., 2015). The sensory richness and aesthetic qualities of luxury properties also contribute to overall guest impressions, reinforcing the need for well-designed physical environments (Giglio et al., 2020).

In light of these shifting expectations, the concept of *Memorable Tourism Experience* (MTE; Tung & Ritchie, 2011) offers a valuable lens for understanding how emotionally resonant and personally meaningful encounters have become central to the perceived value of luxury hospitality. Building on this framework, and drawing from more recent literature on luxury hospitality consumption and experiential branding, this study delves into the case study of Mangia's to explore the *Memorable Guest Experience* (MGE) as reflected in the discourse of online consumer reviews (Vásquez, 2014).

Mangia's is a luxury hospitality brand offering a portfolio of upscale resorts, clubs, and restaurants in the Italian islands of Sicily and Sardinia. The brand positions itself at the intersection of Mediterranean heritage, sustainable luxury, and personalized service. It caters primarily to international and domestic clients seeking immersive experiences that blend natural beauty, authentic regional cuisine, and high-quality amenities. This strategic positioning makes Mangia's a valuable case study for exploring the evolving expectations of luxury guests—particularly in the context of Sicily and Sardinia, which serve as iconic yet underexamined destinations within the global luxury hospitality industry (Lo Mascolo et al., 2024).

The present study is part of a broader research exploring guest experiences across multiple Mangia's resorts in Sicily and Sardinia. As a preliminary investigation, this paper focuses exclusively on the Sardinian resort Mangia's Santa Teresa Sardinia, Curio Collection by Hilton and analyzes how the MGE is reflected in online reviews. The analysis combines Corpus-Assisted Discourse Studies (CADS; Baker, 2023; Gillings et al., 2023) and artificial intelligence (AI) to capture both linguistic insights and experiential themes. By integrating macro-level corpus techniques with micro-level experiential mapping, the study identifies both recurring discursive patterns and key dimensions that shape guest satisfaction and memorability.

Although exploratory in nature, this contribution offers valuable insights for both scholars and industry professionals. From the standpoint of academic inquiry, it advances hospitality and tourism research by drawing on marketing and linguistic perspectives to examine digital discourse within the MGE framework, with particular attention to outcomes such as guest

satisfaction, brand loyalty, and positive guest advocacy. For industry practitioners, the findings offer a practical foundation for designing experiences that align with the expectations and values of today's discerning guests. By connecting theoretical insights with real-world applications, the study supports ongoing efforts to enhance the quality and emotional resonance of hospitality services—deepening understanding of guest satisfaction and aligning with current trends in service innovation.

## 2. The MGE in the Luxury Hospitality Industry

In the realm of luxury hospitality, delivering an unforgettable guest experience is crucial to achieving high levels of satisfaction and cultivating brand loyalty. While Tung & Ritchie (2011) identified four core dimensions of the MTE—i.e., affection, expectations, consequentiality, and recollection—recent literature on luxury consumption in hospitality settings suggests a broader and more nuanced set of experiential factors. These are shaped by evolving consumer values, particularly those related to personalization, emotional connection, wellness, and authenticity.

As highlighted by D'Acunto & Volo (2021), guests interpret the notion of luxury in diverse ways, associating it with different values and expectations, which in turn influence their service perceptions and behaviors. This reinforces the necessity for personalization—a theme further explored by Lin & Choe (2022), who argue that tailoring luxury services to individual preferences significantly increases engagement and enhances perceived value. Such personalization deepens the emotional and cognitive resonance of the guest experience, making it more memorable.

Another indispensable factor is service quality. According to Alex (2024), luxury hotel clientele place strong emphasis on customized attention and meticulous service. Meeting these expectations not only fosters guest satisfaction but also strengthens long-term brand commitment. Closely related is the idea of co-creation, whereby meaningful staff–guest interactions contribute to more emotionally rich and personally relevant experiences. Harkison (2017) emphasizes how collaborative encounters foster stronger emotional connections, while Panchapakesan et al. (2021) highlight the role of exceptional service in triggering guest delight—an emotional response that encourages advocacy and repeat patronage.

The physical and sensory environment also plays a pivotal role in shaping guest experiences. Harkison et al. (2018) note a sector-wide shift from product-based offerings to immersive, guest-centric experiences that appeal to the senses. This is echoed by Park et al. (2020), who emphasize the importance of wellness-oriented features and spatial design in enhancing satisfaction and differentiation in the luxury segment.

In parallel, digital technologies have become integral to modern luxury experiences. Shin & Jeong (2022) stress that technological enhancements must be harmonized with the emotional warmth of traditional service to avoid undermining guest expectations. Finally, online reputation has emerged as a critical aspect of the guest journey. Cenni et al. (2020) and Chang et al. (2020) note that online reviews are now a key indicator of service credibility, shaping both pre-visit expectations and postvisit evaluations.

Drawing from these interconnected themes in the literature, the present study adopts an expanded MGE framework comprising seven key dimensions that reflect the emotional, cognitive, sensory, social, and contextual components of memorable luxury experiences, as supported by prior research:

i. *Emotional engagement* is foundational, as feelings of joy, awe, or excitement deepen guests' emotional connection with their experience and enhance positive word-of-mouth (Bai et al., 2023; Ezeh and Dube, 2024).

ii. *Cognitive involvement*, including reflection, learning, and curiosity, is another key factor, with storytelling and interpretation being instrumental in enhancing mental engagement (Kim, 2010).

iii. *Sensory stimulation*, through rich visual, auditory, tactile, olfactory, or gustatory cues, plays a critical role in reinforcing memories. Unique culinary experiences or visually striking settings, for instance, often result in vivid and enduring recollections (Vukoičić et al., 2024).

iv. *Social interaction*, including meaningful exchanges with locals, fellow guests, or staff, enhances memorability by adding relational depth to the experience (Wang et al., 2021).

v. *Novelty* provides a sense of adventure and distinctiveness, helping experiences stand out in a saturated market (Lee & Li, 2019).

vi. *Personal relevance*, or how well an experience aligns with individual preferences, values, or life narratives, significantly influences how guests encode and recall their experiences. Tailored encounters that resonate with the guest's identity are more likely to be remembered and shared.

vii. *Contextual elements* such as ambiance, accessibility, and the broader cultural and physical environment further contribute to the overall memorability of the experience.

Together, the growing body of research on luxury consumption and experiences points to a paradigm shift in how value is created and perceived in hospitality. Offerings that are emotionally rich, cognitively engaging, sensorially immersive, and personally meaningful lie at the heart of both guest memorability and modern luxury. For hospitality providers, this underscores the importance of designing experiences that are not only exceptional in quality but also aligned with evolving consumer values—particularly those related to authenticity, sustainability, and emotional connection.

## 3. Methodology

This study employs a hybrid methodological framework that combines CADS with AI. The data consist of user-generated content (UGC) in the form of online reviews published on the resort's Tripadvisor page between June 2024 and May 2025. Tripadvisor was selected as the data source because it is one of the most widely used digital platforms in hospitality and tourism, offering a vast repository of guest reviews. As of 2018, the platform had collected nearly 730 million reviews and opinions across more than eight million listings, including hotels, restaurants, and attractions (Antonio et al., 2020). It attracts hundreds of millions of users worldwide and encourages contributors to share honest, experience-based feedback, making it a rich and credible source of experiential data.

### 3.1 CADS Analysis

CADS is a methodological approach that combines techniques from corpus linguistics with the interpretive orientation of discourse analysis. It enables the identification of recurring lexical patterns in large electronic corpora while also interpreting their contextual and

ideological significance (Baker, 2023; Gillings et al., 2023). In this study, CADS was used to examine how guests narrate and evaluate their resort experiences in online reviews.

At the time of data collection (i.e., June 2025), the resort's Tripadvisor page featured 95 reviews written in a range of languages, including English (41), Italian (40), Portuguese (5), French (4), Dutch (2), Danish (1), German (1), and Polish (1). For analytical depth and cross-linguistic comparison, the study focused exclusively on English- and Italian-language reviews—the two most substantial groups—assumed to reflect the experiences of international and domestic guests, respectively. Each selected review was manually extracted as a separate text file, maintaining a one-to-one Corresponding author between files and reviews. The files were then imported into #LancsBox X (Brezina & Platt, 2025) to build two distinct corpora: *MangiasEN* (English reviews) and *MangiasIT* (Italian reviews).

Both corpora underwent lemmatization and part-of-speech (POS) tagging[15] to reduce morphological variation and distinguish grammatical categories. This preprocessing procedure enabled more accurate identification of content words (i.e., nouns, verbs, adverbs, and adjectives) and facilitated the retrieval of consistent lexical patterns across texts.

A frequency analysis was conducted to identify the 15 most frequent contentword lemmas in each corpus. This enabled the detection of prominent experiential themes discussed by guests and highlighted commonly referenced aspects of the resort. Additionally, to assess lexical diversity—i.e., the variety of vocabulary used in each corpus—the type/token[16] ratio (TTR) was calculated. TTR is computed by dividing the number of unique word types by the total number of tokens and multiplying the result by 100 (Brezina, 2018).

To further explore how guests articulate evaluation and satisfaction, concordance analysis was employed. This technique examines how a specific word— referred to as the *node*—functions in context by displaying its surrounding co-text in a table format. In this study, concordance analysis focused on three highly frequent evaluative adjectives: *good* in the MangiasEN corpus, and *ottimo* (great) and *perfetto* (perfect) in the MangiasIT corpus. By examining their concordance lines, the analysis identified the referents of these adjectives, thereby illuminating how satisfaction and memorability were linguistically constructed.

### 3.2 AI-Assisted Analysis

In addition to CADS, the study employed an AI-supported classification of reviews based on the MGE framework. At this preliminary stage, the AI-assisted analysis was conducted exclusively on the English reviews. The classification was performed using ChatGPT-4, a large language model developed by OpenAI, which enabled the identification of the MGE dimensions present in each review and how they were linguistically expressed.

The classification procedure followed a structured protocol to ensure replicability and consistency. English reviews were submitted to ChatGPT-4 along with a carefully designed prompt that guided the classification process. The prompt instructed the model to identify which of the seven MGE dimensions were present, justify each classification based on linguistic evidence, and extract a representative quote from the reviews. The dimensions were defined directly within the prompt to ensure interpretative clarity and transparency. The full prompt used for the analysis is reported below:

[15] *Lemmatization* is the process of reducing a word to its base form (i.e., lemma)—for instance, *stayed*, *staying*, and *stays* are reduced to *stay*. *Part-of-speech (POS) tagging* involves assigning each word a grammatical category, such as noun, verb, adjective, or adverb, which enables more precise linguistic analysis.

[16] A *token* refers to any individual word occurrence in a corpus, regardless of repetition. A *type* refers to each unique word form. For instance, in the sentence *dinner was excellent and the service was excellent too,* there are nine tokens but only seven types, as the words *was* and *excellent* appear twice but are each counted once as type

*Read the following online reviews and identify which of the seven dimensions of the Memorable Guest Experience (MGE) are present. For each dimension you detect, provide:*

a. *The name of the dimension*

b. *A brief justification for your choice (based on the language used)*

c. *A representative quote from the review that illustrates it*

*The seven MGE dimensions are defined as follows:*

i. *Emotional engagement: expressions of joy, awe, excitement, or emotional connection*

ii. *Cognitive involvement: signs of learning, reflection, or curiosity; appreciation of storytelling or cultural interpretation*

iii. *Sensory stimulation: references to visual, auditory, tactile, olfactory, or gustatory impressions*

iv. *Social interaction: mentions of meaningful exchanges with staff, fellow guests, or locals*

v. *Novelty: descriptions of new, unique, or adventurous experiences*

vi. *Personal relevance: alignment between the experience and the reviewer's personal values, identity, or preferences*

vii. *Contextual elements: mentions of ambiance, accessibility, architectural design, or the broader physical/cultural environment*

The model's output included a list of present dimensions, short justifications, and direct quotes extracted from the reviews. These results were subsequently aggregated to produce frequency counts of each MGE dimension. All AI-generated results were manually reviewed to verify accuracy, correct potential misclassifications, and ensure contextual alignment with the intended framework.

This AI-assisted procedure enabled a scalable and systematic mapping of experiential content, enhancing consistency and efficiency in the preliminary analysis. Importantly, all outputs underwent human validation to ensure interpretive rigor. The combination of AI-supported categorization and CADS analysis allowed for a duallayered examination of guest experience, revealing both the key experiential dimensions reflected in online reviews and the discursive patterns through which satisfaction and memorability were constructed.

## 4. Findings and Discussion

### 4.1 MGE Narratives in the MangiasEN and MangiasIT Corpora

As shown in Table 1, the MangiasEN corpus consists of 41 English reviews, comprising 10,396 tokens, 1,925 types, and 1,791 lemmas. The MangiasIT corpus, slightly smaller, includes 40 Italian reviews, with a total of 2,783 tokens, 924 types, and 980 lemmas. While the lower token count in the MangiasIT corpus suggests that Italian reviews are shorter in length, both corpora are sufficiently robust to support meaningful comparative analysis. To assess lexical diversity, the TTR was calculated for each corpus. The resulting ratios provide an indication of how diverse the vocabulary is within each set of texts: the MangiasEN corpus

yielded a TTR of 18.52%, while the MangiasIT corpus showed a higher TTR of 33.21% (Table 1).

| | **MangiasEN** | **MangiasIT** |
|---|---|---|
| **Files** | 41 | 40 |
| **Tokens** | 10,396 | 2,783 |
| **Types** | 1,925 | 924 |
| **Lemmas** | 1,791 | 980 |
| **TTR** | 18.5% | 33.2% |

**Table 1:** Corpus Statistics for the MangiasEN and MangiasIT Corpora

This difference suggests that the Italian reviews, although shorter, contain a greater proportion of unique word forms. However, this contrast must be interpreted in light of the known sensitivity of TTR to corpus size (Brezina, 2018). Smaller corpora tend to yield higher TTR values due to reduced lexical repetition, whereas bigger corpora naturally include more recurring vocabulary, which lowers the TTR. Therefore, while the Italian reviews appear more lexically diverse, this may partly result from their brevity. At the same time, these TTR values may also reflect different reviewing conventions between domestic and international guests—Italian-speaking reviewers may use more varied or expressive vocabulary in shorter texts, whereas English reviews may rely more heavily on formulaic or descriptive phrasing typical of travel narratives. To explore these patterns more deeply, a fine-grained qualitative analysis of larger discourse segments will be necessary to contextualize vocabulary choices and their implications for guest experience.

A frequency analysis of content-word lemmas was conducted on both corpora to identify the most prominent experiential references. The top 15 most frequent lemmas—categorized by POS—are presented in Table 2.

| | **MangiasEN** | | **MangiasIT** | |
|---|---|---|---|---|
| **Rank** | **Lemma_POS** | **Relative Frequency** | **Lemma_POS** | **Relative Frequency** |
| 1 | hotel_n | 130.82% | struttura_n | 82.64% |
| 2 | room_n | 70.22% | personale_n | 75.46% |
| 3 | staff_n | 62.52% | camera_n | 71.86% |
| 4 | food_n | 43.29% | colazione_n | 50.31% |
| 5 | service_n | 40.40% | buffet_n | 50.31% |
| 6 | bar_n | 36.55% | ristorante_n | 50.31% |
| 7 | day_n | 36.55% | ottimo_adj | 50.31% |
| 8 | drink_n | 34.63% | esperienza_n | 46.71% |
| 9 | good_adj | 32.70% | servizio_n | 43.12% |
| 10 | restaurant_n | 30.78% | cibo_n | 43.12% |
| 11 | pool_n | 30.78% | pulizia_n | 39.53% |
| 12 | time_n | 28.86% | vista_n | 35.93% |
| 13 | stay_n | 28.86% | relax_n | 35.93% |

| | | | | |
|---|---|---|---|---|
| 14 | beach_n | 27.90% | perfetto_adj | 35.93% |
| 15 | star_n | 27.90% | qualità_n | 35.93% |

**Table 2:** Top 15 Most Frequent POS-Tagged Lemmas in the MangiasEn and MangiasIT Corpora

The English reviews show a consistent focus on core hospitality elements. Among the most frequent lemmas are *hotel*, *room*, *staff*, *food*, *service*, and *restaurant*, indicating that guests frequently comment on lodging, staff, and dining. These terms point to the foundational aspects of the luxury resort experience, with *room* and *staff* particularly central to perceptions of comfort and service quality. Additionally, several lemmas refer to amenities and leisure activities—such as *bar*, *drink*, *pool*, and *beach*— which highlight the importance of recreational features in the international guests' experience. Temporal structuring is evident through words like *day*, *stay*, and *time*, which often serve to narrate the sequence or duration of the visit rather than contribute evaluative content. The lemma *star* likely refers to the resort's rating, serving as a shorthand for institutional quality markers or summary judgments. Notably, *good* is the only explicitly positive evaluative adjective among the top 15 lemmas. While it signals general satisfaction, its tone is relatively moderate and lacks the emphatic intensity found in the Italian reviews. Overall, the English corpus reflects a narrative style that is descriptive, experience-focused, and shaped by references to both tangible amenities and standardized quality indicators.

The Italian corpus reveals a comparable experiential core, with frequent lemmas such as *struttura* (establishment), *personale* (staff), *camera* (room), *colazione* (breakfast), *buffet*, *ristorante* (restaurant), and *cibo* (food). These terms confirm the importance of the physical setting and dining in shaping the guest experience. In contrast to the English corpus, however, Italian reviews feature more explicit evaluative and affective language. The adjectives *ottimo* (great) and *perfetto* (perfect) are both among the most frequent lemmas, suggesting that domestic guests tend to express satisfaction in more emphatic terms. The presence of *qualità* (quality), *servizio* (service), and *pulizia* (cleanliness) points to an emphasis on evaluative criteria and operational standards, while *vista* (view) and *relax* (relaxation) suggest attention to scenic elements and leisure-oriented aspects of the stay. In addition, the lemma *esperienza* (experience) appears frequently, pointing to an overarching concern with the memorability and meaningfulness of the visit.

The frequency analysis shows that both language groups focus on similar core aspects of the resort experience—particularly lodging, staff, and dining—as indicated by high-frequency lemmas such as *room*, *staff*, *food*, and *service* in English, and *camera*, *personale*, *cibo*, and *servizio* in Italian. English reviews also include frequent references to leisure facilities (*bar*, *drink*, *pool*, *beach*), while Italian reviews include lemmas such as *qualità*, *relax*, and *esperienza*, pointing to concerns with the perceived quality and overall experiential value of the stay. Additionally, the use of the adjective *good* in English, compared to *ottimo* and *perfetto* in Italian, suggests a difference in the intensity of evaluative language, which in turn may reflect different standards of luxury. These patterns indicate shared experiential themes but also hint at different emphases in how satisfaction is expressed. While frequency alone cannot reveal the full discursive construction of guest experiences, these findings offer a foundation for deeper qualitative analysis.

These frequency patterns are further contextualized by the distribution of satisfaction ratings explicitly stated in the reviews. On Tripadvisor, users are prompted to assign a numerical rating to their experience at the time of submitting their review, selecting from one to five stars—where five indicates the highest level of satisfaction and one the lowest. As shown in Table 3, the English reviews present a broader spread of satisfaction ratings. Of the 40 English reviews analyzed, 15 assigned the maximum five-star rating, while the remaining reviews include a significant number of moderate and low scores—specifically, seven one-star and five two-star ratings. This variation mirrors the more moderate tone and less emphatic evaluative language observed in the English corpus. By contrast, the Italian reviews exhibit markedly higher levels of guest satisfaction: 36 out of 40 assigned the maximum five-star rating, with only four Italian reviews falling below this level. This trend aligns with the frequent use of strongly positive adjectives such as *ottimo* and *perfetto*, reflecting a more emphatic and overtly positive mode of evaluation.

| **English-Language Ratings** | | **Italian-Language Ratings** | |
|---|---|---|---|
| ***** | 15 | ***** | 36 |
| **** | 5 | **** | 2 |
| *** | 9 | *** | 2 |
| ** | 5 | ** | 0 |
| * | 7 | * | 0 |

**Table 3:** Guest Satisfaction Ratings in English and Italian Tripadvisor Reviews

Taken together, the lexical and rating data suggest that English-speaking reviewers tend to be more measured in their appraisals, both linguistically and numerically. They use less intense evaluative language and assign a broader range of satisfaction scores, including a notable number of low and moderate ratings. By contrast, Italian-speaking reviewers tend to frame their experiences in unequivocally positive terms. Their reviews frequently include strongly positive adjectives and are overwhelmingly accompanied by the highest possible star rating. This Corresponding author between linguistic expression and satisfaction score reinforces the idea that guest experience is not only shaped by the resort's offerings but also mediated through different reviewing conventions and cultural communication styles.

### 4.2 MGE Dimensions in the MangiasEN Corpus

The AI-assisted analysis of the English reviews reveals that all seven dimensions of the MGE framework are represented, though with different levels of frequency and emphasis. Table 4 shows that the most frequently occurring dimension is contextual elements (35 occurrences), followed by social interaction (26), emotional engagement (21), sensory stimulation (4), cognitive involvement (4), personal relevance (3), and novelty (1).

| **MGE Dimensions** | **Occurrences** |
|---|---|
| Contextual elements | 35 |
| Social interaction | 26 |
| Emotional engagement | 21 |

| | |
|---|---|
| Sensory stimulation | 4 |
| Cognitive involvement | 4 |
| Personal relevance | 3 |
| Novelty | 1 |

**Table 4:** Occurrences of the MGE Dimensions in the English Tripadvisor Reviews

Among these, contextual elements appear prominently in descriptions of the resort's natural setting, architectural design, spatial layout, and accessibility. Guests often refer to scenic sea views, well-maintained public areas, and the quality of the built environment as key components of their experience. One reviewer describes "lovely, contemporary and spotless public areas," while another highlights a "nice stay amidst a gorgeous landscape... immaculate room, lovely surroundings." These details underscore the importance of physical surroundings in shaping memorability.

Social interaction also emerges as a central dimension, with numerous reviews highlighting encounters with staff—both positive and negative. Personalized service, friendly and attentive behavior, and the naming of individual employees are frequently associated with positive evaluations. For instance, one guest gives "a big shout out to Vincenzo and Klejvi, exceptional service and always a smile," whereas others report frustration, such as being told "'there are no tables for you here'" or experiencing "unhelpful and quite rude" interactions. These interpersonal dynamics significantly influence the tone of the reviews and appear to be key drivers of overall guest satisfaction or disappointment.

Emotional engagement is likewise prevalent, with guests expressing affective responses ranging from joy and gratitude to disappointment and regret. One guest reflects on a "fabulous holiday," recalling how they "sat with a cocktail watching the sun go down over the beach and sea." In contrast, another guest recounts a negative emotional impact tied to payment issues: "we have now wrongfully paid tens of thousands of euros... ruins our impression." These emotional reactions often serve as narrative anchors, reinforcing how feelings—especially when intense—amplify the memorability of a stay.

Sensory stimulation is less consistently referenced but remains significant, particularly in mentions of views, smells, and tactile comfort. One reviewer notes that "everywhere smells so fresh," while also praising the "comfortable beds and especially the pillows." These sensory descriptions are often linked to relaxation and comfort, and further support the affective dimension of guest experience.

Cognitive involvement, personal relevance, and novelty occur less frequently but add depth when they appear. Cognitive involvement is evident in reflective comments on cultural or design features, such as observing "rock formations which appear in shape of animals" and spending time "studying these remarkable features." Personal relevance is marked by emotionally significant moments, such as a honeymoon: "this was our honeymoon after getting married in May," suggesting a strong alignment between the guest experience and life milestones or personal values. Novelty is associated with distinctive activities, including one guest's description of "playing tennis with a spectacular sea view... one of the best things I've ever done!"

Overall, the findings from the English reviews suggest that while all MGE dimensions can be observed, contextual elements**,** social interaction**,** and emotional engagement play the most prominent role in how international guests construct and recall their stay. These results

offer valuable insights into which experiential aspects contribute most to guest satisfaction and long-term brand memorability in luxury hospitality, particularly in contexts where emotional, environmental, and interpersonal factors intersect.

## 5. Conclusion

This study explored how the MGE is discursively constructed in online reviews written by English- and Italian-speaking guests of Mangia's Santa Teresa Sardinia, a luxury resort in the Mediterranean. By combining CADS and AI-assisted analysis within a multidimensional MGE framework, the research contributes to a more nuanced understanding of how guests evaluate, recall, and narrate luxury hospitality experiences. The findings offer theoretical and practical insights into the evolving expectations of luxury guests, particularly in culturally rich yet underexamined destinations such as Sardinia.

The CADS analysis showed that while Italian- and English-speaking guests share a focus on core experiential domains—such as lodging, staff, and dining—they differ in the tone and structure of their appraisals. Italian reviews were shorter and consistently more emphatic, frequently using strongly positive evaluative language and assigning five-star ratings. English reviews were more varied in tone and numerical evaluation, suggesting more measured reviewing style that may reflect different standards of luxury. These patterns underscore how guest satisfaction is not only shaped by the resort's offerings but also mediated through cultural norms of digital expression.

The AI-assisted analysis of English reviews further identified which aspects of the experience were most salient in generating memorability. Contextual elements, social interaction, and emotional engagement were the most frequently referenced dimensions, confirming the importance of environmental immersion, empathetic service, and affective resonance in luxury hospitality. Less frequent but still meaningful dimensions such as sensory stimulation, cognitive involvement, personal relevance, and novelty added further complexity, revealing the layered nature of guest experience.

Together, these findings reinforce current conceptualizations of "new luxury," which emphasize emotional connection, personalization, and sustainability over material exclusivity (Atkinson & Kang, 2021; Soni & Kumar, 2024). They also align with recent studies stressing the centrality of relational, affective, and contextual factors in shaping satisfaction and brand loyalty (Harkison et al., 2017; Shin & Jeong, 2022).

Furthermore, the linguistic and evaluative contrasts observed between English and Italian reviews demonstrate the value of including cross-cultural perspectives in the analysis of UGC. Unlike questionnaires, which often yield low response rates and can discourage detailed or emotionally nuanced answers, UGC consists of spontaneous, self-initiated reflections shared in the guest's own voice. This unsolicited feedback tends to be richer in narrative and affective content, offering more authentic insights into how individuals across cultural backgrounds perceive, interpret, and recall their stay.

From a methodological perspective, the combined use of CADS and AIassisted analysis offers a scalable, replicable, and interpretively robust approach for examining experience-based digital discourse. Although this preliminary phase focused exclusively on English reviews, the protocol developed here can be extended to multilingual corpora and comparative cross-property analyses (e.g., a comparative study of Curio Collection by Hilton hotels) in future research. This methodological direction reflects broader shifts in digital discourse research, as artificial intelligence begins to play a more prominent role (Chovanec & Vásquez (2025). By integrating AI into the analytical process while preserving human

interpretive oversight, this study contributes to the advancement of a hybrid model of digital discourse analysis—one that balances computational efficiency with contextual sensitivity.

The study also provides actionable insights for hospitality practitioners seeking to enhance brand reputation, service design, and guest engagement. The prominence of contextual aesthetics, interpersonal dynamics, and emotional narratives suggests that luxury providers should focus on curating immersive environments, investing in emotionally intelligent staff training, and fostering personalized, valuesbased experiences.

Future research could expand this analysis by incorporating more diverse language groups, longitudinal data, or multimodal elements such as visual content and ratings metadata. Further work might also explore how AI-generated responses or AImediated guest interactions affect perception and memorability—thus extending the inquiry into AI's role not just in analysis, but in experience delivery itself.

In sum, this study reaffirms the central role of digital discourse in shaping perceptions of luxury and memorability. By investigating how digital narratives reflect and construct the guest experience, it contributes to both the scholarship and practice of marketing and communication in hospitality—advancing a discourse approach to understand what makes luxury truly memorable.

## Acknowledgment

## Abstract

Questa ricerca ha avuto origine da un bisogno esplicito: cinque sindaci di un'area rurale miravano a unificare i loro Comuni con l'ambizione di trasformare il territorio in una destinazione turistica sostenibile e coerente. Attraverso una Ricerca-Azione, diverse categorie di stakeholder locali sono state coinvolte attivamente in sette fasi di lavoro, distribuite su tre anni.

Un primo risultato è emerso precocemente dall'indagine qualitativa effettuata tramite diciotto interviste con policy-maker, imprenditori e opinion leaders del territorio: il termine sostenibilità presentava interpretazioni marcatamente divergenti, evidenziando cinque significati distinti e spesso incompatibili. L'assenza di un significato condiviso, in grado di guidare la collaborazione multistakeholder, è emersa dunque come ostacolo principale.

Durante il processo partecipativo di ricerca-azione, i livelli di collaborazione si sono poi evoluti e gli stakeholder hanno iniziato a negoziare e prioritizzare interpretazioni condivise della sostenibilità. Il principale contributo teorico di questa ricerca è lo sviluppo della "Shared Meanings of Sustainability Matrix", che cattura la relazione dinamica tra shared purpose e collaborazione in quattro configurazioni: Messy Meanings, Multiple Meanings Prioritization, Blend of Meanings, Unified Meaning. Questo studio si basa sullo sviluppo di un approccio grounded theory in un contesto empirico e reale, e la sua originalità suggerisce come i significati della sostenibilità possano essere co-costruiti attraverso una collaborazione iterativa, contestualizzata e orientata al purpose. Grazie al metodo di Ricerca-Azione, quindi al processo di ricerca partecipata, e ai risultati proposti con la matrice, si possono trarre indicazioni pratiche per altre aree rurali che intendano avviare una collaborazione multistakeholder inclusiva verso un turismo sostenibile.

*Keywords: Sustainability Shared Meaning, Shared Purpose, Multistakeholder Collaboration, Rural Area, Sustainable Tourism.*

## 1. Variabilità dei Significati della Sostenibilità nel Turismo

Raggiungere gli obiettivi dell'Agenda 2030 delle Nazioni Unite per lo Sviluppo Sostenibile richiede azioni coordinate tra un ampio spettro di stakeholder. Tuttavia, il processo di articolazione e allineamento di un purpose condiviso attorno agli obiettivi di sostenibilità rimane complesso, specialmente in contesti articolati come le aree rurali (Cawley e Gillmor,

2008), dove la frammentazione sociale, economica e istituzionale rappresenta un ostacolo significativo alla collaborazione (Lane e Kastenholz, 2015) e l'assenza di un purpose condiviso diventa un impedimento critico per la collaborazione orientata alla sostenibilità (Waligo et al., 2015; Bramwell e Sharman, 1999). Al centro di questo sforzo vi è la costruzione di significati condivisi della sostenibilità, che non siano semplicemente dichiarati ma co-creati, negoziati e radicati in valori comuni (Cloutier e Langley, 2017; Cannas et al., 2018). In un'area rurale, la sostenibilità viene spesso interpretata in modi molteplici e conflittuali (Albrecht et al., 2021; Vespestad et al., 2025), dove l'allineamento deve avvenire attraverso processi di negoziazione del significato tra attori diversi con interessi e livelli di potere differenti (Cloutier e Langley, 2017). Alcuni stakeholder possono percepire la sostenibilità come risultati a breve termine, come la redditività, mentre altri sono più interessati agli impatti a lungo termine sulla comunità; altri ancora considerano le pratiche sostenibili come un percorso verso la crescita economica, ad esempio attraverso il turismo (Murphy e Price, 2012).

Nonostante l'aumento dell'attenzione politica alla sostenibilità, in particolare in linea con l'SDG 12.8 delle Nazioni Unite, che promuove l'accesso alla conoscenza e stili di vita sostenibili, poco si conosce su come la sostenibilità venga interpretata, tradotta e messa in pratica dagli stakeholder locali nelle aree rurali (Albrecht et al., 2021; Vespestad et al., 2025). In assenza di un linguaggio comune o di una comprensione condivisa, gli sforzi multistakeholder per promuovere la sostenibilità rischiano di risultare frammentati, simbolici o inefficaci (Cannas et al., 2018; Lane e Kastenholz, 2015). Poiché gli abitanti delle aree rurali spesso mostrano resistenze sociali al cambiamento (Cawley e Gillmor, 2008), essi potrebbero anche opporsi ad accettare significati di sostenibilità imposti dall'esterno.

Questo studio esplora come i significati condivisi della sostenibilità possano (o non possano) emergere tra i vari attori chiave operanti in aree rurali (Cawley e Gillmor, 2008) caratterizzate da potere frammentato, infrastrutture limitate (Karali et al., 2021) e deboli tradizioni di collaborazione (Lane e Kastenholz, 2018). Le aree turistiche rurali dipendono in modo particolare dalla fiducia interpersonale, dalla governance informale e dalle istituzioni radicate localmente (Choudhary et al., 2025; Zou et al., 2014). In tali contesti, perseguire lo sviluppo del turismo sostenibile comporta sfide sociali e ambientali, tra cui l'adattamento ai cambiamenti climatici, la conservazione del patrimonio culturale e la rivitalizzazione economica (Carneiro et al., 2015).

Il presente studio offre un contributo distintivo e significativo posizionando il processo di costruzione del significato come partecipativo e collaborativo. Piuttosto che imporre concetti definiti esternamente, gli stakeholder locali hanno potuto articolare i propri significati di sostenibilità, radicandoli nei loro valori, bisogni e realtà vissute. Attraverso un rigoroso processo qualitativo multistakeholder, lo studio ha sviluppato la "Shared Meanings of Sustainability Matrix": una matrice derivata in modo induttivo che cattura come i significati condivisi possano evolvere attraverso interazioni, negoziazioni e collaborazione attorno ad uno scopo comune e condiviso, un vero e

proprio shared purpose. Questo approccio approfondisce la comprensione teorica del turismo sostenibile e della collaborazione multistakeholder e fornisce indicazioni pratiche per progettare strategie più inclusive e sensibili al contesto nello sviluppo del turismo rurale.

Il paper è strutturato come segue: dopo aver delineato il quadro teorico e i gap della letteratura, vengono descritti la metodologia e i risultati in due fasi: la prima fase per delineare i cinque ambiti dei significati della sostenibilità; la seconda fase per definire i confini dei nuovi concetti di significati condivisi, proposti tramite la "Shared Meanings of Sustainability Matrix" quale risultato dei diversi livelli di collaborazione multistakeholder e di shared

purpose. Successivamente vengono discusse le implicazioni di questi risultati, concludendo con suggerimenti per future direzioni di ricerca.

## 2. Overview della Letteratura

### 2.1 Purpose come un costrutto collettivo

La nozione di purpose si è evoluta da una direttiva strategica imposta dalla leadership a un costrutto socialmente negoziato, che emerge attraverso il dialogo tra molteplici stakeholder (Almandoz, 2023; Tafuro e Piccaluga, 2025). Particolarmente nei sistemi di governance multistakeholder, come quelli presenti nelle destinazioni turistiche (Bramwell e Sharman, 1999; Cannas et al., 2018), il purpose non è predeterminato: esso si plasma e si riplasma attraverso negoziazioni continue, situate in contesti istituzionali e culturali specifici.

Cloutier e Langley (2017) sottolineano che negoziare il purpose è sia un'impresa strategica sia un processo morale, specialmente in contesti collaborativi dove è necessario conciliare logiche, norme e sistemi di valori diversi. Il loro lavoro mostra come la tensione morale e la contesa possano diventare forze produttive, permettendo agli stakeholder di costruire significati condivisi che siano sia moralmente rilevanti sia strategicamente attuabili.

Nella governance turistica, in particolare nei contesti rurali, questo processo è amplificato dall'assenza di autorità centralizzata e dalla molteplicità di stakeholder coinvolti (Waligo et al., 2015). In tale contesto, il purpose opera meno come direttiva stabile e più come narrazione mobilitante, capace di favorire l'allineamento nonostante la frammentazione organizzativa (Hollensbe et al., 2014).

In contesti di governance frammentata, la sfida non consiste solo nell'allineare interessi, ma anche nel costruire significati condivisi (Albrecht et al., 2021), un processo strettamente intrecciato con l'identità e le emozioni condivise (Cannas et al., 2018).

Albrecht et al. (2021), concentrandosi sui manager delle destinazioni, mostrano come, anche all'interno dello stesso ruolo istituzionale, i significati attribuiti a "sostenibilità" possano variare considerevolmente, spaziando dalla conservazione ambientale alla competitività economica o all'equità sociale. Questa variabilità semantica complica la co-creazione di valore, poiché diventa difficile elaborare strategie coerenti senza chiarire i significati e i valori sottostanti (Cannas et al., 2018).

Questa tensione è particolarmente evidente nelle aree rurali, dove gli stakeholder locali affrontano spesso vincoli strutturali, priorità in competizione e una mancanza di infrastrutture discorsive condivise (Karali et al., 2021). Come sostengono Lane e Kastenholz (2015), il turismo rurale si è evoluto in un ambito multifacetico e frammentato, dove l'innovazione è frequentemente guidata da pratiche bottom-up, informali e culturalmente situate, piuttosto che da una pianificazione strategica unificata. In tali contesti, costruire un Shared Meanings of Sustainability richiede non solo l'allineamento del discorso, ma anche l'istituzione di processi legittimi di partecipazione e leadership capaci di conciliare aspettative diverse (Choudhary et al., 2025).

Tuttavia, l'assenza di un discorso sulla sostenibilità coerente e moralmente impegnato può condurre a quella che gli autori definiscono 'moral muteness', una condizione in cui le organizzazioni di destinazione evitano di affrontare le implicazioni etiche delle proprie narrazioni sulla sostenibilità (Vespestad et al., 2025).

## 2.2 Collaborazione Multistakeholder per la Sostenibilità nel turismo

Per costruire una strategia di turismo sostenibile, questa ricerca si fonda sui punti di vista degli stakeholder utilizzando la stakeholder theory. Questa teoria è nata per comprendere le responsabilità delle organizzazioni in un contesto sociale (Freeman, 1984). Secondo Donohoe, Reyes e Becerra (2015), i manager devono considerare molteplici stakeholder e hanno l'obbligo di rispondere alle loro esigenze. La teoria è stata applicata alle organizzazioni turistiche (Getz e Timur, 2005), al turismo culinario sostenibile (Stone et al., 2022) e al turismo rurale sostenibile (Choudhary et al., 2025; Karali et al., 2021) come strumento per bilanciare gli interessi degli stakeholder. La sostenibilità del turismo dipende da processi di governance ampi, inclusivi e significativamente partecipativi (Bramwell e Sharman, 1999; Getz e Timur, 2005). Tuttavia, la collaborazione multistakeholder resta difficile da implementare, soprattutto nelle aree rurali, dove gli stakeholder differiscono in termini di capacità istituzionale, visione del mondo e accesso alle strutture decisionali (Scheyvens, 1999; Liu e Shu, 2020). Inoltre, l'assunto secondo cui la collaborazione conduca automaticamente alla sostenibilità è stato messo in discussione da studi empirici che mostrano come gli stakeholder operino spesso con comprensioni divergenti o poco articolate di cosa significhi sostenibilità (Albrecht et al., 2021; Vespestad et al., 2025). L'ambiguità semantica che circonda la sostenibilità ostacola quindi la costruzione di strategie coerenti e limita il potenziale di vera co-creazione di valore e collaborazione (Cannas et al., 2018). Questa sfida è particolarmente acuta nelle aree rurali, dove lo sviluppo turistico è strettamente intrecciato con le identità locali, le dinamiche comunitarie e i vincoli territoriali (Lane e Kastenholz, 2015).

Nonostante l'importanza dichiarata di implementare iniziative di sostenibilità, vi sono ancora scarsi approfondimenti empirici su come molteplici stakeholder costruiscano o non riescano a costruire significati condivisi della sostenibilità nei contesti del turismo rurale. Emergono tre principali lacune nella letteratura. Primo, sebbene Vespestad et al. (2025) abbiano evidenziato come gli stakeholder possano tacere o distorcere i messaggi di sostenibilità, sappiamo ancora poco su come possano resistere, riformulare o cocreare significati condivisi più radicati e ricchi di valore. Secondo, vi è una carenza di ricerche su come le pratiche discorsive e il dialogo collaborativo influenzino l'emergere di un shared purpose nella governance della sostenibilità, soprattutto in contesti caratterizzati da strutture di governance deboli e dove la fiducia deve essere costruita relazionalmente (Lane e Kastenholz, 2015). Terzo, sebbene la divergenza dei significati sia riconosciuta (Albrecht et al., 2021), i processi di negoziazione, prioritizzazione o allineamento attorno a un significato unificato restano poco esplorati.

Sulla base di queste lacune, emergono le seguenti domande di ricerca:

**(RQ1)** Quali significati associamo alla sostenibilità da parte dei diversi stakeholder che operano nella stessa area rurale? **(RQ2)** Come può essere sviluppato un significato condiviso di sostenibilità attraverso la collaborazione multistakeholder?

## 3. Il bisogno di una Ricerca-Azione

Questa ricerca ha avuto origine da un problema reale riguardante la possibilità di sviluppare il turismo in maniera sostenibile in un'area rurale, in cui un gruppo di decisori politici desiderava sottoporre a rigorosa indagine e azione congiunta con ricercatori accademici. In quanto tale, lo studio adotta la metodologia della RicercaAzione (Action Research, AR) (O'Leary e Coghlan, 2022), con l'obiettivo di contribuire a una migliore offerta turistica ambientalmente sostenibile, orientando il lavoro scientifico non solo all'identificazione dei problemi ma anche alla loro risoluzione (Dolnicar e Green, 2025). L'AR può perseguire un duplice scopo: garantire il rigore teorico e fornire un contributo rilevante per la gestione

(Erro-Garcés e AlfaroTanco, 2020). L'AR richiede uno studio longitudinale e comporta la collaborazione tra un team di ricercatori e attori organizzativi, favorendo lo scambio di idee e riflessioni (Näslund et al., 2011).

La Ricerca-Azione è particolarmente adatta al turismo rurale. In primo luogo, è appropriata per gli studi sul turismo (Martins et al., 2024) poiché il sistema turistico comprende non solo imprese e produttori di servizi legati al consumo turistico tipico, ma si estende a tutti gli stakeholder della destinazione turistica, inclusi i cittadini e la comunità locale (Choudhary et al., 2021; Perkins et al., 2021).

In particolare, l'AR si presta bene alle destinazioni rurali (Paül et al., 2016) perché coinvolge diversi tipi di stakeholder nei processi decisionali come motore per il turismo sostenibile (Goebel et al., 2020), creando un clima collaborativo mediante la pianificazione di azioni con gli stakeholder locali (Capriello, 2012). Questo approccio di ricerca consente di rispettare i principi della ricerca responsabile, affrontando in modo più efficace le sfide sociali e sottolineando l'importanza di considerare l'ecosistema della ricerca (Pereira-Moliner e Molina-Azorín, 2024).

### 3.1 Applicazione in un'area rurale

Questa Ricerca-Azione si fonda sul dialogo collaborativo con policymaker, decisori e altri stakeholder chiave nelle destinazioni rurali, al fine di identificare le condizioni di sviluppo per un turismo sostenibile. Superando le definizioni olistiche, le aree rurali sono circondate dalla natura, e nelle scelte di sviluppo turistico locale ci si aspetta un elevato grado di armonia con l'ambiente naturale (Diamond, 2023). Tuttavia, le piccole aree rurali continuano spesso a sperimentare marginalizzazione economica (Briedenhann et al., 2004), e l'orientamento alla sostenibilità dei decisori è emerso come questione centrale negli studi scientifici (Khizar et al., 2023).

Il contesto di questo studio longitudinale è un'area rurale nota come "Colli Berici", situata nella provincia di Vicenza nel Nord-Est d'Italia, che si estende per circa 64 miglia quadrate. Questa peculiare collocazione geografica pone l'accento sulla preservazione delle radici culturali e del patrimonio naturale, ma deve affrontare sfide legate alla natura frammentata delle decisioni politiche, economiche e sociali, definite da Nelson et al. (2023) come peculiarità delle destinazioni rurali. In questo contesto, i decisori sono distribuiti in 24 piccoli Comuni, dove gli imprenditori locali, principalmente produttori e agricoltori, mirano a valorizzare i punti di forza del territorio, quali natura, prodotti tipici e autenticità.

Il numero totale di policymaker nell'area comprende 24 sindaci dei 24 piccoli villaggi, tra cui cinque hanno promosso questa ricerca e vi hanno partecipato attivamente sin dalle fasi preliminari, coinvolgendo tutti gli altri nelle fasi avanzate. L'obiettivo finale era sviluppare proposte e azioni di turismo sostenibile nella specifica area territoriale. In quest'area, tali sindaci sono considerati pionieri nel promuovere motivazione e collaborazione verso la sostenibilità.

Dal punto di vista turistico, l'area rappresenta una destinazione minore, ricca di natura, tradizioni culturali e prodotti enogastronomici tipici, mentre le principali attività economiche sono industria e agricoltura, con pochi servizi turistici. Gli esercizi ricettivi (agriturismi, bed and breakfast, strutture ricettive a conduzione imprenditoriale e hotel) rappresentano una quota molto ridotta del totale provinciale. È grazie ai cinque sindaci pionieri che molti stakeholder locali hanno accettato di collaborare per riposizionare la loro area rurale come destinazione rurale sostenibile. Tuttavia, il discorso sulla sostenibilità in questa area non era ben articolato e vi erano numerose divergenze su come procedere. Per avanzare nel progetto, i cinque sindaci hanno promosso una collaborazione con il polo scientifico di area economica

della sede vicentina dell'Università di Verona. In tal modo, questo studio è stato realizzato in collaborazione con cinque Comuni dell'area dei Colli Berici, la Camera di Commercio di Vicenza e la Fondazione Studi Universitari di Vicenza, con l'obiettivo di esplorare le condizioni per promuovere lo sviluppo di una destinazione rurale sostenibile nell'area, rappresentando l'inizio di un percorso pionieristico ancora in corso.

### 3.2 Design della Ricerca-Azione

Il team di ricerca principale comprende cinque policymaker (sindaci), quattro ricercatori accademici (due ricercatori senior e due junior research scholars) e un esperto, ciascuno con un background diversificato in management, marketing, turismo e/o sostenibilità. Durante l'intero processo di ricerca numerosi stakeholder sono stati coinvolti attivamente. Questo approccio basato sul lavoro di squadra mira a mitigare i bias individuali, seguendo i principi delineati da Eisenhardt (1989) e Oppermann (2000). L'uso della triangolazione rafforza ulteriormente la validità dell'analisi. Il team ha cercato di includere la comunità imprenditoriale e i cittadini locali nelle diverse fasi della ricerca (Jones e Walmsley, 2022).

Considerata la natura ciclica dei progetti di Ricerca-Azione (Ballantyne, 2004), lo studio si è sviluppato in sette fasi, articolandosi in 77 incontri distribuiti su un periodo di tre anni: le prime cinque fasi si sono svolte in 14 mesi, mentre le fasi sei e sette sono state completate in un arco di due settimane, due anni più tardi.

La fase preliminare di scoperta (prima fase) ha permesso di comprendere meglio il problema e di definire gli obiettivi della ricerca, le attività da svolgere, i ruoli e i tempi correlati. Ogni incontro ha avuto una durata di circa due ore. È stato firmato un accordo formale tra i cinque sindaci, un consulente professionale con il ruolo di project leader e il centro di ricerca universitario, con il supporto finanziario della Camera di Commercio locale. Questo accordo costituisce una prova dell'impegno dei partecipanti verso questa Ricerca-Azione e i suoi obiettivi.

La seconda fase, focalizzata sulla diagnosi preliminare del contesto, comprende due round di raccolta dati:

- una ricerca su più fonti secondarie(Demo.istat.it; Daticensimentipermanenti.istat.it; Turismobigdata.isnart.it; Osservatorioturismoveneto.istat.it; InBalance e Stock View, di proprietà dell'Ufficio Statistico della Camera di Commercio di Vicenza);
- uno studio qualitativo multistakeholder. Contestualmente, per la selezione del campione, è stato chiesto ai cinque sindaci e ad altri professionisti locali di nominare i principali decision-maker locali e i cittadini maggiormente coinvolti in iniziative orientate alla sostenibilità.

I partecipanti sono stati invitati a suggerire ulteriori contatti disponibili a partecipare, seguendo la tecnica delllo 'snowball sampling' (Parker et al., 2019). Diciotto partecipanti qualificati hanno collaborato attivamente durante questa fase qualitativa, tra cui sette policymaker, due decisori e otto imprenditori (ulteriori dettagli sul campione saranno forniti durante la presentazione alla conferenza). Le interviste semistrutturate individuali sono durate circa 60-90 minuti ciascuna. Con il progredire della raccolta dati sono emerse sempre meno idee e problematiche nuove, raggiungendo così una saturazione teorica (Glaser e Strauss, 2017). Tutte le interviste e gli incontri sono stati videoregistrati e audio-registrati con il consenso informato dei partecipanti. L'obiettivo principale delle registrazioni video era catturare risposte, commenti liberi e significati del silenzio. La raccolta dati includeva trascrizioni e note sul campo. Parole, espressioni facciali, linguaggio del corpo e tono di voce sono stati analizzati in maniera integrata per cogliere significati ed emozioni correlati. La codifica tematica e la categorizzazione (Gibbs, 2007) delle trascrizioni e delle note

osservazionali hanno consentito di ottenere insight attraverso la discussione aperta e l'interpretazione semantica collaborativa del team di ricerca. Una teorizzazione iterativa ha richiesto una revisione della letteratura su diversi temi. Sono stati redatti due rapporti intermedi e un rapporto finale, tutti discussi con la comunità target in workshop ad hoc. Poiché la fase di diagnosi ha rivelato divergenze di opinione e molteplici significati legati alla sostenibilità in questa area rurale, i risultati sono stati discussi con esperti per perfezionare la codifica e riflettere sulle ragioni di tali divergenze semantiche.

Il team ha quindi pianificato una serie di azioni (terza fase), come workshop partecipativi per sensibilizzare sul significato della sostenibilità e condividere un obiettivo comune come base per un piano d'azione per lo sviluppo del turismo sostenibile (come suggerito da Basile et al., 2021). I partecipanti sono stati contattati tramite canali istituzionali (WhatsApp e Facebook), e sono stati distribuiti manifesti informativi negli spazi pubblici dei comuni coinvolti come invito aperto agli incontri. Questi workshop hanno costituito momenti di dialogo collaborativo (quarta fase), durante i quali sono state discusse numerose proposte, coinvolgendo i cittadini più attivi nell'offerta turistica dell'area rurale, tra cui ristoratori, titolari di agriturismi, agenzie turistiche, gestori di musei e guide turistiche. Per facilitare una collaborazione aperta, sono state stimolate attività di teamwork formali e networking informale.

La quinta fase ha affrontato la rilevanza scientifica e discusso i principali risultati con la comunità accademica internazionale.

Successivamente, due anni più tardi, sono stati aggiunti follow-up in presenza (sesta fase) presso le sedi dei partecipanti, come visite aziendali, per raccogliere dati sugli effetti delle azioni intraprese. L'ultimo follow-up ha permesso di cogliere le dinamiche longitudinali e discutere alcune delle implicazioni manageriali e sociali dello studio, come testimoniate direttamente dai partecipanti.

La settima fase ha consentito una riflessione critica, supportando la teorizzazione iterativa e conducendo infine allo sviluppo della Shared Meanings of Sustainability Matrix.

## 4. Risultati

Dalla diagnosi preliminare basata sulla ricerca desk su fonti secondarie sono emerse alcune condizioni urgenti per lo sviluppo del turismo sostenibile in un'area rurale: maggiore attenzione al tempo libero e ai consumi educati; stimolo di pratiche sostenibili insieme a politici e imprenditori; crescita del trend del turismo lento; agevolazioni fiscali e fondi per investire in sostenibilità.

Nell'iniziale fase di analisi preparatoria di contesto, il team ha verificato la presenza di eventuali contenuti nella comunicazione digitale degli stakeholder locali, esplorando news, pagine dei siti web e dei profili social ufficiali dei comuni locali, delle principali imprese e delle associazioni rilevanti. Questa esplorazione ha evidenziato una significativa scarsità di informazioni pubblicamente disponibili sia sul processo di condivisione dello scopo comune, sia sulle varie iniziative legate alla sostenibilità nel contesto rurale oggetto della ricerca. Tale iniziale mancanza di informazioni accessibili e complete ha sottolineato la necessità di interagire direttamente con gli stakeholder locali tramite interviste approfondite. I risultati sono presentati nelle sezioni seguenti.

### 4.1 I significati della sostenibilità

Per esplorare la prima domanda di ricerca ("Quali significati associano alla sostenibilità i diversi stakeholder che operano nella stessa area rurale?"), sono state analizzati i contenuti e le note di 18 interviste approfondite condotte con stakeholder di cinque Comuni di un'area

rurale. Attraverso un processo di codifica tematica (Gibbs, 2007), sono stati identificati diversi pattern interpretativi che riflettono le modalità con cui la sostenibilità viene definita.

Le risposte dei partecipanti alla domanda "Cosa intende per sostenibilità?" hanno rivelato un'ampia gamma di interpretazioni, riflettendo la natura polisemica e contestuale del concetto. Piuttosto che emergere una definizione unitaria, la sostenibilità si è mostrata come un costrutto frammentato e multidimensionale, con significati modellati dai valori personali, dai ruoli settoriali e dal contesto territoriale.

Questa eterogeneità semantica è stata organizzata in cinque temi principali, ciascuno dei quali evidenzia una diversa dimensione dell'interpretazione e dell'attuazione della sostenibilità nelle aree rurali.

**Tema 1: Tutela ambientale ed efficienza delle risorse**

Molti partecipanti hanno articolato la sostenibilità in termini di preservazione ambientale e uso responsabile delle risorse, sottolineando concetti come "non inquinare", "energie alternative", "riduzione degli sprechi energetici e dei prodotti" e "uso corretto dell'energia". Altre espressioni come "consumo del suolo", "economia circolare" e "valorizzazione dei rifiuti" rivelano un orientamento pragmatico all'efficienza ecologica. Questo tema riflette un inquadramento tecnico-ambientale della sostenibilità, in cui il concetto si concretizza in azioni volte a minimizzare l'impatto ecologico.

Un manager partecipante ha affermato: "*La parola sostenibilità può significare tutto e niente. Sostenibilità di cosa? Dell'ambiente? Sì, credo che dobbiamo perseguire la sostenibilità ambientale. Ma per quanto mi riguarda, finora non ci siamo riusciti: basta guardare lo stato della natura. In ogni caso, dobbiamo mirare a un modello di lavoro sostenibile: non dobbiamo inquinare*". Un altro imprenditore ha inquadrato la sostenibilità attraverso l'efficienza delle risorse: "*Nel mio settore, sostenibilità significa ridurre al minimo gli sprechi di energia e di prodotti. L'infrastruttura dell'azienda deve essere progettata di conseguenza, il che richiede investimenti per garantire un approvvigionamento energetico diretto. Significa anche produrre e vendere beni in maniera efficiente, con il minor spreco possibile. Questo è essenzialmente tutto*".

**Tema 2: Inquadramento economico e leve istituzionali**

Alcuni partecipanti hanno associato la sostenibilità alla crescita economica e ai meccanismi di supporto istituzionale, evidenziando termini come "sviluppo economico", "vantaggio competitivo", "incentivi fiscali", "transizione di mercato" e "pressione istituzionale". Queste espressioni riflettono una visione della sostenibilità basata su performance, redditività e posizionamento strategico all'interno di contesti normativi in evoluzione.

Un amministratore locale ha osservato: "*Per me, sostenibilità significa abilitare la transizione. Come amministratore locale, ho sostenuto economicamente diversi progetti di sostenibilità [...]. Le aziende hanno contribuito con finanziamenti (con incentivi fiscali). Questo è ciò che significa sostenibilità: azione e responsabilità*". Un altro stakeholder ha evidenziato il collegamento tra mentalità e pianificazione economica: "*Quando usiamo il termine sostenibilità, la dimensione finanziaria è fondamentale nella pianificazione. Ma oltre a questo, è necessaria una trasformazione della mentalità locale (istituzionale). Questa visione potrebbe gettare le basi per una nuova forma di sviluppo economico radicata nel territorio*".

**Tema 3: Identità territoriale e turismo basato sul luogo**

Un terzo gruppo di risposte ha mostrato un forte attaccamento al territorio, al patrimonio e all'identità culturale, con termini come "autenticità territoriale", "valorizzare la nostra

agricoltura tradizionale", "turismo enogastronomico", "recupero dei materiali locali", "relazioni culturali", "prodotti tipici" e "progettazione nella nostra area naturale".

Questi partecipanti interpretano la sostenibilità come profondamente radicata nella cultura locale e nella cura del territorio, in linea con ricerche che considerano il turismo come veicolo di valorizzazione territoriale. Ad esempio, un intervistato ha sottolineato l'unicità del territorio locale: "*Nel nostro comune, la sostenibilità riguarda la composizione unica del territorio: parte collinare, parte agricola, parte centro urbano. Questi diversi paesaggi offrono valore ambientale e risorse differenti. Questa diversità potrebbe essere una forza in termini di sostenibilità. Tuttavia, per un piccolo comune come [nome del comune], non è facile misurare o mostrare la sostenibilità senza una visione più ampia e sistemica. Alcune pratiche auto-sostenibili radicate localmente esistono, ma una valutazione adeguata richiede probabilmente una prospettiva su scala più ampia*". Un sindaco ha poi sottolineato la conservazione della natura come risorsa turistica: "*Sostenibilità significa creare sistemi produttivi che utilizzino al meglio le componenti naturali senza danneggiare significativamente l'ambiente. C'è una forte consapevolezza locale di protezione del territorio, che attira visitatori tutto l'anno. La sostenibilità qui significa anche bilanciare questo patrimonio ambientale con sviluppo economico, industriale e artigianale radicato nella nostra identità agricola*".

**Tema 4: Etica, emozione e benessere**

Alcuni partecipanti hanno enfatizzato gli aspetti normativi ed emotivi della sostenibilità, usando parole come "amore", "cura", "benessere di animali e persone", "equità di genere" e "solidarietà".

Queste risposte riflettono una costruzione morale della sostenibilità, in cui preoccupazioni etiche e relazioni umane con natura e comunità sono centrali. Uno dei sindaci ha affermato: "*Per me, sostenibilità significa che la mia generazione non può consumare tutte le risorse del pianeta perché molti altri arriveranno dopo di noi. È un principio di solidarietà intergenerazionale. Significa anche rispettare l'ambiente e sostenere modelli economici che aiutino i più vulnerabili. La sostenibilità dovrebbe promuovere maggiore equità, contrariamente agli eccessi del capitalismo sfrenato. Questo, secondo me, è il vero significato della sostenibilità*". Un imprenditore locale ha collegato la cura dell'ambiente all'impegno personale e comunitario: "*Sono un grande sostenitore della sostenibilità [...] Come cittadino e imprenditore, sono sempre stato impegnato nella comunità. Credo che dobbiamo imparare ad amare la nostra terra, proprio come i nostri antenati ci hanno insegnato a prenderci cura di ciò che abbiamo [...]. Dobbiamo sempre ricordare le nostre radici*".

**Tema 5: Obiettivo aspirazionale e vago**

Infine, alcune risposte utilizzavano riferimenti vaghi o circolari, come "sviluppo sostenibile", "cambiamento trasformativo", "condizione necessaria per sopravvivere" o "percorso futuro". Questo tema riflette un inquadramento visionario ma vago della sostenibilità, dove il concetto funge più da orizzonte retorico o ideale normativo che da principio concreto e contestualizzato. Pur esprimendo preoccupazione e ambizione a lungo termine, l'ambiguità di queste narrazioni può ostacolare la prioritizzazione collettiva e l'azione. Uno dei sindaci ha spiegato: "*Per me, sostenibilità significa sviluppo sostenibile. Nel mio campo, tutto ciò che si costruisce deve essere strutturalmente supportato, così come la sostenibilità deve essere supportata da elementi concreti. Vale per ogni settore (commerciale, finanziario, ecologico). Tutto ciò che facciamo deve essere economicamente e ambientalmente sostenibile. Credo che questo mindset dovrebbe diventare parte del pensiero di tutti perché siamo davvero arrivati a un punto critico. La sostenibilità, secondo me, dovrebbe essere la nostra linea guida*".

Nelle aree rurali, la sostenibilità può rappresentare una forma di ambiguità strategica più che un orientamento olistico. Vi è una tendenza a considerare solo gli investimenti sostenibili concretamente realizzabili, come protezione ambientale o riduzione delle emissioni, economicamente fattibili e capaci di garantire il sostentamento di chi li attua. Sebbene i

cinque temi abbiano offerto una panoramica strutturata dei significati attribuiti alla sostenibilità dagli stakeholder, essi non catturano completamente fino a che punto tali significati fossero radicati in un 'shared purpose' né come si traducessero in forme di azione collettiva. Per esplorare queste dimensioni, sono stati condotti incontri partecipativi approfonditi con l'intero team, finalizzati a perfezionare la codifica tematica ed esaminare come diversi livelli di collaborazione e di condivisione del purpose emergessero nei discorsi.

Successivamente, sono stati organizzati workshop e seminari educativi per approfondire ulteriormente il concetto di 'shared purpose' verso la sostenibilità. Questi workshop hanno permesso di promuovere una comprensione più olistica della sostenibilità e di introdurre l'importanza della costruzione collettiva del significato. I partecipanti hanno iniziato a riconoscere la necessità di agire insieme e di impegnarsi in un dialogo collaborativo duraturo.

I cinque sindaci pionieri hanno implementato ulteriori azioni e incontrato numerosi stakeholder, coinvolgendo tutti i 24 sindaci dell'area rurale. Successivamente, è stato firmato un accordo formale (IPA, Intesa Programmatica d'Area) per l'area berica, creando un organismo di coordinamento regionale composto da più comuni dell'area, volto a promuovere lo sviluppo territoriale sostenibile attraverso pianificazione collaborativa, implementazione di progetti e cooperazione inter-istituzionale. Questa evoluzione ha consentito di delineare una visione longitudinale, costruendo in maniera induttiva una matrice interpretativa, la Shared Meanings of Sustainability Matrix.

### 4.2 Una matrice interpretativa per la condivisione dei significati della sostenibilità

In base alle esperienze emerse nella fase di rilevamento dei risultati (fase 6 della Ricerca-Azione), è stata ideata una matrice bidimensionale per rispondere alla seconda domanda di ricerca ("Come può essere sviluppato un shared meaning attraverso la collaborazione multistakeholder?"). La 'Shared Meanings of Sustainability Matrix' (Figura 1) rappresenta le dinamiche evolutive della costruzione dei significati della sostenibilità e della collaborazione all'interno dell'area rurale, dalla posizione iniziale "A", osservata nella fase preliminare dello studio, alla posizione "B" emersa durante il follow-up. La matrice è stata sviluppata in modo induttivo, non sulla base di teorie preesistenti, ma grazie all'analisi interpretativa e al raffronto ragionato dei discorsi degli stakeholder emersi da interviste, durante i workshop e in vari scambi di opinioni durante i follow-up.

Un'evoluzione del grado di 'shared purpose' è emersa nel tempo. Inizialmente articolato e condiviso dal project leader, la visione comune successivamente si è rafforzata attraverso i workshop collettivi, riflettendosi nelle modalità con cui i partecipanti descrivevano l'allineamento (o la mancanza di allineamento) tra i propri obiettivi e quelli degli altri stakeholder, nonché nella coerenza del linguaggio utilizzato per articolare una visione comune delle azioni da intraprendere.

Analizzando le interviste, e come confermato dagli esperti, i partecipanti hanno variamente menzionato differenti livelli di collaborazione con altri, indicati dall'uso di pronomi personali o collettivi (ad esempio, "io" oppure "noi") o ricordando azioni sviluppate individualmente o in collaborazione con altri stakeholder, rivelando così una nuova variabile analitica: il livello di collaborazione.

La matrice cattura dunque le configurazioni empiriche dei significati della sostenibilità lungo due assi analitici:

− asse orizzontale - grado di 'shared purpose', ossia la misura in cui i significati della sostenibilità convergono o restano frammentati tra gli stakeholder;

– asse verticale - livello di collaborazione, ossia la misura in cui gli sforzi di sostenibilità sono coordinati tra diversi stakeholder locali.

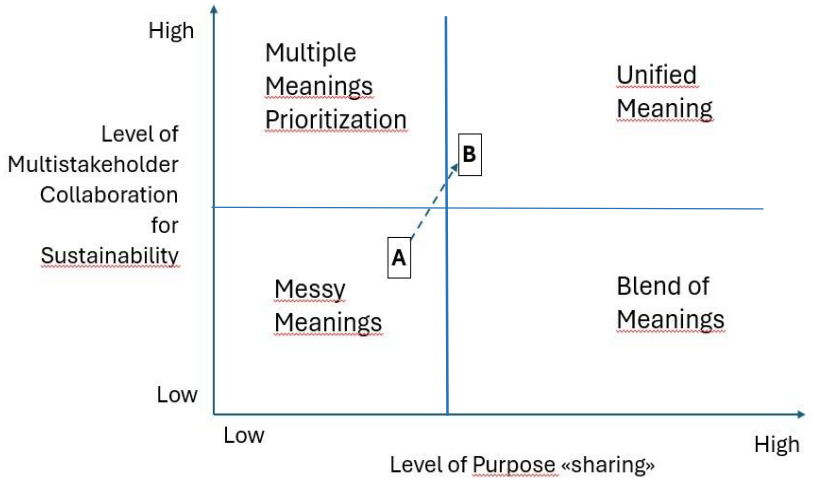
L'area occupata nella configurazione in basso a sinistra della matrice è stata denominata *"Messy Meanings"*. Il concetto di sostenibilità nel caso in esame era ambiguo, e gli stakeholder operavano con definizioni incoerenti e talvolta contrastanti, con poco dialogo o integrazione. Il purpose era diffuso e la collaborazione minima. Si può dedurre che inizialmente il caso fosse nella posizione A in Figura 1, e che quindi non esistesse né una definizione condivisa di sostenibilità né obiettivi di sostenibilità condivisi. Gli obiettivi di sostenibilità (se presenti) erano individuali e non coordinati, poiché ciascuno stakeholder operava in maniera indipendente senza un shared purpose. Nel corso delle attività della Ricerca-Azione (incontri partecipativi, workshop, seminari, ecc.), il sistema ha iniziato a cambiare.

Gli attori locali hanno cominciato a riformulare la sostenibilità in termini più concreti e collettivi. Come dichiarato dal sindaco leader del progetto: "*Quando abbiamo iniziato, ci siamo conosciuti tramite un'iniziativa lanciata da cinque comuni sotto il nome di sostenibilità — questo era il principio guida dell'associazione. Abbiamo formalmente costituito un'associazione di comuni con personalità giuridica, riunendo infine 24 comuni e coprendo un territorio di circa 110.000 abitanti. Quest'area include quasi interamente i Colli Berici, rappresentando un riferimento territoriale chiave per il nostro lavoro. Oltre ai 24 comuni, abbiamo coinvolto 13 altri stakeholder, tra cui Camera di Commercio, sindacati, associazioni di categoria, organizzazioni del terzo settore, cooperative sociali e consorzi turistici locali e Università. Abbiamo creato un gruppo di lavoro collaborativo composto da attori pubblici e privati. Il tema centrale è rimasto la sostenibilità — inquadrata nella visione '(nome omesso prima della revisione) Area 2030', approvando un piano strategico focalizzato sulla sostenibilità sociale, ambientale ed economica*".

Sebbene non sia emerso un significato pienamente unificato, alcune interpretazioni dominanti hanno guadagnato rilevanza (ad esempio qualità ambientale e valorizzazione territoriale). Queste non sono state imposte dai ricercatori, ma negoziate attraverso la pratica e il dialogo. Ciò ha portato a un nuovo posizionamento nella matrice, in posizione B di Figura 1: la configurazione *"Multiple Meanings Prioritization"*. In questo stato, gli attori hanno riconosciuto la coesistenza di punti di vista diversi e la presenza di molteplici obiettivi di sostenibilità convergendo, in modo negoziale, verso la scelta delle priorità dei vari significati emersi. Come dichiarato dal leader del progetto: "*Abbiamo creato gruppi di lavoro interdisciplinari che hanno riunito competenze e prospettive diverse — amministratori pubblici, artigiani, agricoltori e rappresentanti sindacali. Questi gruppi erano organizzati intorno a cinque temi chiave. … Abbiamo poi tenuto diverse sessioni di brainstorming, chiedendo: 'Come immaginate il turismo sostenibile nell'area?' Ho guidato il gruppo per aiutare a sintetizzare le discussioni, perché nel lavoro di gruppo è essenziale avere qualcuno che possa distillare le idee e filtrare i temi chiave"*.

Gli stakeholder hanno dunque iniziato a dare priorità in modo intenzionale ai temi di sostenibilità condivisi, rilevanti nel contesto e politicamente fattibili. La collaborazione è ancora disomogenea, ma maggiormente ancorata a narrazioni condivise.

### 4.3 Una configurazione in evoluzione



È importante sottolineare che questa evoluzione non suggerisce un movimento lineare verso la convergenza. Piuttosto, riflette una configurazione evolutiva dipendente dal contesto, dalla capacità istituzionale e dalla fiducia relazionale. Due ulteriori configurazioni presenti nella matrice risultano particolarmente rilevanti per la teoria della collaborazione multistakeholder:

- *"Blend of Meanings"* - coesistono molteplici interpretazioni della sostenibilità, ma esse sono integrate in modo significativo attraverso una narrazione condivisa. Il consenso sul mix di significati ha uno scopo primario di identità e comunicazione esterna, ma è pur sempre un processo partecipativo e ciò consente un pluralismo produttivo, permettendo la collaborazione nonostante prospettive differenti;

- *"Unified Meaning"*- la sostenibilità è definita collettivamente e ampiamente

condivisa tra gli stakeholder, supportata da elevati livelli di collaborazione. Lo scopo comune è unico ma integrato in ogni membro dell'ecosistema, a cui tutti gli attori convergono nelle loro azioni individuali senza bisogno di ulteriori negoziazioni. Questo scenario si osserva tipicamente all'interno di sistemi di governance istituzionalizzati o ben coordinati, in cui un purpose comune guida l'azione condivisa.

Sebbene queste due configurazioni non siano emerse nel caso esaminato in questo studio, questi due percorsi rappresentano stati aspirazionali o logicamente possibili a cui gli stakeholder facevano implicitamente riferimento e fungono da punti concettuali di riferimento per comprendere le potenziali direzioni nell'evoluzione della collaborazione multistakeholder.

Fonte: Elaborazione delle

**Figura 1:** Shared Meanings of Sustainability Matrix

Il caso di studio si colloca tra frammentazione e prioritizzazione negoziata. Tuttavia, segnali iniziali di movimento, tra cui l'interesse degli stakeholder nella coprogettazione di iniziative educative e l'adozione del framework nel discorso locale, suggeriscono che la matrice stessa stia diventando uno strumento di riflessione, coordinamento e orientamento strategico. Questa matrice è utile sia come dispositivo diagnostico sia come mappa orientativa, aiutando gli stakeholder a individuare la propria posizione, comprendere le tensioni esistenti e identificare possibili percorsi evolutivi.

## 5. Discussione dei Risultati

Questa Ricerca-Azione ha evidenziato l'assenza di un 'shared meaning' della sostenibilità tra i diversi stakeholder coinvolti nell'area rurale di riferimento. Dallo studio sono emersi cinque grandi temi relativi ai significati della sostenibilità, supportati da differenti attori che vivono e/o operano nella stessa piccola area rurale. Alcuni stakeholder hanno interpretato la sostenibilità in termini di efficienza ambientale e mitigazione degli impatti (Tema 1): in un contesto rurale, questa sensibilità ambientale può essere profondamente radicata nella natura, richiamando il concetto di 'connectedness to nature' evidenziato da Diamond (2021). Altri stakeholder hanno ancorato il significato principale della sostenibilità alla fattibilità economica, agli incentivi o alle strutture di compliance (Tema 2); questo risultato è coerente con studi precedenti in contesti in cui la sostenibilità è considerata uno strumento per risolvere trade-off (Murphy e Price, 2012; Moeller et al., 2011). Tuttavia, la presente ricerca propone una lettura originale della sostenibilità come processo generativo, in cui considerazioni economiche interagiscono con collaborazione e 'shared purpose' per coprodurre significati condivisi.

Altri significati emersi si riferiscono all'identità locale, alla continuità culturale o ai legami affettivi con il territorio e la comunità (Temi 3 e 4): tali argomentazioni sono state riscontrate anche in altri contesti, con riferimento a legami personali e generazionali e alla radicata autenticità locale (Diamond, 2021). A differenza di ricerche precedenti, questo studio rivela una connessione originale tra questi significati e il concetto di sostenibilità in relazione diretta allo sviluppo delle destinazioni turistiche. Il quinto tema utilizza un linguaggio aspirazionale senza un piano d'azione concreto, evidenziando come la sostenibilità possa essere fluida e soggetta a continui spostamenti concettuali, ampliando o restringendo i propri confini semantici, come osservato in studi precedenti (Baush et al., 2024).

Questo studio ha inoltre introdotto la '*Shared Meanings of Sustainability Matrix',* che offre indicazioni su come possano emergere 'shared meanings' attraverso l'intersezione tra purpose-sharing e collaborazione. La matrice illustra come gli stakeholder possano progressivamente passare da interpretazioni frammentate e individualizzate a significati della sostenibilità più integrati e collettivamente detenuti.

Nella configurazione *"Messy Meanings"*, i significati restano vaghi o contraddittori. Gli stakeholder operano con minima coordinazione e la sostenibilità è evocata come obbligo o ideale, ma non come principio azionabile. Ciò riflette osservazioni precedenti sulla tendenza delle istituzioni nelle aree rurali ad adottare un linguaggio della sostenibilità senza allineamento sul contenuto o sulle implicazioni (Vespestad et al., 2025). In questa configurazione, la sostenibilità manca di ancoraggio nel shared purpose o nel riconoscimento reciproco, e il potenziale per un'azione congiunta rimane inespresso.

Uno spostamento si osserva nella configurazione **"***Blend of Meanings"*, in cui gli stakeholder integrano logiche differenti (economiche, ambientali, territoriali, ecc.) pur senza una risoluzione definitiva. Queste posizioni riflettono un'ambiguità produttiva e aprono spazi per sperimentazioni collaborative. Come mostrato in studi su aree protette e partnership tra stakeholder, il progresso non richiede necessariamente la convergenza dei valori (Signori e Flint, 2020), ma può emergere da accordi flessibili che permettono negoziazioni situate (Jamal e Stronza, 2009). Nel nostro caso, i blended meanings consentirebbero un certo grado di shared purpose anche in presenza di bassi livelli di collaborazione. Questi bassi livelli di collaborazione sono stati spiegati in altri contesti rurali come forme di 'self-reliance collaboration' (Diamond, 2021), dove l'individualismo deriva dalla scarsa fiducia nelle autorità pubbliche.

Nella configurazione *"Multiple Meanings Prioritization"*, alcuni valori vengono deliberatamente elevati, come l'equità intergenerazionale, la cura del paesaggio o la decarbonizzazione della mobilità. Questi significati risultano non solo più integrati, ma anche più riflessivi, richiamando la necessità di superare la mera coordinazione manageriale e investire in spazi discorsivi dove i significati vengono co-costruiti (Liburd et al., 2022).

Infine, la configurazione *"Unified Meaning"* riflette una trasformazione più profonda: la sostenibilità diventa una narrazione condivisa, ancorata a un'identità comune. Questi risultati confermano evidenze secondo cui le comunità rurali possono mobilitarsi attorno a forme di azione collettiva radicate territorialmente (Luo et al., 2025). In questa configurazione, la collaborazione non è semplicemente strategica, ma costituisce essa stessa il significato della sostenibilità.

## 6. Implicazioni

### 6.1 Implicazioni teoriche

Nel complesso, i risultati supportano un contributo teorico più ampio. La matrice proposta posiziona i significati condivisi non come un compromesso statico tra collaborazione e purpose sharing, ma come una proprietà emergente della loro interazione. Essa amplia i lavori esistenti suggerendo che il processo di costruzione del significato della sostenibilità non è una condizione preliminare per la governance, ma costituisce una forma di governance stessa, incorporata nel linguaggio, nel dialogo e nel shared purpose (Liburd et al., 2022). In questo senso, uno 'shared meaning' diventa la proprietà analitica e pratica che connette la teoria multistakeholder con il dibattito in evoluzione sul purpose organizzativo (Hollensbe et al., 2014; Tafuro e Piccaluga, 2025). Questa ricerca contribuisce inoltre al dibattito sulla stakeholder theory nello sviluppo del turismo rurale. Studi precedenti (es. Albrecht et al., 2021; Vespestad et al., 2025) hanno mostrato come il contributo degli stakeholder sia essenziale nello sviluppo di piani per un turismo rurale sostenibile. Tuttavia, la novità del presente lavoro consiste nel fatto che—prima ancora che il processo turistico venga considerato—sono importanti le definizioni condivise di sostenibilità. Vi è infatti ancora scarsa evidenza che gli stakeholder di un'area condividano una definizione di sostenibilità. Il contesto studiato non aveva una storia di sviluppo turistico e ha rivelato che la sostenibilità era un termine conteso. Senza stabilire un punto di riferimento, è probabile che in molte realtà emergano resistenze al cambiamento (Karali et al., 2021) o una mancanza di coordinamento nell'attuazione dei piani d'azione (Lane e Kastenholz, 2015). Per questo, l'Action Research come quella condotta risulta particolarmente importante in destinazioni appena sviluppate. Lo sviluppo turistico dovrebbe essere localmente focalizzato (Bramwell e Sharman, 1999; Snyman e Bricker, 2019), e appare che responsabilizzare gli stakeholder locali attraverso termini condivisi possa aiutare a creare fiducia e a stabilire una base comune per la definizione degli obiettivi. Sebbene consulenti turistici e ricercatori accademici possano essere esperti nello sviluppo del turismo sostenibile, questa ricerca evidenzia l'importanza di un approccio locale e pratico per avviare lo sviluppo turistico.

### 6.2 Implicazioni pratiche

Dal punto di vista operativo, amministratori locali e stakeholder del turismo dovrebbero investire non solo in meccanismi di collaborazione strategica, ma anche in spazi di allineamento discorsivo, come forum deliberativi, workshop partecipativi o laboratori di co-design. Questi formati possono servire da piattaforme per tradurre obiettivi di sostenibilità vaghi o divergenti in iniziative più concrete e collettivamente supportate. Piuttosto che forzare un consenso prematuro, i manager locali dovrebbero coltivare processi interpretativi che aiutino gli stakeholder ad articolare, confrontare e negoziare i propri significati della sostenibilità.

All'interno del turismo sostenibile, un obiettivo chiave è garantire che i benefici siano condivisi (Liu e Shu, 2020). Allo stesso tempo, diversi stakeholder possono avere obiettivi differenti o talvolta conflittuali. Questo studio segue l'enfasi di Snyman e Bricker (2019) secondo cui "comprendere i desideri dei residenti e degli stakeholder è una considerazione essenziale nella concettualizzazione della sostenibilità del turismo e della condivisione dei benefici in contesti locali vari e diversificati" (p. 713). I benefici derivanti dai valori condivisi degli stakeholder includono elementi di empowerment sociale (valori condivisi) ed economico (risultati economici condivisi) tra stakeholder e residenti (Scheyvens, 1999). In questo studio, i valori condivisi equivalgono a una definizione condivisa di principi sostenibili, su cui è possibile costruire una strategia per garantire benefici economici e sociali duraturi nel turismo rurale. In questi contesti le iniziative top-down rischiano l'insuccesso se le definizioni sono imposte da un'autorità centrale senza accordo sui significati e le priorità locali. A livello sociale, lo studio evidenzia l'importanza del collective meaning-making come fonte di legittimità democratica nelle aree rurali. Nelle comunità dove l'autorità formale è debole e la collaborazione spesso informale, la sostenibilità può diventare una narrazione socialmente condivisa che lega interessi diversi. Quando il significato viene co-prodotto piuttosto che imposto, si favorisce un maggiore attaccamento emotivo, partecipazione civica e senso di responsabilità condivisa. In questo senso, la comunicazione sulla sostenibilità dovrebbe andare oltre informazioni tecniche o branding simbolico e radicarsi in narrazioni partecipative ancorate all'identità locale e al shared purpose.

## 7. Conclusioni

Questo studio ha esplorato come significati condivisi della sostenibilità possano emergere tra stakeholder diversi operanti in un'area rurale caratterizzata da infrastrutture di coordinamento deboli, potere frammentato e tradizioni di collaborazione limitate. Coinvolgendo gli stakeholder in un processo partecipativo e iterativo di Action Research, la ricerca evidenzia che i significati condivisi della sostenibilità non preesistono, ma si sviluppano nel tempo attraverso dialogo strutturato, costruzione di fiducia e condivisione del purpose.

I risultati mostrano che inizialmente la sostenibilità è interpretata attraverso cinque temi eterogenei di significato (*Protezione ambientale ed efficienza delle risorse; Quadro economico e leva istituzionale; Identità territoriale e turismo place-based; Etica, emozione e benessere; Obiettivi aspirazionali e vaghi*). Tuttavia, man mano che le interazioni evolvono dalle interviste individuali a focus group collaborativi e workshop, gli stakeholder iniziano ad allinearsi su obiettivi, linguaggio e visioni condivisi. Questo processo culmina nello sviluppo della "*Shared Meanings of Sustainability Matrix*", che concettualizza come i significati condivisi evolvano attraverso collaborazione e

purpose sharing. La matrice funge sia da contributo teorico sia da strumento pratico per guidare l'allineamento degli stakeholder in contesti di governance complessi, evidenziando quattro configurazioni: *Messy Meanings, Multiple Meanings Prioritization, Blend of Meanings e Unified Meaning*.

Dal punto di vista teorico, lo studio contribuisce alla letteratura emergente sul purpose come costrutto negoziato, relazionale ed emergente. Evidenzia che il processo di costruzione del significato della sostenibilità non è un prerequisito per la governance, ma costituisce una forma di governance stessa, fondata su dialogo, riconoscimento e riflessività collettiva. Posizionando il significato condiviso come risultato dinamico dell'impegno multistakeholder, la ricerca connette la stakeholder theory con il turismo sostenibile.

Dal punto di vista pratico, lo studio fornisce indicazioni per amministratori rurali e facilitatori: investire in processi di meaning-making è cruciale per attivare azioni sostenibili.

Facilitatori e leader locali possono utilizzare la matrice come strumento diagnostico e di sviluppo per valutare la posizione di un territorio in termini di comprensione condivisa e collaborazione e per progettare interventi mirati a supportare l'allineamento.

A livello sociale, i risultati sottolineano l'importanza di responsabilizzare gli attori locali affinché articolino i propri valori e aspirazioni, resistendo all'imposizione di definizioni top-down della sostenibilità. Questo approccio inclusivo può rafforzare la coesione sociale, accrescere la legittimità e favorire coalizioni più durature per il cambiamento, in particolare nelle aree rurali dove fiducia e identità sono centrali per gli sforzi di sviluppo.

In conclusione, lo studio suggerisce che un 'shared purpose' costituito da uno 'shared meaning' della sostenibilità non si realizza necessariamente standardizzando l'eterogeneità dei temi in un unico significato semantico, ma può essere raggiunto anche valorizzando la varietà di esperienze e visioni dei diversi stakeholder.

## Riconoscimenti

Questa ricerca fa parte del progetto "Lo sviluppo sostenibile nei comuni dell'Area Berica", sviluppato nell'ambito dell'iniziativa ABESVI (Area BErica per lo sviluppo Sostenibile VIcenza), condotta nell'ambito di un accordo formale di cooperazione (protocollo) tra l'Università di Verona e la Provincia di Vicenza. Il progetto è stato sostenuto finanziariamente dalla Camera di Commercio di Vicenza, Italia. Ringraziamo la Fondazione Studi Universitari di Vicenza, Vicenza UNIVR Hub, il Dott. Ruggeri e il Prof. Mion, nonché l'impegno attivo dei sindaci e degli amministratori locali di cinque comuni della provincia di Vicenza: Barbarano-Mossano, Castegnero, Longare, Nanto e Villaga. Un ringraziamento speciale va anche al CPV (Centro Produttività Veneto) per aver facilitato l'impegno del pubblico e organizzato conferenze didattiche sulla sostenibilità nel turismo.

## Abstract

City branding has emerged as an essential strategy for urban governance, enabling cities to move beyond simple promotional campaigns and articulate distinctive identities that balance global competitiveness with cultural preservation. This study analyzes the evolution of Rome's city branding approach as a strategic instrument for urban planning and governance, examining how the urban brand transcends its traditional role as a communication tool to actively shape governance and decision-making processes. Adopting a qualitative single-case study design, it examines policy documents, branding campaigns, media materials, and field observations collected from 2015 to 2025, with particular attention to developments after 2020. The analysis uses thematic and discourse methods to identify patterns in Rome's use of historical narratives, stakeholder engagement practices, and sustainability objectives. Findings indicate that Rome strategically mobilizes its historical and cultural assets while developing innovative narratives of urban renewal and inclusive governance, demonstrating how branding operates as both a cultural and strategic asset that integrates heritage preservation, innovation, and sustainable urban development through participatory approaches. This research contributes to the theoretical understanding of city branding as a governance tool in heritage-rich contexts and offers practical guidance for developing integrated, participatory branding strategies that balance cultural integrity with contemporary urban challenges, specifically addressing the gap in empirical analysis of how branding integrates into strategic planning and participatory governance in historic cities.

*Keywords: City Branding, Destination Branding, Urban Governance, Heritage Management, Sustainable Development, Rome*

## 1. Introduction

Territorial branding has become a central element of urban and regional policies due to increasing global competition for tourists, investments, talent, and resources (Papadopoulos & Heslop, 2002). Consequently, cities have emerged as key actors in sustainable economic development, cultural preservation, and international strategic positioning (Kavaratzis & Kalandides, 2015), transforming how they define their identity, communicate values, and plan for the future.

Place branding encompasses strategies for constructing and managing a place's identity to attract external resources and enhance reputation (Moilanen & Rainisto, 2009; Fetscherin, 2010). While destination branding targets tourism (Buhalis et al., 2022), city branding specifically addresses cities as complex, multifunctional systems. It has evolved into a strategic urban policy instrument, moving beyond mere promotion to support governance

and guide sustainable development through the integration of tangible and intangible assets, forming the unique "DNA of the city" (Prilenska, 2012; Hammouda, 2019).

Despite growing theoretical interest in city branding as a governance and participation tool, the literature often applies traditional marketing models without fully accounting for cities' socio-cultural and economic complexities (Kavaratzis & Kalandides, 2015). Many studies prioritize promotional aspects and tourist perception, neglecting empirical analysis of how branding integrates into strategic planning and participatory governance. Specifically, the challenge for historic cities that balance their heritage with innovation and sustainability remains underexplored. This study aims to address this gap by examining Rome's case to understand how its urban brand functions as a strategic and participatory lever for coherent, shared urban development.

The central research question guiding this study is: To what extent does the urban brand transcend its role as a communication tool to actively shape governance and decision-making processes?

This question aims to uncover whether city branding in a heritage-intensive context like Rome goes beyond top-down promotional narratives to serve as a strategic framework that integrates governance, urban planning, and stakeholder interaction. By examining how Rome's urban brand operates as both a cultural and strategic asset, the study seeks to contribute to the broader understanding of branding as a dynamic tool for negotiating and balancing heritage preservation, innovation, and sustainable urban development.

## 2. Theoretical Background

The literature on place branding highlights how global competition necessitates differentiation and strategic positioning to attract resources through a distinctive identity (Fetscherin, 2010). Destination branding, traditionally focused on tourism and creating an appealing image (Buhalis et al., 2022; Merrilees et al., 2009; Ramadania et al., 2025), is primarily a marketing tool for promotion and competitive differentiation (Moilanen & Rainisto, 2009). However, this approach is limited for cities, which are complex, multifunctional spaces with diverse stakeholders. More recent literature emphasizes city branding as a multidimensional process that builds an attractive image but also guides a shared vision of urban development, integrating innovation, sustainability, and local identity (Pedeliento & Kavaratzis, 2019; Chan, 2022). City branding is thus a strategic tool influencing policy choices and development trajectories (Eshuis & Edwards, 2012), aiming for long-term competitive advantages by coordinating symbolic and functional attributes (Casais & Poco, 2023). Cities leverage unique resources to build brands that resonate locally and globally, differentiating through functional aspects (infrastructure, economic opportunities) and symbolic dimensions (cultural identity, heritage, emotional resonance) (Cruz-Ruiz et al., 2022).

Cultural heritage is a significant asset for city branding, especially for historic cities, contributing to urban identity through coherent signals, positioning, and emotional narratives (Pedeliento & Kavaratzis, 2019; Górska-Warsewicz, 2020). Effective branding requires aligning institutional communication, urban behavior, infrastructure design, and residents' practices (Kavaratzis & Kalandides, 2015) and activating place-based values related to the cities (e.g. Hammouda, 2019; Chi et al., 2018; Warren & Dinnie, 2018). However, tensions arise in balancing heritage valorization with innovation and regeneration, harmonizing accessibility, preservation, global competitiveness, local integrity, modernization, and authenticity (Veasna et al., 2013; Nagaynay & Lee, 2020). Integrative approaches combine heritage conservation, urban innovation, and participatory governance, reflecting residents' values and ensuring consistency between communication and

development (Hakala et al., 2020). Despite theoretical advancements, empirical literature lacks analysis of branding's incorporation into planning and institutional strategies, specifically whether it's a communication tool or a strategic lever for governance and development (Żemła, 2024).

## 3. Methodology

This study adopts a qualitative, single-case study approach, focusing on the city of Rome as its unit of analysis. It was chosen as the case study for its status as a UNESCO World Heritage Site and also because of its unique urban configuration, in which heritage assets are dispersed across the city. This diffuse urban heritage forms the basis for rich historical narratives with strong global relevance, presenting an ideal context for understanding the integration of heritage and branding within urban planning. The study relied on a triangulated data collection strategy, combining institutional materials and social media analysis to ensure a comprehensive dataset. Primary data were sourced from 12 institutional documents obtained online from official platforms, including "Roma si Trasforma," during a systematic desk review conducted between March and May 2025. Documents were selected based on their formal status, thematic alignment with governance and sustainability, and their representation of Rome's institutional vision for integrating branding and urban development.

To complement institutional data, social media content analysis was conducted to understand public perceptions of Rome's urban branding. A dataset of user-generated content from TripAdvisor spanning 2023–2025 was compiled, analyzing popular reviews and hashtags. The analysis was conducted in two stages. First, the institutional documents were classified using Nagaynay and Lee's (2020) triadic framework of identity construction, heritage preservation, and infrastructure development. Second, a qualitative coding process followed Saldana's (2013) methodology.

To ensure reliability and validity, all data were manually coded by two independent researchers. The codes were iteratively refined and organized around the analytical pillars of identity, heritage, and infrastructure. This cross-validation process allowed for a nuanced and layered interpretation of how branding functions as both a governance tool and a strategic negotiation mechanism involving various stakeholders.

## 4. Preliminary results and conclusions

As shown in Table 1, the model distinguishes theoretical dimensions from their operational translation, each assessed through qualitative indicators applied to planning documents, promotional content, and field observations.

**Table 1:** Expanded Analytical Framework for Strategic Dimensions in Rome's City Branding

The preliminary findings of this study shed light on the multifaceted nature of city branding in heritage-intensive contexts, using the case of Rome as an emblematic example of the strategic tensions and opportunities that emerge when tradition and innovation converge. The analysis reveals how Rome's branding initiatives seek to harmonize its symbolic weight as a global cultural icon with contemporary governance imperatives, such as sustainability, urban renewal, and inclusive participation. The contribution of this research is threefold. From a theoretical perspective, it advances the understanding of city branding dynamics in contexts where historical legacy represents both a strategic asset and a constraint for contemporary identity formation. Methodologically, it introduces a multidimensional framework that enables a nuanced analysis of how branding strategies integrate heritage preservation with innovation and urban governance. On a practical level, the study offers actionable insights for policymakers, planners, and branding professionals in heritage-rich cities, supporting the development of coherent, inclusive, and culturally grounded branding strategies that respond to both resident needs and global visibility demands.

## Abstract

Although immersive technologies have become mainstream in tourism and cultural domains, how the combination in a heritage museum of the physical experience and the VR experience, of museum and destination, can shape the destination brand equity remains an unexplored research area. This research aims to conceptualise how and to what extent the *quality of VR information systems* and the *familiarity (with the destination, museum and technology)* affect *immersive experiences* in a physical museum and then influence *destination brand equity* (DBE), with a focus on its relational components. The research proposes a positive relationship between the quality of the VR system and the on-site VR experience (at the museum) of both the museum and the destination, and its significant positive effects on destination brand equity. As a novelty of this study, VR fosters an immersive experience that bridges the museum and the destination and introduces the key role of familiarity with technology, destination and museum. These findings suggest that the VR immersive experience linking the museum, and the destination is an immediate contextual experience and introduces the role of cognitive relationships mediated by memory, cultural and knowledge background.

*Keywords: virtual reality, immersive experiences, VR quality system, familiarity, destination brand identity, destination marketing.*

## 1. Introduction

Digital experiences are becoming relevant and pervasive aspects of ordinary life, reshaping boundaries between physical and virtual worlds and impacting human-technology interaction. Virtual and augmented reality technology advances have become mainstream in tourism and cultural domains (Loureiro et al., 2020). Blurring the boundaries between the physical and digital realms, immersive technologies propose unforeseen experiences and new marketing opportunities for cultural organisations and tourism destinations.

The role of immersive experiences in cultural heritage and museum domains has been widely detected**,** covering several aspects, such as characteristics and quality of the information systems; technology acceptance, adoption and use; users' immersion, interaction and sense of presence; visitors' experiences; visitors' satisfaction and post-experience behaviour. In destination marketing, VR immersive technology has been addressed mainly as a pre-experience that shapes destination image and preference and affects the intention to visit the destination (Yung et al., 2021; Flaviàn et al., 2022).

Although immersive technologies have become mainstream in tourism and cultural domains, how the combination in a heritage museum of the physical experience and the VR experience, of museum and destination, can shape destination brand equity remains an unexplored research area.

This research aims to measure how and to what extent the *quality of VR information systems* affects *immersive experiences* in a physical museum and then influences *destination brand equity* (DBE), with a focus on its relational components (Fang et al., 2024; Ekinci et al., 2023). *Familiarity with the destination, museum and technology*, an under-investigated topic, has been introduced to frame cognitive processes that, based on memory, cultural and knowledge background, may influence the immersive experience and its impacts on destination brand equity. A conceptual framework has been proposed, bridging the museum with the destination. It considers the causal relationships between the four constructs: *quality of VR information systems, immersive experiences, familiarity* and *destination brand equity* (DBE).

## 2. Conceptual framework

Immersive technologies innovate the museum business model, allowing reliving the past, overcoming physical and temporal distances or recreating in a virtual space an imaginative world. They combine the valorisation of museum-preserved knowledge (e.g. physical historical collection) with creative immersive experiences, enhancing education, learning, entertainment and escape (Lee et al., 2020; Trunfio et al., 2022).

This research proposes a conceptual framework that considers the causal relationships between the four constructs: *quality of VR information systems, immersive experiences, familiarity* and *destination brand equity* (DBE). It proposes 9 hypotheses to be validated (Figure 1).

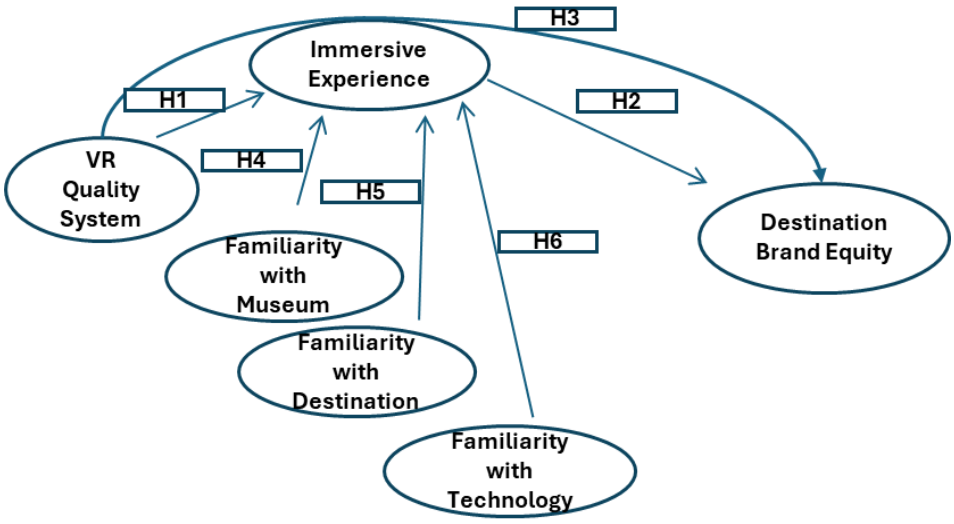

**Figure 1:** Conceptual framework

The quality of VR information systems (e.g. comfort, usability, vividness, multimedia information systems, etc.) has been investigated as affecting technology acceptance, adoption and use and then enhancing immersive experiences and driving and post-experience behaviours (Flavián et al., 2019; Jung et al., 2018; Nam et al., 2024; Trunfio et al., 2022). Immersive experiences in museums and cultural organisations represent a consolidated area

of investigation which has reframed Pine and Gilmore's experience economy into the context of immersive technologies. Entertainment, education, aesthetic and escape, but also enjoyment and socialisation have been largely measured, including their effects on post-experience behaviour (Bec et al., 2019; tom Dieck and Jung, 2018; Trunfio et al., 2022).

Previous research investigated familiarity as knowledge or prior experience of the destination before the VR immersive experience and as a moderator of enjoyment, flow state and satisfaction (Kim and Hall, 2019; Nam et al, 2024).

Destination brand equity (DBE) is a well-established concept in destination marketing, derived from Consumer-Based Brand Equity (Aaker, 1996; Keller, 1993) with various applications to destination brands (e.g., Bianchi et al., 2014; Chi et al., 2020). DBE is "the set of value-driven assets (or liabilities) added to visitors' perceptions of destination brand image" (Ekinci et al., 2023, p. 1257). The relational dimension of destination brand equity, which is the end of sequential building blocks that are vital to the "overall destination brand equity" (Fang et al., 2024), is proposed in this study to measure the impact of VR experiences in museums on the relationship building between museum visitors and the hosting destination.

The Destination Brand Relationship Block adopted in Fang et al.'s study (2024) frames the emotional/conative component in brand equity formation. It includes destination brand relevance, intimacy and loyalty. Destination brand relevance frames how visitors perceive the destination as relevant for themselves or the collectivity (e.g., family, friends, local community), opening a deep emotional connection. Intimacy frames the emotional closeness and attachment to the destination brand. These nuanced views of the visitor-destination emotional relationship impact brand trust and loyalty and, therefore, visitors' confidence in the destination's capacity to meet expectations, positive word-of-mouth and willingness to visit the destination again (Fang et al., 2024; Ekinci et al., 2023).

## 3. Methodology

This research investigates cutting-edge museums in which VR technologies have been applied to create a virtual journey of the destination. The study applies Partial Least Squares Structural Equation Modelling (PLS-SEM) (Goldberger, 1991). PLS-SEM integrates the structural model, which estimates hypothesised causal relationships among latent constructs and allows for the evaluation of both direct and indirect effects (Hair et al., 2016), and the measurement model, which assesses the reliability and validity of the manifest indicators used to define the constructs (Schumacker and Lomax, 2012). Given the exploratory nature of the research, all constructs were modelled as reflective, assuming that each unidimensional latent construct gives rise to its corresponding manifest indicators.

## 4. Findings

The research conceptualises how *VR system quality* significantly affects the *museum's immersive experience* (impacting *learning, enjoyment and escape)* and reshapes *destination brand equity*.

The structural model tests that *VR system quality* exerts an influence on the *museum immersive experience*, that is, the technological quality of the VR application is crucial in shaping users' sense of immersion ($H_1$). In turn, the *museum's immersive experience* can contribute to *destination brand equity*, supporting the idea that emotional and perceptual engagement in VR positively affects users' relationship with the destination brand ($H_2$). An indirect effect of *VR system quality* on *destination brand equity* through the *museum immersive experience* can be tested ($H_3$). Conversely, *familiarity with the museum* ($H_4$), *the destination* ($H_5$), and *the technology* ($H_6$) can show effects on *museum immersive experience*, or indirectly on *destination brand equity* ($H_7$, $H_8$, $H_9$).

## 5. Discussion, implications and future research

The research aims to demonstrate relationships between the quality of the VR system and the on-site VR experience (at the museum) of both the museum and the destination, and its effects on destination brand equity. It means that a high level of the VR system quality can enhance users' immersion and the realism of the virtual journey, allowing immersive experiences (e.g. entertainment, education, escape, etc.) and shaping relevance, intimacy and loyalty with the destination. As a novelty of this study, VR experience bridges the museum and the destination as an immediate contextual experience, with no significant effects of familiarity with technology, destination and museum, suggesting a marginal role of cognitive mediation processes by memory, cultural and knowledge background.

Future research will advance this preliminary conceptual framework, including a qualitative study deepening knowledge of visitors' experience and further validating the link between the relational components of DBE and VR immersive experience in the museum.

# The destination image and its impact on tourist civic behaviour: a theoretical framework for the Italian context

Luigi Zingone

e-Campus University, Rome, Italy

luigi.zingone@uniecampus.it

## Abstract

With overtourism on the rise, Italian tourist places need to rethink how they promote themselves to make sure visitors are not just attracted but also actively and responsibly involved. This study analyses how the perceived image of Italian tourist destinations — characterised by a rich cultural, artistic, landscape and food and wine heritage — can influence tourist citizenship behaviour (TCB) and willingness to sacrifice (WTS) among tourists. The aim is to understand how cognitive (services, accessibility, heritage) and affective (emotions, experiences) components contribute to forming an overall image capable of stimulating prosocial behaviours such as respect for the environment, active promotion of the destination and the ability to adapt in critical situations. Through a theoretical adaptation of the model at the national level, it is hypothesised that a positive image of the destination encourages greater civic engagement and a willingness to make sacrifices on the part of visitors, thus supporting the competitiveness and sustainability of Italian destinations. The study proposes a useful framework for Italian DMOs that intend to enhance not only tourist attraction but also the responsible participation of visitors.

*Keywords: destination image, tourist citizenship behaviour, willingness to sacrifice, sustainable tourism, place marketing*

## 1. Theoretical Background

The concept of destination image (DI) has been a focus of tourism marketing studies for decades, as it is a crucial element in travel choice, perceived satisfaction and destination loyalty (Gallarza et al., 2002; Stylidis et al., 2020a). DI is commonly defined as the set of perceptions, beliefs, knowledge and feelings that a person associates with a particular place (Tasci & Gartner, 2007). It consists of three dimensions: cognitive, affective and conative (Baloglu & McCleary, 1999).

The cognitive component reflects the objective and tangible attributes of the place (accommodation facilities, cultural attractions, quality of services, safety, accessibility) and is often influenced by external sources of information such as the media, social networks or the experiences of others (Beerli & Martín, 2004). The affective dimension, on the other hand, relates to the emotional responses generated by the place, i.e. how relaxing, stimulating, pleasant, welcoming or boring it is perceived to be (Stepchenkova & Zhan, 2013). The interaction between these two components generates the overall image of the place, which guides the tourist's behavioural intentions (Qu et al., 2011; Stylos et al., 2017). The image of

a tourist destination is therefore not limited to a static interpretation but becomes a dynamic and strategic lever for shaping visitor behaviour, especially in terms of relationships. DI not only influences the decision to travel, but also guides actions after the visit, such as recommending the place, the desire to return and tourist citizenship behaviour (TCB). TCB is based on the paradigm of customer citizenship behaviour (Bove et al., 2009), borrowed from the corporate world and adapted to the context of tourism, where the tourist is no longer a passive subject but an active player who can contribute to the success and sustainability of the destination. According to Torres-Moraga et al. (2021), TCB includes actions such as: recommending the destination to others (advocacy behaviour), helping other tourists, offering suggestions or feedback to facility managers, and taking care of the place visited. Such actions, being voluntary and prosocial, improve not only the individual's experience, but also the collective experience and the overall perceived value of the territory.

Literature suggests that TCB is favoured by a positive overall image of the destination. When a tourist develops a strong cognitive-emotional connection with a place, they tend to act in a more responsible, respectful and collaborative manner (Hosany, 2012; Liu & Tsaur, 2014). A study by Limonta et al. (2024), conducted in Manta (Ecuador), confirmed the existence of a direct and significant link between overall destination image and TCB (H4). In particular, the cognitive and affective components of DI appear to have direct and indirect effects on tourist citizenship behaviour. Another crucial behavioural dimension that has emerged in the most recent literature is Willingness to Sacrifice (WTS), i.e. the willingness of tourists to make voluntary sacrifices to support the destination. The concept of WTS includes financial sacrifices (choosing more expensive but environmentally friendly facilities), time sacrifices (accepting longer waiting times for sustainable services), emotional sacrifices (moving away from habitual comforts), or practical sacrifices (adopting behaviours that respect the local environment) (Verma et al., 2019; Aro et al., 2018). Limonta et al. (2024) demonstrate that TCB has a positive impact on WTS (H5), emphasising that an engaged and "citizen" tourist is also more likely to support the destination, even in the face of minor inconveniences.

In the Italian context, and in small cities of art, the proposed theoretical model finds particularly fertile ground. These destinations are characterised by a strong identity and symbolic value, connoted by relevant cognitive elements such as historical and artistic heritage, accessibility, and the quality of cultural and food and wine offerings. At the same time, deep emotional elements emerge, such as a sense of authenticity, hospitality and the warmth typical of local communities. This balance between cognitive and emotional dimensions contributes to building an overall positive image, capable of influencing tourists' behaviour in a collaborative and responsible manner. It is hypothesised that tourists, especially seasonal ones who live in the city for an extended period and perceive these destinations favourably, are not only likely to recommend them but also exhibit tourist citizenship behaviour (TCB) such as litter collection, support for local events, participation in cultural or environmental initiatives, and sharing advice with other visitors. Such behaviours, when integrated into a coherent and participatory narrative of the destination, can encourage greater willingness to tolerate occasional inefficiencies or to choose sustainable tourism solutions, even if they are less economically advantageous.

## 2. Methodology

This study proposes a theoretical model for Italian DMOs, aimed at enhancing not only the attractiveness of destinations but also the responsible participation of tourists. The framework links the image of the destination, in its cognitive and affective components, to tourist citizenship behaviour (TCB) and willingness to sacrifice (WTS), suggesting new strategies for sustainable and collaborative governance. Based on a critical review of international literature, the model conceptually adapts the empirical work of Limonta et al.

(2024), originally tested in Ecuador, to the cultural, social and territorial specificities of Italy. The exploratory and deductive qualitative approach integrates theoretical analysis and formalisation of causal relationships, without resorting to empirical investigation, consistent with the strategic objective of the work. The framework, accompanied by a visual diagram, is presented as a conceptual tool to guide place management and promote tourist engagement towards civic and sustainable behaviour.

## 3. Results

The main result of this study is the development of an integrated theoretical framework that links destination image (in its cognitive and affective components), tourist citizenship behaviour (TCB) and willingness to sacrifice (WTS), with the aim of providing Italian DMOs with a tool to promote participatory and sustainable tourism. Unlike the original model proposed by Limonta et al., this framework has been specifically adapted to the Italian context, considering the peculiarities of small and medium-sized Italian art destinations, characterised by a strong sense of identity, a rich cultural offering and unique social and environmental dynamics.

In the proposed model, the cognitive image – relating to the perceived tangible attributes of the destination (e.g. quality of services, attractions, accessibility) – and the affective image – based on emotions and sensations experienced (such as authenticity, human warmth, pleasantness) – together contribute to forming an overall image that directly influences tourist citizenship behaviour. The latter manifests itself in voluntary actions such as respect for the environment, support for the local community, positive word of mouth and active participation in cultural and social initiatives. TCB, in turn, is positively associated with willingness to sacrifice (WTS), understood as the tourist's propensity to tolerate inconvenience or sacrifices (of time, economic resources or comfort) in order to support the quality and sustainability of the destination. Furthermore, the framework highlights the mediating role of overall image in the relationship between cognitive and affective components and TCB, as well as the mediating role of TCB in the relationship between image and WTS.

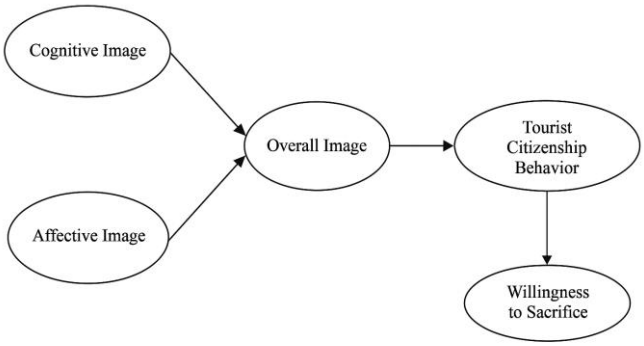

**Figure 1:** The theoretical Framework (Source: Author' elaboration)

## 4. Conclusions

The proposed theoretical framework represents a first step towards new tourism marketing strategies that focus not only on the attractiveness of destinations, but also on the civic and responsible involvement of tourists. The model systematically links the cognitive and

affective components of destination image to the formation of an overall image, which positively influences tourist citizenship behaviour (TCB) and willingness to sacrifice (WTS). This approach aims to support Italian DMOs in rethinking the relationship between tourists and the territory in a participatory way, especially in a context characterised by growing overtourism phenomena where sustainability, reputation and resilience are crucial for competitiveness. Although theoretical and propositional, the model opens up interesting prospects for future empirical applications. It can be validated through a quantitative survey of tourists visiting small and medium-sized Italian art destinations, characterised by a strong historical and cultural identity and a focus on sustainability. The suggested methodology involves a structured questionnaire with validated scales to measure perceptions of cognitive and affective image, level of TCB and propensity for WTS. The analysis could use PLS-SEM, which is suitable for predictive models with latent constructs. An empirical application would allow the robustness of the model to be verified and tourist segments prone to prosocial behaviour to be identified, offering DMOs concrete tools for communication campaigns and engagement actions consistent with tourist citizenship. The framework aims to provide an operational basis for innovating the management of Italian destinations towards sustainability and co-creation, providing ideas for designing offers, communication and promotion of responsible behaviour.

# Perceived Benefits of Urban Regeneration in Coastal Tourism Destinations

Judit Zoltan

University of Bologna, Italy

judit.zoltan@unibo.it

## Abstract

Promoting well-being for both residents and tourists has become a central issue in the tourism industry, with a shift from hedonistic to eudaimonic approaches in destination marketing. In this context, the present study examines the role of a newly regenerated urban area in altering tourist behavior and shaping the perceived image of a coastal destination. The study area refers to an urban green infrastructure, the Sea Park of Rimini, which a result of the seafront conversion from a previously grey infrastructure.

Survey data collected from tourists who recently visited the destination aims to assess the effects of this public intervention. The results indicate the propensity among tourists to engage in physical activities within this newly developed area, highlighting its perceived sustainable benefits and its contribution to the formation of a new destination image. Tourists reported greater social than environmental benefits arising from the requalification of the area, and they confirmed the changing image of the destination. The relationship between the type of usage and the perceived image provides valuable insights and allow to derive managerial implications for city planning, destination and hospitality marketing.

*Keywords: urban requalification, tourist behaviour, wellness, green infrastructure*

## 1. Introduction

Urban green infrastructure (UGI) can be defined as urban parks, gardens, woodlands, green streets, and designed (semi-)natural areas (Parker & Zingoni de Baro, 2019). Visiting these areas offers several benefits for residents, including improved well-being, reduced stress, enhanced physical health, and the provision of educational opportunities (Vujcic et al., 2019). In addition to their social benefits, green areas provide significant environmental advantages, such as mitigating greenhouse gas emissions and supporting adaptation to the diverse effects of climate change. As a result, the expansion of UGI's has become a critical component of strategic urban planning, particularly in Europe. In the context of tourism, UGI's can develop as key attractions and essential elements of the destination experience (Terkenli et al., 2020). However, their role in shaping tourist behavior and influencing the perceived image of a destination remains underexplored. The current study seeks to address this gap by examining the effects of an extensive urban regeneration project in the mature seaside destination of Rimini. The newly developed Sea Park (Parco del Mare) replaces a 16 km stretch of grey infrastructure—comprising a coastal road with parking spaces—and transforms the area into green spaces, sports facilities, and lanes designed for soft mobility. This study focuses on two

main aspects: first, the propensity of tourists to engage in physical activities within these newly created spaces, and second, the perceived shift in the destination's image, specifically in terms of social versus environmental benefits. By investigating these elements, the study aims to provide insights into how urban green infrastructure can influence tourist behavior and contribute to the evolving image of coastal destinations.

## 2. Literature review

The literature on destination image is primarily based on the concept of brand image. Keller (1993) defines brand image through the associations it evokes and among others, the benefits it offers. Accordingly, the benefits perceived by tourists can shape their overall impression of a destination. Destination image is, in fact, a dynamic concept, often divided into pre-visit and post-visit images, with potential changes throughout the visitation process. In the case of revisiting a destination, familiarity with past experiences plays a significant role in image formation. Consistent with Gunn's (1988) theory, destination image is strongly influenced by the attractions available. Therefore, the introduction of a new attraction can contribute to changes in the destination's image.

This study focuses on a new urban green infrastructure, and considers two types of benefits: environmental and social. The expansion of green spaces and improvements in walkability at a destination are likely to suggest a more sustainable, "green" image. To be classified as a "green" destination, a brand should be associated with environmental conservation and sustainable practices, while avoiding shortcomings that could lead to criticism of greenwashing (Inch, 2011; Katrandjiev, 2016).). The complexity of destinations presents challenges in projecting an overall green image. As noted by Inch (2011), stakeholder involvement is crucial in establishing a credible green destination image.

In addition to environmental benefits, urban green infrastructures can also provide social benefits that are perceived by tourists through the concept of wellness. Following the body-mind-spirit approach (Smith & Kelly, 2006), wellness activities have gained significant popularity in tourism (Myers, Sweeney, & Witmer, 2000). Wellness destinations are defined and conceptualized across various studies in the literature (Smith & Diekmann, 2017). In general, such destinations are expected to have a strong connection with natural areas and offer numerous facilities for tourists seeking wellness experiences (Thal & Hudson, 2019). Tourists engage in wellness and fitness activities with the aim of maintaining and improving their health and well-being (Voigt & Pforr, 2014). A distinction can be made between primary and secondary wellness travelers. For primary wellness travelers, wellness is the main motivation of the trip, and the availability of specific facilities and services at the destination influences their travel planning. In contrast, secondary wellness travelers engage in wellness activities occasionally while on holiday, with the primary purpose of their visit being different from wellness-related activities. Furthermore, when wellness and fitness activities are part of a regular routine, similar to that in the home environment, they are more likely to be considered trip behavior rather than a purpose (Weed, 2009).

Finally, as wellness is often associated with well-being, some reflections can be made on its representation in destination marketing. The type of tourism activity consumed can moderate how tourist well-being is affected during a holiday. Su, Tang, and Nawijn (2020) distinguish between two dimensions of well-being: hedonia, which is linked to relaxation and enjoyment, and eudaimonia, which is related to activities that require more effort. In destination marketing, there has been a shift from focusing on hedonistic consumption toward a more eudaimonic approach, with an emphasis on self-realization and quality of life (Hartwell et al., 2012).

## 3. Methodology

A survey research design was employed to address the research question concerning the impact of urban regeneration on tourist behaviour and destination perception. The target population for the survey consisted of tourists visiting or having recently visited Rimini. Data collection was carried out in two phases: face-to-face interviews at the study location and an online survey administered with the assistance of the local destination marketing organization. The questionnaire comprised several sections, gathering information on trip characteristics, activity participation, motivation, perceived image of the destination in relation to the Sea Park, and demographic variables. The data were analysed using multivariate statistical methods.

## 4. Results

The survey results indicate that the public intervention under analysis successfully stimulated fitness-based tourism. Nearly half of the respondents reported engaging in physical activities within the Sea Park. When comparing practising and non-practising tourists, the tests revealed significant differences in their profiles and behavioural characteristics. The variable capturing pre-visit awareness of the new infrastructure was found to be positively correlated with the actual use of the area for exercise. The impact of the intervention on tourists' perceptions of the destination was further confirmed through regressions. Strong agreement was recorded regarding the perceived change in the destination's image, especially among tourists on a repeated visit. The destination's guest profile appears to be relatively loyal, with over 75% of respondents having prior experience visiting the area. Additionally, changes in perception related to the destination's "green" or "wellness" image were examined. The former was found to be associated with tourist behaviour, while the latter was correlated with international travel.

## 5. Implications and conclusion

The study aimed to explore the role of a newly developed urban green infrastructure in shaping tourist behavior and the destination's image. Overall, a change in the destination's image is evident, but the specific nature of the perceived image remains ambiguous. Regarding the benefits of the Sea Park in relation to the three pillars of sustainability, the results highlight that the social and environmental benefits are most prominently recognized. While the majority of tourists agree that the Sea Park represents a new tourist attraction, this perception is notably stronger among those who have used the park for physical activities. Prior awareness of the infrastructure was found to play a crucial role in influencing tourist behavior, particularly in terms of increased engagement in physical activities. An interesting finding relates to the international divide concerning the perceived "green" aspects of the park. Domestic tourists tend to perceive fewer environmental benefits and, as a result, show a weaker connection to the green image. This may be attributed to the assumption that domestic tourists perceive other locations within Italy as similarly committed to green initiatives, thereby rendering the greening element less salient. Alternatively, international tourists may have a greater awareness of the environmental benefits or may have a lower benchmark for green spaces in their home countries.

The use of the Sea Park for physical activities further reinforced the destination's image as a wellness destination. Given that many tourists were already aware of the park before their arrival, it is possible that their image of the destination was shaped prior to their participation in physical activities. Although the mass tourism image of the past that was characterized by entertainment and hedonistic consumption, is somewhat challenged, the implementation of this new infrastructure is not enough on its own to reposition the destination. Besides marketing efforts, stakeholder engagement is crucial to build a green destination brand

(Insch, 2011). For example, the hospitality offers and other attractions at the destination should similarly demonstrate green efforts. Given the positive evaluation of the Sea Park, it should unquestionably play a central role in the destination's branding and marketing strategies. Tourists view the park as an additional attraction that enhances the city's offerings. Tourists with active lifestyles could plan their physical activities in advance as part of their trip, and the park could further enhance the destination's attractiveness from a sustainability perspective. Targeting for example the LOHAS (Lifestyles of Health and Sustainability) segment, that are more health-conscious and physically active tourists, could be central towards the repositioning of Rimini as a wellness destination. As tourists often carry their home habits with them on vacation, customized campaigns targeting a sporty audience could be placed in high-visibility areas. Moreover, hotels could capitalize on the opportunity by promoting the park as an attractive setting for physical activities. They could include information on exercise opportunities in their marketing materials and offer services such as sport kits at the concierge, running itineraries with fixed distances, rentable smartwatches, or selling earphones designed for running. These initiatives could help further integrate the park into the overall destination experience and attract more tourists with an active lifestyle.

# Track 7
# Technology and Innovation Marketing

Coordinators: Eleonora Di Maria & Marco Galvagno

La sezione tematica si propone di stimolare la ricerca e accogliere i contributi di tutti gli studiosi che indagano la relazione multidimensionale che lega tecnologia, innovazione e marketing, assumendo due prospettive di analisi: la prima, più strettamente collegata al marketing dell'impresa high-tech; la seconda, maggiormente orientata ad approfondire l'impatto generato dalla diffusione delle nuove tecnologie dell'informazione e della comunicazione e alle più recenti tecnologie connesse alla quarta rivoluzione industriale sulla funzione marketing. In particolare, fenomeni recenti quali la diffusione tra le imprese del paradigma dell'open innovation (si pensi ad esempio a forme estreme di open innovation quali il crowdsourcing), l'emergere di nuove tecnologie abilitanti (si pensi per citarne alcune al 3D printing, all'Internet of Things, al Cloud Computing, alla robotica e all'intelligenza artificiale) e il nuovo ruolo assunto dal cliente rispetto ai processi di creazione del valore (si pensi ai modelli della Sharing Economy e al movimento dei makers) stanno producendo un radicale ripensamento delle logiche, degli approcci, dei metodi e degli strumenti di marketing.

La sezione vuole pertanto cogliere la sfida lanciata da uno scenario in fortissimo cambiamento e rappresentare un punto di riferimento e un "luogo" di condivisione di conoscenze circa attività di ricerca che da diversi punti di vista e prospettive teoriche analizzano il Technology and Innovation Marketing.

Le domande di ricerca a cui la sezione intende contribuire possono ascriversi a 3 macro-categorie:

- come il marketing sta cambiando in risposta ai cambiamenti della tecnologia;
- come nuovi approcci di marketing stanno cambiando il processo di sviluppo dell'innovazione (in particolare quella di matrice tecnologica) e la sua diffusione sul mercato;
- come le nuove tecnologie e i nuovi modelli di marketing stanno cambiando il ruolo del cliente nei processi di innovazione e di creazione del valore.

This section welcomes research examining the multidimensional relationship between technology, innovation, and marketing, from two perspectives: marketing in high-tech firms and the impact of new information, communication, and Industry 4.0 technologies on the marketing function. Recent developments—such as the spread of open innovation and crowdsourcing, the rise of enabling technologies (3D printing, IoT, cloud computing, robotics, AI), and the customer's evolving role in value creation (e.g., sharing economy, makers) are reshaping marketing logic, methods, and tools.The section aims to be a reference point for sharing knowledge on Technology and Innovation Marketing, encouraging contributions from diverse theoretical viewpoints. It addresses three main research questions: how marketing is changing in response to technological evolution; how new marketing approaches influence innovation development and market diffusion; and how emerging technologies and marketing models transform the customer's role in innovation and value creation.

# Exploring Blockchain Technology for Trust-Based Consumer Relations in the Context of Sustainability: Evidence from the Agri-Food Industry

Adriana Baselice[1], *, Maria Coscia[1], and Alessandra De Chiara[1]

[1] L'Orientale University of Naples, Department of Human and Social Sciences, Naples, Italy

* Corresponding author: maria.coscia@unior.it

## Abstract

The growing focus on sustainability issues, together with the substantial volume of information directed at markets, is prompting consumers to demand greater transparency and authenticity in communication, as well as credibility in the data and information relating to products. In this context, blockchain technology (BC) can play a pivotal role, as its characteristics and functionalities enable it to serve as a strategic communication and marketing tool. The present study seeks to explore, within the agri-food sector, the role that BC can assume in supporting communication and contributing to the establishment of trust-based relationships with loyal customers. To this end, a qualitative approach is adopted, utilising a multiple case study based on secondary data, in order to investigate the motivations and objectives that lead agri-food companies to implement BC. As this research represents an initial exploratory phase, the study offers theoretical implications, underscoring the need for future research based on primary data to further examine the conditions required to foster trust and credibility in BC applications within the agri-food market.

*Keywords: Blockchain Technology, Agri-Food Industry, B2C, Communication, Trust*

## 1. Introduction

Among environmental and social sustainability concerns, critical issues such as food safety, contamination risks, and food counterfeiting are increasingly emerging within the agri-food industry (Duan et al., 2020). Consequently, from the demand side, consumers are becoming more attentive to the quality and authenticity of food products, requiring greater traceability and transparency from agri-food companies regarding the products they purchase (Antonucci et al., 2019; Rana et al., 2021). Indeed, food safety and authenticity are among the principal factors influencing consumers' purchasing decisions (Eurobarometer, 2022).

In this context, Blockchain (BC) technology emerges as a promising tool to address these critical issues, owing to its distinctive characteristics and functionalities. In particular, from a sustainability perspective, BC also has the potential to support sustainable practices by enabling transparent communication of environmental and social data, enhancing supply chain responsibility, and facilitating the verification of sustainability claims (Cao et al., 2023). Furthermore, as a distributed, immutable, and accessible ledger capable of documenting the production, processes, and distribution of agri-food products (Kramer et al., 2021), BC serves, on the one hand, as a supply chain management tool, significantly reducing information asymmetry and fostering collaboration among stakeholders (Kshetri, 2018), thereby improving overall effectiveness and efficiency in terms of traceability; and on the

other hand, as a communication and marketing tool through which agri-food companies can directly and interactively convey and promote the transparency and authenticity of their products to the end consumer (Antoniadis and Kontsas, 2019).

Although academic debate has explored the potential applications of BC in the agri-food industry, few studies have examined the role that BC can play as a management, communication, and marketing tool. In light of this, the present study aims to address this gap by investigating, through empirical evidence, the motivations and objectives driving companies to adopt BC. Accordingly, this paper addresses the following research question:

- Why, and with what objectives, do agri-food companies choose to implement BT?

## 2. Literature Review: Blockchain Technology in Agri-food Industry

BT can be defined as a distributed ledger, structured as a chain of blocks, which stores related transactions in chronological order, with its integrity guaranteed by cryptographic algorithms and a peer-to-peer consensus mechanism (Treiblmaier, 2019). Within this system, each participating node may propose the creation of a new data block, which is added to the chain only after validation by the network, without the need for a central authority, and cannot subsequently be altered. Based on this technical structure, several scholars have identified characteristics in BC such as decentralisation, disintermediation and immutability, which, in practical application, translate into guarantees of security, transparency, traceability and auditability (Christidis and Devetsikiotis, 2016; Zheng et al., 2018).

BC first emerged in the financial domain with the introduction of Bitcoin (Nakamoto, 2008) and later extended its application to various non-financial sectors. Theoretical discussions have extensively explored Blockchain technology from a technical perspective, defining its areas of application according to its core functionalities (Zheng et al., 2018; Casino et al., 2019). In this context, several authors have highlighted the potential of Blockchain technology to be successfully integrated into the agri-food industry, emphasising its positive and beneficial impact on both producers and consumers (Vern et al., 2024).

Building upon this foundation, BC is increasingly recognised as a tool to support sustainability in agri-food supply chains, by enabling more efficient resource management, reducing waste, and facilitating the verification and communication of environmental and social standards (Rana et al., 2021). BC is considered potentially revolutionary for its ability to track, in real time, who performs specific actions, when and where these are carried out, as well as the quality and quantity of the product (Saberi et al., 2018), thus contributing to improved traceability and management efficiency within the agri-food supply chain (Duan et al., 2020; Ji & Xu, 2025). Other scholars have emphasised Blockchain's potential in reducing food fraud and protecting the authenticity of agri-food products (Tian, 2016; Antonucci et al., 2019).

With regard to sustainability, the transparency and immutability guaranteed by BC can facilitate the verification and communication of sustainability-oriented certifications and claims, enabling consumers to access reliable information concerning the environmental and social impact of products and encouraging more responsible consumption choices (e.g., Rana et al., 2021; Cao et al., 2023). Furthermore, the academic debate presents BC as a strategic communication tool capable of revolutionising both communication methods and the marketing strategies adopted by agri-food companies (Cao et al., 2023). Direct access to data, enabled by BC labels, encourages the development of new, more direct and transparent forms of communication, responding to growing demands for authenticity and safety (Martinelli and De Canio, 2023).

The potential to enhance transparency and traceability of processes and products represents a marketing opportunity that can shorten the distance between producer and consumer (Buvaneswari and Swetha, 2019), thereby strengthening brand positioning in the market and overcoming barriers that hinder customer loyalty (Bonetti et al., 2024). In this regard, Sepe (2023) demonstrated that perceived transparency and perceived product trust—a consequence of data accessibility—have a significant influence on guiding consumers in their food purchase choices.

Accordingly, the integration of BC in the agri-food sector is not only aimed at improving supply chain management and communication, but also at supporting the achievement of sustainability objectives, in line with the growing expectations of consumers and stakeholders for more responsible and transparent food systems. In line with this, the present study seeks to explore the role of BC in the agri-food industry, investigating the motivations and objectives that drive companies to adopt this technology.

## 3. Methodology

To achieve this objective, our preliminary research design, grounded in a qualitative approach, adopts a process that incorporates a multiple case study methodology based on secondary data (Eisenhardt, 1989; Miles & Huberman, 1984). This process comprises two stages:

(1) Identification of case studies. The analysis was specifically focused on Italy, with particular emphasis on the agri-food industry in Campania. The research was contextualised in Campania, as it is the Italian region with the highest number of traditional food products (GU Serie Generale no. 61, 2024). Five companies were selected (see Table 1) according to the following criteria: Campania-based enterprises that have pioneered the adoption of Blockchain Technology across different agri-food sectors; and the greatest availability of relevant data. The number of companies included in this research is consistent with previous studies employing a similar empirical approach within the Blockchain field (e.g., Danese and Romano, 2020).

(2) (2) Collection of secondary data. Secondary data were obtained through the consultation of the principal corporate platforms (websites and social media) and third-party sources reporting pertinent information, from which various corporate documents, data relating to Blockchain application, and video materials were extracted. This data collection was conducted during October 2024. The analysis of the data was performed independently by the authors, in order to minimise mutual influence, and subsequently followed by a joint consultation to compile notes on each enterprise.

The research process is intended to proceed, in subsequent phases, with the collection of primary data through a focus group comprising economic and institutional actors with expertise in the sector under investigation.

**Table 1:** Sample Description - Source: Authors' elaboration

## 4. Findings

This preliminary analysis of secondary data, sourced from official company platforms and pertinent third-party publications, reveals that the principal motivation for companies to implement a Blockchain-based data recording system is to enhance the traceability of individual products or the entire supply chain (see Table 2). Companies identified traceability and transparency as essential features of Blockchain technology, as these enable the verifiable recording of every stage of production and ensure comprehensive traceability throughout a product's lifecycle.

Furthermore, the analysis highlights two main objectives that underpin the behaviour of companies in adopting Blockchain technology: (a) to render communication with consumers more transparent; and (b) to promote product authenticity, thereby combating counterfeiting and facilitating market positioning.

Communicating with consumers in a more direct and transparent manner—by providing clear and detailed information regarding production processes and product characteristics—is considered a priority, particularly in the cases of BioItalia, Pastificio Liguori, and Spinosa. This objective is pursued through the adoption of Blockchain technology, which enables companies to establish direct communication channels with consumers, offering them easy and immediate access to information concerning the processes that have led to the creation of the final product and its attributes. Consequently, companies ensure maximum transparency across the supply chain and demonstrate enhanced corporate responsibility, both of which contribute to strengthening consumer trust—a fundamental element in the effective functioning of markets and B2C relationships.

Similarly, the companies examined reported the adoption of Blockchain technology as a marketing tool to promote the authenticity of their products to end consumers, with the dual aim of combating the counterfeiting of Made in Italy products and enhancing their market positioning.

## 5. Discussion and Conclusion

The findings of this preliminary analysis indicate that, within the agri-food sector, the adoption of BT is primarily motivated by the need to enhance the traceability of products and the entire supply chain, thereby increasing efficiency and establishing a solid foundation for trust-based relationships with consumers. Moreover, consistent with the aforementioned perspective, the utilisation of Blockchain can support sustainability objectives by enabling the transparent communication of sustainable food practices, certifications, and the environmental and social impacts of production processes, in line with the study by Cao et al. (2023).

Specifically, Blockchain is implemented with the dual objectives of, firstly, rendering communication with consumers more transparent to emphasise product quality and safety, and secondly, promoting product authenticity and combating counterfeiting. The empirical findings are congruent with the existing academic discourse, which identifies Blockchain, owing to its distinctive characteristics and functionalities, as a potential solution to the increasingly evident challenges faced by the agri-food sector, particularly those related to the need for improved traceability and transparency in the management and communication of data and information pertaining to processes and products (Rana et al., 2021).

Furthermore, the results confirm the dual functionality of Blockchain, which assumes different connotations depending on the perspective adopted. In particular, the use of Blockchain as a supply chain management tool (Kshetri, 2018; Saberi et al., 2020) serves as the means by which its role as a communication and strategic marketing tool is realised, with the aim of enhancing transparency (Tian, 2016), promoting authenticity (Antonucci et al., 2019), and strengthening both brand positioning in the market and consumer trust (Bonetti et al., 2024).

Additionally, the findings of this research offer significant theoretical implications for the adoption of Blockchain in the agri-food sector. As this study is based on secondary data and

constitutes an initial exploratory phase, it underscores the necessity for future research employing primary data to investigate in greater depth the conditions required for the development of trust and credibility in Blockchain applications. Subsequent studies could utilise interviews, surveys, or direct observations to better understand how trust and credibility are established and maintained among stakeholders within the agri-food supply chain.

Finally, this preliminary research has enabled us to delineate the need for further investigation into the conditions necessary for Blockchain to be perceived as credible, beginning with the issue of data accuracy and, consequently, the responsibility and ethics of the companies (both upstream and downstream within the supply chain) that input data.

## Abstract

Despite rapid advances in food-printing technology, commercial uptake of 3D-printed food is still modest and extant research provides only piecemeal consumer-psychology perspectives. This study aims to develop and test an integrative model that jointly considers psychological barriers (perceived safety, food neophobia, perceived health risk), facilitators (perceived benefits, knowledge of the product, personal innovativeness) and the moderating roles of environmental consciousness and social desirability in shaping consumers' intention to consume 3D-printed food.

Primary data were collected through a structured questionnaire administered to 141 Italian consumers and analyzed with partial least squares structural-equation modelling.

Results show that food neophobia is the unique barrier exerting a significant negative effect on intention, whereas perceived benefits, product knowledge and personal innovativeness all positively influence adoption. Environmental consciousness strengthens the impact of personal innovativeness, while other moderating paths and the direct effects of perceived safety and health risk are nonsignificant.

Theoretically, the study clarifies the relative salience of facilitators over risk-based deterrents and identifies an "eco-innovative" consumer segment in which sustainability values amplify innovativeness effects. Practically, marketers should foreground customizable nutritional and environmental benefits, provide experiential knowledge opportunities, and implement gradual exposure strategies to mitigate neophobia and accelerate mainstream acceptance of 3D-printed food products.

## 1. Introduction

Recent advancements in food technology are transforming the way individuals produce and consume food, with increasing emphasis on personalization, sustainability, and resource efficiency. Among these innovations, three-dimensional food printing has emerged as a promising solution that combines digital manufacturing techniques with culinary creativity. By layering edible materials through additive manufacturing techniques, three-dimensional

food printing allows for the creation of customized shapes, textures, nutritional profiles, and even sustainability-enhanced meals (Varvara et al., 2021; Sun et al., 2015). These capabilities open new possibilities across sectors, from fine dining and healthcare to waste reduction and dietary personalization (Zhu et al., 2023). Despite these advantages, the commercial adoption of 3D-printed food (3DPF) remains limited.

Previous research has highlighted perceived benefits, such as nutritional optimization, environmental sustainability, and aesthetic appeal, as key factors in shaping positive consumer attitudes (Cunningham et al., 2025; Ng et al., 2022). Although enthusiasm for 3DPF is rising, research that explains the phenomenon from a consumer-psychology angle is still fragmented. Existing work has mostly concentrated on improving printing technologies and material attributes, while the psychological forces that drive, or deter, adoption receive far less attention (Zhu et al., 2023). Seo and Shigi (2024), for instance, emphasize positive expectations such as sustainability benefits, yet overlook potential inhibitors like food neophobia or perceived risk. Although Silva et al. (2024) include food neophobia, perceived benefits, and digital affinity when examining attitudes toward 3DPF, they do not attempt to integrate these elements into a single theoretical model.

To address this issue, the present study proposes an extended theoretical model that incorporates both psychological barriers, including perceived food safety, food neophobia, and perceived health risk, alongside major facilitators, such as perceived benefits, knowledge of the product, and personal innovativeness. In addition, the model introduces two moderating variables: environmental consciousness and social desirability, which have received limited attention in this context despite their relevance in sustainability and innovation literature (Kautish et al., 2021; De Jong et al., 2010).

Drawing on a nationally representative sample and validated scales analyzed through structural-equation modelling, the study delivers a more comprehensive, theoretically grounded picture of consumer responses to 3DPF.

This paper offers insights for both marketers and policy makers, including the need to turn knowledge into positive experiences through educational and tasting initiatives, and the importance of communicating clear environmental benefits to enhance consumer acceptance of 3DPF.

The remainder of the paper is structured as follows: Section 2 reviews the relevant literature and develops the research hypotheses. Section 3 presents the research methodology. Section 4 reports the empirical results, followed by Section 5, which discusses the main findings. Section 6, 7 present theoretical and managerial contributions while Section 8 concludes the study by outlining research limitations and future directions.

## 2. Theoretical Background

Three-dimensional food printing utilizes additive manufacturing techniques, digitally controlled processes that build objects layer by layer from a digital file, to create food products by depositing edible materials in successive layers (Varvara et al., 2021).

Currently, extrusion-based systems dominate the field due to their material flexibility and broad applicability, working by pushing paste-like materials such as doughs, purées, or plant proteins through nozzles (Baiano, 2022), while inkjet and binder-jet technologies offer finer structural detail by depositing liquid droplets or selectively binding powdered ingredients, thus providing higher resolution in certain contexts (Shah et al., 2024). Selective laser sintering has also been adapted for materials like sugar and chocolate, using laser energy to fuse powder layers into delicate structures (Zhu et al., 2023).

The development of three-dimensional food printing gained early momentum with the 2005 launch of the open-source Fab@Home platform for multi-material printing, which by 2007 could print edible materials such as cookie dough and chocolate, and culminated in the early 2010s with the emergence of commercial devices like Natural Machines' Foodini printer for food pastes and purées, enabling shaped vegetable purées and pasta bases (Baiano, 2022).

Current applications of 3DPF span a wide range of contexts, from fine dining, where chefs use the technology to create geometric garnishes and bespoke chocolates (Baiano, 2022), to healthcare settings, where it supports personalized nutrition by printing vitamin-fortified bars and texture-modified purees for patients with dysphagia (Zhu et al., 2023). Organizations such as NASA are also investigating the use of three-dimensional food printing to produce on-demand meals in zero-gravity or remote environments, utilizing shelf-stable ingredient cartridges to ensure safety and efficiency (Baiano, 2022). Beyond institutional and professional use, hobbyists and home cooks have adopted consumer-grade printers to craft novelty items such as pancake art and customized cookies (Shah, 2024). One of the key advantages of three-dimensional food printing is its ability to produce customized meals by varying nutrient concentrations, introducing healthy ingredients such as vitamins and fibers, and adapting macronutrient and micronutrient profiles to meet individual dietary needs and preferences (Baiano, 2022). Another major benefit is sustainability: the technology minimizes ingredient waste and allows the repurposing of surplus produce and alternative proteins, thus enhancing supply-chain efficiency (Zhu et al., 2023). Finally, the technology improves accessibility in healthcare settings by enabling the production of nutritionally adequate meals with customized textures and shapes, particularly for patients with dysphagia, who require modified food consistencies for safe consumption (Baiano, 2022).

Perceived benefits, such as nutritional enhancement, convenience, and waste reduction, significantly drive consumer acceptance of 3DPF, notably increasing consumers' willingness to experiment when these clear advantages are evident (Cunningham et al., 2025). Supporting this, Ng et al. (2022) highlight that perceived benefits, particularly those related to health improvements, strongly shape positive consumer attitudes towards this technology. Additionally, emphasizing these nutritional and environmental benefits has proven effective in shifting consumer attitudes favorably towards 3DPF, as demonstrated by survey findings in South Africa and Malaysia (Cunningham et al., 2025; Ng et al., 2022). Furthermore, in emerging markets, emphasizing perceived product value, defined through quality and practical utility, can significantly enhance consumers' willingness to pay premium prices for printed foods (Yang et al., 2024).

## 2.1 Barriers and facilitators to adoption

The adoption of 3DPF faces different challenges. Recent research (Zhu et al., 2023) highlights consumers' lack of trust in 3DPF due to the unfamiliar and unclear process. The lack of standard regulations generates doubts about hygiene, safety, and naturalness (Hwang and Choe, 2020). The literature on the topic is still fragmented. No empirical study has identified a clear set of barriers or facilitators (Zhu et al., 2023). To address this gap, the present study introduces a theoretical model based on literature focusing on three potential psychological barriers and facilitators. Barriers may represent an obstacle to consumer adoption: *Perceived Safety* (SAF), *Food Neophobia* (FN), and *Perceived Health Risk* (PHR). Facilitators can increase consumption by reducing their reluctance: *Perceived Benefits* (PB), *Knowledge of the Product* (KN), and *Personal Innovativeness* (PI).

### 2.1.1 Food neophobia, perceived health risk and safety of 3DPF

SAF can be an obstacle to the adoption of 3DPF. There are no national or international laws that regulate the production process or define standards for food, which increases reluctance

and reduces acceptance (Zhu et al., 2023). This absence of standardized guidelines restricts the potential consumption of 3DPF because no information scares consumers (Zhu et al., 2023). According to the findings of preceding studies, respondents have expressed a notable level of concern regarding the safety of 3DPF. Results found by Mansan and McSweeney (2020) that about half of the participants in their study were worried about the safety of 3DPF. A study by Lupton and Turner (2016), also highlighted that safety was a key concern among participants. Considering these insights, Hypothesis 1 is formulated as follows:

H1: SAF significantly and negatively affects the intention to consume 3DPF.

FN is the aversion to try novel or unfamiliar foods (Gustavsen et al., 2025). It is an adverse emotional reaction to new food, technologies, and sources. FN is a mental protective strategy used to avoid harmful substances or situations, often seen as a rejection of unfamiliar foods (Velasco Vizcaíno and Pohlmann, 2025). Nevertheless, it is influenced by demographic and socio-economic variables such as age, gender, education, and family background (Chang et al., 2024), which may sometimes reduce FN. For example, some studies have confirmed the value of minimizing FN in increasing consumer acceptance of insect consumption (Chang et al., 2024). Frequent exposure to new food reduces its perceived novelty and leads to acceptance among consumers (Gustavsen et al., 2025). Considering these insights, Hypothesis 2 was formulated.

H2: FN significantly and negatively affects the intention to consume 3DPF.

PHR influences consumer acceptance of innovative food products. The PHR is the consumer's belief that food may negatively impact health and rise when a product is novel and the information is limited (Chang et al., 2024). According to the World Health Organization, foodborne illnesses related to food consumption represent one of the most frequent causes of mortality in the world (Chang et al., 2024). Food risk concerns increased during the COVID-19 pandemic due to the fears of indirect transmission through food or packaging (Hwang and Choe, 2020). Recent research on 3DPF highlights consumers' concerns about naturalness, potential harm, freshness, taste, and nutritional value (Chang et al., 2024). Considering these insights, Hypothesis 3 is formulated as follows:

H3: PHR significantly and negatively affects the intention to consume 3DPF.

### 2.1.2 Perceived benefit, knowledge, and personal innovativeness

The perception of benefits influences consumers' intention to consume and the acceptance of innovative foods. It is the subjective evaluation of the advantages of consuming 3DPF. PB are social and quality-related (Seo and Shigi, 2024). PB have a social advantage because they have a crucial role in reinforcing the sustainability of the production process, particularly for consumers who have green awareness. Moreover, taste, healthiness, convenience, and nutritional customization are essential to raising product acceptance (Seo and Shigi, 2024). Evaluating the benefit of adopting innovative food depends on the cost-benefit paradigm, which is often discussed in decision-making research (Kim et al., 2019). A strong perception of the social and health-related benefits of 3DPF positively influences consumers' intention to adopt innovative food (Seo and Shigi, 2024). Considering these insights, Hypothesis 4 is formulated as follows:

H4: PB has a significant positive impact on the intention to consume 3DPF.

Another key factor is PI which is the openness to new experiences or technologies (Agarwal and Prasad, 1998). It is considered a key dimension of consumers' personality, reducing

reluctance and shaping adoption. With high PI, early adopters are consumers less constrained by traditional norms who show a higher propensity to try unfamiliar products (Agarwal and Prasad, 1998). Early adopters have high PI and, for this reason, are opinion leaders and can influence the diffusion of innovative technologies through social influence, particularly in food. Their openness to innovation may reduce psychological reluctance to 3DPF, which plays a decisive role in shaping public perception and normalizing the adoption of emerging food technologies (Wang et al.,2024). Considering these insights, Hypothesis 5 is formulated as follows:

H5: PI has a significant positive impact on the intention to consume 3DPF.

In addition, KN plays a significant role because it shapes consumers' attitudes toward innovative food. Previous research indicates that the level of knowledge impacts consumers' choices and evaluation processes when there is an unfamiliar product (Kelting et al., 2017). For example, for insect-based foods (food with alternative proteins), good knowledge and more information are linked to higher product consumption. Previous experience and familiarity with products influence willingness to consume them (Piha et al., 2018). Better product knowledge reduces the perceived risk and raises trust in the production process. Knowledge leads consumers to a more deliberate decision-making process instead of an instinctive rejection of unfamiliar products (Piha et al., 2018). Considering these insights, Hypothesis 6 is proposed as follows:

H6: KN significantly and positively impacts the intention to consume 3DPF.

### 2.2 Moderating variables: environmental consciousness and social desirability

Based on existing literature, *Environmental Consciousness* (EC) and *Social Desirability* (SD) (Costa et al., 2021; Kautish et al., 2019) can play a fundamental role in shaping consumer intentions toward 3DPF. They can influence the relationship between barriers and facilitators to the intention to consume 3DPF. The acceleration of environmental concerns, sustainability challenges, and consumer awareness about environmental crises has positioned green consumption as socially relevant (Kautish et al., 2019).
